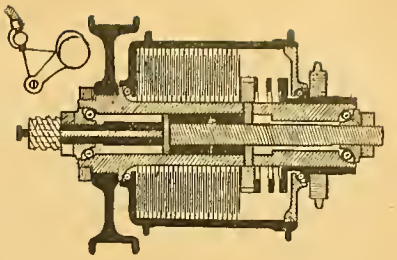
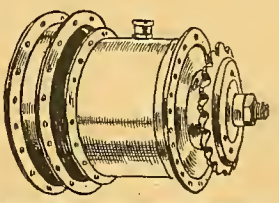
The Ideal spring fork is an attachment which can be fitted to any motor bicycle. It was recently described and illustrated in these pages, but we now reproduce a line drawing of this article, which renders the design somewhat clearer than the half-tone block from a photograph previously published. It will be noticed that the shackle plates are attached at three points, viz., the ball head clip, usual fork crown, and the fork ends. The Ideal fork enables a front wheel rim brake to be fitted, is a well constructed article, and should appeal to riders who possess machines with rigid forks and are desirous of bringing their mounts more up to date. (Ideal Spring Fork Co., Gilbert Road, Belvedere, Kent.)

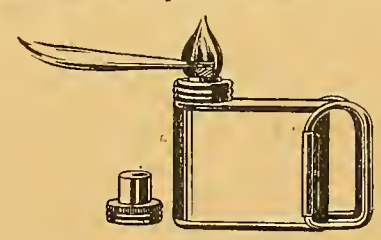
The Harris clutch, which is of the plate type, is fitted in the rear hub. The chief advantages of a clutch are that it is possible to disconnect the drive of the engine from the road wheel for controlling the speed of the machine in traffic, and it also enables a standing start to be made with the rider seated in the saddle. The clutch consists of a number of plates, half of which are connected to the hub barrel and the remainder to a sleeve attached to the rear belt rim. When the plates are separated the belt rim and engine can be revolved by means of the pedalling chain, while the road wheel remains stationary. When the plates are forced together by a spring (operated by a lever on the handlebar or footrest) the friction between their surfaces locks the sleeve plates to the hub plates, and in consequence the road wheel, hub, sleeve, and belt rim rotate together as a solid mass. The clutch hub is no wider than an ordinary hub and belt rim, and will fit many machines without structural alterations. (Harris, Ltd., Upper Highgate Street, Birmingham.)





Section and Elevation of the Harris Plate Clutch Hub.

The firm of Neville, Williams, and Co. are responsible for the production of a new soldering medium known as Tinol, which is a grey paste sold in air-tight tins, consisting of the alloy of metals forming solder reduced by a special process to an exceedingly fine powder, and mixed with a flux which is free from acid—a point of especial importance in soldering electrical joints. In actual practice, Tinol is exceedingly easy to manipulate, as under ordinary circumstances no previous cleaning of the parts to be soldered is necessary. We have proved the efficacy of the material after practical tests. The

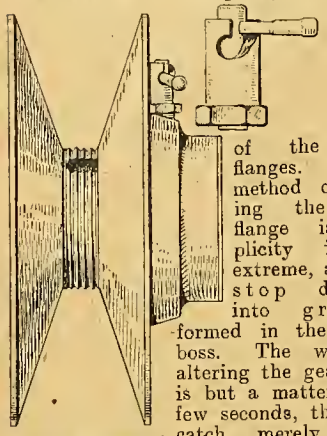


The Tinol Soldering Lamp.

Tinol cored soldering stick is another item of interest to those who do their own repairs. It consists of a tube of solder filled with Tinol paste, and it possesses the advantage of enabling soldering to be carried out without the aid of any further flux. To facilitate the use of Tinol, a neat blow lamp is supplied burning methylated spirit, which works admirably. (Neville, Williams, and Co., 11 and 13, Southwark Street, S.E.)

Accessories and Equipment.

A simple adjustable pulley of new design and requiring no tools to operate it is the "Moveo." A large range of gear ratios may be obtained with the use of this pulley on account of the deep flanges. The method of locking the loose flange is simplicity in the extreme, a spring stop dropping into grooves formed in the pulley boss. The work of altering the gear ratio is but a matter of a few seconds, the small catch merely being raised up the inclined surface of the guide, when the outer flange is free to move, the stop fixing the flange as soon as it registers with one of the keyways. (J. H. R. Loxham and Co., Charnley Street, Preston.)



Loxham's "Moveo" Pulley.

The Wolf tool-kit consists of a leather roll-up, containing eleven tools. The case is sold complete with the tools, or each tool can be supplied separately. Another accessory is the Wolf double purpose petrol can. This has a funnel, permanently attached to the top of the can, fitted with gauze strainer, and flexible metal spout. (Wolf Engineering Co., Ltd., Pountney Street, Wolverhampton.)

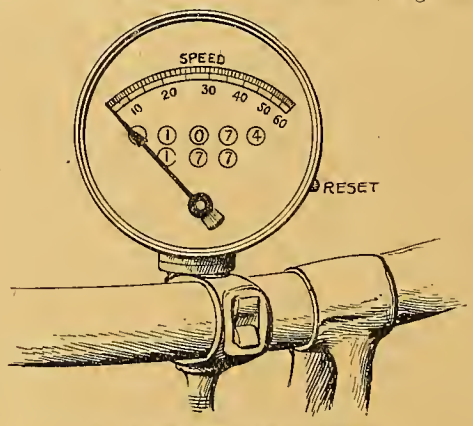
One of the latest introductions into this country is the Clarion sweet chime bell, which gives a clear ringing note, and for lightweights and silent motor bicycles gives "audible and sufficient warning" of a pleasant nature. For many years motor cyclists have been on the look-out for an odometer at a low price. Their old and faithful friend the Veeder is now sold in a strong model suitable for motor cycle use. The Veeder motor cycle trip cyclometer is larger and more substantial than the old cycle type, is made for 24in., 26in., or 28in. wheels, the miles are shown in white figures on a black background, and the tenths now carried well away from the other figures in red, also on a black background. The star wheel is much stronger than previously, and a special friction device is employed, which prevents the wheel from spinning when the machine is travelling at a high rate of speed. The new bracket designed to fit this instrument is adjustable to fit any make of machine. It is constructed to bring the cyclometer as near the centre of the wheel as possible to allow the striker to describe as small a radius as possible so as not to hit the star wheel unduly hard.

Clarion Chime Bell for use on motor cycles. It is sold by Markt & Co.

The Service Co.'s Waterproof Lamp Cover—excellent for those who wish to keep their lamps clean.

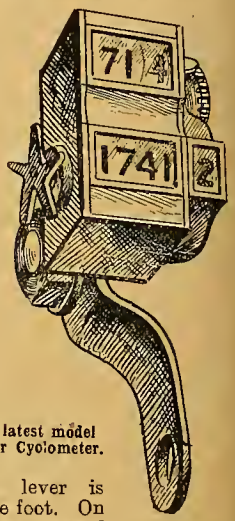
A long stout clamp holds it in position. The roller lessens the wear on the star wheel by giving a rolling instead of a sliding contact. Another accessory for which the firm are well known is the motor cycle speedometer—an instrument which has proved its reliability times without number. It is made in three types, the most attractive of which is the Model 32, fitted with maximum speed hand total register and trip odometer. (Markt and Co., 6, City Road, E.C.)

The Coronet adjustable pulley is claimed to give a range of gear ratio from 3 to 1 to about 7 to 1. The boss of the fixed flange is screwed to take the loose flange, and on it and the loose flange are cut keyways in which a key is free to slide. The key is provided with a slot engaging with the loose flange by which the key is made to travel inwards and outwards as the flange is screwed up or down on the boss. To fix the loose flange a knurled lock ring is provided. (Booth's Motories, Charles Street, Halifax.)

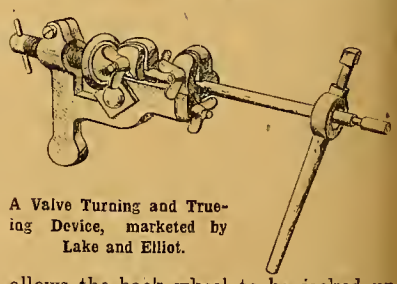


The Indicator of the Jones Speedometer.

The firm of Lake and Elliot have for many years devoted their attention to the wants of motor cyclists. Being supplied with a well-equipped factory they are capable of turning out the very best class of work. As they were cognisant of the clever designs executed by A. D. Powell, Leicester, they have purchased the patents covering his "Fit-all" and "Hub" two-speed gears, and are now manufacturing these. It will be remembered that the Fit-all gear is attached to the crankshaft of a motor bicycle, and will fit any standard make. The Hub gear has been considerably improved. On the high speed (and this is one of the improvements) the drive is engaged by means of a bronze internal expanding ring, 2in. wide. We have purposely dealt with these gears in brief, as they hardly enter into the scope of this special issue. One of the productions for which Lake and Elliot have been most famous in the eyes of motor cyclists is the Millennium express stand; this is a remarkably ingenious device. It is light, scientifically constructed, and possesses the advantage of being very quickly released. To put the stand into action it is lowered to the ground, and the machine is jerked up against it. To release the stand, a specially long lever is operated by the foot. On this lever being pressed the stand is released, and flies quickly back to its normal position. Another ingenious device is the Millennium front wheel combined carrier and stand, which provides an excellent carrier over the front mudguard, and also allows the back wheel to be jacked up in the case of a puncture. Quite an ingenious tool is the Millennium valve truer, for which motor cyclists are sure to have need sooner or later in their experience. When a valve gets so pitted that grinding would be a most tedious process such a tool as the Millennium valve truer is a real boon. It is remarkably simple, and consists of a bracket provided with two bearings for carrying the valve stem. When the valve is held absolutely parallel its face is brought up against an adjustable cutter. A long lathe carrier supplied with the tool is attached to the end of the valve, and by this means the latter is rotated, and the face trued up in a remarkably short space of time. The valve truer may be held either in the hand or in a vice. A tool for similar work, which



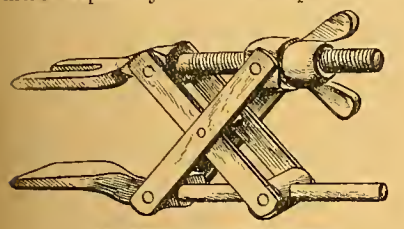
The latest model Veeder Cyclometer.



A Valve Turning and Trueing Device, marketed by Lake and Elliot.

Accessories and Equipment.

displays great ingenuity, also sold by Lake and Elliot is made for truing valve seatings, but as this is a job more especially for the repairer it



Lake and Elliot's Valve Spring Lifter.

needs only a short reference. One of the neatest valve spring lifters we have yet seen is the Millennium. It will be seen from the accompanying illustration that its ingenious design allows it to have an entirely parallel action, enabling it to be free from any tendency to bend the valve stem. After the jaw has been inserted underneath the cotter, if the wing nut is turned it causes both the jaws to open and keep perfectly parallel in so doing. Another excellent set of box spanners for use on motor cycle engines are known as the Midas. There should be a ready

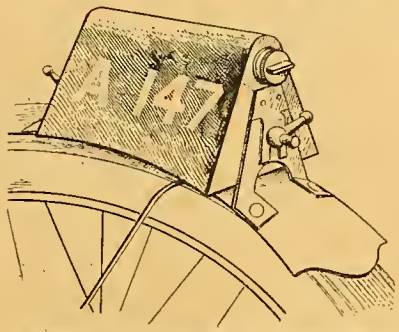
The "Autogrip" Spanner.

demand for these, as they are compact and useful. The tommy bar is provided with a screwdriver end which fits into the square provided with the set. When this is placed in position the rest of the tubes are slipped over, and the whole forms a

Lake and Elliot's Stand.

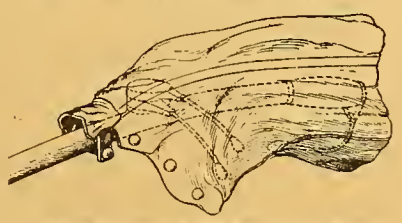
particularly neat screwdriver with a convenient handle. The Autogrip spanner is another most ingenious tool. This can be instantly fitted on to a nut of almost any size, and the force exerted to turn the nut keeps the jaws firmly closed, so that the nut cannot be damaged. By pulling out the lower jaw and replacing it, three different adjustments may be obtained. Two sizes of spanners are sold, one taking sizes from zero to 1in., and the other from zero to ⅜in. When not required as a spanner the tool may be used as a pair of pliers. (Lake and Elliot, Albion Works, Braintree, Essex.)

The Service Co., where so many up-to-date accessories are always to be found, has just introduced a spare petrol tank and number plate. The tank, which is wedge-shaped, carries about a quart of petrol, and is shaped



This spare Petrol Carrier fits on the front mudguard extension, and is sold by the Service Co.

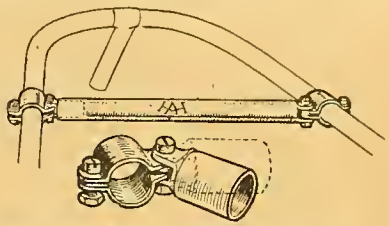
to fit on to the front mudguard extension by the aid of two brackets, which are fitted to the mudguard, where they remain permanently. The spare can slips into these two brackets, and is then locked in position by thumbscrews. On each side the front



A Hand Protector for cold weather—it enables the control levers to be operated without removing the hand.

number may be painted. It is also interesting to note that the tank may be readily detached and its contents poured into the main petrol reservoir. Another accessory which should appeal to all-weather riders is the Service "hand muff" lined with fur. At the extremity of the muff there is an opening, which can be closed by the aid of two patent fasteners, through which the control levers are passed, so that they are always in the muff. The muffs are also supplied with a steel stay running across the top to keep them clear of the control levers. The Service Co. are also marketing a rubber cover for the high tension terminal of magnetos. Yet another accessory sold by the same company is their special belt, which, we understand, is giving great satisfaction. The belt consists of two strips of chrome leather, on which are built rectangular pieces of raw hide leather at intervals. The result is an extremely flexible and highly efficient belt. (The Service Co., Ltd.), 292-293, High Holborn, W.C.)

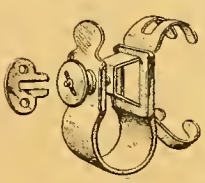
The H.H. handle-bar is a transverse adjustable bar for fixing across existing handle-bars of any make for carrying the watch, speedometer, or other similar accessory, fitted with a loose



Hunt's Handle-bar Attachment for carrying watch, horn, speedometer, etc.

plug end and clamps (to fit it, it is only necessary to remove the plug and cut the bar to the desired length, and then replace the plug.) (A. H. Hunt and Co., 115, Cannon Street, E.C.)

The Metropolitan Machinists' Co. is specially devoting its attention to motor cycle accessories, since the latest catalogue devotes no less than sixty-six pages to this subject. The number of items of interest sold by the Metropolitan Machinists' Co. is very great, nearly every well-known accessory being stocked. Among the numerous samples recently shown us we noticed an excellent solid leather telescopic valise, strengthened inside by means of a skeleton iron frame, which is provided with substantial straps and is sold at a very moderate figure; a tubular motor cycle luggage carrier, which can be supplied to fit any make of motor cycle, which is at once strong, well made, and by no means unsightly; and the "Off-an-On" motor cycle tyre lever made of the best forged steel. This is really a useful accessory. One end of it will act as a screwdriver, while the other, by means of which the tyre is levered on or taken off, performs its functions in the most satisfactory manner. One side easily slips underneath the beading to remove the cover, while the other when the lever is raised forward allows the beading to drop into the rim. Many motor cyclists



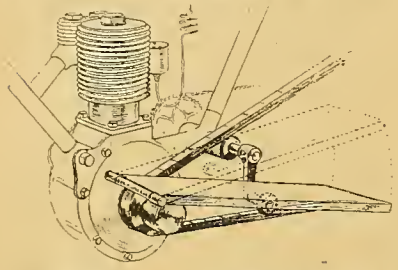
A simple Watch Holder with key. Sold by the Metropolitan Machinists' Co.

A useful combined Tyre Lever and Screwdriver sold by the Metropolitan Machinists' Co.

favour handle-bar watches, and one of this firm's specialities is a thiefproof handle-bar watch holder, quite an ingenious device, which, by the aid of a special key, prevents the watch or holder being removed when once locked. (The Metropolitan Machinists' Co., Ltd., 75, Bishopsgate Street Without, E.C.)

Accessories and Equipment.

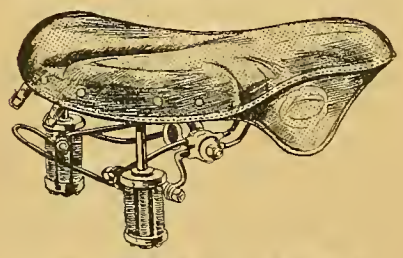
The L.M.C. Auto Varia pulley and free engine device enables a higher gear ratio to be used for the level than would be advisable with any type of fixed pulley, with a correspondingly low gear ratio for hill-climbing. The loose flange of this pulley is controlled by springs of a strength proportionate to the power of the engine. When



The "Auto-Varia" Free Engine Pulley and Footboard Starting Device, which obviates the necessity for pedals.

running on level ground the pulley flanges are close together, and the belt at the highest point in the groove. On hills the extra pull on the belt compresses the springs in proportion to the gradient, so opening the pulley groove, and lowering the gear ratio. If desired, a handle-bar controlled free engine is obtainable by opening the pulley groove until the belt drops on to a ball bearing, when the engine is free to run without propelling the machine. (The Lloyd Motor Co., 132, Monument Road, Birmingham.)

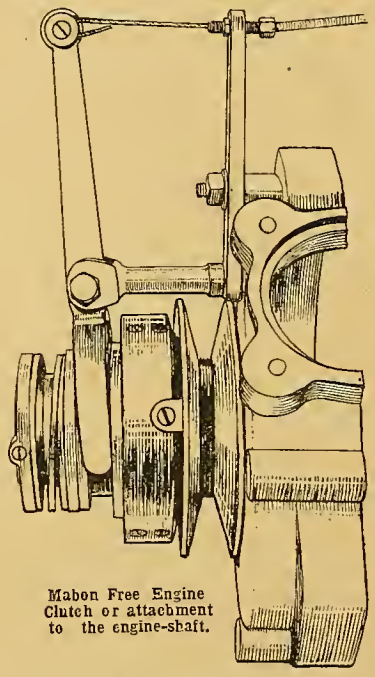
The latest introduction of Lycetts, Ltd., is a new pattern motor cycle saddle. The framework is made of six steel rods. Two support the rear cantle, the remaining four being connected two each to the top caps of nests of five coil springs shown in the illustration. The rods, to which are fastened the bottom caps of the nests of springs, are fastened to the rear cantle. There is no front spring.



Lycett's Latest Saddle with padded top and new rear springing arrangement.

When the rider's weight is in the saddle it is free to rise and fall the distance shown between the top cap of the springs and the underside of the cantle, the movement being controlled by the springs, which are always in tension. The top is of specially selected leather and well padded. Lycetts make excellent toolbags for attachment to the top or sides of the rear carrier, and also make the rear carrier itself. This latter is made of steel tubing, and is attached to the frame in the usual manner with clips. (Lycetts, Ltd., The Saddlery, Birmingham.)

The Mabon clutch has now been brought to a high state of perfection. It is constructed on the usual principle, there being seventeen plates fixed alternately by means of keys and keyways to the engine-shaft and to the movable portion of the clutch. One of the latest improvements is the fitting of an adjustable pulley, which is carried out in a particularly neat manner. The hollow clutchshaft is now slotted so that the pulley and clutch may be removed bodily, and the engine-shaft need not be disturbed. The arm holding the clutch fork is also slotted so that it may be adjusted to suit all sizes of crank cases, and the fork pins may be arranged to take up their positions centrally. The adjusting screw which allows the tension of the clutch spring to be varied screws on

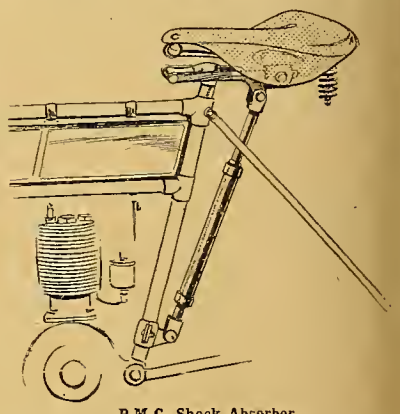


Mabon Free Engine Clutch or attachment to the engine-shaft.

to the hollow shaft, and is provided with a grub screw so that it is firmly locked into position. (A. Mabon, 54, High Road, Finchley, N.)

The S.A. valve seater and truer is designed to facilitate grinding of exhaust and inlet valve seats. A tool and two cutters are supplied. One cutter is used in place of the valve, and by means of hand pressure only a light cut is taken over the seating in the valve chamber, and unless the seating is very faulty only a very minute portion of metal is removed. The seating of the valve itself is then trued by placing the stem through a hole in the other cutter (this latter being held in the hand or a vice) and gently rotating the valve by means of a screwdriver or other tool. It is claimed that the faces produced by these cutters enable the valve to hold petrol without further treatment with any abrasive compound. The cutters are made for all standard makes of motor cycles, and the cost is most reasonable. (Southern Automobiles, Ltd., 102, Westcombe Hill, Blackheath, S.E.)

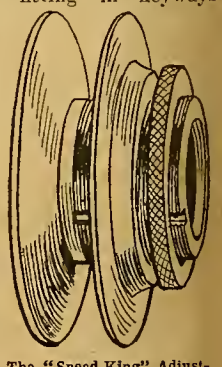
The P.M.C. shock-absorber is one of the numerous accessories marketed by the Premier Motor Co. The special saddle L pin is hinged and connected to a tube telescoping into another, which is again hinged to a clip fastened round the seat tube just above the bottom bracket. The movement of the telescoping tube is controlled by two strong coiled springs, one taking the downward thrust and the other the recoil. These springs absorb



P.M.C. Shock Absorber.

shocks which would otherwise be transmitted to the rider when the machine was ridden over rough ground. The P.M.C. shock-absorber is made to fit any make of motor cycle, but it is advisable when ordering to give the diameter of the L pin and seat tube and distance between top of seat lug and bottom bracket. The P.M.C. lamp and generator have made a name for themselves. (Premier Motor Co., Dartmouth Street, Aston Road, Birmingham.)

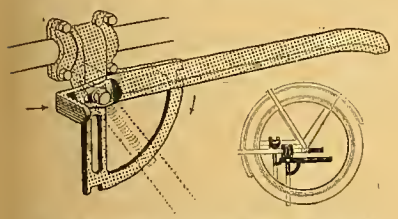
The Speed King adjustable engine pulley is marketed by Farrar's Motor Exchange. It consists of the usual fixed flange and boss and a loose sliding flange, which is prevented from turning by keys fitting in keyways cut on the boss of the fixed flange. To lock the loose flange in position, a knurled locking ring is provided, which screws on a thread cut on the boss. A three-note Fanfare horn, Farrar's Special flexible canvas and rubber belt, and the Albion self-lighting gas lamp are among the accessories handled by this firm. The lighting device for the lamp consists of a spring plunger, which operates on the principle of a flint and steel. When the plunger is drawn out and released smartly, a shower of sparks is directed towards the burner, and the gas is thereby ignited. (Farrar's Motor Exchange, Albion Works, Square Road, Halifax.)



The "Speed King" Adjustable Engine Pulley.

Accessories and Equipment.

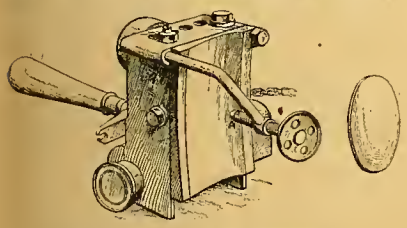
The S.N.P. stand is attached to the chain stays, and does not interfere with the removal of the back wheel. The legs extend horizontally when out of action, and to put the stand into



A quickly-operated stand called the S.N.P. (Smith, North and Priestland). It is attached to the chain stays.

action each leg is pulled rearwardly and then pushed down, when a catch, operated by a spring, drops into a groove at the opposite end of the quadrant. (Smith, North, and Priestland, Birmingham.)

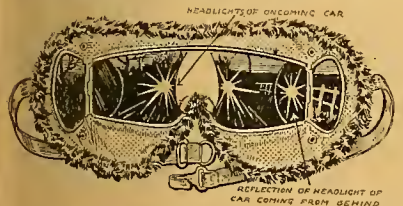
A small portable vulcaniser especially useful to motor cyclists is the H.F. "Baby." Vulcanising tyre patches is the only really safe and sure method, and when possible motor cyclists should have patches vulcanised to punctured or burst tubes. There



Harvey Frost's small size Vulcaniser.

is then no fear of the patch coming loose owing to heat caused by friction. (Harvey Frost and Co., Great Eastern Street, E.C.)

The head of the firm of W. and R. Jacobs is himself a keen and active motor cyclist, and so is thoroughly appreciative of the wants of his brethren of the self-propelled wheel. One of the latest accessories placed on the market by his firm is the Le Grand Reflex goggle, which is provided with



Le Grand's "Reflex" Goggles, which are fitted with side mirrors to reflect overtaking traffic.

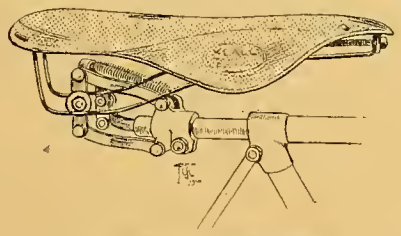
mirrors at each side of the main front glass, in which, if the wearer cast his eyes towards them, he clearly sees what is behind him. Under normal conditions, we are assured, the presence of these mirrors is not noticed. In addition to the White's economisers for controlling the main air supply of all standard makes of carburetters, and rendering the most refractory of the latter easy starting, the firm sell excellent tube and belt cases, known as the Electary, in three types. Two will hold either a tube or a belt, and the third will take both. Metal clips are supplied for attachment to the frame of the machine or the side of the luggage carrier. In ordering these, if the approximate length of belt is stated a case of the correct size will be sent. In addition to the above, we were shown numerous electrical and other accessories. (W. and R. Jacobs, 39c, King William Street, E.C.)

For several years motor cyclists have known the Stanley Dermatine motor cycle belt as the product of much thought and many experiments. It is claimed for it by its makers that it is the most flexible belt on the market. A rubber casing, grooved in the bigger sizes and plain in the small size,

The Stanley Dermatine Belt, and Hook Fastener supplied with links of varying lengths.

covers a strong though pliable core, and the belt is made in four widths, varying from ⅝in. to 1in. With this belt it is advisable to use a Stanley detachable or adjustable fastener, either of which serves its purpose equally well, and it is worthy of note that the hook of the latest patterns is guaranteed against breakage. (The Stanley Dermatine Motor Belt Co., 32, London Road, Bromley Kent.)

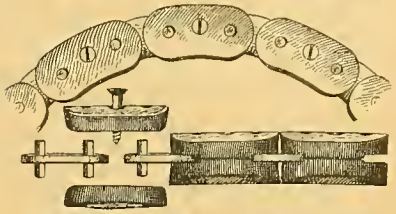
The XL'All spring saddle has been slightly altered in design since it was last described and illustrated in these pages. Reference to the illustration



The latest XL'All Spring Saddle.

shows clearly the double link construction, which gives a parallel easy motion in any position. The springs are fixed to an arched bridge piece connecting the links, which allows the saddle to clear the mudguard. The saddle is fixed to the horizontal extension tube as shown. An excellent type of spring fork which is not at all difficult to fit is also sold by the same firm. (XL'All Co., 6 and 7, Moseley Street, Birmingham.)

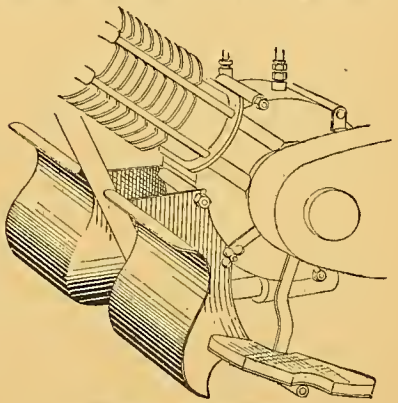
Whittle's patent link grip belt is designed to ensure great flexibility, combined with gripping power, so that when the belt is slack it will still drive. It is a combination of leather blocks, cut to fit the V groove of the pulley, and steel links. The V leather sections are so attached to the links that no metal comes in contact with the pulleys, and no fastener is reqnired. Any one of the links may be taken out by removing one screw, and in the same



Whittle Link Grip Belt, showing method of detachment.

manner the belt may be shortened or lengthened to suit requirements. The Whittle belt is now being tested with satisfactory results on a Motosacoche by the Motosacoche Co. (Thomas Whittle and Sons, Ltd., Rose and Crown Street, Warrington.)

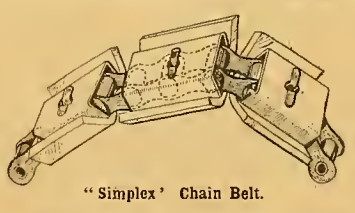
A firm which will cater largely in the future for motor cyclists' wants in the way of accessories is Phelon and Moore, Ltd. The P. and M. foot protectors are at present made only for P. and M. machines. They are attached to the footrests and two bolts of the crank



P. and M. Foot Protectors.

case, and are shaped to protect the feet only. In addition to the above, P. and M. air tube cases attached to the carrier by neat metal clips, valve protectors, and sparking plugs, are marketed. (Phelon and Moore, Ltd., 12, Mortimer Street, W.)

The Simplex chain belt consists of an ordinary cycle chain, on which are mounted hollow steel V pieces at intervals. These V pieces are surrounded by leather riveted to the links of the chain and to the V pieces by



"Simplex" Chain Belt.

bifurcated copper rivets. The combination of the chain with the leather-covered V pieces provides a flexible chain belt. When the leather covering is worn through, it should be an easy matter to replace the sections. (Norton Mfg. Co., Ltd., Deritend Bridge, Floodgate Street, Birmingham.)

Accessories and Equipment.

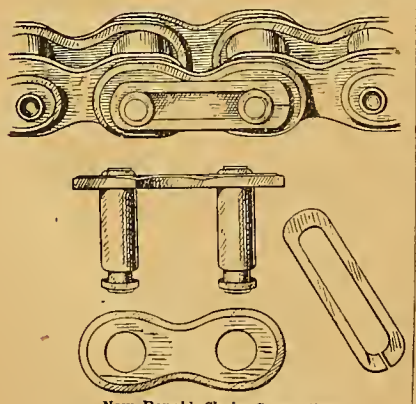
The Novdel Co. market an extremely neat combined carbide and match carrier. This consists of a metal case about the same diameter as a tyre inflator. Owing to its convenient size it is easily carried in two ordinary spring inflator clips. The interior is provided with a coil spring to keep the carbide from rattling about. The caps have self-locking bayonet joints,

Novdel Spare Carbide Carrier.

and the insides of the caps are provided with substantial rubber washers which prevent the damp attacking either the carbide or the matches, which, of course, are carried in separate compartments. Each carrier holds sufficient spare carbide to fill an ordinary sized motor cycle lamp. (The Novdel Co., Ltd., 92, Bexley Road, Northumberland Heath, Belvedere. Kent.)

The N.A.B. spring seat-pillar has been on the market for a number of years, and is popular among motor cyclists and pedal cyclists. It was one of the first spring seat-pillars to be introduced, and, owing to its special construction with rows of balls to prevent friction between the sliding and fixed portions of the pillar, it is not only easy in its action, but practically unwearable. The makers are keeping well up to the times, as they now construct a horizontal tube to carry the seat-pillar to fit machines like the N.S.U., and others, where a horizontal saddle stem is used. An angle clip is also provided for fitting on to the side of a horizontal seat tube, so that the saddle is brought close to the frame. (Reliance Works Co., Tram Terminus, Floating Bridge, Southampton.)

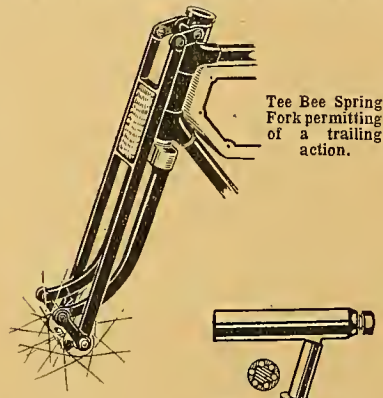
Motor cyclists who have been troubled in the past with chain pins coming out through the nut working loose will be interested in the latest novelty in connection with Renold motor cycle chains. This is called the spring clip joint. Two of the rivets and one side plate are rigidly connected together and are passed through the holes in the rollers so connecting



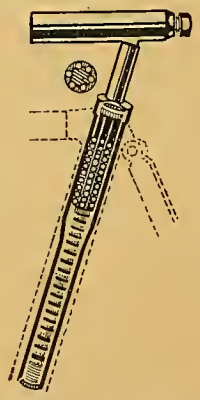
New Renold Chain Connection.

up the chain. The other side plate is then fitted on, and in the recess of the rivets a spring clip is placed locking the ordinary side plate in position. Not only is this a safer method of connection than the bolt and nut, but it is also a very much easier matter to connect and disconnect a chain. In passing, it must be admitted that chain transmission is gaining ground. (Hans Renold, Ltd., Brook Street, Manchester.)

The Tee Bee specialities for motor cyclists are so numerous that it is impossible to deal with them all in this issue. The firm has two excellent springing devices. One is a spring fork on an entirely new principle which allows the wheel to swing



Tee Bee Spring Fork permitting of a trailing action.



N.A.B. Spring Seat Pillar, largely used on motor cycles.

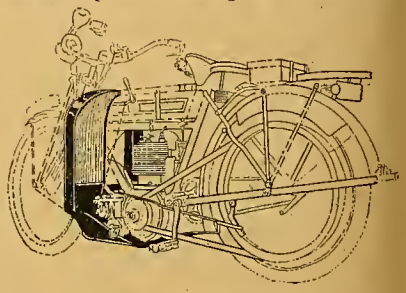
backwards and upwards. The usual practice has been to swing the wheel in front of the fork, but Templeton Bros. place the centre of the wheel behind the fork ends, allowing the wheel to trail instead of being pushed forward. It is worthy of note that the spring saddle attachment is so made that the rider's position is not raised. For high-framed machines a special pattern is made, bringing the saddle more over the back wheel. (Templeton Bros., 535, Sauchiehall Street, Glasgow.)

Practically since the advent of the motor cycle in this country the name of the Watawata belt has been before the public. The canvas and rubber belt is a keen competitor with belts made of leather, but for those who prefer a very flexible belt, and do not mind a little increased trouble of cleaning and dressing, there is no question that the Watawata saves power and is an efficient means of transmission. It is made up of two or more strips of leather with specially shaped leather blocks at intervals. By this construction, when the belt passes round the small pulley the different parts adjust themselves freely to the small diameter of the pulley, eliminating the destructive and power-absorbing strains which are present in V belts of solid construction. The annexed sketch shows how the underpart of the

The Watawata Leather Belt.

belt accommodates itself to the small diameter of a pulley by buckling or bending up into the spaces provided between the aforementioned blocks of leather by which the strips are kept apart. Large diameter copper washers are employed on the top ply, which prevent the plies doubling up, as they often do when small washers are used. (O. and W. Ormerod, Railway Leather Works, Rochdale.)

The Miller shields for the complete protection of rider and machine are much sought after by those motor cyclists who make a point of using their machines



Miller's Mud Shield.

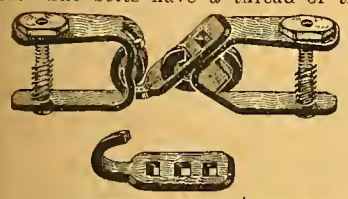
all the year round. The shield completely protects the rider's legs, thighs, and feet from the cold wind and the mud and wet which are thrown from the front wheel. It does this without screening the cylinder from the cold draught of air which is essential to the perfect running of the engine. In addition to protecting the rider, it will be noticed that the screen passes underneath the engine and connects up at the rear with a special back wheel guard which protects belt, belt rim, and rider from mud and wet thrown from the back wheel. Another small accessory made by the same firm is a spare valve carrier. This is made of hard wood, and takes one valve complete with spring. (John A. Miller, Bracken Road, Brighouse, Leeds.

Phrax motor cycle belting is made with a layer of leather at top and bottom and a central layer of rubber strengthened with canvas. It is claimed by the makers that when the belt passes round the small pulley the bottom layer of leather is compressed into the

middle layer of rubber, swelling it sidewise, and securing a perfect grip of the pulley irrespective of the tightness of the belt. Phrax belting is made in all sizes from $\frac{3}{8}$in. to $1\frac{1}{2}$in.; also a lightweight section. (Phrax Belting Co., 87-88, Cheapside, Birmingham.

Accessories and Equipment.

The special features of the Vulcan belt fasteners are the method employed for preventing the ends of the belt pulling out, and the extension hook for taking up the stretch of the belt and for use with adjustable pulleys. Our illustration shows one of the Vulcan fasteners with extension hook in position. The bolts have a thread of the

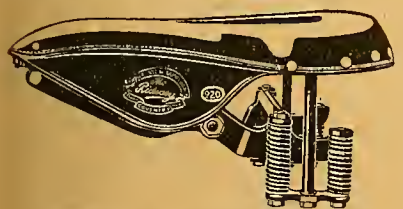


Vulcan Detachable and Adjustable Belt Fastener.

usual kind for engaging with the nut or button, but on the part which fits in the belt the thread is similar to that of a wood screw. The screws, therefore, easily pull themselves into the belt—a feature which will be appreciated by every practical motor cyclist. (Stanley T. Robson, 59, Hobmoor Road, Birmingham.)

During the winter and rainy months magneto troubles are frequently caused by wet attacking the vulnerable parts of the insulation and winding. Mr. Surridge has devised a neat and simple remedy for this in the form of a rubber case, which is both water and oil-proof. It is very tough, and will stand any amount of rough handling. Reference has been made to the Holdtite patches (see our issue of November 22nd, 1909), which vary in size, and are easily applied. The tube is first prepared with coarse glass paper, after which it is coated with a good thick layer of solution. The patch is then treated with a thin coating of solution, and after both have become tacky they are placed together, and the repair is done. These patches are supplied in boxes of twelve, varying in size. Mr. Surridge also makes a speciality of a red rubber air tube which has every appearance of being both strong and serviceable. (R. Surridge, 58, George Street, Camberwell, S.E.)

The construction of the latest Middlemore and Lamplugh motor cycle saddle is somewhat novel. Each side frame member has at the rear extremity tensional springs connected by a plate supporting a central rod which



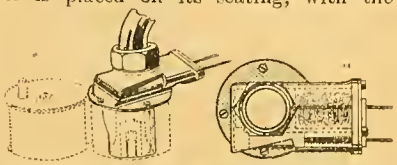
Middlemore and Lamplugh's Rideasy Saddle.

is connected to the saddle cantle. There is no spring in front, the elasticity of the tensional spring alone being depended upon to provide a comfortable seat. The top of the saddle is hogskin comfortably padded on the lines of the well-known "Rideasy" made by the same firm. The quality of the work is in the first rank. (Middlemore and Lamplugh Ltd., Coventry.)

As a means of comfort most motor bicyclists have probably scoffed at the possibility of a wind screen as being helpful towards this end. However, Mr. J. A. Taylor is confident of its success, and has produced a serviceable wind screen for the use of motor bicyclists and tricarists. For bicyclists it is adapted for any handle-bar width, and being made of celluloid is extremely light, weighing only just over 3 lbs. It may also be fitted to the passenger seat of a tricar or sidecar. In the event of the wind proving too strong for its use (which is highly improbable, as it is very little wider than the rider's shoulders) it is easily removable. These screens are made with polished walnut frames, plated fittings, and brass bound frames up to two feet square. (J. A. Taylor's Cycle and Motor Works, Lower Edmonton, N.)

The J.A.P. carburetter, which is very popular among motor cyclists, especially users of Bat machines, displays great ingenuity. The jet consists of a plate or disc in which slots are cut radially in pairs, and the depth of these slots is varied in different size jets. The jet plate fits over a disc, the lower portion of which is surrounded by gauze. The petrol enters from the bottom and issues through eight small holes in shallow recesses which register with the cuts on the jet disc. The main air enters from an elbow at the bottom of the vaporising chamber which is controlled by a shutter, which will partially close the air holes. One of these can be covered or uncovered at will by a brass slide controlled by a milled screw outside the carburetter, so that the mixture may be altered slightly according to the atmospheric conditions and to facilitate starting. Immediately over the jet there is fixed a thick plate containing two sets of holes, the outer set communicating directly with the outer air and the inner set with the mixture from the jet, the two leading into a single set of holes communicating with throttle. Normally, the holes communicating with the air are covered up by steel balls, but as the throttle is opened further and the suction increases, these balls lift from their seatings and the mixture is proportionately weakened. Another well-known J.A.P. speciality is the J.A.P. sparking plug, which has been long on the market, and has times without number proved its excellence. (J. A Prestwich and Co., Ltd., 1, Lansdowne Road, Tottenham, N.)

We repeatedly receive enquiries from owners of old pattern machines with Longuemare carburetters with regard to the fitting of handle-bar control. The Wright adapter is specially made for this purpose. All that is necessary is to remove the usual throttle and air adapter, and replace it with a Wright adapter which is illustrated in the accompanying sketch. Mills and Co. (Kettering), Ltd., who make this attachment, also market a device for valve grinding which enables the valve to be ground to a state approaching finish, before it is placed on its seating, with the

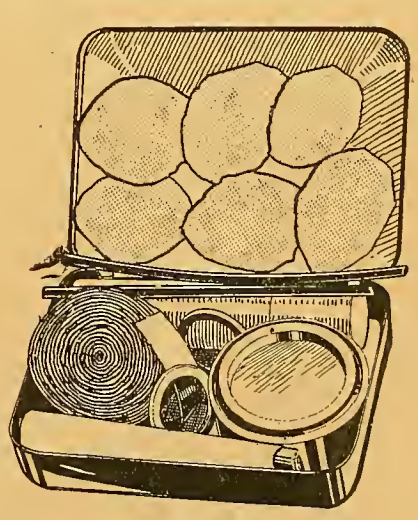


Wright attachment for Longuemare carburetters.

result that the valve seating is not worn away by repeated grinding. The device is of a suitable shape and size for carrying in a tool bag. (E. Mills and Co. (Kettering), Ltd., Crown Works, Kettering.)

The N.S.U. belt fasteners are made in various sizes from $\frac{3}{4}$in. to $1\frac{1}{4}$in. With the $1\frac{1}{8}$in. size each link is held by two screws. In addition to the above, they have a special belt fastener for grooved belts. The N.S.U. engine shaft two-speed gear is, as most motor cyclists are aware, capable of being fitted to different makes of machines. Its chief advantages are excellent quality and lightness. There are few gears more satisfactory. (The N.S.U. Motor Co., Great Portland Street, W.)

Every motor cyclist who starts out on a lengthy ride without a perfect tyre repair outfit is tempting the fates. The Turco motor cycle outfit contains, besides a plentiful supply of Turco, lightning patches, canvas back attaching sheet, rubber solution, canvas, French chalk, glass paper, insulating tape, valve rubber, and sparking plug washers. The price is distinctly moderate for such a complete outfit. The firm also supply carbide. Made and sold under the same brand of

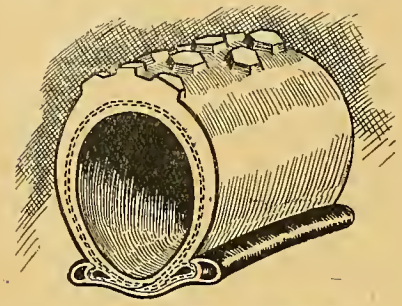


The "Turco" Tyre Repair Outfit.

Turco, it is packed in handy oval flasks, which enable a one pound tin to be conveniently carried in the pocket if there is no room for it in the tool-bag or luggage carrier. (Union Rubber and Chemical Co., Ltd., Shaw Street, Ashton New Road, Manchester.)

Tyres

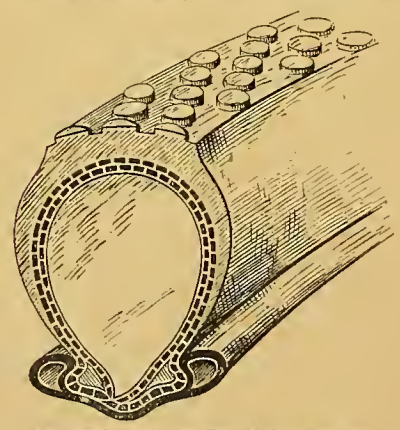
Melksham is on the borders of Salisbury Plain, and in close proximity to Stonehenge. This will explain the trademark of the Avon Indiarubber Co., Ltd., which is a reproduction of three of the mighty monoliths which attract so many visitors to that part of the country. Being large makers of indiarubber goods they have not overlooked the possibilities of the motor cycle business, and market Avon tyres in several different patterns. First



The Avon Tyre, with hexagon shaped non-skidding rubber studs.

there is the Hexagon pattern rubber-studded tyre in two qualities, then the round rubber-studded in two qualities, the Seven Lines or ribbed in three qualities, and a steel-studded in one quality. Special attention is paid to the quality of the rubber studs to withstand the severe strain upon them. In constructing the steel-studded cover the washers top and bottom make a very firm grip of the cover, and the studs are not liable to come out. A speciality is made of the Seven Lines or ribbed pattern type, and the steel-studded tyre for motor cycle passenger work. (Avon Indiarubber Co., Ltd., Melksham, Wilts.)

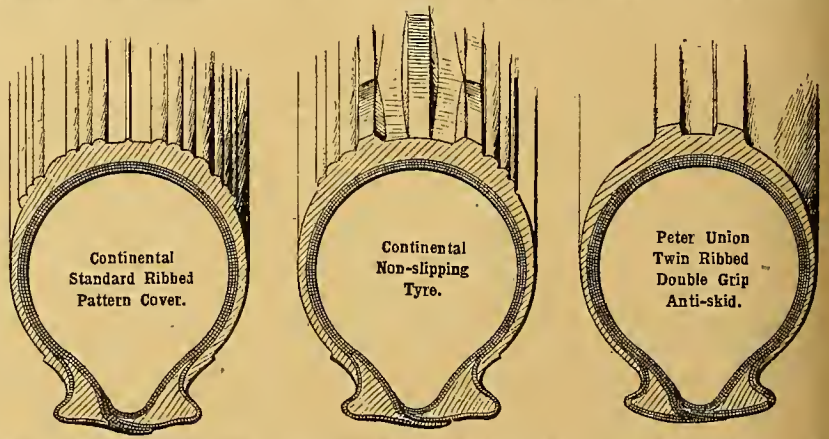
The firm of W. and A. Bates, Ltd., is making a speciality of motor cycle tyres, turning out large quantities which are giving most satisfactory results. These tyres are made in rubber-studded and ribbed patterns, both in three weights—standard, heavy, and extra heavy—according to the weight and power of the machine. The extra heavy is intended for



Bates Rubber-studded Tyre with square tread and beaded edges.

passenger work. When the casing of the tyre is in good condition it can often be made as good as new by re-treading. In such cases Bates's non-slipping rubber-studded treads will be found to give excellent results. They are exactly the same in pattern as the illustration of the rubber-studded complete tyre on this page. (W. and A. Bates, St. Mary's Mills, Leicester.)

The Continental motor cycle tyre is specially designed for the heavy work to which it has to be put. The "Modèle de Course" pattern is a cover with a splendidly substantial tread possessing just over a centimetre of solid rubber and canvas at the thickest portion of the tread. It is specially recommended fo nowerful

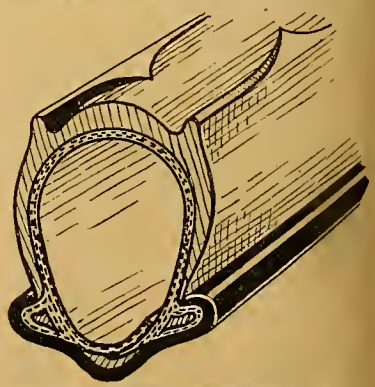


Continental Standard Ribbed Pattern Cover.
Continental Non-slipping Tyre.
Peter Union Twin Ribbed Double Grip Anti-skid.

multi-cylinder machines or motor bicycles with sidecar attachments. The rubber non-skid tyre with oat pattern tread is a popular tyre, admitted to be most efficient against side-slip. It is made in two grades, the standard for machines up to 3 h.p., and the Autobi for heavier motor cycles and tricars. For the latter steel-studded tyres are also sold. The two lighter grades of covers may be had with either wired or beaded edges. The Continental butt-ended inner tube, one of the earliest and most successful on the market, has been further improved, in that the joint is now designed so that the minimum amount of friction exists, and a firm and safe joint is provided. (The Continental Tyre Co., Ltd., Clerkenwell Road, E.C.)

There is no doubt that the Peter Union tyre is a popular one among motor cyclists, and the fact that the company issue a special booklet describing their motor cycle tyres shows that they are really in earnest in catering for this important section of the motoring public. Several different types of covers are made. The first is the ordinary type, heavy pattern, all rubber, and with longitudinal grooves on the tread. The cover is a substantial one, and has four layers of canvas. The twin rib double grip cover is one of which the firm are making a speciality for this season. It is undoubtedly most effective against skidding, and is much faster than the steel-studded tyre. The twin rib double grip Peter Union tyre was used by M. Geiger on the twin V.S. when he broke the End-to-end sidecar record, with great success. The sectional illustration below shows that the tread has a good thickness of rubber, and is therefore likely to outlast other covers unprovided with such a liberal coating of resilient material between the air tube and the road. The Peter Union steel non-skid has hardened steel studs, which cannot come out with fair usage, and wear gradually till they are flush with the tread. The Peter Union puncture-proof band is an efficient safeguard against puncture, and the makers inform us it acts as an insulator, and prevents heating of the inner tube, and is largely used. (The Peter Union Tyre Co., 190, Gt. Portland Street, W.)

The Three Spires tyre differs from many others of the non-skid type by reason that it is a non-skid as long as the tread lasts. The anti-slipping portion of the tread is at the sides, and not in the centre. In consequence, the tread can be made perfectly smooth, which makes the tyre much faster. It is manufactured in beaded edge only, and in the following

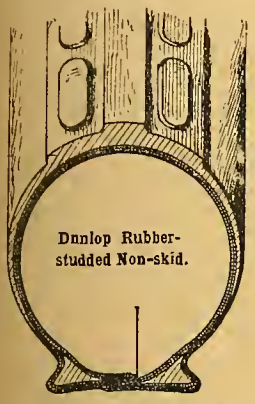


The "Three Spires" Non-slipping Cover

sizes: 24in. by 1¾in., 26in. by 1¾in., 2in., 2¼in., and 2½in. (The Coventry Rubber Co., Coventry.)

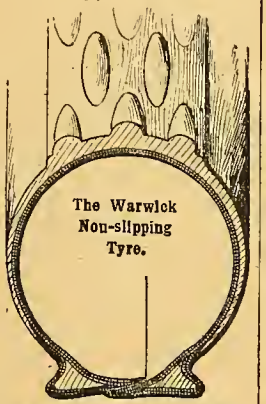
Tyres.

There is no more famous tyre on the market than the British-made Dunlop, which has proved its excellence on motor cycles for many years. On first examining a section of the cover, one is disposed to think that the tread is rather thin, but, owing to the excellent quality of the material used in building up the tyre, it is really durable, and possesses that resiliency which a thicker tyre cannot well have. The latest pattern is provided with a tread of lozenge-shaped studs running down either side of a central rib. As a non-skid, the tyre is wonderfully efficient, and in actual use on the road it has times without number proved itself both durable and effective. In addition to the rubber-studded non-skid tyre just described, the company make a grooved tyre, on the tread of which seven longitudinal grooves run. Somewhat of a novelty is the Dunlop butt-ended inner tube, which is clearly shown in the appended illustration. It will be seen that the joints are situated near the valve. The solid ends of the tube project some distance into the outer portion before they reach the butt, and to the further side is attached a long flap provided with eyelets, which is slipped over the valve, thus preventing any possibility of creeping. From what we know of the Dunlop material, this tube is likely to become extremely popular. (The Dunlop Tyre Co., Ltd., Aston, Birmingham.



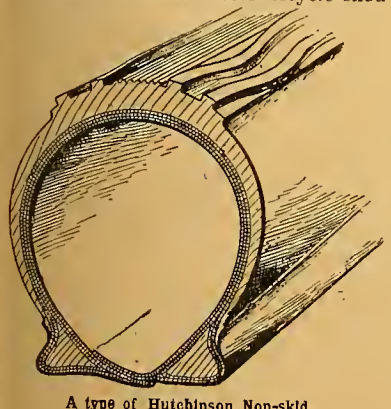
Dunlop Rubber-studded Non-skid.

Ribbed pattern Dunlop Tread.



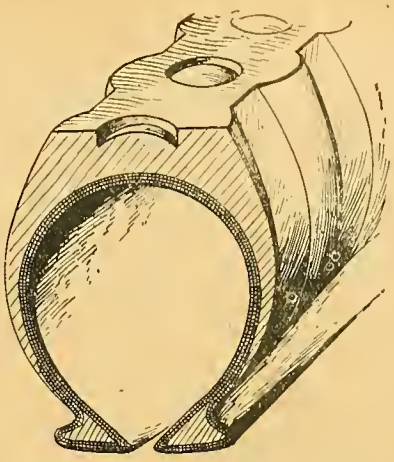
The Warwick Non-slipping Tyre.

The Hutchinson tyre made its *début* before the British public at the end of last year in a remarkable manner. With his Matchless motor bicycle shod with Hutchinson reinforced motor cycle tyres, afterwards aptly christened the Brooklands type, H. V. Colver secured the 50 miles, 100 miles, and two hours' world's records on Brooklands track. Now, as all the world knows, the surface of this famous track is particularly hard on tyres, and this, coupled with the fact that exceedingly high speeds were maintained, speaks wonders for the durability of the tyres owing to the enormous strains they had to withstand. It is also interesting to note that the extra reinforced Brooklands type Hutchinson tyre is guaranteed for twelve months. This type of cover is also made in a lighter form. A cover which Messrs. Hutchinson consider will meet with a ready demand is the extra reinforced non-skid, a square treaded tyre with four wavy ribs on either side of the tread, and with the word Hutchinson moulded in between. These ribs the company claim will ensure a good grip of the road, and will be effective against side-slip. This cover has a very thick rubber tread. (The Hutchinson Tyre, 70, Basinghall Street, E.C.)



A type of Hutchinson Non-skid.

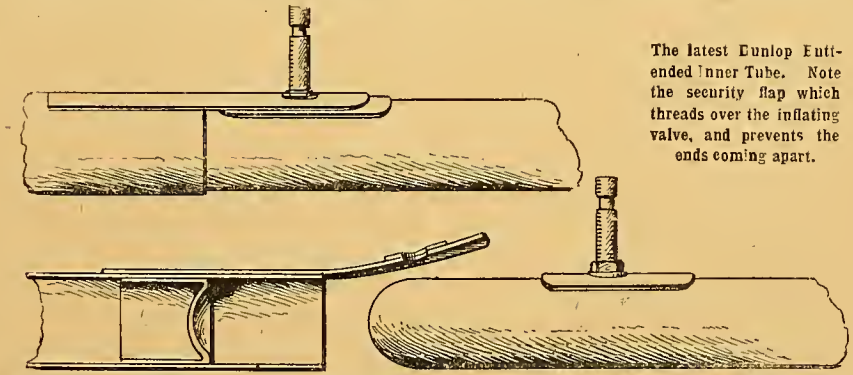
Motor cyclists must be well acquainted with the principles of the Kempshall tyre, which has saved many an intrepid rider from side-slip and skid. In addition to the actual cover, the Kempshall Co. is now introducing a "Fearnought," which acts as a reinforced tube. This inside tubing may be inserted round the tube under any cover, however old, and lengthens the life of the tube to a considerable extent. Ribbed and anti-skid covers are another feature of this firm. The Kempshall emergency patch, consisting of several plies of rubber and canvas solutioned together, backed by black rubber sheeting and faced with red rubber sheeting, the whole being shaped so as to fit inside the cover, is an excellent adjunct to the motor cyclist's kit. Rows of small but thick pins, their heads being embedded in the canvas and their points sticking out, enter the fabric of the outer cover and keep the patch in position without the extraneous aid of solution or tape. This is a great advantage when one is in a hurry, as it is always a most difficult matter to get patches to stick to the fabric of a cover. (Kempshall Tyre Co., 1, Trafalgar Buildings, W.C.)



Kempshall Motor Cycle Non-skid Cover.

The Kempshall Emergency Patch for repairing a gash in the outer cover.

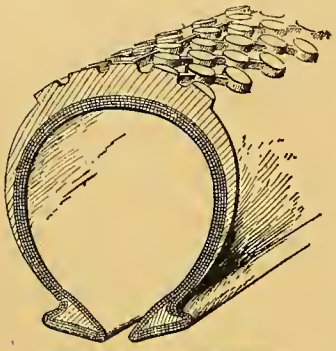
One of the earliest firms to exploit the rubber-studded tyre which is now so popular was the B. F. Goodrich Co. The construction of the Goodrich tyres is without doubt interesting. The whole of the outer surface of the tread is moulded in one piece, and is composed of close-grained, soft rubber, which does not cut easily. It will be found that, except with a very sharp instrument, the rubber does not lend itself easily to be penetrated. A blunt pin pushed into one of the rubber studs will apparently enter a long way, and



The latest Dunlop Butt-ended Inner Tube. Note the security flap which threads over the inflating valve, and prevents the ends coming apart.

Tyres.

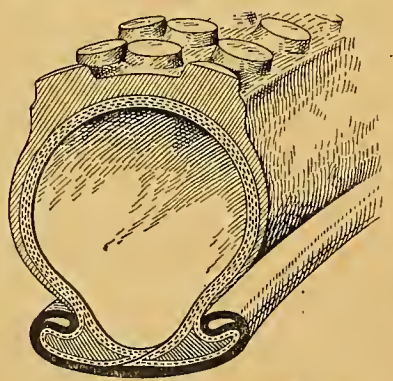
perhaps bulge out the other side, but it does not cut the rubber at all; consequently a Goodrich tyre is not easily punctured. For 1910, the cover has been considerably strengthened. It will be noticed that in the Goodrich tyres the studs are placed close together, and the company have found from experience that the tyre does not hold the mud so readily as other makes of studded tyre, as it is claimed that the part of the tyre actually in contact with the ground has the studs contracted at the moment of contact, and that as soon as the weight is released



Goodrich Rubber-studded Non-slipping Tread.

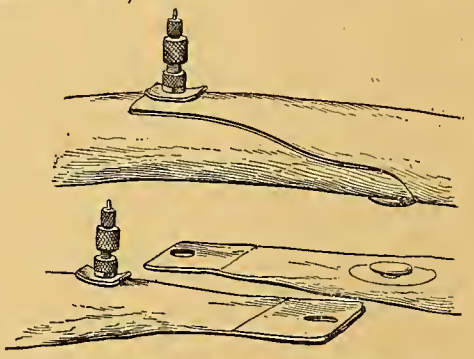
they expand and throw the mud clear. Goodrich tubes, we are told, consist of ninety-four per cent. of the best Para rubber. The B. F. Goodrich Co. have turned their attention to an excellently made butt-ended tube. On the underside of the tube there is a rubber button, which fits into a slot cut on the other end of the tube, while on the other side there is an eyelet which slips over the valve, thus making the joint secure. (The B. F. Goodrich Co., 7, Snow Hill, E.C.)

The Hanover Rubber Co. are best known to motor cyclists as makers of the Shamrock-Excelsior rubber-studded tyre, which is made in the heavy type only, and, being substantially constructed, the reason for its popularity is not far to seek. Another type is the corrugated pattern, which is likewise substantial, and differs only from the other in the surface of the tread. For the driving wheel of motor bicycles used in conjunction with a sidecar or



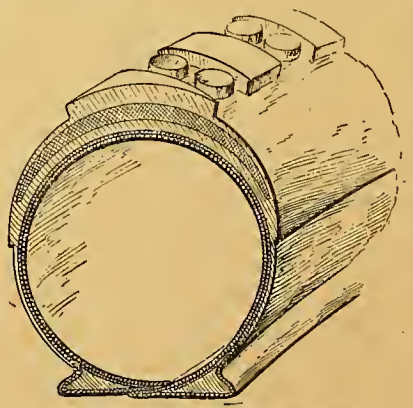
Shamrock-Excelsior Rubber-studded Cover.

for tricars, the Shamrock-Excelsior steel-studded tyre is particularly suitable. There are altogether three rows of studs, the two outer ones being close to the edge, with their surfaces roughened, while the inner row is of small studs placed farther apart. The studs themselves are fastened to the rubber tread, and, to make quite sure that they do not chafe the tube, a lining of felt encircles the interior of the tyre. The rubber-studded and corrugated tread tyres are made in suitable sizes for lightweights. (The Hanover Rubber Co., 29-31, Old Street, E.C.)



The new Goodrich Butt-ended Air Tube inflated. In the lower drawing it is shown deflated ready for connecting.

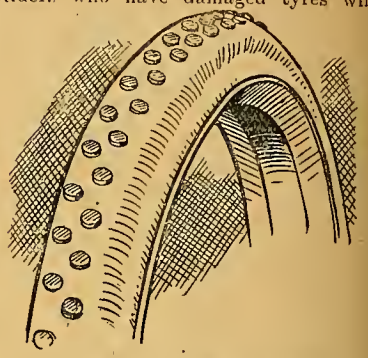
Probably no motor cycle tyres ever sprang more quickly into popular favour than the Rom tyre, the most popular model of which is the "combination" pattern. The tread of this consists of rectangular bars moulded diagonally on to the exterior of the



R.O.M. Combination Steel Studs and Rubber Bars.

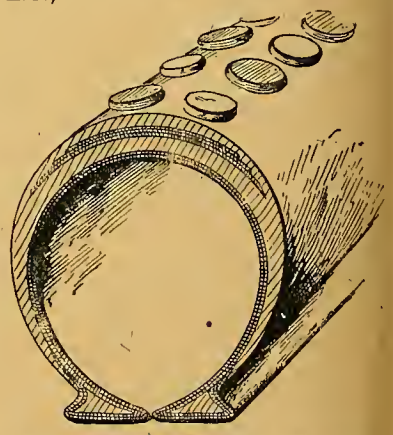
cover, between which are steel studs, the object of these being to preserve the resiliency of the tyre and yet to provide a really efficient non-skid. It is not generally known that the Rom Tyre Co. make an excellent all-rubber-studded tyre which, we understand, is giving great satisfaction, while the company also make a speciality of a well-made butt-ended tube. (The Rom Tyre Co., 31, Brooke Street, Holborn, E.C.)

A strong and serviceable looking cover is a leading feature of the Bancroftian Co.'s output. The Gothania cover, as it is styled, is provided with a double row of steel studs, and is made of the best rubber. Riders who have damaged tyres will



A steel-studded cover—the Gothania.

do well to sample Mirabilis tyre stopping, which is claimed to be an efficacious remedy for bad cuts in outer covers. Solution having been inserted in the cut, the Mirabilis stopping is added when the former is nearly dry, and will vulcanise the affected part in about five hours. It is sold in small tins which do not take up much room. (The Bancroftian Co., 49, Bishopsgate Street Within, E.C.)



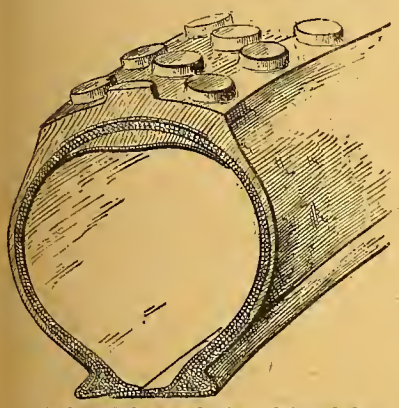
Liversidge alternate Rubber and Steel-studded Non-skid.

In the Liversidge non-skid motor cycle tyre there is a double row of studs. These are alternately rubber and metal, this being, in the opinion of the makers, the best preventive against side-slipping and skidding. The firm is pinning its faith to this form of tyre alone for motor cycles. It may be noted that this tyre was once known as the Scott, but its name has now been changed. (Liversidge and Sons, 196, Old Street, E.C.).

Probably no tyre has a better record behind it for durability than the Palmer, and it speaks well for the enterprise of the firm that they issue a special catalogue of motor cycle tyres, which is most interesting reading. Palmer tyres are made in two grades—one with an extra strong fabric and the other with patent "airless cord." This famous cord tyre has been, as all the world knows, an astounding success. The Palmer fabric consists of parallel threads of great strength, each of which is thoroughly insulated with

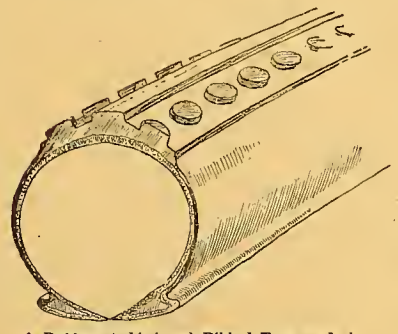
Tyres.

rubber, thus rendering it impervious to moisture. People often wonder why the cord tyre is known as the "airless" cord tyre, so it will be interesting to explain the reason for the title. In the vulcanising processes through which the tyre has to go the air expands at the high temperatures and prevents the rubber from making contact with the fibres of the threads. The cord consists of a number of unit threads (of about the same size as sewing cotton) which pass through very long tubes of small bore into a high pressure cylinder containing indiarubber solution, maintained at a constant pressure. As the threads slowly enter the tubes they meet with a gradually increasing pressure of rubber solution, which forces the air backwards from between the fibres of the threads, with the result that the space it filled is occupied by rubber solution. The threads then go through



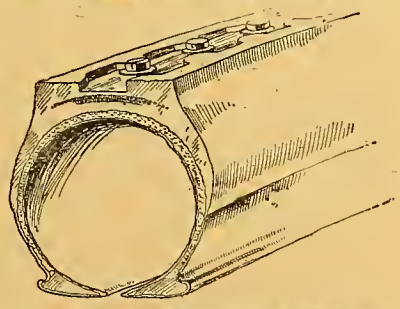
The latest Palmer production. This embodies the patent cord casing described in the accompanying letterpress.

various building up processes, which result in every thread being absolutely insulated from the other by rubber, and a cord is made composed entirely of rubber and threads from which the air has been excluded. After the cord is laid a cover of rubber is applied and the whole is moulded and vulcanised, while the inside which comes in contact with the tube is coated with an anti-friction preparation. A thin red strip is inserted in the thread, so that when the latter becomes worn down the strip shows and indicates that retreading is necessary. From the foregoing it may be gathered how carefully Palmer tyres are constructed. The best known Palmer tyre is the three-ribbed pattern, which is most efficient against sideslip, has a thick tread, and is practically invulnerable against small nails and thorns. The latest type of Palmer is the rubber-studded cord tyre, which possesses the great durability and resiliency which have made the cord tyre famous, and at the same time has excellent anti-skid qualities which cannot fail to render it popular. It is interesting to mention to which rims Palmer tyres can be fitted. A 2in. rim will take 26in. and 28in. × 2in., and 26in. and 28in. × 2¼in. (specially made). The 26in. and 28in. × 2¼in. and the 26in. and 28in. × 2½in. Palmer tyres fit the 2¼in. Palmer rim only. The firm also supply a 650 × 65 mm. motor cycle tyre to fit rims not of their make. The Palmer Tyre, Ltd., have a splendid record of the excellent performances of their tyres and numberless flattering testimonials. (The Palmer Tyre, Ltd., 121, Shaftesbury Avenue, W.C.)



A Rubber-studded and Ribbed Tyre made by the Midland Tyre and Rubber Co.

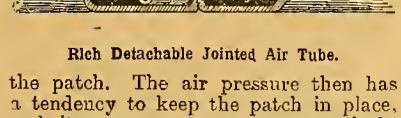
The Midland tyres are made in two patterns, as shown in the accompanying illustrations. One is rubber-studded with a solid rib down the centre, a single row of studs being placed on both sides of the rib. The other is a substantially constructed tyre with a thick square rubber tread hollowed in the centre, where steel studs are fitted. The thickness of the tread exceeds half



A Midland pattern of cover. Steel studs and square rubber tread.

an inch, and makes this tyre particularly suitable for heavyweight machines or passenger service. (The Midland Tyre and Rubber Co., Ryland Street, Birmingham.)

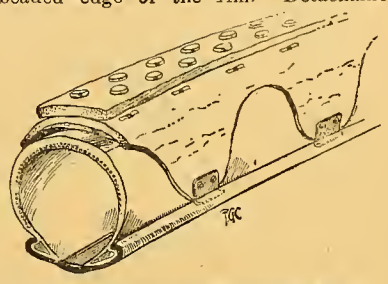
The Rich detachable air tube illustrated on this page has been on the market over five years, and has proved its reliability. It has a free circulation of air right round the air tube, and one of the advantages in connection with this is that patches may be applied on the inside by turning the tube inside out previous to applying



Rich Detachable Jointed Air Tube.

the patch. The air pressure then has a tendency to keep the patch in place, and it cannot move or cause a leakage. It is important when buying these tubes to see that the proper lubricant is supplied for smearing on the joint, as the tubes are often condemned through improper use. (The Rich Patent Detachable Air Tube Co., Crawley, Sussex.)

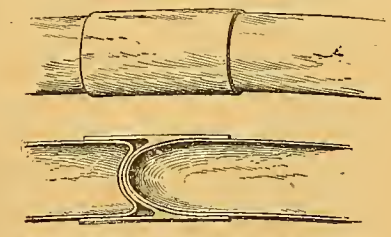
In addition to the Lomax tyre, which is made with a rubber-studded tread, and in four patterns suitable for single and passenger work, this firm markets a detachable non-skid, which is easily fitted to any worn motor cycle cover. Three rows of steel studs are fastened to a chrome leather band provided with metal hooks fastened along the sides. These hooks engage in the beaded edge of the rim. Detachable



The Lomax Detachable Non-skidding Band.

non-skids are very convenient for those riders who prefer a plain tread for summer use, as they can be removed during the summer months, when a non-skid tyre is not so necessary. (The Lomax Tyre Co., Ltd., Resilient Works, Great Charles Street, Birmingham.)

"Sir Bibendum" seems to ride merrily on through all vicissitudes, fair weather and foul, and never to grow thin through his exertions. It would indeed have to be a sharp and well tempered nail to pierce this hardy sportsman's heart. Michelin non-skid motor cycle tyres differ in no respect, except in size, from the all-conquering car tyres, which have done such good service both on the road and track. The exceptional efficiency of Michelin covers is due to the fact that the tread is an integral part of the cover and not an attachment. A band of stout and trustworthy leather protects the cover, and the walls of rubber are not

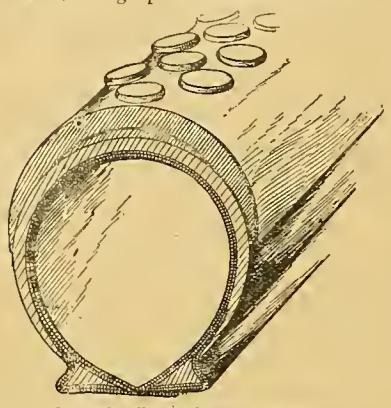


Section of the Michelin Butt-ended Air Tube.

entirely covered by this band. However, it extends far enough to ensure their being protected from cuts. Sufficient ventilation of both cover and tube is thus assured, while at the same time the tyre is in no way deprived of its resiliency. Michelin tyres may be had either wired-on or with beaded edges. One of the chief nuisances when experiencing tyre troubles is the necessity of removing the wheel if a tube must be replaced. One of the

Tyres.

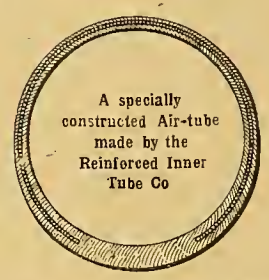
Michelin specialities is a butt-ended tube which can be removed without detaching the wheel. This is claimed to be a thoroughly reliable device, and as long as the butt-ends are pushed properly home there can be no fear of their coming apart when the tube is in-



The Michelin Steel-studded Non-skid.

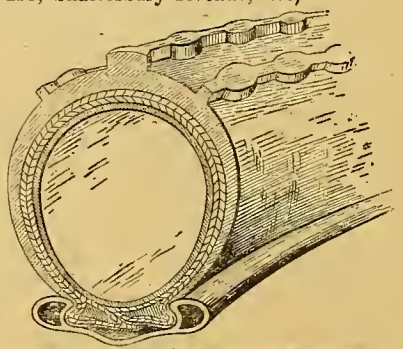
flated. Very satisfactory results may be obtained by using this tube, and "Sir Bibendum" adds yet another to his many triumphs by the introduction of this device. (Michelin Tyre Co., Sussex Place, Sonth Kensington, S.W.)

The Challenge Reinforced Inner Tube for motor cycle tyres is an invention which deservedly claims the attention of our readers. All motor cyclists are aware that if the cover of a motor cycle tyre be severely gashed the next thing that happens is that the tube forces its way through the fabric, and then bursts. Now if the tube is made especially strong such a contingency will not occur, and the motor cyclist would be enabled to continue his journey until such a time as a new cover could be purchased. In outward appearance the tube resembles any other, but in actual construction it is quite different, as it is reinforced by two layers of specially woven and almost untearable fabric embedded in the rubber. This interlining extends all the way round the tube except at the base (adjoining the rim), where there is a narrow strip of pure rubber of double thickness, protected by the rim, which serves to supply the necessary elasticity. According to tests



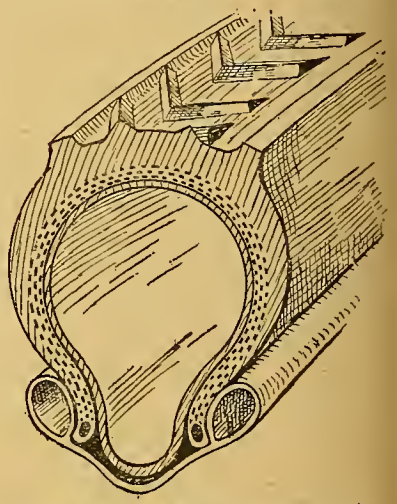
A specially constructed Air-tube made by the Reinforced Inner Tube Co

carried out by the Royal Automobile Club, the resiliency of the Challenge Reinforced Inner Tube is precisely the same as that of a standard tube. The Challenge tube has been most successful on motor cars, and this added to the fact that further improvements have been made should render it quite satisfactory for motor cycle work. It adds but little to the weight, not much to the cost, and allows covers to be used which under other circumstances would be fit only for the scrap-heap. (The Reinforced Inner Tube Co., Ltd., 218, Shaftesbury Avenue, W.)



Clincher Dreadnought Cover with Rubber Bars.

Very few important road events occur without a good proportion of the machines used being fitted with Clincher tyres. This firm was one of the first to introduce the rubber-studded non-skid tyre which is now so popular. In addition to the ordinary tyre with separate studs the "Dreadnought" is made with a unique non-slipping tread, and is intended particularly for heavy motor bicycles or passenger work. The North British Rubber Co. is one of the oldest firms in the tyre trade, and there is no necessity for us to enlarge upon the qualities of its workmanship An illustration of the rubber-studded non-slipping pattern will be found on this page, and other Clincher patterns are the "A Won" and the "A Won Dreadnought" with a ribbed tread. (North British Rubber Co., Ltd., Castle Mills, Edinburgh.)

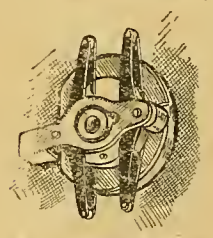


The Moseley Non-slipping Tyre with wired edges. The same tread is also made with beaded edges.

Moseley's non-slipping motor cycle tyre is made with both wired and beaded edges. Our illustration is that of the wired-edge pattern. The firm makes the motor cycle covers of the same quality of fabric and rubber as is used for its motor car tyres. We had one of these covers in use on a tri-car last year, and found it gave every satisfaction. Moseley and Sons regard the wired edge cover as safer than the beaded edge. (David Moseley and Sons, Chapel Field Works, Ardwick, Manchester.)

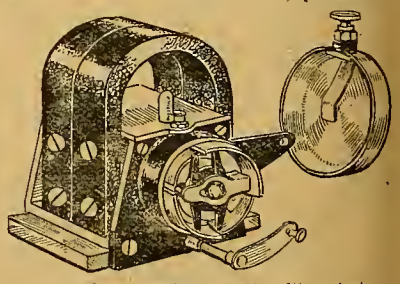
Electrical Appliances

Motor cyclists who are unacquainted with the U.H. magneto will do well to make an early acquaintance with this useful accessory. Every U.H. magneto is tested to run up to 4,000 r.p.m. without missing a single spark, and the fact that 40,000 miles of use have caused no appreciable wear on the machine shows that it is thoroughly reliable. The U.H. magneto is of simple construction, and there are few parts likely to give trouble. They are made for motor cycles of every h.p., and are remarkably light and compact. The contact breaker is on quite different lines from the usual type employed on magnetos. One of the platinum points is mounted on a spring, at the end of which is a fibre block, while the other platinum point is attached to a plate immediately below it. This spring normally keeps the two points in contact but the fibre block in process of rotation strikes a cam forming the arc of a circle fixed to the brass segment forming part of the timing lever. During the contact with the steel cam the points separate. The armature runs on caged ball bearings. (G. A. Claus, 83, Mortimer Street, W.)



The U.H Magneto Contact Breaker.

Numerous interesting accessories are handled by the City Ignition Co., who, by the way, make a speciality of repairing magnetos, coils, and accumulators—a fact which may interest not a few of our readers who daily ask for

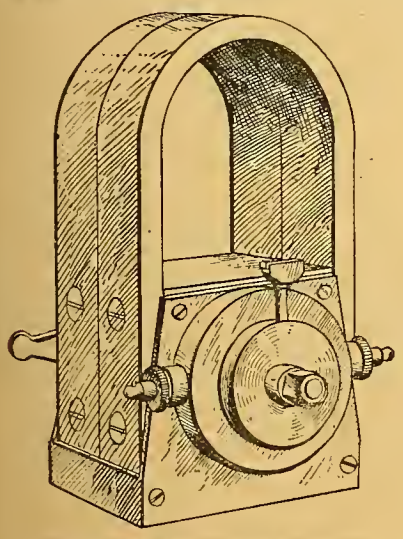


U.H Single-cylinder Magneto with contact breaker cover removed.

Electrical Appliances.

a suitable place whither coils may be sent to be overhauled. The firm first came before the notice of motor cyclists when it introduced the Voltoo two-volt coil, which is manufactured at the company's premises, but it moves with the times, and now makes a speciality of a high-tension motor cycle magneto, which is sold at an extremely moderate price, and is guaranteed against reasonable wear and tear for twelve months. The magneto follows standard lines. The armature carries both the high and low-tension windings, which are carefully insulated from one another, while the condenser is fitted on an insulated metal case situate between the magnets, directly above the armature, thus completely enclosing the latter and excluding oil and dirt. The armature spindle runs on ball bearings. (The City Ignition Co., 14, Spencer Street, Goswell Road, E.C.)

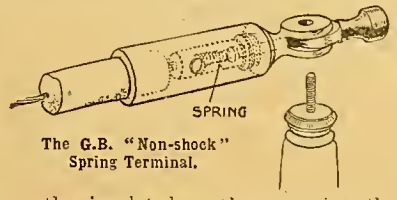
The Bosch Co. was the first firm to put on the market a self-contained magneto on which both high and low-tension windings were carried on the armature, thus doing away with the necessity of a separate coil. The



Latest pattern Bosch Magneto for twin-cylindered V type engines.

same principle carried out in the earlier models is still maintained, but many improvements in detail have been added. Firstly, the old and at times troublesome fibre ring has been eliminated, and now, by insulating the rocker carrying the platinum point, and instead of the fibre ring substituting steel segments, the contact-breaker has been simplified and improved. When the magneto was first adapted to V type twin-cylinder engines, a difficulty presented itself which to many electrical experts seemed to be insuperable. Owing to the angle at which the cylinders were set, one spark occurred near the maximum position of the armature, namely, where the greatest number of lines of force were cut, and the other some distance away, which resulted in a strong spark occurring in one cylinder and a much weaker one or none at all in the other. This resulted more often than not in only one cylinder firing when the machine was first started, while the other would not chime in until a good speed had been attained. Next, curiously enough, the intensity of the sparks would change over, and as the speed increased the spark which had been strong would weaken and that which had been weak would increase in strength. The whole thing was merely a compromise, but, thanks to Bosch workmanship, it did wonderfully well. (The whole idea is clearly explained in "Motor Cycles and How to Manage Them.") For some time a staggered armature has been employed, which allows the sparks to be equalised in intensity. The latest and final improvement is to support both sides of the armature spindle on ball bearings, and thus to minimise friction to the greatest possible extent. The particular type of magneto with which we have chiefly dealt is the D.A.V. with ball bearings, but the same principle is maintained in all the other models, which are made to suit all types of motor cycle engines. To work in conjunction with the Bosch magneto special sparking plugs are made, with steatite insulators, and with four or two electrodes. The latter are specially suited to engines subject to excessive lubrication. (The Bosch Magneto Co., Ltd., 23, Store Street, W.C.)

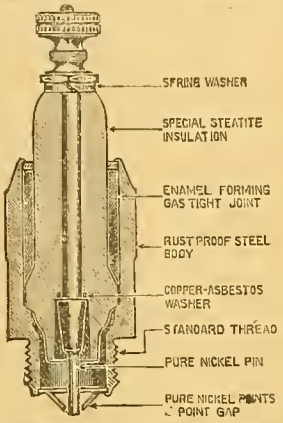
The G.B. Non-shock terminal provides for instant attachment or detachment from the sparking plug without shock to the rider whilst the engine is running. To detach the terminal all that is necessary is to place the thumb and one finger of the left hand



The G.B. "Non-shock" Spring Terminal.

on the insulated portion covering the cable and the index finger of the right hand on the small insulated knob. Press the two parts together and the terminal can be lifted off the screw thread of the sparking plug. It is impossible for the terminal to be shaken off the plug by vibration, and it dispenses entirely with any nut or other fastening. (The County Chemical Co, Chemico Works, Bradford Street, Birmingham.)

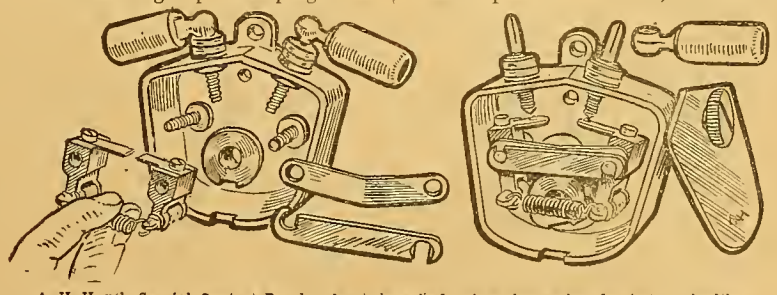
Bluemel's sparking plug has a patent enamel joint which is clearly shown in the annexed sectional illustration. In making up the plug the enamel is poured between the insulator and the metal body of the plug making an absolutely permanent gas tight joint capable of resisting the highest cylinder pressure. The enamel joint,



A section of Bluemel's Enamel Jointed Sparking Plug.

it is said, does not subject the insulator to any pressure, furthermore it allows for free expansion and contraction. The insulator itself is a special steatite. The plug points are all pure nickel and adjustable. The usual packing for making a joint between the insulator and the body is, of course, one of the weakest points of most plugs, and this patent enamel joint appears to solve the difficulty. (Bluemel Bros., Wolston, near Coventry.)

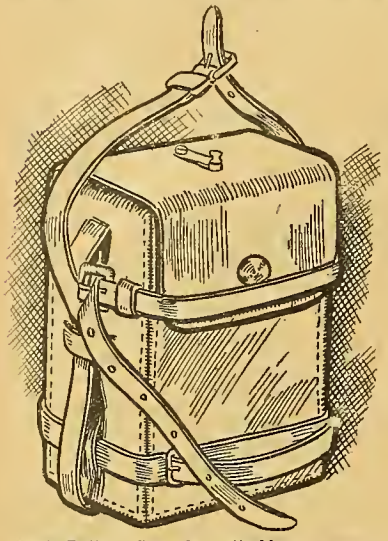
Despite the practically universal use of the high-tension magneto on motor cycles, there is still a demand for dry battery ignition, and though the majority of primary cells may be sold to supplant accumulators on old second-hand machines, it is interesting to note that Mr. F. A. McNab, the clever exponent of the Trump-J.A.P. motor bicycle on Brooklands Track, always uses a dry battery, a plain coil, and a make and break contact-breaker. It is for the Hellesen dry cells that the firm of A. H. Hunt and Co. is most famous, and wonderful results are obtainable from this method of ignition. It is not generally known that the secret of success with dry batteries is to render the work of the latter as light and intermittent as possible. A dry cell which is given hard work to do for a continuous period rapidly polarises, but, provided the work it has to do is either light or intermittent, it serves its owner faithfully and well, and will often last 1,500 to 2,000 miles when used for ignition. Naturally, a great deal depends on the coil, which should



A. H. Hunt's Special Contact Breaker for twin-cylindered engines using dry battery ignition

Electrical Appliances.

be as economical as possible, and in consequence coils should be used which use very little current indeed. During



Flash Battery Case for attaching a spare battery to the frame. Observe the switch on the cover.

a recent visit to the company's depot, we saw a plain coil of A. H. Hunt's make, with which a delicate ammeter was put in circuit, register .15 amp. when working, and a trembler coil use .2 of an amp. The source of current was a Flash size Hellesen dry battery. It is interesting to note that in future all Hellesen cells will be supplied with insulated terminals, which will totally obviate shorting against the top of the tank. The same firm sell a special coil with two insulated secondary terminals for use with a double pole plug. Two types of cases are sold for the Hellesen battery. One is of metal and the other of leather. One of the latter is an especially neat model, as it has a switch fitted to its exterior, and is also specially designed to fit on Druid spring forks. A small electric lamp for use with a dry battery is sold at a moderate price, and is intended for town or short-distance riding. Other specialities which we saw were: An all-metal switch, a particularly neat fitting sold in two models (one-way and two-way), which is well made and positive in its action); a substantial sparking plug, to which a neat terminal can be fitted if desired; and a simple, ingenious, and efficient contact-breaker. (A. H. Hunt and Co., 115, Cannon Street, E.C.)

In these days when the fierce sparks derived from a magneto running at high speeds enforce the motor cycle rider to buy perfectly made plugs to stand their ferocity, a short description of the Pognon plug, which is one of the most substantial on the market, may be welcome. On referring to the illustration, it will be seen that the plug consists of three doubly baked porcelains—A, B, and C. The porcelain A is held firmly in position by the milled nut D, which presses it firmly against the shoulder of the gland nut E, which serves to keep the middle porcelain B pressed tightly against the two washers, one each side of the collar F turned on the central spindle, and also to keep the porcelain C firmly pressed against the bottom of the plug. The object of these three porcelains is to allow for unequal expansion, as it is unequal expansion which causes porcelains to crack. It will also be seen that when the central spindle becomes hot there is no risk of its expansion causing the joints to leak. A large hollow space round the central point also prevents any carbon forming, which may cause a short circuit. In the case of plugs sold for magneto ignition, genuine platinum points are fitted. It is interesting to note that Pognon plugs are used by the principal navies of Europe. Motor cycle Pognon plugs are guaranteed for six months. (H. M. Hobson, Ltd., 29, Vauxhall Bridge Road, S.W.)

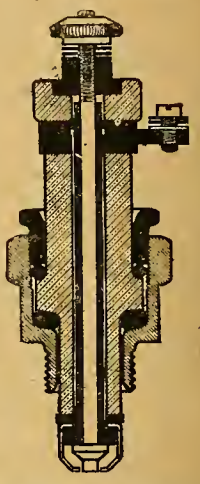
The Oleo Magneto Plug with Mica insulator.

When we called on the firm of Leo Ripault and Co. we found the latest arrival was a strong spring fork. It will be one of the chief accessories of this firm, and has every appearance of being a useful adjunct to the machine. It is hardly necessary to say that Oleo plugs are still a leading feature of Leo Ripault and Co.'s stock, their latest being a sparking plug specially adapted to engines with combustion heads which are very close to the underside of the tank. One of the models is illustrated above. (Leo Ripault and Co., 64a, Poland Street, W.)

Most motor cyclists are interested in anything which will improve the running of their engines, and among the earliest devices used by racing motorists was a double or treble spark in the cylinder, occurring simultaneously. In the early days this could not be employed without a multiplicity of coils and a network of wires, but the increased number of sparks gave better results, or men like Cissac, Anzani, Barnes, etc., would not have used them on racing machines. However, any motor cyclist, with slight alterations to one-valve cap, can have a double spark by making use of the Lodge Double Pole Sparking Plugs. A double pole plug is merely an insulator containing two conductors or wires for the current insulated from one another. The current passes down one wire, jumps the gap, and passes up the other, searching for a path to earth. The frame or earth connection is made by connecting the second of the two insulated conductors to an ordinary sparking plug, and the current in its way to earth *viâ* the spark gap of the ordinary plug appears a second time, viz., at the points of the ordinary plug. Both plugs spark practically simultaneously, and the plugs are arranged one in the centre of the combustion head and one over the inlet valve. (Lodge Bros. and Co., 14, New Street, Birmingham.)



Section of the Lodge Double Pole Sparking Plug.

Accumulators are the leading line of Richford and Co., and the E.P.R. requires little or no introduction to motor cyclists. Guaranteed acid-proof clear celluloid cases form the covering, and, the four sides being formed of one sheet, leakage is impossible. Non-corrosive E.P.R. terminals are utilised; in fact, everything of the best is used. There are two separate types of E.P.R. accumulators—the acid and the unspillable. In the latter, spun glass takes the place of the celluloid separa-

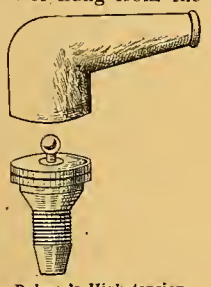
Electrical Appliances.

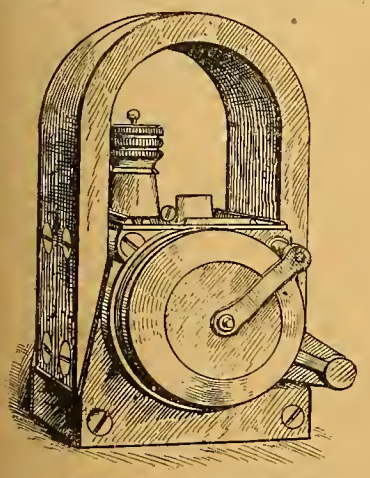
tors, and this absorbs the acid and simultaneously holds it in suspension. Internal shorting is impossible in this type. A speciality in which Richford and Co. deal is the Richford grinding compound for grinding in motor valves. It has the advantage of always being ready without mixing. Richford soldering paste, which is specially to be commended for electrical purposes, and will make a fast joint between any metals except aluminium, is another useful adjunct to the motor cyclist's kit. (Richford and Co., 153, Fleet Street, E.C.)

One of the hardiest and most practical little devices for preventing trouble and annoyance caused by short circuits from the high tension terminal is the Palmer magneto terminal cover. In the case of twin-cylinder magnetos we have found one of these covers to be of very great service when placed on the front terminal which is apt to catch the mud and wet flung from the front wheel more than the single-cylinder model. The cover is made of india-rubber, and is so shaped that it grips the insulated portion of the brush holder and the high tension wire, thus preventing mud and wet reaching the metal parts of the terminal and connection. It can be fitted in a moment, and the h.t. wire can be removed from the terminal and replaced without taking the cover off. (R. Palmer, 30-31, New Bridge Street, E.C.)



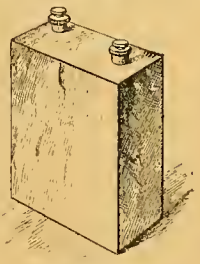
Palmer's High-tension Terminal Cover.

The makers of the Simms magneto machine have been closely associated with the manufacture of these useful accessories for no fewer than seven years. All Simms magnetos are now provided with ball bearings and all are constructed more or less on the same lines. The addition of the ball bearings and the carrying of the condenser on the armature-shaft are the latest improvements. In other respects these machines follow standard lines, carrying the low and high-tension windings on the armature, and thus dispensing with the need of an extra coil, while the contact breaker is provided with a steel cam, the rocker being insulated by means of a fibre contact block. The Simms new high-tension terminal is a great improvement, and is amply efficacious against wet. The chief types are the S.M¹. (which we illustrate), for single-cylinder machines, the S.V.M. for twin-cylinder V engines, and the lightweight magneto As regards accessories, the Simms Magneto Co. have introduced an excellent magneto cover made of *papier-maché*, hydraulically pressed and moulded to the exact form. These covers are also strengthened at the angles, and being oil and waterproof cannot lose their shape and cause short circuits by so doing. As they fit exactly, they do not require any extra fastenings after being slipped over the magneto. The Simms plug is one of the most substantially constructed on the market. The body is of the best steel and the insulator is of special unbreakable material. The electrodes are substantially made, and are quite tough enough to stand the hot sparks produced by a magneto. (The Simms Magneto Co., Ltd., Welbeck Works, Kilburn, N.W.)



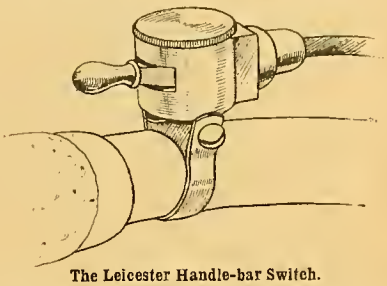
The Simms Magneto for single-cylindered engines.

Among the advantages which dry batteries possess may be mentioned cleanliness and reliability; there is no need to charge them, and they are unaffected by vibration or rough usage. On account of their low internal resistance, the Siemens-Obach dry cells have a large output of current. The Siemens Co. recommend the carrying of two batteries connected to a two-way switch, so that they may be used alternately. Like other manufacturers of dry batteries, they also recommend the use of a specially economical coil and suitable contact breaker, giving as quick a break and as short a duration of contact as possible. Siemens batteries are made in all sizes, and are provided with a special locking terminal, so that the wires cannot come loose. In some cases it may increase the life of the battery if a small adjustable resistance is placed in circuit, and the company supply a special adjustable resistance for this purpose. (Siemens Bros. and Co., Ltd., Caxton House, Westminster, S.W.)



The Siemens Dry Battery.

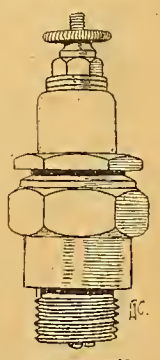
It is unquestionably an advantage to have a switch on the handle-bar for use with either form of ignition. In the case of battery ignition the switch is, of course, provided to prevent the batteries running down when the machine is not in use. For magneto ignition it is most serviceable in connection with the cooling of the engine. For instance, when descending a long hill the magneto can be switched off, and the throttle left slightly open when the engine, if previously overheated, will cool more rapidly with a little cool gas entering the cylinder than by any other means. It is also useful for controlling speed. The subject of our illustration is the No. 1 Leicester switch. (T. Wathes and Co., 88, High Street, Leicester.)



The Leicester Handle-bar Switch.

The United Motor Industries have for many years devoted their attention to motor cycle accessories. At the present time they are fortunate in having a manager who is himself a practical motor cyclist—Mr. A. Hoffmann, who we remember some years ago was a prominent competitor in Motor Cycling Club events. The chief speciality of the company is the Eisemann magneto, which first came into prominence about 1902, and differed from its successors in that it has a separate coil. The latest type of Eisemann motor cycle magneto follows standard practice, and carries both high and low-tension windings on the armature. Another speciality of the U.M.I., Ltd., is the L.M. plug, which has stood the test of time. Every L.M. plug—and there are numerous patterns—has a porcelain insulator which has been twice baked, and after using a great number of these plugs on air-cooled engines we have never once had a porcelain crack. (The United Motor Industries, Ltd., 45, Poland Street, Oxford Street, W.)

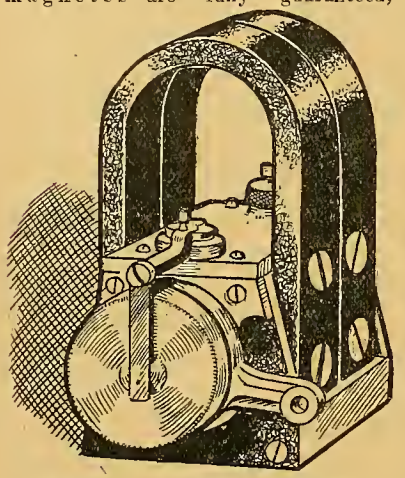
The Pyramid sparking plug, as illustrated, is a well constructed article with porcelain insulation, and is specially made for motor cycle engines with small diameter recesses in the valve caps. It has one central wire and three sparking points on the body. The Warrior is another pattern with mica insulation and body constructed wholly of brass. The central conductor terminates in a star with eight points in close proximity to the body. On this plug the points project a considerable distance into the combustion head, but as the firm makes so many different patterns a sparking plug can be procured to suit any motor cycle engine on the market. (Sphinx Mfg. Co., 242, Bradford Street, Birmingham.)



The Pyramid Sparking Plug.

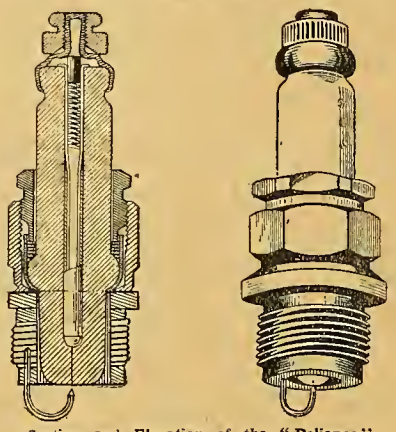
Electrical Appliances.

A particularly neat magneto machine is the "N.F." In accordance with the latest practice, the armature carries the high and low-tension windings, the former being wound over the low tension winding and highly insulated from it. The condenser is fitted in an insulated metal case, the whole of which fits between the magnets, and is immediately over the armature, thus protecting the latter from oil and dirt. The magneto is most accessible. The contact breaker can be easily adjusted and all parts are interchangeable. It is interesting to note that the wearing parts of the contact breaker are of steel insulated with fibre, thus rendering them durable and free from trouble. "N.F." magnetos are fully guaranteed,



"N.F." Magneto, type 1 M.R., for single-cylindered engines.

and, we are told, are tested before being dispatched to spark up to 5,000 r.p.m. The contact breaker of the Wolf magneto shows considerable originality. The whole of the interior mechanism is mounted on a fibre ring attached to the base plate of the timing lever disc. The rocking arm has a slot cut at one of its extremities, and in it is carried a fibre contact block, which comes in contact with a steel cam on the armature shaft, which actuates the make and break. The whole of the contact breaker is accessible and easily dismounted. The condenser is carried over the armature, and the magneto has the decided advantage of giving a good spark at remarkably slow speeds. (Wolf and Co., 138, Southwark Street, S.E.)

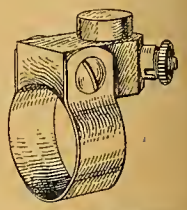


Section and Elevation of the "Reliance" Sparking Plug.

A special feature of the Reliance sparking plug is a very fine hair-like insulator which is embedded in the porcelain. This very fine insulator causes the spark as it leaves so minute a point to be concentrated to such a degree that the heat of the spark directed against the surface of the insulator instantly destroys any short circuiting matter surrounding the point. As will be seen on reference to the sectional illustration, contact with the fine platinum wire is made by means of a copper quill surrounded by a mica tube to prevent leakage of current in case of an accidental fracture. The current passes from the cap or copper quill to the central conductor by means of a small piece of high resistance material, which serves the same purpose as an air gap. The great claim made by the makers of this plug is that it sparks in water—a feat which it is said is not possible with any other sparking plug. (S. and F. Stephenson, Hopwood Street, Liverpool.)

In addition to accumulators, headlights, coils, and other electrical accessories, Messrs. Vandervell have their own magneto, a well made and most efficient machine provided with ball bearings. It is an easy starter, very light and neat in appearance. It follows standard lines as regards design. (C. A. Vandervell and Co., Warple Way, Acton Vale, W.)

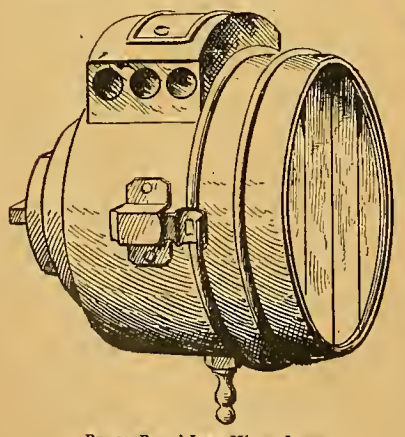
A handle-bar magneto switch which can be most quickly put in and out of action is the Ryley. It is most simply constructed, and consists of a band clip for the handle-bar and an ebonite insulator, in which works a spring "push" electrically connected to the terminal shown on the outside of the ebonite insulator. The current is broken by pressing the push, and remade when it is released. (J. A. Ryley, Martinean Street, Birmingham.)



J. A. Ryley's Magneto Switch.

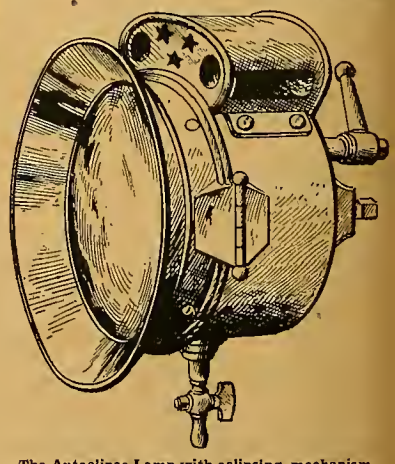
The "Autob" switch is a particularly neat electrical fitment intended to be attached to the handle-bar. The lightest pressure on the switch handle is sufficient to break contact, and the moment the handle is released contact is remade. It can therefore be used for controlling the machine in traffic, provided the ignition is not too far advanced. If it is desired to break contact permanently the handle is pulled back to its fullest extent, when it remains in the "off" position until the current is required again. (Utopian Works Co., 92, Myrtle Road, Leicester.)

The firm of Brown Bros. probably do as large a trade in motor cycle accessories as any other business house in Great Britain. Many of these items are proprietary articles, but



Brown Bros.' Lens Mirror Lamp.

there is one accessory for which the firm are justly famous, and that is our old and trusted friend the Autoclipse lamp. This lamp possesses some qualities to which no other lamp can lay claim. In the first place it is, we believe, the only motor cycle lamp which can be had fitted with an anti-dazzling mechanism, and those motor cyclists who pay the small extra amount required for this apparatus and use it truly deserve the title of considerate motorists. The device consists simply of a dull black disc which serves to cut out the reflector. The reflector is one of the best Mangin lens mirrors, and to add to its intensity the front glass is a weak condenser lens which results in a very powerful beam of light being shot forward. Added to the above the lamp is now provided with an extended



The Autoclipse Lamp with eclipsing mechanism, for which Brown Bros. are sole agents.

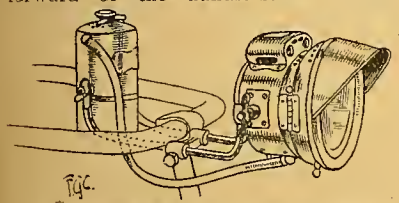
Lamps.

hood, and besides having the qualities referred to above, it is not only well and strongly made but beautifully finished. Now the lamp we have just described is a good one, and all good things are necessarily expensive. Still, not unmindful of the motor cyclist with the slender purse, Brown Bros. supply a well-made lens mirror lamp strongly built of one piece of metal (excluding, of course, the door), the body of which is enamelled either in one of three colours or black. The advantage of the enamelling is considerable, there is less bright metal to keep clean, and the hard enamel always looks smart and is most durable. The price of this lamp is remarkably low. Excellent drip feed generators working on standard lines are sold to supply gas to both the above-mentioned lamps. (Brown Bros., Ltd., Great Eastern St., E.C.)

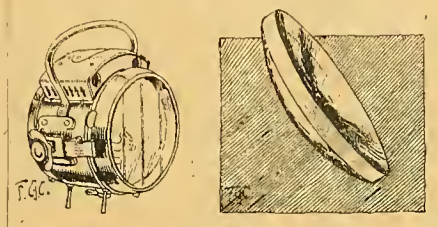
The Lucas separate generator headlight is a beautifully made article. Like all Lucas accessories it is not only made to sell but to last. The lamp and generator are carried on a double bracket made of steel rods in such a manner that the lamp projects forward of the handle-bar and the



The Lucas Headlight and Generator carried on one bracket.

generator behind. This allows for vertical adjustment, and at the same time balances the weight and removes some of the strain thrown on the bracket by vibration. Reference to the illustration of this lamp and generator will make our meaning clearer. The lamp is fitted with a mirror lens, thick glass to the door and hood to throw the light downwards. (Joseph Lucas, Ltd., Great King Street, Birmingham.)

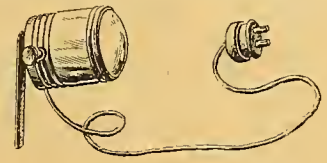
The "Polkey" acetylene projectors are splendid specimens of British workmanship. These lamps are made in two sizes. The larger one has side brackets for a forked lamp bracket, a bail handle, and legs which enable it to be stood upright on the ground or any convenient place while adjustments are made to the machine. The mirror lens is 4in. in diameter, and the front glass is divided vertically. The burner can be readily cleaned by means of prickers attached to thumb screws which are an integral part of the burner. Screwing these up sends the prickers through the holes in the burner, thus removing any particles of dust which are so liable to clog the fine holes of acetylene gas burners. The smaller pattern has all the features of the larger one, except that the mirror lens is smaller in diameter and a single bracket is attached to the back of the body instead of the sides. We have had some personal riding experience with "Polkey" projectors, and can recommend them to any motor cyclists who like a powerful light for night riding. (G.



The Polkey Acetylene Projector. On the right is shown the Special Mirror Lens.

Polkey, Ltd., Pitsford Street, Birmingham.)

An interesting accessory at A. H. Hunt's is a small electric lamp for short-distance riding fitted with a good reflector and a condenser lens.



An Electric Inspection Lamp which can be used for short distance riding.

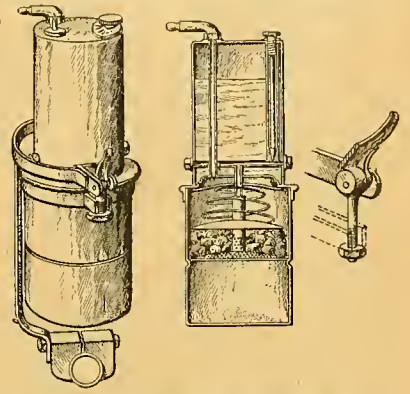
It has a new form of plug switch forming part of the wire connection, which is a particularly neat fitting. (A. H. Hunt and Co., 115, Cannon Street, E.C.)

An interesting article sold by the City Ignition Co. is the Cicoy motor cycle electric lamp, an exceedingly neat little fitting, which, when fitted with an Osram bulb, should be economical, and yet give a powerful beam of light. At the front of the bulb is a

The City Ignition Co.'s Electric Headlight.

condenser lens, accurately focussed, while green and red side windows are fitted. The lamp is provided with a patent switch plug lamp holder, which cannot drop out or shake loose. The City Ignition Co. also deal in lens mirror acetylene lamps with separate generator, and numerous other practical and interesting accessories and tools. (The City Ignition Co., 14, Spencer Street, Goswell Road, E.C.)

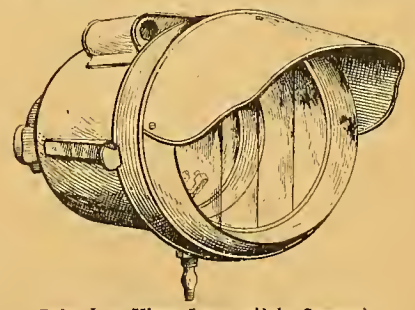
The Seabrook-Solar generator works on accepted principles, but it has been considerably improved. For example, the water does not drip direct from the tank to the container, but transversely across the bottom of the water tank there is a pipe carrying a wick. This pipe has a nut at each end, so that the wick may be readily withdrawn for cleaning purposes. On the top of the pipe the needle valve is fitted, and when the latter is open, the water first of all percolates through the wick before it reaches the carbide, thus controlling the drip to a great extent and allowing the needle valve to be fully opened without risk of flooding the container, and causing an over-production of gas. In the container, the carbide rests upon a grid, with the result that the vibration sifts the carbide residue to the bottom and



Elevation and section of the Solar Generator. The small sketch on the right is that of the eccentric toggle joint.

allows the carbide to be readily attacked by the water preventing dust from reaching the orifices through which the water and gas pass. Another point about the generator is the method of attachment of the container to the water tank. Instead of using a central screw, the attachment is effected by means of special lever clips or toggle joints. The lamp itself is well-made and most substantially built. It is fitted with a very fine lens mirror. There is a neat fitting at the back for the bracket. With the exception of the door the lamp consists mainly of one piece of metal, and all the riveting is done on the inside. (Seabrook Brothers, 32, Featherstone Street, City Road, E.C.)

The Pulco lamp is a particularly well-made article, fitted with a lens mirror as a standard, but which, if desired, may be fitted with a genuine Mangin

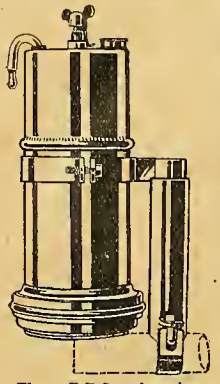


Pulco Lens Mirror Lamp sold by Gamage's.

mirror. The firm have also placed on the market a small electric lamp with the bulb in the centre (the most efficient position), which should be very useful, especially for short distances. (A. W. Gamage, Ltd., Holborn, E.C.)

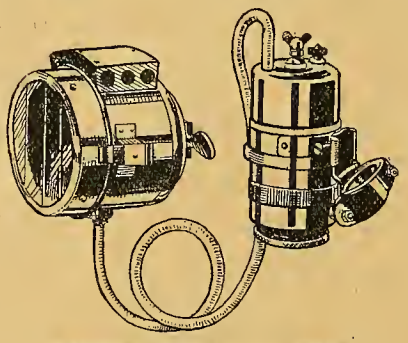
Lamps.

Well known to our readers as the makers of the F.R.S. lamps, which have quickly obtained an excellent footing among motor cyclists, the firm of S. Hall and Sons have made quite a speciality of their generators. The accompanying line drawing of the generator shows that a vertical tube is supported on the top rail of the machine by a stout clip. Fixed round the body of the generator is an adjustable band clip, ending in a tube or support, which telescopes into the one rigidly fixed to the frame of the machine. This method of attachment renders the generator instantly removable for the purpose of cleaning or replenishing, and at the same time the generator is held at a point where the adjustment of the water feed is in close proximity to the rider's hands. The interior arrangement of this generator is on the usual drip feed lines, but it also contains a grid or sieve which allows the spent carbide dust to fall to the bottom of the container, and leaves fresh carbide waiting to be attacked by the water. The F.R.S. automatic generator consists of two cylindrical compartments—one for the water and the other for the carbide. There is a small tap, which is turned full on or off. When the tap is on, the generation of the gases is quite automatic. (S. Hall and Sons, 18-20, Swinton Row, Edinburgh.)



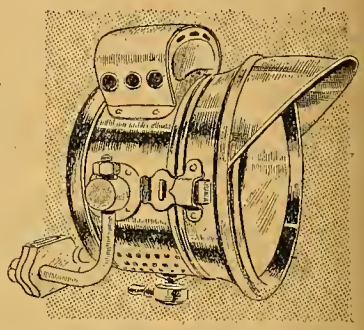
The F.R.S. Acetylene Generator and Carrier.

Motor cycle gas lamps are doubtless put to many uses on occasion besides illuminating the motor cyclist's path. The Broadhurst lamp was recently temporarily used to illuminate the rear premises of a provincial post office during a heavy holiday rush, when the postmaster found that it threw a strong beam of light for upwards of fifty yards. The lamp and generator are British made, and excellent value for the low price charged. The body of the lamp is solid brass, riveted and brazed. A powerful mirror lens is provided, and the whole of the lamp and generator nickel-plated. (R. Broadhurst, 25, Smithford Street, Coventry.)



Broadhurst's Headlight and Separate Generator.

The Powell and Hanmer acetylene headlight is a well-made article, which should commend itself to motor cyclists. The firm have been known for some years as manufacturers of cycle and motor cycle lamps, and their work can be depended upon to give every satisfaction. Our illustration shows that this headlight is supported on a special forked bracket, which is provided with a socket to fit the ordinary lamp iron. The body is of brass, riveted together, and the door hinge and catch are particularly strong and well constructed. The lamp has a 4in. mirror lens and thick glass to the front



Powell and Hanmer's Acetylene Headlight.

door. It is also provided with a hood to cast the light downwards. No back glare is possible, as the principal ventilating holes are at the sides of the cowl. A separate generator is sold for this lamp with a special bracket which attaches to any convenient portion of the frame or fork. (Powell and Hanmer, Chester Street, Birmingham.)

The C.A.V. electric motor cycle lamp is second to none, it is substantially made, beautifully finished, and accurately designed and constructed to give the maximum amount of light, while it is provided with a metallic filament bulb which is not only efficient but durable. To support it a special fork bracket is provided made in two halves to clip round the handlebar stem. We have thoroughly tested the lamp on the road, and can speak of its excellence after practical experience, and we are glad to hear it is meeting with a ready demand. (C. A. Vandervell and Co., Warple Way, Acton Vale, W.)

Riding Apparel

Situated in the centre of the motor cycle industry, it is not surprising that this firm of boot makers have specialised in motor cycle foot gear. Those who witnessed the Tourist Trophy Race last year doubtless noticed that several of the prominent riders wore particularly neat high-legged boots. These were specially introduced for the Tourist Trophy Race. They are, of course, equally serviceable for ordinary touring, and look very much neater than ordinary boots and leggings. The same firm make excellently shaped solid leather leggings for those who prefer them. (C. Ager, Smithford Street, Coventry.)

Ager's T.T. Boots, which were worn by a number of competitors in last year's T.T. race.

The Continental Tyre and Rubber Co. is responsible for the introduction of a pair of waterprof gauntlets, which prevent rain from being driven up the sleeves and are dark grey in colour. The backs of the gloves are covered with a preparation of rubber, while the underside is composed of leather. Inside the gloves are lined with wool, which makes them comfortable and warm. (The Continental Tyre and Rubber Co., Clerkenwell Road, E.C.)

John Piggott, Ltd., have an interesting display at their Cheapside premises of motor cycle clothing, among which we may mention a neat yet inexpensive suit of oilskins, which are rather lighter than those ordinarily used for seafaring purposes, the coat of which has a special storm flap, and the trousers are fitted with a gusset, and patent clips so that they fit round the calf and yet totally exclude the wet. The firm also make a special point of selling a Norwegian cap, made entirely of wool on the Balaclava principle, which is sold at a very moderate figure. They also manufacture a set of dust overalls, which are showerproof. The leggings amply protect the lower part of the body and strap round the waist, and there are slits in the sides so that the rider can conveniently reach his trouser pockets. A strap is provided to slip underneath the boots, and the coat is double-breasted. For cold weather an excellent soft chamois leather waistcoat is sold, the sleeves of which are made of the same material, but their outer portion is of Italian cloth, enabling the coat to be quickly slipped on. The lining of the sleeves is perforated so as to provide ample ventilation. Another interesting article is a pigskin legging made out of one piece of leather, which is neat and durable, and will fit almost anyone. John Piggott, Ltd., also market a practical waterproof coat, which is strongly built, is fitted with adjustable wind cuffs, is double-breated, and has the usual storm flap. They also make an umbrella coat fitted with a gusset at the neck, which buttons up securely, and is easily donned and doffed. (John Piggott, Ltd., Cheapside, E.C.)

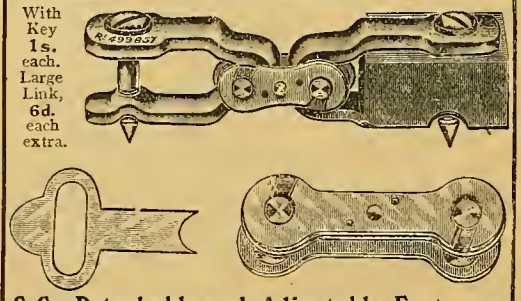
With Key **1s.** each. Large Link, **6d.** each extra.



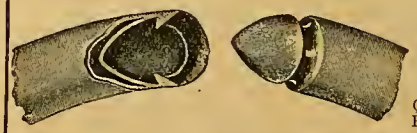
S.G. Detachable and Adjustable Fasteners.

Very flexible. Accurate fit. For ⅜in., ½in., 1in. S.G. Belts. Protected Design.

S.E. BANDS FITTED TO OLD COVERS

21/- each.

(Vulcanized on.)



S.E. Butt End Tubes.

Quickest and Easiest to fit.

Complete Catalogue on application.

THE HANOVER RUBBER CO., 29-31, Old Street, London, E.C.

Shamrock-Excelsior

In answering this advertisement it is desirable to mention "The Motor Cycle."

Riding Apparel.

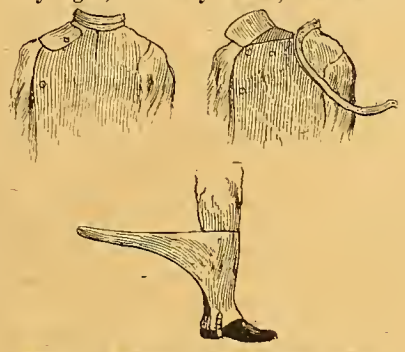
Any article made by the Dunlop Rubber Co. can be relied upon to give satisfaction. This firm make a speciality of motor cycle clothing. In the annexed illustration we show a pair of their waterproof motor cycling overalls. These protect the upper parts of the rider's body as well as the legs and thighs; in fact, they are practically waterproof trousers, and not merely single leggings with straps. The openings at the sides of the legs are fastened with patent spring fasteners, and the gaiter portions extend well over the lace openings of an ordinary walking boot. In addition to this item of motor cycle clothing, the Dunlop Rubber Co. make coats, caps, and suitings in several different patterns. (The Dunlop Rubber Co., Aston Cross, Birmingham.)

The Dunlop Rubber Co.'s Mackintosh Overalls.

The firm which makes the Bedford riding breeches, stock a large variety of specially woven riding tweeds, which make up into ideal breeches for motor cyclists. Every pair is made to the purchaser's measurements, and can be made up full or otherwise to the buyer's requirements. If it be desired the breeches can be provided with double seating without extra charge. A special feature is the strong trimming of these clothes. Jackets suitable for motor cyclists are also made by this firm. The Richmond leggings, either black or tan, are a sound investment for the motor cyclist. They are whole cut and blocked in one piece, which, combined with the fact that they are made of best hide, makes them a particularly strong article. Having spring fronts and clips they are easily adjustable. (The Bedford Riding Breeches Co., 51, Kingly Street, Regent Street, W.)

Bedford Motor Cycling Breeches.

There is no doubt that the motor cyclist has to face wet, wind, and cold under less defensible conditions than those existing with any other form of land locomotion. For him, liberty, warmth, and protection are absolutely essential for ensuring comfort and health, so that his garments require to be of a very special and efficient character. For such a purpose there is no better material than Burberry's Gabardine, which is wonderfully light yet very warm, and absolutely waterproof. At the same time, it provides sufficient ventilation to obviate the disadvantages offered by oilskins or macintosh. Burberry's have just brought out a most excellent motor cycling suit, made of Gabardine lined with fleece. The coat is double-breasted and has a wide overlap, while it is fitted with a puttee collar which wraps completely round the neck and then fastens on the collar of the coat. With this coat, which is not only light, but very warm, the motor cyclist is excellently protected, especially as regards the parts of the body most vulnerable to chill. Excellent wind cuffs are provided to the sleeves. The leg overalls are lined with wool, and a puttee attachment is supplied, which fastens tightly round the calf and is held in position by patent fasteners. With this set a cap made in the Balaclava style is sold, which can be turned down to protect completely the ears and chin of the wearer. This suit is one of the best of the kind we have yet seen, and as we can speak from experience of the efficacy and comfort of Burberry's Gabardine, we have no hesitation in recommending it to our readers. (Burberry and Co., 30-33, Haymarket, S.W.)

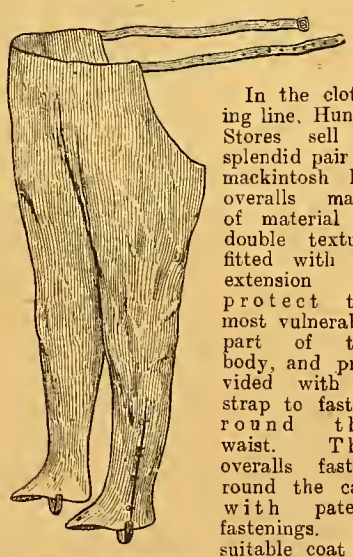


Burberry's Gabardine Outfit for Motor Cyclists.

The Para Rubber Co., as their name implies, make a speciality in waterproof clothing. The suit illustrated consists of coat and legging overalls, in Paramatta waterproof material of first rate quality. The same firm sell suitings in heavy Irish tweeds double-breasted coats, lined camel fleece and fitted inside with a large pocket containing a leather tool roll. High-legged boots are another speciality. (Para Rubber Co., 93, John Bright St., Birmingham.)

Clothed in the Para Rubber Co.'s Paramatta Suit.

A. Dunhill, Ltd., have now decided to turn their attention seriously to catering for the interests of motor cyclists. They make a point of an excellent suit of overalls, light yet strong, and at the same time thoroughly waterproof. The coat is long, so as to protect the seat, while the leg overalls, which are fitted with patent hook fastenings, are fitted with an extension to protect the lower part of the body, and a strap to keep them firmly in position, and to keep the rider warm. Of the excellence of Dunhill's waterproof overalls we can speak from experience, as we have had a set in use for some time. As an alternative to the waterproof coat they sell a special poncho, which is well adapted for the use of motor cycle riders. It is slipped over the head and fastens round the neck with the aid of buttons and a strap. For ordinary weather Dunhill's supply a triple whipcord, double-breasted coat, which is warm, comfortable, and is sold at a moderate figure. In addition to the waterproofs, the holland dustproof overalls will be useful when the warm weather arrives. At the present time warm waistcoats are likely to appeal to motor cyclists. We were shown a chamois leather under waistcoat, which was beautifully soft, and, of course, intensely warm. Under garments are also supplied of the same material. (Alfred Dunhill, Ltd., Euston Road, N.W.)



Hunt's Mackintosh Overalls.

In the clothing line, Hunt's Stores sell a splendid pair of mackintosh leg overalls made of material of double texture fitted with an extension to protect the most vulnerable part of the body, and provided with a strap to fasten round the waist. The overalls fasten round the calf with patent fastenings. A suitable coat is sold to go with these garments. (Hunt's Stores, Newgate Street, E.C.)

The Albany motor cycle suit consists of jacket, overalls, and cap all made to match in guaranteed absolutely waterprof paramatta cloth, and in two colours—grey green and fawn. The jacket is provided with storm cuffs, is made of double texture material and double breasted. The overalls button from the knee downwards and are made in single legs or trousers, with front to protect the upper part of the body. (G. Raws and Sons, the Albany, Oldhall Street, Liverpool.)

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Butt-ended Tubes.

[4625.]—The only butt-ended tubes I have come across have been fitted with a pin valve. So far as my experience goes, these valves give about four times the trouble of the ordinary valves fitted to endless tubes. I should be much obliged if you would publish this letter, as I am sure it would tend to make "butt-enders" more popular. R. B. BOYCE.

Riding in Spectacles.

[4626.]—I am one of the unfortunate motor cyclists who have to wear glasses. In mist or rain they at once become useless owing to water collecting on the glass. Is it possible to wear any sort of goggles outside the glasses made of some transparent substance that, while not obscuring the vision, will at the same time prevent water collecting on the glasses? If so, where can they be procured?

The Motor Cycle is invaluable to us out here, our nearest approach to a "repairer" of any sort whatever being a Chinese blacksmith!

Pahang, F.M.S. SPECS.

Should Starters be Barred at Brooklands?

[4627.]—Major Lindsay Lloyd invites opinions of motor cyclists through your columns on the question of starters in Brooklands events. As a prospective competitor in this year's races may I suggest that starters should be permitted, as otherwise the strongest man with a light machine would score in the start. Personally I am not nearly so nimble and active as several well built riders I have seen in past events at Brooklands, and on that account (although not my fault) I should be left in the rear in the first hundred yards. To get over the danger of collisions between starters and competitors, why not have a broad line across the track, say twelve to twenty yards from the starting line, and prohibit any starters from crossing that line? This would prevent the "pushers off" straggling all over the track.

AUXILIARY EXHAUST.

Finish for All-weather Machines.

[4628.]—I heartily agree with the remarks of the correspondent referred to by Mr. Hulbert. Fancy vaselining and unvaselining seventy-two spokes. Every practical rider knows perfectly well that this dazzling spoke business is simply a question of appearance Fancy an up-to-date car with plated (so-called) rims and spokes. It is really about time this was done away with and properly enamelled spokes and rims insisted on, and then we shall have got rid of about the last of bygone absurdities. I think we are all about sick of bicycle cleaning, and the sooner the all-weather machine comes on the scene the better, as the push bicycle has already done.

PRACTICAL AND NOT ORNAMENTAL.
(Member of the Edinburgh M.C.C.)

[4629.]—In the issue of the 7th inst. R. G. Lindsay recommends aluminium paint for motor cycle frames, spokes, and hubs. A few years ago I painted my pedal cycle as friend Lindsay did his, but in my case the paint quickly wore off, and in three months the rust was showing in many places, although I often touched up the bad parts as soon as seen. What I would like to know (and no doubt many others would too) is how to make the aluminium paint more permanent. If your correspondent can enlighten me I shall be very grateful to him. A. DEAN.

P.S.—Having had an experience of aluminium, can some one give theirs of French grey paint or enamel, not stoved?

Brooklands Hill-climbing Certificates.

[4630.]—*Re* the paragraph in last week's supplement concerning Brooklands hill-climbing certificates, I suggest the item of most importance to note on the certificate is the gear of the motor cycle at the time of climbing the hill.

W. A. SANSOM.

A Puzzle or a Poser?

[4631.]—Regarding the blowing back of a spray of petrol from the air holes of a carburetter. I used to ride a 3 h.p. chain-driven Humber, with the carburetter high up on the right-hand side, and when travelling at a fair speed I always noticed a spray of vapour blowing out of the large gauze-covered air hole. I must say I never troubled to consider what the cause of it might be, but "Ixion's" article explains it. It was an automatic inlet valve, and the machine always ran wonderfully well. H. B. M.

The Surface of Sutton Bank.

[4632.]—Seeing in *The Motor Cycle* that Sutton Bank has wintered badly, I well remember similar complaints last year; still, all was ready just the same. However, if the A.C.U. will wait a bit we will see what can be done. A motor cyclist here is going to "have a go" at Sutton Bank in two or three weeks, and I hope to examine the hill myself in a month's time, when I shall be pleased to give my opinion through *The Motor Cycle*. There is plenty of time to get the celebrated hill into condition. One would think it was more important than the Budget.

Pickering. W. WRIGHT.

Club Competitions.

[4633.]—Whilst not agreeing with "Ixion" in the first part of his advice to club secretaries, which by the way would be rather a strenuous task for the secretaries of the larger clubs, I entirely agree with the latter half. Nowadays competitions are promoted in which no "old crocks" such as I possess would stand an earthly chance.

These big runs are all right for the man with a large income and the trade, who can afford to own and supply machines that are new and right up to date. But with such as myself a machine has got to last three or four years, and towards the end of that period gets a bit "short of breath" so to speak, and is only good for such rambles as he suggests. I am sure there are others who own such machines as I have described, and who would welcome these "simple" competitions with open arms.

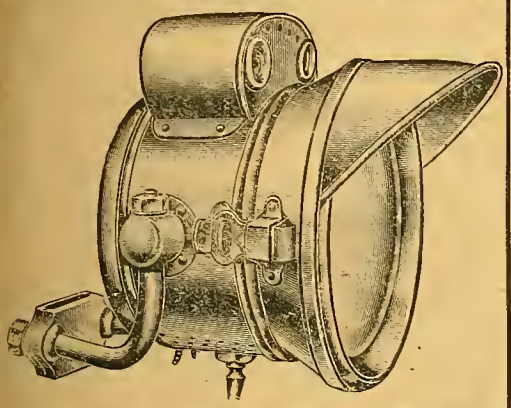
BERTRAM F. G. FOWKE.

Perpetual Motion?

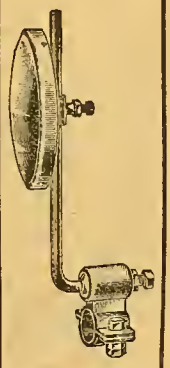
[4634.]—In your issue of February 14th you publish under Recent Patents a short account of an engine which it is proposed to drive by compressed air. Surely this cannot be serious on the part of the patentees. It is proposed to compress sufficient air in the tank to start the engine, and then by means of the geared pumps to replenish the air supply. This is somewhat after the style of the idea of making a motor drive a dynamo and then using the current produced to drive the motor. It is obvious that there must be a loss in pressure in the cylinders due to friction and in the turbine due to the effort required to move the rotor. Then the work given out, that is the pressure coming from the pumps, must be less than that coming to the engine, and so it would be impossible to force the air into the tank. To get any motion at all the efficiency of the engine must be greater than 100 per cent., which is, of course, absurd. C. A. COPPACK.

KERRY ACCESSORIES.

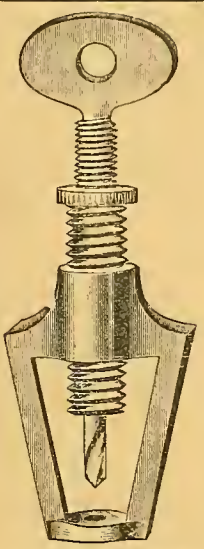
BEST that MONEY CAN BUY.



The "Kerry" New Model Motor Cycle Lamp.—This lamp projects a powerful beam of light, is extremely well finished, and is fitted with a fork bracket, extra strong, to withstand the vibration of motor cycles. Price of lamp only, **18/6**; generator for same, **10/6.**



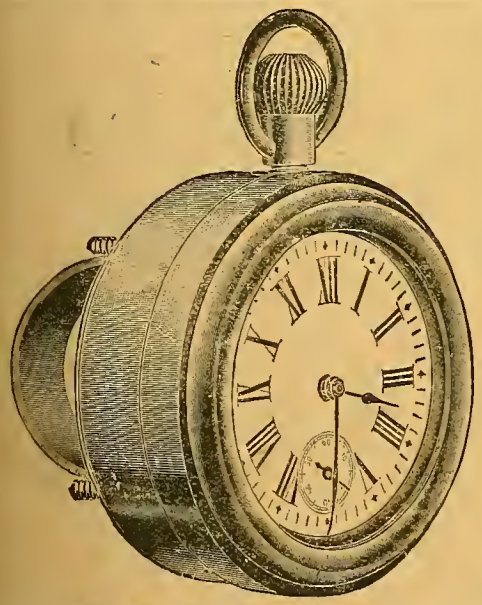
The "Kerry" Motor Cycle Mirror Adjustable to any angle. Price, **6/6** each.



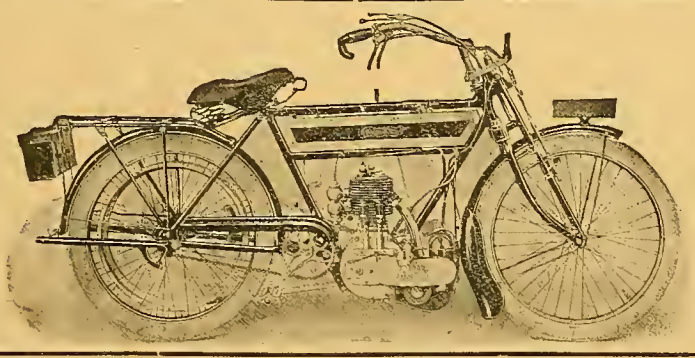
The "Kerry" Belt Punch. Fitted with central screw adjustment to ensure perfect accuracy in drilling of belt. Price **2/6** each.

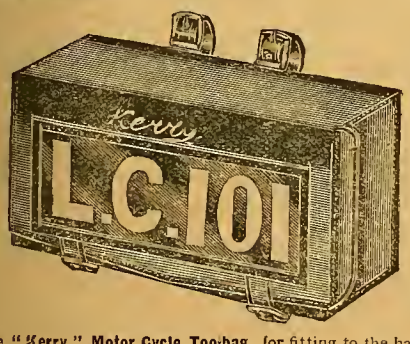
The "Kerry" magneto cut-out, for clipping to handlebar. Operated by hand without releasing the hold of handlebar. Indispensable for traffic riding.

The "Kerry" Oil.—High-class oil at a low price. Specially prepared for motor cycle engines. Quart, **1/-**; half-gallon, **1/10**; one gallon, **3/6.**

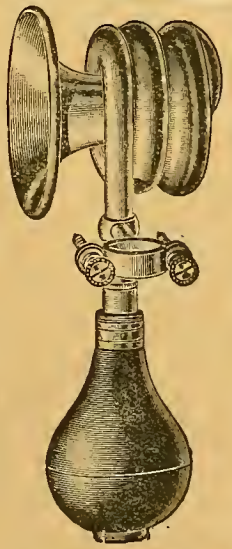


The "Kerry" Motor Cycle Watch, for clipping to handlebar. Price **6/6** each.



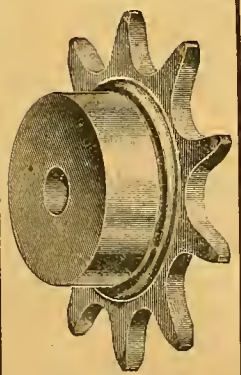


The "Kerry" Motor Cycle Toolbag, for fitting to the back of carrier below the surface, so as to leave the whole of the carrier free for luggage use. Price **7 6** each.

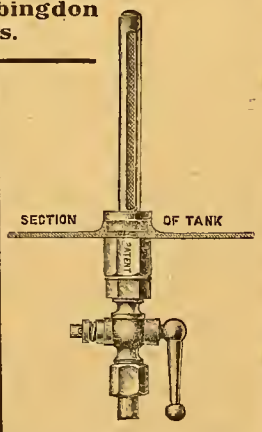


The "Kerry" Three-coil Duck horn. Price **6/6** each.

Write for illustrated Price List of Kerry-Abingdon Motor Cycles.



The "Kerry" Magneto Sprockets.—All sizes from 9 to 28 teeth stocked. Prices from **1/8** to **6/6**, according to size.



The New "Kerry" Petrol Strainer for Motor Cycle Tanks. Easily fitted by screwing the gauge into the existing petrol tap bush. Price of strainer only, **2/6.**

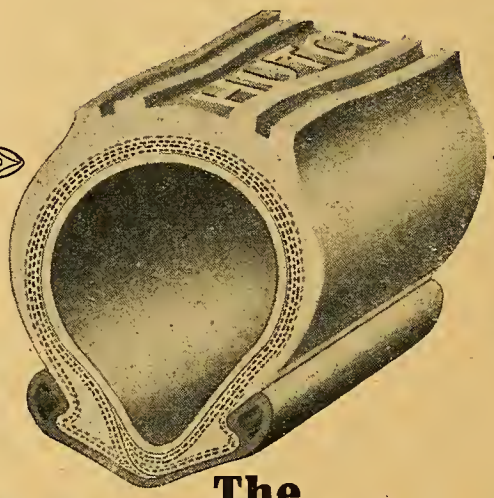
East London Rubber Co., 29-31, Great Eastern St., LONDON, E.C.;

or Kerry House, Furnival Street, SHEFFIELD; and 101-2, Thomas Street, BRISTOL.

Still Retains its Laurels!

The Hutchinson Square Tread attern.

With the word Hutchinson worked into Tread.



The HUTCHINSON

MOTOR CYCLE TYRE

still holds the World's Records for 50 miles, 100 miles, and 2 hours,

in spite of the many attempts that have been made by numerous riders to beat them.

Riders!

If you require immunity from tyre trouble, see that your machine is fitted with them.

Stocked by all the Leading Agents everywhere

THE HUTCHINSON TYRE,
70, Basinghall Street, London, E.C.

In answering this advertisement it is desirable to mention "The Motor Cycle."

Benzol as a Fuel.

[4635.]—I am thinking of purchasing a second-hand four-cylinder F.N., and should be glad if any readers of *The Motor Cycle* could inform me whether they have tried running one of these machines on benzol, and if so, with what results.

Would they give me the quality of the benzol used, and whether any alteration to the carburetter was necessary, as I am anxious to try it. R. P.

Increase of Speed on Partially Raising the Exhaust Valve.

[4636.]—I think most of the writers on the above subject are on the wrong track. I think if they alter the timing and give the exhaust a lead they will find that raising the valve will not make any difference to speed. When an engine has such a fault it is very dangerous, if the rider is not used to it, especially in going round greasy corners. The trouble can be cured by having the timing wheel made slightly larger or smaller, so as to make half a tooth difference, as one setting does not suit every engine alike—in fact, some engines will run with the exhaust valve having a lead of three teeth, which means the valve shut when piston has half an inch to travel before reaching dead centre.

PONY.

Causes of Overheating.

[4637.]—In explanation to "C. McC." [4593], a leakage of air between carburetter and engine in induction pipe or induction pipe joints will cause more petrol to be sucked off the jet than necessary if the motor is to fire at all, thereby causing a very rich mixture under any engine speed, assuming carburetter to be designed and set correctly.

This overheating, I find, cannot be remedied by closing the extra air lever to balance the air taken in at the joints, as the suction acts on the leakages in induction pipe before reaching the jet.

Now perhaps Mr. "C. McC." will want to know why some misguided twin enthusiasts drill extra air holes in their induction pipes which they find do not apparently cause overheating. I suggest these extra holes are for speed purposes only, and evidently carburetter and pipes are not designed for speeds above certain limits.

Again "C McC." might say that extra air holes tend to keep the engine cooler. Then why not drill the whole length of piping with holes, and have the engine as cool as possible?

I wonder if Mr. "C. McC." knows the difference between the oil pump and the explosion stroke yet. I assure him that there is a difference, but I will be kind, and assume that his education has not been neglected on this point.

P. G. J.

The Future of the End-to-end Record.

[4638.]—I have read with considerable interest Mr. B. H. Davies's article in *The Motor Cycle*. I quite agree with him in inferring that the actual speed a rider would have to travel to beat the record would turn out to be a public nuisance, as well as being dangerous; but I think the general public would be far more interested if a motor cycle travelled the whole distance at 20 m.p.h. without a mechanical failure of any kind.

I intend to do this later in the year, and I think I shall ride a 2 h.p. Moto-Rêve, which is only capable of 40 m.p.h. "all out" on the flat, but can average 20 m.p.h. all day with ease. Surely this would be a record for an engine of its cubic capacity.

I also notice he says it would be a pity for a "young sporting undergraduate" to lose his life in trying to beat Mr. Hart-Davies's record. So do I, as I happen to be an undergraduate! It will certainly bring a great deal of discredit on the sport if the End-to-end route becomes a racing track. C. PATTESON.

[There is no doubt that the Auto Cycle Union will put down all future attempts on the End-to-end record with an iron hand, and rightly so, too, as the speed is now too great to allow the ride to be safely undertaken, while the record rider is absolutely compelled to be driving at times to the common danger if he wishes to have any chance of breaking the existing record. If, however, any rider of a lightweight, or of any other type of motor bicycle for that matter, desires to accomplish the journey on a continuous run at 20 m.p.h., he is quite at liberty to do so, and if he were observed all the time (a difficult matter, it is true) the performance would be officially recognised by the Auto Cycle Union.—ED.]

T.T. Machines for Touring Purposes.

[4639.]—I notice that "Ixion," in his reference to my article which appeared in your issue of February 28th, is of opinion that I omitted to mention two drawbacks connected with the T.T. machines: An excessively cramped position for riders of more than small stature, and the necessity of supplementing the outfit with a pair of spring forks for touring work.

If he is generalising, well and good, but if his two "drawbacks" are to be taken as applying to the particular make of machine which formed the basis of my article, I would remind him that the wheelbase of the T.T. Triumph is reduced by employing shorter back stays—to bring the back wheel close up behind the diagonal tube—while the rest of the frame, including saddle pillar, footrests (front pair), and *spring* forks, remains exactly as in the standard model. T.T.T.

An encouraging turnout on the occasion of the first run of the newly formed Leicester and District M.C.C. Market Harborough was the destination decided upon.

Standardisation of Rims and Tyres.

[4640.]—We have noticed the letter appearing in your issue of the 28th ult. with reference to the above matter, and we are surprised to read the experience of your contributor "Ex-Lightweight."

We have manufactured rims for motor cycles for some considerable time, and beg to inform you that practically the whole of the tyre manufacturers have now come into line with regard to the fitting of their 2in. and 2¼in. tyres. As far as we are aware our 26in × 2in. rim will take 2in. or 2¼in. tyres made by the following: North British Rubber Co. (Clincher), Palmer Tyre, Ltd., Dunlop Tyre Co., Kempshall Tyre Co., and the Continental Tyre Co. We are under the impression that the Palmer Tyre Ltd. have done away with the 2¼in. tyre, which fitted on to the 2½in. rim, except in the case of replacements.

With regard to the 2½in. tyres, the tendency, as far as we can see at the present time, is to use the same sized rim as that used by the continental manufacturers, *i.e.*, the 650 × 65 mm. We may tell you that this is the rim which is specially used by the North British Rubber Co. for their 2½in. tyre, and also by the Palmer Tyre, Ltd., for their 2½in. studded tyre. We think there is no doubt that in the near future the whole of the tyre manufacturers will definitely fix upon the 650 × 65 mm. rim for their 2½in. tyre.

THE JOINTLESS RIM, LIMITED.
H. F. BEAMISH, manager.

The Motor Cycle in the United States.

[4641.]—I read in your valuable paper of February 7th the letter of "Disgusted Belt User" in America. Poor fellow, I am extremely sorry for him, as he must have had lots of trouble, with those poorly made English belts! He says he could only get an average of 300 miles out of an English manufactured belt. It seems to me very strange, when in Canada we often get an average of 3,000 miles from English belts over roads that they don't see anything like in Mass., U.S.A. It is common here in the spring to have holes in the road ten to twelve inches deep; roads that never see a load of gravel or stone—just a ploughed field with a fence each side. I wonder what he got disgusted at—the belts or himself? I have never heard an American yet give an English manufactured article its full credit when it is deserving. We can and always will give the English manufactured goods the preference, because they are superior goods in every way to the American goods. There are about forty motor cycles here, and they are all English made, and belt driven too; there is not a chain driven machine around here that I have seen. Not because the chain is inferior to the belt. But because we find the absence of vibration in the belt. If we used chain drive over these roads, I don't know what would become of the riders. I thought it was about time we wrote you to defend the old country goods, as I have always found them very satisfactory in this country, and hope I always shall. If the "disgusted" man is dissatisfied, that is not to say everybody is that way.

London, Ontario, Canada. BELT USER.

Lightweights v. Heavyweights.

[4642.]—May I ask Mr. Measures to keep to the point, viz., which is the more serviceable machine for the professional man who in all weathers has to make frequent calls, necessitating daily riding in traffic and constant wheeling of the machine through gateways and passages and in and out of its own shed.

Dr. Gaskell after much experience of all kinds of machines wrote in praise of the lightweight for this kind of work. Mr. Measures, in reply, professed to be much amused at a most sensible letter, and claimed that his heavyweight was just as handy and suitable.

Since I ride the same make of machine as Mr. Measures, I ventured to point out that, though young and active, I found it far too fatiguing for daily riding in traffic and dodging about from house to house, and asked Mr. Measures whether he knew what it means to pay a round of calls on a heavy machine in a busy town in all weathers day after day for, say, a year.

In reply to this, he again professed amusement, and tells us that, although he lives in an obscure hamlet in Sussex, nevertheless he sometimes has to go to Brighton or Southampton—distances, I believe, of about fifteen and seventy miles respectively—and that, therefore, he knows what it is to ride in traffic. May I point out to him that an occasional visit to either Brighton or Southampton is not daily riding in traffic, which is quite another matter. For long-distance riding—and surely Southampton and back is a long ride, for I take it that Mr. Measures, being a professional man, must get back the same day—the heavyweight, as I have already admitted, is *facile princeps*, but for gadding about in a busy town day after day in any weather it is absolutely unfitted, as Mr. Measures would soon find out were he to live in such a town, and were his work confined to it and the surrounding districts within five or six miles radius.

Mr. Measures takes umbrage at my criticism of his assurance that he starts and stops as often as thirty times in a couple of miles, which I pointed out resulted in one stop every 117 yards. He now goes beyond this, for he tells us that when playing with his juvenile mechanics and boy scouts he finds "it necessary to make" even "many stops in 117 yards." This is utterly beyond me. He asks me why I do not publish my name. To do so might possibly deprive him of that amusement which he repeatedly assures us he derives from this correspondence, so I refrain.

RUS IN URBE.

The Transmission Question.

[4643.]—With reference to the correspondence on the above, I would like to give you my experience of the so-called rigid type. I obtained delivery of a 5 h.p. F.N. on April 1st (surely an auspicious day) last year, and have ridden the machine practically every day since, having covered just on 10,000 miles. For the first 9,000 I never touched the transmission except occasionally to put in some grease. I then, unfortunately, broke two teeth off the small driving bevel pinion; no other damage was done, as I immediately removed the parts of the broken teeth. I procured a new bevel pinion at a cost of about 3s., fitted and adjusted same, and the machine now runs as quietly as ever. About five hundred miles were done with a sidecar.

I find tyres do not last long. I can only average about 2,000 or 2,500 on the back wheel, but I attribute this more to the bad roads I traverse here (Derry and Donegal) than to the rigid transmission.

I wonder more riders who do a lot of short-distance riding do not ride in long coats; they are so much less trouble to take off and put on than overalls, to say nothing of the looks, and they keep one just as clean. My coat is made of black rubber composition, very full in the tail, and can be cleaned in a minute with a damp cloth. With a small leather mud shield on a steel frame (home made at a cost of 2s. 8d.) and the long coat, I can on arriving at my destination take off the coat, and be perfectly clean and ready for business. As to the danger of the long coat, I have had three or four falls from side-slip, and the coat has not got in the way. Of course, before mounting you must throw the tails over the saddle. W. A. LANE.

SUMMARY OF CORRESPONDENCE.

Sinclair Wilmington writes: "Why ever doesn't some manufacturer bring out a complete belt cover? Such a contrivance, although offering difficulties, is by no means an impossibility, and surely a fortune awaits the first successful device."

EXPERIENCES WANTED.

"M. M. S." (Manchester) would like readers' experiences with the new 1½ h.p. Moto-Rêve, particularly with regard to petrol consumption, length and steepness of gradient it will climb with 11 stone rider without pedalling, and general handiness.

"F. F." (London) would like readers' experiences of the Mabon clutch and adjustable pulley on a 3½ h.p. engine. Would it render the machine easier to start and control in thick traffic?

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

ROC Two-speed Gears for Easter

Send your machine at once if you want the ROC conversion for Easter. The conversion comprises new back wheel, 2-speed gear, pedal-operated clutch, live axle, hand-starting, new rear frame members, brake work, large section belt rim, etc., inclusive of fitting—finished and tested for immediate use—at Twelve Guineas. The conversion also includes the new ball-bearing improvement to gear box. In ordering your new mount, specify "ROC Two-speed," or consign your machine to us to be modernised.

NOTE.—The "ROC Two-speed" has the largest sale—adopted by leading firms under licence—the best tried system—enables you to glide away from standstill like a car.

ROC Military Models.

4 h.p. single and 5-6 h.p. twin include the Roc clutch and gear system in the standard specification. Booklet on application.

THE PALMER IS THE TYRE THAT DOES GRIP

Even on greasy roads, as the three ribs which form the tread present to the mud a solid wall of rubber, the bottom of which is in actual contact with the road. Users of Palmers can confirm this.

The tread of the Palmer Tyre is very thick, but contains no canvas or other materials that would affect its resiliency and cause the tyre to wear itself out at the expense of engine power and petrol.

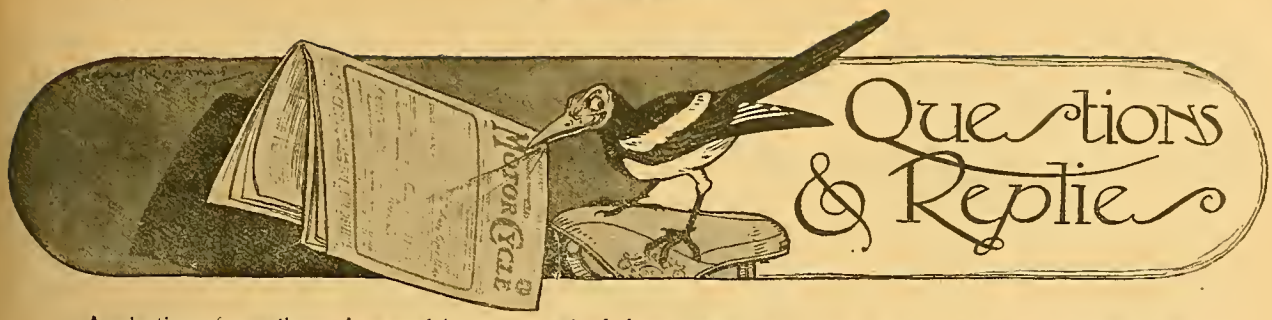
In answering these advertisements it is desirable to mention "The Motor Cycle."



A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, **must be accompanied by a stamped addressed envelope for reply.**

Charge Blowing Past Rings.

With reference to the engine of my 1907 Vindec Special (engine, 5 h.p. twin Peugeot), the compression in the front cylinder was very bad, and when the machine was moved forward the air could be heard escaping with a hissing sound. Consequently I took the engine down, and found that the three piston rings (which are all on top of piston) are quite bright all round, except that each of the rings is black for a space of about one-eighth of an inch on each side of the aperture where they are cut. I suppose that I am losing power by this being the case, and shall be glad if you can explain why they are so blackened, and how I can remedy this.—T. P.

The dark mark on the rings seems to indicate that the charge is blowing past them, and we should therefore advise you to have three new rings fitted. If this does not restore good compression and full power, it may be that the cylinder requires to be re-bored and a new piston fitted.

Blow-backs in the Carburetter.

My 5½ h.p. twin motor bicycle has lately been giving me trouble in a peculiar way. The engine starts well, and runs well for perhaps a mile, perhaps more. Then suddenly there are several blow-backs in the carburetter, and the engine stops at once. Immediately after the stoppage there always seems on trial to be plenty of petrol in float chamber, and on dismantling carburetter the jet is perfectly clear. There is no obstruction on the gauze below float chamber, and the needle valve is set so as to give a high level of petrol. After a few minutes' waiting the machine will run again, but only for short distances, everything seeming to point to starvation of petrol, and yet, as I say, there is always plenty in the carburetter.—A. T.

We are inclined to think that the inlet valve may not close properly, and we should therefore advise you to examine the valve and stem, and especially the operating mechanism, and make sure that nothing is binding. A stem sticking in its guide would cause the blow-backs of which you complain. If the trouble still continues, make certain that the carburetter is heated properly, and try the effect of a restricted main air inlet.

Speed not Affected by Spark Advance.

Can you please tell me why my machine (a single-cylinder) will not answer to spark lever (high tension magneto)? No matter if I have lever advanced or retarded the speed is not altered. I have fitted new spring on contact breaker, also new fibre ring, but it made no improvement. Have also tried stronger inlet spring (a.o.i.v.) but without results. Is it likely that the magneto requires re-magnetising, as it has now been in use five years, but the strange thing is that it never misses, and gives a good spark?—G.J.

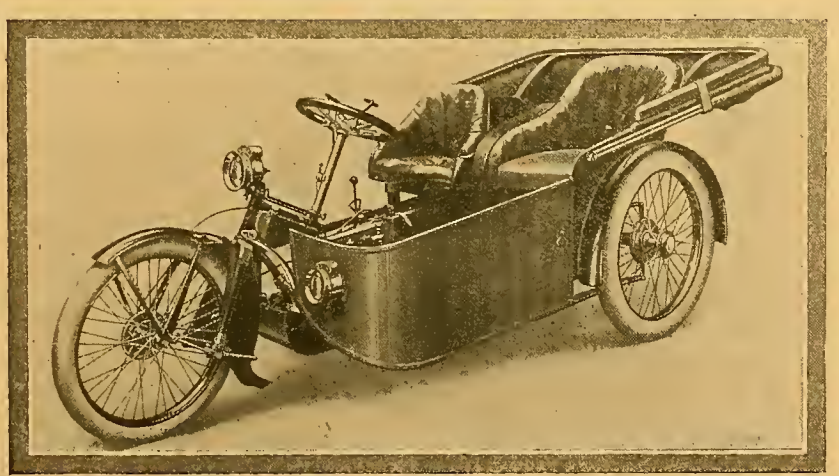
It is difficult to account for the trouble as you have replaced the fibre ring. This usually corrects any difficulty in the engine not being responsive to the movement of the spark lever. Examine carefully the bell crank lever, and if worn at all, replace this part also, and adjust the points so that they break .5 of a millimetre. If this does not effect the desired improvement, turn your attention to other parts of the engine. Perhaps the carburetter does not get sufficient air at high speeds, or the valves are not lifting their full extent. Also the springs have most likely lost their original tension.

Free Engine Clutches.

What is your candid opinion of free engines? Are they worth a place on a touring machine, and is it really possible to move off from a standing start with a normal gear, without a lot of care in manipulation? I have heard many conflicting statements. Does it hurt the clutch to slip it on a long hill, and is it likely to wear out quickly as a result?—B.J.A.

Our opinion is this, that where a rider cannot afford to fit a proper two-speed gear, a free engine is of great assistance. It must not, however, be expected to fulfil the same purpose as a variable gear. Provided the gear be properly adjusted and lubricated, you would be able to start from standstill with a normal gear, say about 4½ to 1, if you operate the clutch very carefully. It is not advisable to slip the clutch unnecessarily, as the plates would soon begin to wear. In addition, the constant friction would burn up the lubricating oil, and as soon as the plates got dry they would begin to seize, with disastrous results to the clutch parts and the hub bearings. A clutch on a single-geared bicycle has to perform very severe work, consequently it is advisable to treat it carefully.

A LUXURIOUS SIDECAR COMBINATION.



The bicycle is one of the new pattern four-cylinder T.A.C. three-speed worm driven machines, and, as will be observed, has a bucket seat and wheel steering. The sidecar is coach built and upholstered to match the bicycle, the whole presenting a very taking appearance. All wheels are suspended on laminated springs.

Silencer Dimensions. Single-geared Passenger Machine.

(1.) Will an exhaust box 6½in. by 3½in. be efficient enough to silence a 5 h.p. twin engine? (2.) Will a 5 h.p. twin with clutch take a sidecar anywhere in reason with a 4½ to 1 gear, and, if not, what gear? Weight of driver and passenger, 21 stones. Also can a clutch be slipped on hills without damage if the load is too much for the gear?—J. B. D.

(1.) The exhaust box should be big enough, but it depends entirely upon the design of its interior. (2.) The only method of taking a sidecar and passenger "practically anywhere" is by means of a change-speed gear. A 4½ to 1 gear would be too high for hills of 1 in 12 or 1 in 14. A clutch is not of very great assistance in hill-climbing. The clutch may be slipped a little on hills, and will enable the engine to run faster, and so develop more power, but even the best of motor cycle clutches cannot be slipped indefinitely.

Automatic Lubrication.

Is an automatic drip feed lubricator perfectly reliable in its working on a motor bicycle? Would it be safe to dispense altogether with the ordinary oil pump and fit the lubricator in its place? (This is the only way I could have one fitted to my machine.) Apart from the saving of trouble in looking after the oiling, would the alteration really be worth while, and for about how many miles might I expect it to prolong the life of my engine?—OILE.

You may rely exclusively on automatic lubricators during the summer months, provided you use oil of the same consistency throughout, so that you may have a reliable guide for the adjustment of the lubricator. We may, however, state that one of the failings of an automatic lubricator is that when the temperature is below freezing it is likely to cease working. If the rider stops and leaves the oil tank of his machine exposed to the cold the oil solidifies, and even after the engine has been started the oil has been known to remain sufficiently congealed to prevent it passing the needle controlled orifice. Consequently it would be advisable to retain the ordinary oil pump as an auxiliary if this can be arranged. It is impossible to estimate how much longer the engine will last with automatic oiling.

Magneto Switch. Even Firing.

(1.) Is it possible to connect up a switch to the magneto as fitted to my 2¾ h.p. twin Douglas, 1909 model, and if so, how should I do same? (2.) What is the object of the small screw on left hand side of timing lever situated mid-way, but rather farther back, between the two screws that hold on steel segment on that side? (3.) Although compression is good and all electrical apparatus seems all right, the front cylinder won't fire well under 10-15 m.p.h. if spark is at all retarded; that is to say, back cylinder fires beautifully in any position of spark lever, and will run as slow as you like, but the front fires only intermittently if retarded unless a lot more gas is given, consequently it is very difficult to ride slowly. I have tried practically everything, have changed over plugs and inlet valves, yet the same thing happens; when wire is disconnected it sparks properly if held near machine when running slowly. (4.) What do you recommend as best to use on a Harding triple band brake I have fitted? Cylinder oil does not allow of enough grip, and no oil is noisy and tends to wear out drum. —LB 2305.

(1.) It will be difficult to fit a cut-out switch to the magneto, as an insulated terminal, carrying a blade making contact with the screw securing the contact breaker, would have to be fitted between the steel segments of the advancing sleeve, and both the spaces available are unsuited for this, one space being occupied by the advance lever, and the other is covered by the rod holding the spring clip for the contact breaker cover. (2.) The object of the small screw mentioned is to take up any looseness that may manifest itself through wear of the timing lever carrying the steel segments. (3.) To obtain slow running, make sure that the platinum contacts are clean and very close, as also the sparking plug points, cut off partly or wholly the extra air, place the magneto lever at midway of its range and throttle down to the desired speed. If the valve springs are equal in tension and well screwed down there is no reason why the machine should not fire regularly at low speeds. (4.) It would be better to use dry plumbago.

READERS' REPLIES.

The Risk of Soldering Petrol Tanks.

I notice frequent references to the danger of soldering a tank which has contained petrol. It is true that even after filling with water and emptying enough vapour may be generated to cause an explosion. I suggest as an alternative that the tank be first well swilled out with paraffin. This would dissolve any remaining petrol, which would come away in solution. The tank could then be filled with water, and after again emptying there should not be the slightest risk.—F. ALCOCK.

Balance and Speed of Engine.

With regard to "G. A.'s" query in the last issue, I notice he says his machine is fitted with a trembler coil. May I suggest that he should try a plain coil and make and break, when I think his trouble will vanish. I once owned a motor cycle which had a very sluggish running engine until I changed the coil from trembler to plain and fitted a make and break contact.—BOBINE.

MOTOR CYCLING IN RUSSIA.

Despite very rough roads and an abundance of cobble stones, motor cycles are very popular round about St. Petersburg. The motor cyclists in the left hand photograph were snapped at Pulkowa. The 4½ h.p. Wanderer marked X won the Moscow to St. Petersburg road race in 1907. The best road near St. Petersburg, "Volkonskoe Schossia," is depicted in the right illustration. On this road, short distance car and motor cycle races are sometimes held.

Your wheels will grip

on the most greasy roads, and you need not fear a side-slip, if you fit

MICHELIN

Non-skid Motor Cycle Covers.

They are practically unpuncturable, and always remain efficient as non-skids until worn out.

Michelin Butt-ended Tubes

can be removed and replaced without detaching the wheel or dismantling it in any way.

SLIDE VALVE ENGINES.

THOSE readers who visited the last Stanley Show, or who studied the detailed and illustrated description of the exhibits in *The Motor Cycle*, were doubtless struck with the extraordinary likeness of one motor cycle to another. There is a remarkable similarity in ideas and design, and it is very pleasing to find our manufacturers so perfectly in agreement as to the lines on which a motor cycle should be built, with the result that the intending purchaser has nearly a dozen excellent well-made machines from which to make his selection, anyone of which will be quite as reliable and satisfactory as another.

With identical frames, tanks, magnetos, tyres, and so forth, it is very clear that the individuality of a motor cycle must lie mainly in its engine, and, although at the moment all the popular makes have practically similar engines, it is safe to assume that manufacturers who desire a leading position will in the immediate future pay particular attention to improvements to this the most important item of the whole machine.

In what direction, then, will improvement be looked for? Will it be in the direction of an improved poppet valve engine, a two-stroke engine, or a slide valve engine, and, if so, which of these offers the motor cyclist most in the way of comfort, reliability, flexibility, power, and economy?

Is Finality Reached?

The present poppet valve engine seems to offer little room for radical improvement, the general opinion being that it has reached a point when improvement becomes almost impossible, except in very minor details, and we must consequently rely more on improved methods of manufacture and better materials if this type of engine is to be retained.

At the present stage of its career it is perhaps inadvisable to say much about the two-stroke engine, but many readers will remember that all the early attempts to employ this type of engine for motor cycle purposes resulted in failure, and, although it is possible that big improvements have been and will be made, it is nevertheless very doubtful if the simple two-stroke engine will ever reach the efficiency, flexibility, and economy of the four-stroke engine. In my opinion the defects peculiar to the former will be difficult to overcome, except by adding parts that rob the engine of its simplicity and make it as complicated as, or even more complicated than, the four-stroke type.

The Ideal Motor Cycle Engine.

To my mind, and after a long and careful consideration of the subject, the ideal engine for a motor cycle will be a slide valve engine after the design of the Silent Knight Daimler, and I propose, therefore, to deal at greater length with this type, and to indicate how and why it is so peculiarly suitable to the motor cyclist's requirements.

In a high-speed engine, as fitted to motor cycles, it is absolutely essential that the mixture should enter and the products of combustion leave the cylinder in the quickest possible time, and the engines that can do this most effectively must clearly be the most efficient, assuming, of course, that they are equal in other respects. It follows, therefore, that the more direct and unobstructed the passages to and from the cylinder are made, the more efficient will be the engine at all speeds. As the slide valve engine practically has its inlet and exhaust pipes bolted directly on to the cylinder wall, and opening directly into the combustion chamber, it is obviously as perfect in this respect as an engine can be, and is undoubtedly a vast improvement over an engine with tortuous passages of the older type, quite apart from the absence of a valve head which forms a very excellent baffle plate.

Greater Flexibility.

The slide valve engine thus holds a big advantage in having perfectly straight and unobstructed inlet and exhaust passages, so that high speed, increased torque at low speeds, greater flexibility and power of picking up quickly, as well as economy, may be expected from this feature alone, not to mention the fact that getting rid of the exhaust gases quickly and *directly* from the cylinder is an important factor in obtaining a cool running engine.

The majority of motor cyclists would appreciate a really silent motor cycle, and there is no question about the good effect such a machine would have—a silent machine is at once suggestive of comfort and smooth running—by appealing to the thousands of pedal cyclists and others who are inclined towards motor cycling but to whom the noise is objectionable.

Silence.

Although a certain degree of silence is sometimes obtained by fitting an extra large and good silencer, there is seldom room for it on a motor bicycle, but by employing a slide valve engine we should get almost absolute silence without the necessity of using any special form of silencer. This is because the type of valve fitted to a slide valve engine operates in such a manner that only a comparatively gradual release of the exhaust gases occurs whilst the piston is moving about its lower dead point, the port opening increasing with the speed of the piston on its up stroke, so that full port opening coincides with the maximum speed of the piston. The result is that the release of the gases is more in the nature of a slow "swish" than a sudden "pop."

Now that car engines are usually so silent, the noise of motor cycle engines is brought into greater pro-

Slide Valve Engines,—

minence, and certainly deserves more attention than it seems to get, as it must appear very absurd to the non-riding public to see a noisy little motor bicycle following in the wake of a big silent car. A good deal of the silence of a big car is brought about by the fact that it is usually fitted with a four or six-cylinder engine and a huge silencer, and the noisiest motor bicycles only have one cylinder and a small silencer, but the non-riding public do not know this. There can be little doubt that motor cyclists would like to get rid of the poppet valves, not only because they produce noise, but because they give trouble in other ways. It is quite probable that slide valves on motor cycle engines would not only operate silently, but, owing to their limited movement and perfect lubrication, it is to be expected that they would never require attention in the same way as do poppet valves—in fact, their existence might easily be forgotten.

Moreover, it takes considerably less power to slide a sleeve than to lift a poppet valve against the pressure of partially exploded gases, and the action is, of course, far smoother.

As regards lubrication, a pump could be dispensed with and a drip feed arranged to feed oil directly to the sleeves (a certain proportion of oil would find its way into the crank chamber), the oil, in my opinion, being preferably fed to the lower end of the sleeves, and not to the top as in the Knight engine.

One point to bear in mind is that the usual type of exhaust valve lifter could not be employed with a slide valve engine, so that a valve or compression cock fitted in the combustion head and operated from the handle-bar would be necessary. However, a slide valve engine is almost as easily controlled as a steam engine, and should prove ideal for those who ride much in traffic.

Absence of Tortuous Passages.

The Knight engine has been proved a great success on Daimler, Minerva, and other cars, but there are many who doubt the practicability of employing this engine on motor cycles owing to the possibility of overheating, and difficulty with lubrication.

It must, however, be kept in mind that the outer cylinder is slightly longer than usual (about an inch), and there is a complete absence of tortuous passages or thick metal walls, apart from the fact that the exploded gases are literally shot directly from the cylinder, and consequently have no opportunity of dissipating their heat in valve chambers, etc., and all these features conduce to more effective cooling. As the head is removable, motor cyclists could easily alter the compression to suit touring, racing, and other conditions, by possessing, say, two spare combustion heads of different cubical capacity.

The Question of Balance.

There is, however, one feature of the Knight engine that makes me doubtful whether it can be suitably employed as a *single-cylinder engine*, and that is the apparent lack of balance in the moving parts.

A study of the engine, or of one of the many published diagrams, will show that at one period of the cycle of operations the two sliding sleeves are moving in opposite directions and in another part are moving together, whilst in other parts of the cycle one or both sleeves are travelling first with the piston and then away from it.

As the sleeves and piston are being literally shot up and down some hundreds of times per minute, it appears to me that some modification of the sleeve movement would be necessary to obtain really smooth running. Of course, in a four-cylinder engine the sleeves are perfectly balanced. With the sleeves perfectly balanced the single-cylinder slide-valve engine would be ideal for motor cycles, and, instead of the feared troubles from over-heating and lubrication, to my mind the engine, compared with the ordinary type, would run cooler and lubrication be simplified. It is fairly safe to assume that any reliable makers of motor cycles who emulated the Daimler Motor Co. and fitted an engine of the slide-valve type would speedily obtain a pre-eminent position, as practically all motor cyclists, in my opinion, would welcome a slide-valve engine, with its many and undoubted advantages over the other types.

SLIDE VALVE.

JARROTT CUP COMPETITION.

MOTOR Cycling Club members are reminded that entries for the above event close on Wednesday next, 16th inst. It is satisfactory to note that the minimum number of entries (six) required for the awarding of the special prize for the most meritorious performance on a lightweight machine (engine limit 340 c.c.), offered by Mr. Percy H. Trotman, were received by Monday last, and it is possible that three more will be sent in.

Harry G. Bell, who has made such a bold bid for the Jarrott Cup in the past two events, may be seen on one of the new 2¼ h.p. two-speed shaft-driven F.N.'s.

No fewer than five Douglas machines are entered.

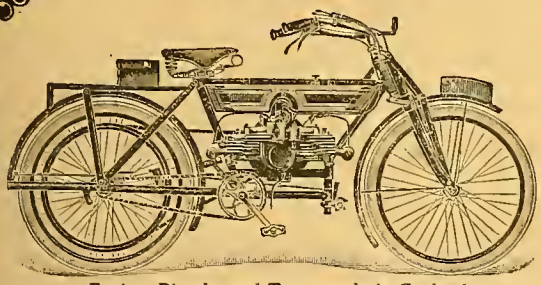
Among those who have entered are: Capt. Sir R. K. Arbuthnot, Bart., R.N., E. Gwynne, S. G. Frost (winner of the cup in 1908), L. A. Baddeley, Vivian Ollson, G. Brough, W. W. Douglas, and Stanley Webb.

Many members who are unable to spare the time to compete intend attending the combined opening run and Easter tour to Salisbury.

A30

RECOGNISING THE MAKE.

MOTOR cyclists are afflicted with a failing that used to characterise pedal-pushers in bygone years, viz., an irresistible desire to find out the make of machine used by other riders. At one time frame design revealed identity, but as the diamond-shaped frame became stereotyped the transfer or some other means of identification had to be sought. A similar curiosity prevails in motor cycle circles now. Nearly every rider tries to find out the names of machines he sees on the road, and the watcher's eyes search all over the machine for some distinctive mark. One of the easiest to recognise, even when in motion, is the N.S.U., which is identified quickly, if not by shape and other details, by the illustration of a stag's antler combining between the prongs the letters N.S.U. on the petrol and oil tank. No matter in what part of the country one may be, riders of the N.S.U. are sure to be met. The different models which will be seen on the road vary from the 1½ h.p. lightweight to the giant 8 h.p. twin.



Engine, Bicycle, and Tyres made in England.

1910 DOUGLAS

Price 38 Guineas.

FOR DOCTORS, CLERGYMEN, AND TRAVELLERS, THERE IS ONLY ONE MOTOR BICYCLE—THE

TWIN-CYLINDER Lightweight DOUGLAS,

January 29th,

in the 1910 A.C.U. Quarterly Trials.

Mr. P. Phillips,
Mr. G. L. Fletcher,
Mr. H. A. Cooper.

All succeeded in making Non-stop Runs.

Out of an entry of 67, only 15 riders made Non-stop Runs. The Douglas Motor Cycles were the only lightweights to do this. This proves the exceptionally arduous nature of the Trials.

DOUGLAS BROS., Kingswood, BRISTOL.

Or London Office: 336, Goswell Road, E.C.

A WORD ABOUT TYRES.

"The alternate Steel and Rubber studded Tyres."

Every cyclist knows that rubber studs on a tyre will check a skid when the roads on which they run are dry ; but when the surface becomes wet and heavy the rubber is of no avail, and metal studs are necessary to get the required "grip" for safety.

The Liversidge Motor Cycle Tyre is constructed with rows of alternate steel and rubber studs—studs that will not tear out, studs that will not skid on any surface. Unequalled for quality and long life.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), on Tuesday morning previous to the date of issue.

When possible advertisements received at Coventry on the Wednesday will be inserted.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or it "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days, and if no sale is effected, each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

£8.—Minerva, 2h.p., Chater-Lea, low, engine as ne Palmer cords, splendid hill-climber.—11, Argyle R Ealing.

THE MOTOR CYCLE SUPPLEMENT

INTER-TEAM TRIAL AT EASTER.

THE rules for the inter-team reliability trial, London-Harrogate and back, at Easter, between the Herts County A.C. and the North-west London M.C.C., are now complete. The start is from the Gatehouse, Highgate, at 7 a.m. sharp on Friday, the 25th inst. Competitors must report themselves in readiness by 6.30 a.m., and will be started at intervals of one minute. The route will be *viâ* Hatfield, Welwyn, Baldock, Biggleswade (check), Grantham (check), Newark, Doncaster (check), Wetherby, and Harrogate (check), returning by the same route. The maximum number of marks obtainable will be 200—100 for each half of the journey. A mark will be deducted for every minute under or over the schedule time.

The awards are: *(a)* Team prize, the Service Cup; *(b)* return journey, 80% of total marks, replica silver cups; *(c)* return journey, 70% of total marks, silver medals; *(d)* return journey, 50% of total marks, bronze medals.

On Saturday, the 26th inst., there will be an inter-club hill-climb with the Harrogate and District M.C.C., North *v.* South, at Sutton Bank, at 2 p.m., for which six classes have been arranged:

(1.) Lightweights weighing not more than 120 lbs. in touring equipment. Pedalling allowed in this class only.

(2.) Single-cylinder touring machines with fixed gears.

(3.) Multi-cylinders; same as Class 2.

(4.) Variable geared machines with single or multi-cylinder engines.

(5.) Passenger motor cycles.

The results in the above classes will be decided on A.C.U. formula.

(6.) For machines of any power; fastest time to win.

There will be a social evening at the Clarendon Hotel, Harrogate, on the 26th inst., and a run to Ripon next day.

B.M.C.R.C. MEETING AT BROOKLANDS.

THE first members' meeting of the B.M.C.R.C. will take place at Brooklands on Wednesday next, 16th inst. The first event in the afternoon will be the All-comers' Handicap, which will start at 2.30 p.m. It is open to all classes of motor cycles the cubical capacity of the engines of which does not exceed 1,000 c.c. Distance 5½ miles. First prize, the club's gold medal; second prize, the club's silver medal; third prize, the club's bronze medal. Starters are allowed. If engines are fitted with auxiliary exhaust ports, whether covered or not, this fact must be stated on the entry forms.

The following entries had been received up to 6 p.m. on Friday last:

2.30 p.m. All Comers' Handicap.

C. E. Bennett (Indian, twin)	D. R. Clarke (Indian, twin)
W. O. Bentley (Indian, twin)	G. Lee Evans (Indian, single)
H. H. Bowen (Bat-J.A.P., single)	A. G. Fenn (Triumph)
H. V. Colver (Matchless, twin)	G. L. Fletcher (Douglas)
H. Lister Cooper (Triumph)	E. Gwynne (Triumph)
W. Chitty (Uxbridge, single)	F. A. McNab (Trump)
	A. C. Maitland (Trump)
	H. Martin (Martin)

The One Hour T.T. Race, which should be a particularly interesting event, is open to machines complying with the 1910 T.T. conditions, except that purely touring accessories, such as mudguards or horns, may be removed. First prize, silver cup presented by Mr. W. H. Wells; second prize, club's gold medal; third prize, club's silver medal. Starters allowed. The entry fee for the first event will be 2s. 6d., and for the second 5s., entry fees for the two events 6s. 6d.

3.15 p.m. One Hour Tourist Trophy Race.

C. E. Bennett (Indian, twin)	D. R. Clarke (Indian, twin)
W. O. Bentley (Indian, twin)	G. Lee Evans (Indian, twin)
H. H. Bowen (Bat-J.A.P., single)	A. G. Fenn (Triumph)
C. R. Collier (Matchless, twin)	E. Gwynne (Triumph)
H. Lister Cooper (Triumph)	W. Lamm (V.S.)
	F. A. McNab (Trump)
	A. C. Maitland (Trump)

All machines must be fitted with round disc number-plates as approved by the committee, which are obtainable, price 3s. 6d. per pair, from the honorary secretary, Mr. T. W. Loughborough, A.M.I.A.E., Ashleigh House, Erith, Kent. At 4.30 p.m. the prizes and a large number of 1909 certificates will be distributed by H.S.H. Prince Francis of Teck, K.C.V.O., D.S.O. Tea will be served in the club house from 4.30 to 6 p.m.

AUTO CYCLE UNION (NORTHERN CENTRE).

The annual general meeting of the committee of the above centre was held at the County Hotel, Newcastle, on Wednesday last. Amongst other things the hon. secretary, Mr. E. L. Bates, reported that there had been four meetings of the Centre Committee during 1909, but that only one competition, namely, the hill-climb at Ragpath Side, had been organised which had been a very great success. The revenue of the centre showed a balance over the expenditure, and as the centre was now in good working order a more active programme could be arranged for 1910. There was a great deal of business before the meeting, and amongst other things the inter-club efficiency trial had to stand over for a future meeting. The results of the hill-climb at Ragpath Side previously reported were confirmed, and gold and silver medals were awarded to Mr. T. Smith and Mr. R. Ellis respectively in the single-cylinder class, and gold and silver medals to Mr. C. Reinhart and Mr. H. Mason respectively in the multi-cylinder class.

BROOKLANDS HILL-CLIMBING CERTIFICATES.

In the Correspondence pages a reader refers this week to the above hill-climbing certificates, which, by the way, were inaugurated owing to the representations of Mr. W. G. Bower, of Zenith Motors, Ltd. The suggestion our correspondent makes, that the gear ratio or ratios of each machine at the time of climbing the hill should be noted on the certificate, is an excellent one which may be adopted.

PRACTISING ON THE TRACK.

During the last few days a number of well-known motor cyclists have been practising on Brooklands Track in view of forthcoming events. Two strangers to the track seen on Thursday were J. Marshall and W. F. Newsome, riding Tourist Trophy Triumphs. Their special duty was testing fittings in general and exhaust valves in particular, but not in readiness for Brooklands races unfortunately. On Thursday H. Martin was due to attempt records on a twin A.S.L., but for various reasons he postponed his attempt.

A Motor Cyclist on a Balloon Expedition.

Mr. W. H. M. Pattisson, of Helmingham, Suffolk, is one of the promoters in the *Daily Graphic* long-distance balloon expedition, which will start on Thursday next if there is a west wind to carry the balloon across Europe. The object of the aeronauts is to beat the world's long distance record now held by Count de la Vaulx, and standing at 1,190 miles. In the photograph Mr. Pattisson is wearing a Jaeger coat and the cap which he is taking on the expedition, and he mentions that it is a most excellent coat for winter motor cycling. Inside it is lined with camel-hair, and covered with a waterproof material, making it very warm, but light withal. Mr. Pattisson has been a keen motor cyclist for the last four years, and favours a Triumph. He enjoys the distinction of never yet having been stopped on the road from any mechanical trouble.

W. H. M. Pattisson, one of the promoters in the *Daily Graphic* Long-distance Balloon Expedition.

Police Trap.

A ten mile speed limit is now in force in Great Missenden, and motor cyclists should be careful to observe this when passing through the village.

Illegal Speed Limit Signs.

The attention of all motorists who pass through Ashton-under-Lyne is drawn to the speed limit signs which have been erected at certain prominent positions on the main roads entering the town. These signs have been erected by the Town Council, without the sanction of the Local Government Board. Although stating that there is a ten mile limit, motorists are under no legal obligation to observe them, as no prosecution can legally take place under this limit notice.

North-eastern Automobile Association.

At a general meeting of the Motor Cyclist Section of the North Eastern Automobile Association at the County Hotel, Newcastle-on-Tyne, Mr. Isaac Baty was appointed chairman, and Mr. E. L. Bates vice-chairman for the ensuing year. Both are members of the Newcastle and District M.C.C., and the appointments are an honour to the club, as it is the first meeting at which the club could take any part since its affiliation to the N.E.A.A.

Imports of Motor Cycles.

There was a substantial increase in the value of foreign motor cycles and parts imported last month. The February figures for the last three years were :

1908.	1909.	1910.
Value of motor cycles imported—		
£3,783	£2,593	£2,161
Parts thereof—		
£1,060	£1,988	£4,187
£4,843	£4,581	£6,348

The figures during the two months ended February were :

Value of motor cycles imported—		
£9,907	£3,222	£5,837
Parts thereof—		
£1,671	£4,172	£8,075
£11,578	£7,394	£13,912

Exports of British-made Motor Cycles.

British exports likewise show a considerable increase, the Board of Trade returns for February, and the total for the two months, showing record figures. February exports were represented as follows :

1908.	1909.	1910.
Motor cycles—		
£1,518	£4,058	£6,556
Parts thereof—		
£2,587	£2,405	£2,904
£4,105	£6,463	£9,460

The total exports during the two months ended February were :

£3,720	£6,519	£15,258
£5,188	£4,448	£5,187
£8,908	£10,967	£20,445

The Re-exports.

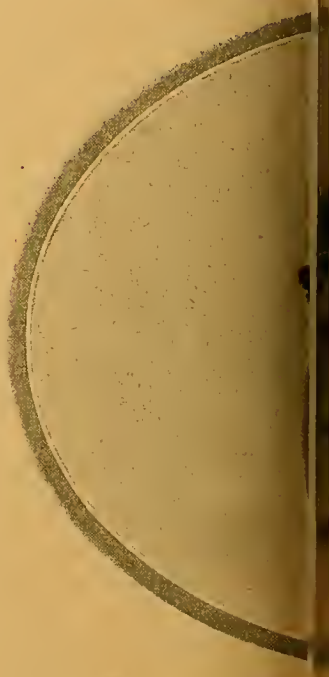
The re-exports of foreign-built machines from this country during February were represented by £150, the two months total being £674.

Monday or Thursday?

Last week we issued a query f that we could take a referendum readers to decide whether the d publication of *The Motor Cycle* remain Monday or be altered to day. The last day for posting is to-day, Monday, the 14th. W not yet made a careful count, h preponderance of replies is enor in favour of Thursday.

Manchester Motor Cyclists in the T.T

The Manchester Motor Club to have seven representatives Tourist Trophy Race next May following riders have already e Harry Reed, Percy Butler, A. J. house, F. Sirette, W. Heaton, Stevens. Another member, C. E. will probably ride a Premier.



G. Lee Evans covering a lap at Broo of about 68 miles per hour (timed by V mounts in forthcoming Brooklands e

The Surface of Sutton Ban

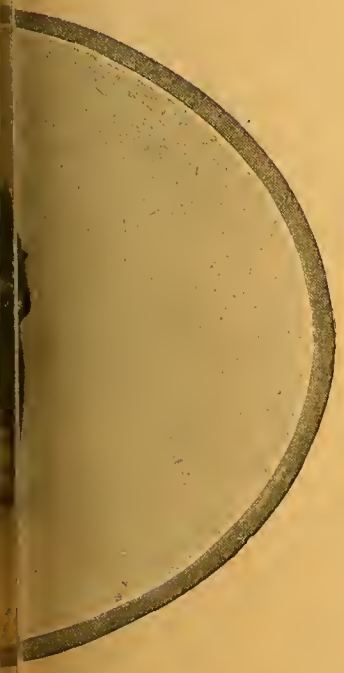
Early last week a number of t of the Harrogate and District visited Sutton Bank in order to the surface with a view to det whether a hill-climb could be he on Easter Saturday. The r report that the surface is little, worse than last year, but perha is more loose metal than usual. the Harrogate club is endeavo have removed. In view of th facts, the inter-club hill-climb the Herts County A.C., No London M.C.C., and Harrogate trict M.C.C. will take place at Bank on the 26th inst., comme 2 p.m., the necessary permissio been granted by Major Bower, Chief Constable of the North Fine weather is only needed to good afternoon's sport.

Accessories and Equipment.

I addition to our usual special fea- r twenty-six pages of this issue, in- ing 170 separate illustrations, are ved to descriptions of novel time- y accessories and the modern ument of a motor cycle.

London Centre of the A.C.U.

t Monday evening a meeting of ondon Centre of the A.C.U. was at 112, Piccadilly, W. The pro- gs began with the election of s. Mr. V. Hart was re-elected an, Mr. H. B. Renner hon. sec- . and Mr. A. G. Reynolds hon. rer. The representatives of the present then nominated their tes for the council meeting on the hinst. After this was done the lub championship rules were con-



h.p. twin-cylinder Indians at the rate at more will be heard of these speedy

at some length, and the clubs sked to convene a special com- meeting to consider the advis- of sending teams to compete. ondon Centre is composed of clubs, and if the London Eliminating Trial is held on the d date, namely, Saturday, June e best three of the teams out thirteen will take part in the The clubs have been asked to a course in the London district, replies from them will be sub- to a special sub-committee, and lts in return be submitted to tre Committee, which will be o meet on Monday, April 4th. llowing auditors have been for the London Centre: Mr. J. bage (Western District M.C.), Glyn-Rowden (North-west Lon- M.C.).

Buying Petrol in Small Quantities.

With reference to the question of small petrol supplies recently ventilated in these columns, a trifling improvement that would appeal equally to the garage proprietor who does not want to break a tin of petrol and the motorist who does not require the whole contents, is suggested by Mr. M. Hampton, of Douglas, Isle of Man, well known to T.T. riders. He says: "The objection to breaking a tin is frequently made because the seller has not measures for a small quantity, but if all tank gauges were marked either on the glass itself or the screw rod inside it, with a scale of contents (like medicine phials, for instance), there would be no necessity for sloppy and wasteful measurement. The petrol could be poured into the tank direct, and both the seller and the buyer would be satisfied, and objection to sell less than a sealed two-gallon can would speedily cease. As a seller, I heartily hope that this improvement may soon be a standard feature on every motor cycle tank."

Monster Meet of Motor Cyclists.

It is known already that the undermentioned clubs will participate in the general meeting of Northern motor cyclists at Richmond (Yorks) on Good Friday:

Middlesbrough and District M.C.C.
Newcastle and District M.C.C.
Bradford M.C.C.
Leeds M.C.C.
York County M.C.C.
Lancashire M.C.C.
Hull (Kingston) M.C.C.
Harrogate and District M.C.C.
Bishop Auckland, Darlington and District M.C.C.
Hartlepool and District M.C.C.
Hull and East Riding A.C.C.
Huddersfield and District M.C.C.
Redcar and District M.C.C.
Scarborough and District M.C.
Batley and District M.C.C.
Sunderland and District M.C.C.

Mr. Geoffrey W. Liddle, the organising secretary, advises us that he is also inviting the Ripon and Doncaster clubs. This meeting increases in popularity every year, and it is anticipated that at least 350 motor cyclists will foregather at the Old Market Square at Richmond between 10.30 and 12 noon on the 25th inst. The meeting will take the same form as in 1909, the programme being as follows:

10.30 to 12 a.m.—Assembly in Market Square.
12 to 1.45 p.m.—Lunch independently, as desired.
1.45 p.m. prompt.—Assemble at Market Cross for purpose of photograph for *The Motor Cycle*.
2 p.m.—Conference in the Town Hall, at which Mr. F. Straight (A.C.U. secretary) will probably be present.

Agenda:

Election of chairman and president.
Election of hon. sec. for 1911 meet.
Election of committee.
To determine dates of inter-club meets and competitions (if any).

We regret to announce that Mr. Liddle cannot see his way to undertake the duties of secretary another year owing to pressure of his own business.

London-Edinburgh Run.

An innovation as regards the Newcastle control is announced. The Newcastle and District Motor Cycle Club has kindly placed its club house at the disposal of competitors. The control at Newcastle will therefore be arranged at the Club House, and meals will also be partaken of there.

Amulree in the End-to-end.

We have a number of illustrations in preparation of Amulree Hill (Kenmore side) which the A.C.U. End-to-end Trials competitors will climb (?) next July. The several turnings will form the chief stumbling block to motor cyclists, although the surface is exceedingly rough in places. Snow has not yet disappeared from the summit, as will be seen by the accompanying reproduction of a photograph taken last week.

Snow has not yet disappeared from the top of Amulree (Kenmore side) which is the official climb in the End-to-end Trials.

CLUB NEWS.

(SEE ALSO PAGE 202.) (SEE ALSO PAGE 202.)

Redditch and District M.C.C.

A general meeting will be held at the Unicorn Hotel on Thursday next, the 17th inst., at 8 p.m., to adopt rules and to enrol members.

Coventry and Warwickshire M.C.

At the annual general meeting on Friday next, the 18th inst., at the Queen's Hotel, at 7.30 p.m., Mr. I. B. Hart-Davies will deliver a lecture on "The End-to-end Record." This will be illustrated with lantern views of incidents of the journey and scenes *en route*.

The opening run will take place the day following, when members are invited to meet for the start at 2.30 p.m. at Guiting House, Allesley, the residence of the president elect, Mr. J. V. Pugh, J.P. The run will take the form of a speed judging competition, for which a separate prize will be offered for car owners and motor cyclists. Tea at the Dun Cow, Dunchurch.

Derby and District M.C.C.

A fairly good response was made to the announcement of the inaugural meeting of the above. A committee and officers were elected, and a plan devised whereby it is hoped the club may soon enlist the whole of the motor cyclists in Derby and district. The next meeting will be held at the Carlton, Osmaston Road, Derby, on Friday next, the 18th inst.

The hon. secretary is Mr. R. Greatorex, 1, Sidney Street, Derby.

Nottingham and District M.C.C.

The opening run was held on Saturday last, Kelham being the destination.

This evening (Monday), at 7.45, Mr. Vernon Brook, hon. secretary of the Birmingham M.C.C., will give a lantern lecture on "Variable Gears" at the Welbeck Hotel.

Alfreton and District M.C.C.

An enjoyable evening was spent at a smoker on Tuesday last, when Mr. A. Aubrey Spring, the hon. secretary of the Notts club, gave a lantern exhibition of views, etc., taken during motor cycle tours, trials, etc. Songs were interspersed during the evening.

Cambridge University M.C.C.

A petrol consumption trial was held on Saturday, March 5th. At the start all tanks were emptied, and each competitor received a certain amount of petrol, depending upon the size of the engine. Each competitor had then to go as far as possible along the course, which was Cambridge to Godmanchester and Royston. There was a strong head wind for the greater part of the way.

Position.	Name.	Machine.	Distance. Miles.	Miles per gallon.
1.	F. P. Dickson	(7 V.S.)	27.7	103.1
2.	A. W. Brittan	(3½ T.T. Triumph)	27.1	144.2
3.	E. H. McCormick	(5 Indian)	26.1	115.2

6.	V. M. F. Oliver	(7 V.S.)	21.4	79.4
7.	C. K. Wigram	(5 Rex)	20.1	88.2
8.	E. H. Lees	(5 Indian)	18.4	81.1
9.	J. M. Oakey	(5 Vindec)	17.6	77.5
10.	J. Ashworth	(2¾ Minerva)	17.3	112.2
11.	E. N. Clifton	(4½ Minerva)	15.6	68.8

Bristol Bicycle and M.C.

To celebrate the commencement of another season, a whist drive and dance was held on the 5th inst., eighty members and friends being present.

The following fixtures have been arranged for 1910:

FUTURE EVENTS.

Mar. 16—(Wed.) British Motor Cycle Racing Club Meeting at Brooklands.
" 25—General Meeting of Northern Motor Cycle Clubs at Richmond, Yorks.
" 25-28—M.C.C. Opening Run. Easter Tour to Salisbury. Jarrott Cup Competition.
" 25-28—N.W. London M.C.C. and Herts. County A.C. Inter-club Trial to Harrogate and back.
" 28—Brooklands A.R.C. Easter Meeting (two events for motor cycles.)
" 30 to April 2—Exhibition of Motor Cycles, at Leicester Association Hall.
April 13—(Wed.) B.M.C.R.C. Meeting.
" 20—A.C.U. Second Quarterly Trial.
" 27-28—Brooklands A.R.C. Meeting.
" 30—M.C.C. Members' Hill-climb.
May 4—B.M.C.R.C. Meeting at Brooklands.
" 4—Herts. County A.C. (motor cycle section) Open Hill-climb.
" 13, 14, and 16 (Whitsun)—M.C.C. London-Edinburgh and London-Edinburgh and Back Runs.
" 26 (Thursday)—International Motor Cycle T.T. Race in the Isle of Man.
" 27—Open Hill-climb in the Isle of Man.

Three reliability trials of 100 miles each, over a twenty-five mile course, to be held in April, June, and August. The first two of these will also be eliminating trials to pick a team for the M.C.C. inter-team trial for *The Motor Cycle* Cup, for which the Bristol B. and M.C. has decided to enter. A twenty-four hours' reliability trial from Bristol to Land's End and back will also be held, starting Friday evening, August 5th, and finishing Saturday evening.

Mr. E. J. Prosser, 1, Brecknock Road, Knowle, Bristol, is hon. secretary of the Motor Section.

Southport M.C.C.

The above club is of recent formation. At present amateurs only are eligible for membership. Mr. G. Arthur Gregson has been elected captain, Mr. Hugh Gibson sub-captain, and Mr. Hedley Breeze hon. treasurer. The subscription is 10s. 6d. The hon. secretary is Mr. R. Holford Jones, 9, Westbourne Road, Birkdale.

Essex M.C.

The A.G.M. was held at the Great Eastern Hotel last Tuesday, the chair being taken by Mr. O. L. Summers. The Secretary read the minutes of the last meeting, and also the annual report, which was adopted.

Owing to the illness of the hon. treasurer (Mr. A. G. Reynolds), it was reported that the balance-sheet was not available to place before the meeting, and it was agreed that its adoption be adjourned *sine die* and a special meeting be convened for the purpose.

Western District M.C.

The opening run (a paperchase) was largely attended. The lots for the hares fell to Messrs. Vowler and Steeves, who after having decided on their route were given some eight minutes start. They laid the trail *viâ* Osterley, Hounslow, Feltham, Colnbrook, and were duly run to earth at Langley Station by Messrs. F. Mullett and F. Ritchie, after a trail of some twenty-three miles. They were compelled to stop owing to the paper giving out.

Newcastle M.C.

At the first monthly meeting last Tuesday, it was decided to renew affiliation to the North-Eastern Automobile Association.

The opening meet, combined with a speed-judging competition, takes place at Belsay on Good Friday.

The president, Mr. Jos. R. Scott, has presented a silver challenge cup to the club.

South Manchester M.C.C.

The third smoking concert of the winter session took place at the club's headquarters, Denmark Hotel, Greenheys, and was a great success. A hot pot supper was served during the interval.

Sheffield and Hallamshire M.C.C.

The opening run is on Good Friday to Newark, followed two days later by a run to Bridlington. The first competition of 1910 is on April 16th, which will take the form of a speed-judging competition to Hathersage.

Southampton and District M.C.

The annual meeting was held on Wednesday, Mr. A. G. Butler in the chair. It was decided to hold the opening run on Good Friday, the members meeting at headquarters at 2 p.m., and afterwards running to Hursley *viâ* Romsey, and home by way of Winchester. It was decided to fix runs for Wednesdays, Saturdays, and Sundays, and to hold club competitions in the form of a hill-climb, motor paperchase, reliability trial, slow running, speed-judging contests, etc.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

Our Readers Vote for Thursday.

IN our issue of March 7th a query was propounded asking readers on which day they preferred to have their *Motor Cycle*. The circular set forth the advantages and disadvantages of both Monday and Thursday as days of publication, and our readers were asked to decide the question for themselves by each filling up a voting form. The voting has resulted so unanimously in favour of Thursday that we have no hesitation in deciding to publish in future on that day, and the next issue will be dated March 31st. No previous subject on which we have taken the opinions of our readers has elicited so many replies or so much unanimity. When sending in their voting papers many readers have written us also informing us that they prefer well-considered and well-illustrated descriptions of all week-end events to appear later in the week and at a time when they have leisure to read them. The question of the week-end seems to have weighed very considerably, as many when voting for Thursday suggest that Saturday might be better still as nearer their time of leisure. The letters also show that our readers emphatically believe in everyone having one day's rest in a week, which in these times is usually sufficiently strenuous without turning Sunday into an ordinary working day.

Club secretaries have voted strongly for Thursday, and have confirmed our statement that it is often a matter of great difficulty and inconvenience for them to arrive at results of Saturday afternoon events in time for Monday publication, and they prefer such results and doings of their organisations to be in the hands of their members on the Thursday following the event in preference to the Monday week, which is inevitable when such particulars do not reach the publishing offices the day after the competition.

The counting of the votes has revealed the following startling figures—a result which we must admit we hardly expected. Had we known that motor cyclists were so undivided in their opinion the publishing day of this journal would never have been Monday.

The figures are:

For Thursday	... ...	94.5 per cent.
,, Monday	... ...	4.52 ,, ,,
Suggesting other days	...	.98 ,, ,,

When the large and world-wide circulation of this journal is taken into account it will be realised that it is bought and read for other purposes than ascertaining results of competitions. Thousands of our readers are much more interested in accounts of tours, technical articles and descriptions of new machines and accessories, correspondence, replies to queries, and general information. This is a point which is rather apt to be forgotten despite its importance.

That motor cyclists generally are not keen on Monday publication is now an assured fact, and the referendum has made our course clear. We shall publish on Thursday, which will enable us to include more interesting and critical descriptions of all competitions. We shall have more time to prepare an increased number of better illustrations of current events. The usual weekly features of the paper will be more complete, and our readers will have the satisfaction of knowing when they read *The Motor Cycle* that they are assisting us to abolish Sunday labour and to provide a better paper

Suggested Curtailment of A.C.U. Trials.

OUR readers, and particularly those who support the Auto Cycle Union competitions, will be interested to know that at a recent meeting of the Cycle and Motor Cycle Manufacturers' and Traders' Union a resolution was carried that in the opinion of the meeting it was advisable that motor cycle trials should be curtailed in number, and a voting paper has been sent out to all members of the Union, and also to those motor cycle manufacturers who have not yet joined it, asking if they will be willing to sign a bond not to compete in (1) the Auto Cycle Union Quarterly Trials and (2) the Auto Cycle Union Six Days' Trials. The decision of the Traders' Union to obtain the opinion of the whole of the trade on the subject of trials has come as no surprise to us. We have already commented on the subject, and hinted that the number of trials was in excess of the actual requirements, and that it might be advantageous to curtail them, but we certainly never thought that such an important event as the Six Days' Trials would be singled out, and we hope that before coming to any hasty decision the trade will give the subject of trials their earnest consideration, as the abolition of all, or nearly all, trials would mean stagnation.

Pros and Cons of Open Trials.

WHILE we are on the subject it might be advisable to set forth the advantages and disadvantages of open trials such as the two events mentioned. To discuss the advantages: First, trials improve the breed of the machine by weeding out the incapable ones. Second, they enable makers to prove to the public the capabilities of the various motor cycles on the market. Third, they advertise the pastime and increase the amount of interest taken in motor cycles, drawing new recruits to the ranks. Fourth, small makers are enabled to gain a footing in the industry, which may otherwise take many years of patient advertising and missionary work to obtain and at a cost very much in excess of the expense entailed in competing. Fifth, open trials provide a means of testing new forms of mechanism and accessories against old tried ideas, which latter might otherwise never be altered unless opportunity existed to prove that later devices were superior. Sixth, a sporting rivalry is created among manufacturers, which ultimately benefits riders by providing them with improved machines. Seventh, open road competitions are a more reliable test of the capabilities of roadster machines as compared with more or less artificial track performances, which, although sporting and helpful, are not equivalent to competitions held under ordinary touring conditions.

A petrol stop at Baldock in the Herts County A.C. trial on the 12th inst. The competitors are—W. Pratt (P. & M. and sidecar and C. C. Cooke (3½ h.p. Triumph). (See page 247.)

Having enumerated the various advantages to motor cyclists and the industry, we will now refer to the disadvantages. First, open competitions of this nature are costly to the manufacturers, and therefore indirectly add to the price which the rider has to pay for his machine. Second, they occupy the time of the A.C.U. officials, who would otherwise be able to devote more of their energies to the organisation of motor cyclists and the amelioration of their lot. Third, they are an incentive to makers to enter trained professional riders in competition with their own customers on the same machines. They are practically compelled to do this to prevent their customers being beaten by other makers' mechanics. As we have repeatedly pointed out, this often disgusts owners, who seldom win unless they have the same intimate knowledge of their mounts as the trade rider and are prepared to devote unlimited cash and time to the pastime.

Personally, we should not like to see the Quarterly or the Six Days' Trials abandoned, but if a choice must be made, we should prefer the Quarterly Trials to be sacrificed in preference to what we think is by far the more important trial. One day's ride of 120 miles, even though it has to be a non-stop, is not the same proof of reliability as an extended competition amounting to an average of nearly 170 miles a day.

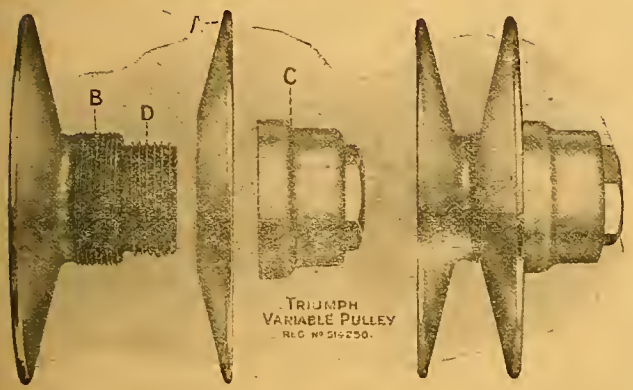
Two Suggestions.

THERE will be some consternation in the minds of the A.C.U. officials when they hear that the trade are considering the question of curtailing their competitions, but it would be advisable for them to see if they could not, by adopting a different policy, depend more upon amateur riders for their open events. The A.C.U. may say it is impossible because the entry fees are never sufficient to pay the cost of a big trial. We should like to suggest that, if the trade decide not to support the Six Days' Trials, the A.C.U. should revise its definition of a private owner somewhat to allow the makers to pay riders' entrance fees, provided the latter pay their own expenses and buy their machine. Another suggestion is for the whole of the makers and the trade to subscribe between them sufficient to enable the A.C.U. to throw open the Six Days' Trials at a purely nominal entrance fee to all who care to compete. Either of these suggestions would relieve the trade of the expense of sending a big staff of their own men right through the trials, and would ultimately result in a more perfect test of reliability. Under the above conditions every machine would be ridden by private owners possessed of no more than the usual mechanical skill, and merit would be sure to show itself to a greater extent, perhaps, than it does to-day.

Triumph

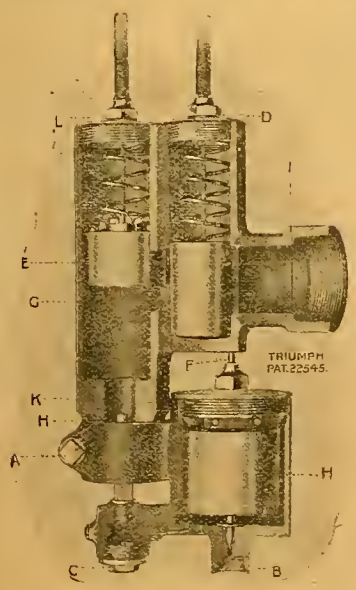
Motoring is made a great deal more pleasurable providing your motor possesses those fitments and refinements which will make it more convenient and comfortable to ride.

No other motor is so fully and exclusively equipped as the Triumph, and we illustrate just two of its special features—there are many others, all illustrated in the Triumph Catalogue.



The Triumph Variable Pulley.

The Triumph Variable Pulley is a great boon to riders touring or living in hilly districts. It gives a range of gears from 4½ to 1 to 6½ to 1, and changes can be effected in a few minutes.



The Triumph Carburetter.

Another Triumph exclusive feature is the patent Carburetter. It will be seen from the sectional illustration that two small pistons govern the air and gas supply. These are controlled from the handle-bar, and the adjustment being extremely sensitive a most perfect mixture is obtained at all speeds. It can be easily dismantled for cleaning purposes.

SUGGESTED IMPROVEMENTS IN DESIGN.

By A.M.I.C.E.

HAS finality been reached in the design of motor cycles? I for one say emphatically, "No." In the hope that my views may be of interest, may I suggest the following principles as sound?

FRAME.—Give up the horizontal top tube; it alone stands in the way of the following: Seat low and forward, long head and big tank. The accompanying illustrations are of an experimental machine I have had built. The tank holds two and a quarter gallons of petrol and half a gallon of oil, as well as a cupboard. I have had 2in. stoppers for years; they are one too big. The appearance of the complete machine may not be exactly elegant.

BACK WHEEL.—This should be sprung. The T.A.C. method is the soundest that has yet appeared. A rise and fall of 4in. should be allowed for both wheels. There are plenty of roads in England which can hardly be ridden on at much over 6 m.p.h. on a push-cycle, e.g., those where every yard or so a sett has sunk an inch or two.

TYRES AND WHEELS.—These would be better bigger. A 3in. tyre would be a great improvement; 26in. wheels are quite the minimum for our roads; 28in. or 30in. wheels would ride easier.

DRIVE.—Though I admire the worm, I do not admire the shaft with its universal joints always at work, with spring back wheel. I think the chain is more suitable, but it must have an oil bath and an elastic (not a slipping) connection. A chain of ample strength and properly cased should not be seen, heard, or felt during a whole year's riding. The usual slipping connection is, of course, only a makeshift, which prevents the chain from breaking. We want something more than just this. It is quite unsound, as "starting friction" in such a case is greater than "moving friction." The engine impulses should be absorbed and given out again—not lost in friction.

A Novel Form of Variable Gear.

One word for the V belt. In conjunction with a chain for gear reduction, it can provide a simple variable gear by means of two adjustable pulleys, one worked by a centrifugal governor and the other kept to the belt by a spring—a combination of a J.A.P. pulley reversed and a L.M.C. pulley. Such a gear changes automatically, according to the pull and speed of the engine, and gives a sweet and silent drive. The pulleys are both large, and the belt enclosed, of course; but even then I doubt if it would wear a whole season. For a chain drive, I think the least we want is a three-speed epicyclic gear on a counter-shaft.

ENGINE.—The four-stroke type, with pressure induction and a large combustion space, would give more power for weight than the usual type. Its strong point is flexibility. The two-stroke engine sounds attractive, but seldom if ever can be made to run slowly.

Small magnetos want improving, so as to give handle-starting on engine-shaft with all cold.

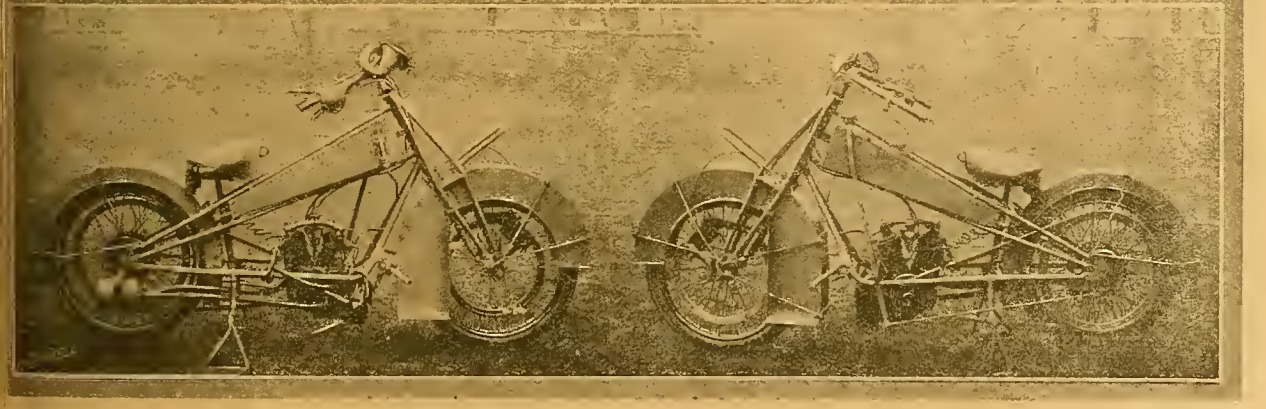
Carburetter Design.

CARBURETTER.—This, in my opinion, is one of the worst things about the modern motor cycle. I have leanings towards the wick surface type, but as regards the spray carburetter, automatic air adjustment is essential. It is now successful on cars, and the days are past when a witty writer described it as giving an incorrect mixture at all speeds. A simple improvement would be the automatic regulation of the spark advance relative to the engine speed. This must, of course, be connected to the throttle by a lever with a moveable fulcrum, so that one can get the whole range of speed with different positions of the throttle, according to the load. When tried without this last connection it has always been a failure.

Silence, especially when running free, needs immense improvement. The argument that a silent machine is dangerous because it cannot be heard is surely quite unsound. It is a good excuse for some manufacturers whose machines are notoriously noisy.

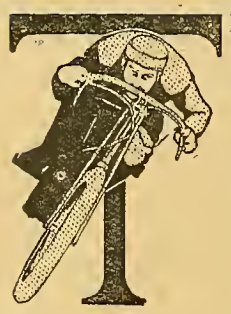
MUDGUARDING.—This wants revolutionising, and it is quite easy with a little thought. The mud has only two proper places—on the ground and *inside* the guards. It wants keeping on one or in the other.

WEIGHT.—The lower the better. Weight is a great disadvantage, but this can be minimised by a really efficient stand. On the other hand, nothing can atone for the absence of comfort or reliability. It is largely a matter of speed, and there is a good deal in the length as well as the weight of the rider. I happen to be leggy, and I simply cannot ride a machine unless it has a longish wheelbase, and this does not conduce to lightness.



A novel motor bicycle possessing many original features, built to the order of A.M.I.C.E. the writer of the article on this page.

BRITISH MOTOR CYCLE RACING CLUB MEETING.



THE first members' meeting of the B.M.C.R.C. took place on Wednesday last on Brooklands track in glorious spring weather. Hardly a cloud was in the sky, yet there was a wind which blew somewhat strongly down the railway straight, and made its presence felt unpleasantly by the competitors. Wednesday's meeting will always be remembered in the annals of the B.M.C.R.C., as it marks the first occasion on which Royalty has ever graced a motor cycle event held in the British Isles by its presence. Shortly after the hour T.T. race had started His Serene Highness Prince Francis of Teck, the patron of the Club, arrived in Mr. J. W. Orde's Daimler.

At 2.30 p.m. a large number of spectators had assembled to witness the first event, the majority of whom arrived by motor cycle. Never before had a motor cycle event on the track been so well attended.

The All Comers' Handicap Race was open to all classes of motor bicycle the cubical cylinder capacity of whose engines does not exceed 1,000 c.c. First prize, Club's gold medal; second prize, Club's silver medal; third prize, Club's bronze medal. Distance, 8.48 miles. "Fork" start, "Straight" finish. The competitors passed the fork twice, and then entered the straight. The following members took part in this event:

No.	Rider.	Machine.	Bore and stroke.	c.c.	Start. m. s.
1.	F. A. McNab	(1-cyl. Trump-J.A.P.)	85 × 85	482	1 51
3.	C. E. Bennett	(2-cyl. Indian)	70 × 83	638	0 36
4.	H. L. Cooper	(1-cyl. Triumph)	84 × 86	476	1 55
5.	G. Lee Evans	(1-cyl. Indian)	82.5 × 93	497	1 9
6.	D. R. Clarke	(2-cyl. Indian)	70 × 83	638	0 36
7.	A. C. Maitland	(1-cyl. Trump-J.A.P.)	85 × 85	482	1 51
8.	H. H. Bowen	(1-cyl. Bat)	85 × 85	482	1 9
9.	W. O. Bentley	(2-cyl. Indian)	70 × 83	638	0 36
10.	W. Chitty	(1-cyl. Uxbridge)	85 × 60	340	2 20
11.	H. V. Colver	(2-cyl. Matchless)	85 × 58	628	scr.
15.	H. Martin	(1-cyl. Martin-J.A.P.)	85 × 60	340	2 20
18.	A. Oberländer	(2-cyl. N.S.U.)	80 × 99	995	0 25
19.	C. Patteson	(2-cyl. Moto-Rêve)	50 × 85	334	4 0

Just before the race was started Major Lloyd gave the spectators permission to witness the start at the fork, on condition they immediately afterwards returned to the paddock to see the finish down the straight. This concession was much appreciated, but, unfortunately, as is always the case with motor cycle races which finish in the straight, it was almost impossible to follow the riders' progress.

Harry Martin (Martin-J.A.P.), the first to finish in the All Comers' Handicap Race.

Martin came in an easy first far ahead of the others, but almost immediately before he crossed the line his trembler blade came adrift, and he just managed to complete the course. The winner's time was 10m. 16s.

		Start. m. s.
1.	H. Martin (Martin-J.A.P.)	2 20
2.	W. O. Bentley (Indian)	0 36
3.	H. H. Bowen (Bat)	1 9

The remainder finished in the following order: H. V. Colver, F. A. McNab, C. Patteson, C. E. Bennett, H. L. Cooper, W. Chitty, A. Maitland, G. L. Evans, and D. Clarke.

Start of the Hour Tourist Trophy Race for motor cycles complying with the 1910 conditions. There were fifteen entrants.

British Motor Cycle Racing Club Meeting.—

The Hour T.T. Race.

The next event was the Hour Tourist Trophy Race, open to motor cycles complying with the 1910 T.T. conditions, except that touring accessories, such as mudguards, etc., could be removed. First prize, silver cup, presented by Mr. W. H. Wells; second prize, club's gold medal; third prize, club's silver medal. The start and finish were at the fork, so that the spectators were able to follow the race comfortably throughout.

Indian machines performed the hat trick in the Hour T.T. Race. C. E. Bennett (right) was first, W. O. Bentley second, and G. Lee Evans third.

The following competitors took part in this event:

	Rider.	Machine.	Bore and stroke.	c.c.
1.	F. A. McNab	(1-cyl. Trump-J.A.P.) ...	85 × 85	482
3.	C. E. Bennett	(2-cyl. Indian)	70 × 83	638
5.	G. Lee Evans	(2-cyl. Indian)	70 × 83	638
7.	A. C. Maitland	(1-cyl. Trump-J.A.P.) ...	85 × 85	482
8.	H. H. Bowen	(1-cyl. Bat)	85 × 85	482
9.	W. O. Bentley	(2-cyl. Indian)	70 × 83	638
0.	C. R. Collier	(2-cyl. Matchless)	85 × 58	628
1.	M. Geiger	(2-cyl. V.S.)	75 × 75	663
2.	A. G. Fenn	(1-cyl. Triumph)	85 × 88	499
8.	A. Oberländer	(1-cyl. N.S.U.)	85 × 88	499

Messrs. Straight, Ebblewhite, and Dutton acted as timekeepers and handicappers in both this and the previous events. At the start Bowen got away well, and so did the others except Oberländer, who stopped about 200 yards from the fork and then got under way again.

Immediately after his arrival Prince Francis of Teck took a lively interest in the race, and after chatting for a few minutes with Major Lloyd, he walked over to the timekeeper's table and there talked to Messrs. Wells and Bischoff for some time.

The Lap Positions.

At the end of the first lap the men passed in the following order: Bennett, Lee-Evans, Bentley, Bowen, Collier, McNab, Geiger, Fenn, Maitland, and Oberländer.

In the second lap Bentley was pressing Evans hard, Collier crept up to fourth place, and McNab, Fenn, Geiger, Maitland, and Oberländer followed.

Bentley assumed the second place in the third lap, with Bennett leading and Evans third—a position which the three Indians maintained till the end of the race. Bennett increased his lead lap by lap, and was soon far ahead, reeling off the circuits at about sixty-two miles an hour; the rest were nowhere. Geiger retired in the seventh lap through valve trouble, and in the ninth lap Oberländer gave up. Maitland retired during the eighth lap.

Gradually the leading men assumed and maintained the following order: Bennett, Bentley, Evans, Bowen, McNab, Collier, and Fenn, till Collier retired at the end of the seventeenth lap.

Class D. New Fifty Miles Record.

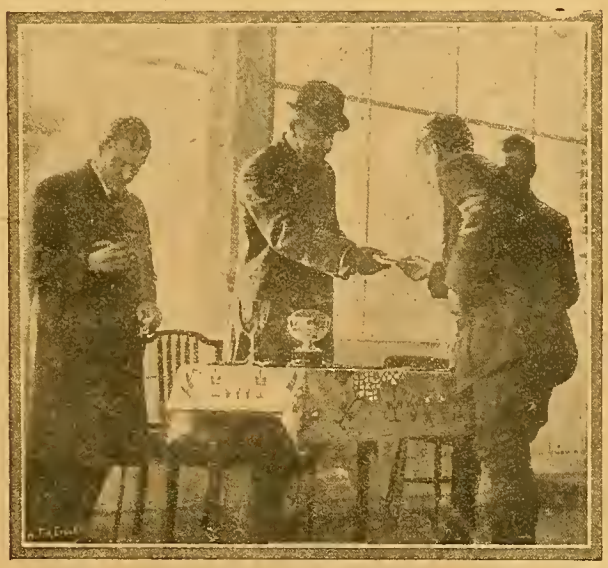
Fifty miles were covered by Bennett in 49m. 55⅖s., which constituted a record for Class D. Bentley's time was 51m. 14⅖s., and Evans's time 53m. 14⅗s.

The following are the results of the T.T. Race, and the distances covered in the hour:

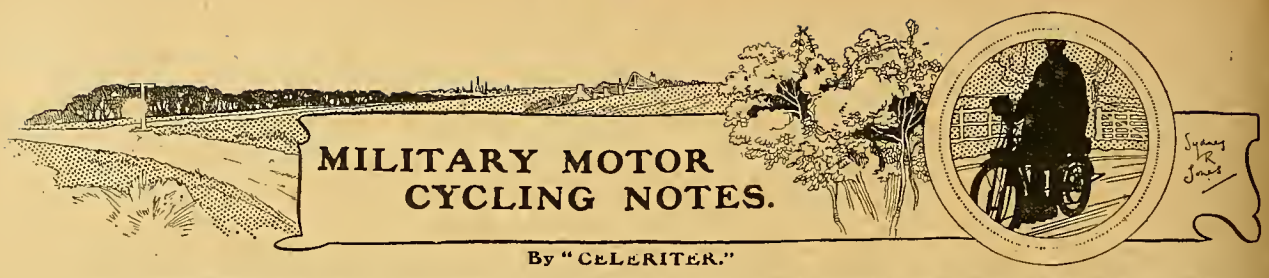
No.	Rider and Machine.	c.c.	Distance. Mls.	Yds.
1.	C. E. Bennett (2-cyl. Indian) ...	638	59	870
2.	W. O. Bentley (2-cyl. Indian) ...	638	58	1,040
3.	G. Lee-Evans (2-cyl. Indian) ...	638	55	690
4.	F. A. McNab (1-cyl. Trump-J.A.P.)	482	54	1,715
5.	H. H. Bowen (1-cyl. Bat)	482	54	1,420
6.	A. G. Fenn (1-cyl. Triumph) ...	499	48	1,020

At the conclusion of the race Mr. Wells and the riders of the Indians received the hearty congratulations of the spectators for the splendid performances of their machines. The prizes won last year were then distributed by H.S.H. Prince Francis of Teck, K.C.V.O., D.S.O., in the verandah of the club buildings. Of the recipients, McNab carried away three cups, one bowl, and two silver medals, Bowen seven cups and one gold medal, and Lee Evans four gold medals. The numerous other certificates and prizes were also awarded to those of the winners who were present.

In addition to these, gold medals were given to Messrs. A. V. Ebblewhite and A. G. Reynolds for the special services they had rendered to the club. It was indeed good to see Reynolds once again on the track, last Wednesday being his first appearance since his recent severe illness. Prince Francis concluded the ceremony by congratulating Wells on the three Indian machines finishing first, second, and third, and appreciating the pluck and skill displayed by the competitors.



H.S.H. Prince Francis of Teck, K.C.V.O., D.S.O., presents the prizes.



MILITARY MOTOR CYCLING NOTES.

By "CELERITER."

This fresh feature is specially contributed to "The Motor Cycle" by a military officer who has a very thorough grasp of his subject in all its details. Those who read this month's and subsequent instalments—the feature will be repeated monthly)—may rest assured that they are perusing an article which will give them a true insight into motor cycling military matters, and teach them all there is to be known regarding the kind of warfare in which a motor cyclist could be of service.

A GOOD deal of arrant nonsense has been written lately on the possibilities of the motor cycle for the purposes of war. It is a pity that people who do not understand the subject should talk, but it becomes worse when they write, and worst of all when they get their writings printed. The majority of the public are credulous, and when they see a thing in print they usually believe; those in the know smile and treat the matter as a joke. It is no joke to mislead people to believe that which is not true, more especially where a question of national importance is involved. I shall therefore take a particular delight in tearing to pieces those false prophets who foresee armies of motor cyclists careering coastwards to meet the invader —a delight which will be only equalled by the joy I shall feel in pulverising those pessimists who are too thick-headed to admit that the motor cycle has its uses from a military point of view.

The War Office Point of View.

The Military Authorities have, up to the present, taken up their usual attitude as regards motor cyclists. These economists have always adopted the maxim that it is poor policy to pay for a thing which you can get for nothing. They acknowledge and admit that the motor cyclist is useful and frequently invaluable. On manœuvres, at a pinch, they can just manage to do without him—in war time he would be indispensable. In peace time therefore they trade on the good nature and keenness of motor cyclists, arguing that with luck they will probably on manœuvres get as many men as they want for very little expense. As regards the more serious business of war they content themselves with the hope that some other fellow will be responsible then, and get the blame—in the meanwhile they themselves are acquiring kudos by keeping down expenses. The question now arises as to what attitude motor cyclists intend to adopt. Are we going to be content to fall in with the War Office scheme of economics and volunteer individually for odd doses of work at manœuvres, or are we going to play the strong man's part and say, "Either we do this thing properly—and at your expense—or not at all"? So long as the War Office, by spending a paltry hundred and fifty pounds or so, can get as many motor cyclists as are absolutely necessary for the conduct of the autumn manœuvres, it is unlikely that the scheme under consideration for forming a Territorial Motor Cycle Corps at an annual cost of one thousand pounds will obtain sanction.

It is merely a matter of negotiation—that is to say, bluff and blarney! Not so very long ago military cyclists were in exactly the same position. So long as they were content to mess along in a semi-authorised way, they could not get concessions out of the authorities; when, however, they took a firm stand and insisted on proper organisation, recognition and pay, they got it and are now a flourishing branch of the service.

A Hint from the Cyclist Battalions.

The Army cannot afford to do without motor cyclists, but it will naturally make the best bargain it can to obtain their services. It is more than possible that within a few weeks all motor cyclists will be asked to join that spectral force which is to be known as the "Technical Reserve." Joining will consist in registering a name and address, technicality will consist in capacity to drive a motor cycle, whilst the reserve item of the contract means that man will be in reserve until he is wanted. An excellent arrangement so far as the War Office is concerned—and so cheap! but not of much use to the motor cyclist who is anxious to do a little military work.

For some years now the cyclist battalions have been agitating to be allowed to enlist a section of motor cyclists. The attitude of the War Office up to the present has been one of tacit acquiescence, provided no additional expense were incurred. On the other hand, whenever motor cyclists were wanted by the Army for manœuvres, or by the General Staff for special duties, the authorities have come a-begging to the cyclist battalions—and never in vain. The battalions wanted the authorities to realise how indispensable motor cyclists were. They have achieved this end. Next manœuvre season the battalions will refuse to supply motor cyclists unless official recognition and pay be granted for the organisation of a motor cycle section. This is the attitude that civilian motor cyclists also should adopt if they want to win this game of beggar-my-neighbour. If the Army want motor cyclists, then it must form a proper motor cycle corps, which will give the members thereof training and experience, and, above all, an official status with a chance of promotion and recognition of services.

The Scheme now before the Authorities.

The scheme for the formation of the Motor Cycle Corps which is now being considered in Whitehall was outlined in these pages recently, and has much to recommend it from both the civilian and the military point of view. Men who join will be afforded opportunities of doing most interesting work without having to put their hands into their pockets; they will also receive a uniform and a recognised military position.

It is no disgrace to be beaten by the INDIAN

GLASGOW UNIVERSITY MOTOR CYCLE SCOTTISH HILL CLIMB on PEESWEEP HILL, March 12th, 1910.

RESULTS:

Class 2, for Multi-cylinders, **UNLIMITED:**
Mr. Alexander's 5 h.p. **INDIAN, FIRST,**
and **RECORD** for the hill.

Class 3, Scratch Race for Singles up to 500 c.c. and Twins up to 750 c.c.:
Mr. Alexander's 5 h.p. **INDIAN, FIRST.**

Touring Topics

The question of luggage-carrying equipment is one of supreme importance—on it depend your comfort and convenience when on Tour.

Now, in the consideration of such question the BROOKS BOOK will prove invaluable—in it are illustrated and described many articles of vital interest to every Motor Cyclist.

Here we illustrate one only—the

BROOKS CARRIER BAG (B9682).

This is shown complete with its inner cases, together with the latter removed therefrom.

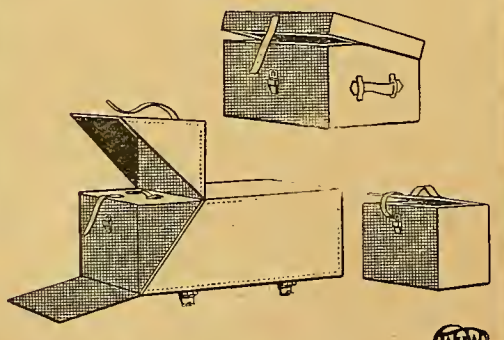
Both the bag and interior cases are made throughout of the finest waterproof canvas, on special three-ply boards. They are light, strong, and dust-proof, and the two inside cases enable you conveniently to divide the articles you desire to carry.

The smaller case can be used for tools, spares, etc.—the larger one makes a handy receptacle for clothing, and, on arrival at your destination, can be lifted out in a perfectly clean condition and taken immediately to your room.

Its size is 17in. × 10in. × 6½in., and it can be obtained with either one, or two, inner cases at **24**/- and **26**/- respectively.

Let us hear from you.

J. B. BROOKS & CO., LTD.
(Dept. B45), **BIRMINGHAM.**



If

you have perfect comfort when awheel, perfect pleasure, perfect health will naturally follow, but—

If perfect comfort is not possible, you will never obtain the maximum of pleasure, and your health and happiness must suffer—

Now nothing exercises a greater influence in this direction than the Saddle, and—

No Saddle is as certain to yield you perfect comfort as a

BROOKS

Remember, every model of the Anti-vibratory Saddles and Seats which bears that name possesses features which are entirely exclusive—

These include the BROOKS COMPOUND SPRINGS which absorb vibration within themselves and at the same time, by their compensating action eradicate entirely all tendency to bounce.

There are many other points in their construction which must interest you—they are described in the BROOKS BOOK—

Let us send you copy free.

Military Motor Cycle Notes.—

From the military point of view a reliable corps of picked men, well trained to the duties they would have to perform, will be available. The only drawback is that everlasting stumbling-block—expense! Each motor cyclist would cost the country £4 per annum on the average. It is not much when we consider that the Territorial infantryman costs £7 and the yeoman £14, and one can only say that if he is not worth £4, then he cannot be worth having at all—which, as Euclid remarks, is absurd!

An Appeal to Readers of "The Motor Cycle."

Whilst the authorities are still debating in their minds what they will do in the matter, there is only one course open to every motor cyclist who is keen to see his hobby play an important *rôle* in national defence. He should send in his name to the Editor of this journal, stating that he would be willing to join the corps when formed, but refusing to join any mole-in-the-corner organisation. It is only by showing a united front that we can hope to gain our legitimate position and the recognition which we deserve. Doubtless it is pleasant enough to go to army manœuvres in civilian attire with a badge on one's arm—it is pleasant, and the expense is almost covered by the allowances—but is it playing the game? Why should motor cyclists make what Mr. Kipling calls "giddy mirumphradites" of themselves—soldier and civilian too—because the authorities are anxious to economise a few pounds? Like our friends of the Army Motor Reserve, our cousins of the cyclist battalions, we deserve recognition and an official status. Let us see to it that we have it. Let the war cry go forth, "No Motor Cycle Corps, no motor cyclists for manœuvres!" In the meantime let us strengthen our own position by registering ourselves, so that when the tussle comes next summer our spokesmen can turn to Whitehall and say, "We have 250 motor cyclists ready to join and to get into uniform if you will sanction the formation of the corps, but we are not going to have anything to do with half measures."

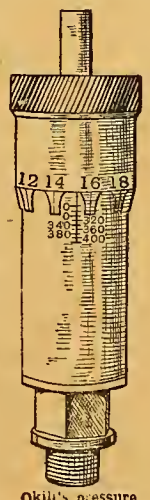
An Ideal Club.

And if the authorities give way—as they will have to do sooner or later—what an ideal All-England club will be constituted! There are thousands of keen motor cyclists who do not belong to any motor cycle club, and do not want to, perhaps, but even these ploughers of the "lonely furrow" would be glad to have motoring friends dotted all over the country—men whom they could arrange to meet for the week-end jaunts—men, too, of about the same social and mental calibre as themselves. Once the Motor Cycle Corps is a concrete fact, it will soon become very popular amongst the best of our motor cyclists. Pleasant days on the road will be easy to arrange. Corporal Jones of Nottingham will write to his friend Sergeant Brown of Chester, and by return of post all will be fixed up. The Nottingham patrol and the Chester patrols will arrange a joint affair, and renew friendships formed at last year's camp or autumn manœuvres. Incidentally, they will learn a few tricks of despatch-carrying and of motor cycle warfare.

(Next month "The Art of Despatch-bearing.")

THE OKILL PRESSURE GAUGE.

FOR some time past we have had one of Okill's compression indicators in use, and have found it a most useful instrument for verifying loss of power. The indicator is particularly useful for multi-cylinder engines, as one cylinder has often better compression than the remaining one or three, and it is difficult to locate where the leakage is actually taking place without some form of indicator, such as the one now under review.



Okill's pressure indicator.

In the case of some single-cylinder engines where the combustion head is very close to the tank it might be difficult to insert the indicator without removing the engine from its cradle, but it is easily screwed into the sparking plug hole of a V type twin-cylinder engine The engine can then be started up on one cylinder, when the indicator will register the amount of pressure in pounds per square inch in the cold cylinder. After one cylinder has been so tested the indicator can be changed over, and the amount of variation in the compression of the two cylinders is thus known. The explosion pressure can also be registered with the same instrument, but in the case of air-cooled engines it is advisable when this is done not to run the engine more than a few seconds, otherwise the indicator might be damaged. The construction of the gauge is most simple, and there are very few working parts. To use it the knurled adjusting screw at the top is set to the approximate figure of compression in pounds per square inch which the cylinder should possess, and the engine is then started. In the case of a single-cylinder engine on cold compression test, it can be pedalled over compression for a few seconds by a willing helper. The tester then places a forefinger on the top of the plunger shown at the top of the indicator, and the knurled screw is turned backwards or forwards until all trace of vibration is lost in the plunger. When the plunger ceases to vibrate the compression will be found on the figure scale marked on the cylinder of the indicator. If it is not possible to secure the aid of a friend to pedal, the actual explosion pressure can be taken on a motor cycle single-cylinder engine fitted with one ignition by procuring a Y-shaped adapter to take the indicator in one hole of the branch and the sparking plug in the other. From experience with the Okill gauge we have found it most useful, and, of course, it is a far more practical and surer method of ascertaining the maximum amount of compression in the cylinder than by standing on the pedal or turning the engine round by hand, as in the case of two-speed geared and other motor cycle engines fitted with handle starting. The makers of the Okill indicator are Messrs. Taylors, All Saints' Street, Bolton, who will gladly supply particulars and prices to any of our readers who may feel disposed to add one of these indicators to their kit as an aid to tuning up operations.

ACROSS THE AMERICAN CONTINENT ON A MOTOR CYCLE

By Stanley Bowmar.

Previous instalments appeared in our issues of March 7th and 14th.

Ogden, the capital of the state, is a clean, spacious city; but Salt Lake is for the Mormons—the City of Saints. It, too, is exceedingly beautiful—has wide streets, bordered by shady trees, and by every pavement there is a stream of cool mountain water. I had forgotten. The Mormons to the Mormons are not Mormons, but Latter Day Saints—a fact which the polygamous population likes visitors to remember. Joseph Smith—"Prophet" is, I fancy, his correct title—is the present head of the church. Prophet Smith's forty-fifth child was born just about the time of my visit. But the good old days, when every Mormon, like the Chinaman of to-day, was allowed to keep as many wives as he could support, or as many as he could persuade to support themselves (which was much more satisfactory), were, of course, recently brought to an end by an Act of Parliament passed by unsympathetic and jealous Washington Congressmen.

The famous temple, the chief attraction of Salt Lake, one must admire from the outside. It is guarded as strictly as a Japanese fort. The tabernacle is, however, open to the public, and at the bureau established for the benefit of the visitors, booklets calculated to convert an Ingersoll are doled out liberally.

So far as the population is concerned, Salt Lake City, which for years was almost exclusively Mormon, is now about evenly divided between Saints and "sinners." The best daily paper upholds the cause of Brigham Young; two others are controlled by the Gentiles, and the two sects vilify each other in typical Wild Western Yankee style—no "by your leaves" or "beg pardons."

The Tales of the American Abroad.

The American abroad is fond of talking with a flourish of the big things at home—big trusts, big fortunes, big ranches, huge buildings, and great lakes. The complacent Britisher listens impatiently, smiles sarcastically, and decides on a Continental tour. "No desire to see America," says he; "Yankee big things don't interest me." But does the American exaggerate habitually? I do not think so. His exaggeration is, it seems to me, greatly exaggerated by those who might do worse than study some of his methods and achievements and learn something from his marvellous adaptability and enterprise.

One of the little known monuments of American enterprise is in Utah—the Union Pacific Railway bridge across the Great Salt Lake (see illustration on page 179 of the issue of March 7th). From the first plank to the last the distance is forty-five miles. Like a taut steel rope it stretches, straight as a die, across the sparkling snow-white salt beach, to lose itself away in the distance on the dancing waters. In times of storm it is lost in sheets of spray, which drench the passing trains. At Mid Lake Station, in the middle of the bridge, there is a telegraph station and a camp of repairmen, who keep watch on the bridge night and day.

When the Union Pacific Railroad was constructed the line ran round the head of the lake—a detour of forty miles—which necessitated also the negotiation of a heavy gradient. This gradient disorganised the traffic. It was the weak link in the chain, by which train loads had to be regulated. Hence the Great Salt Lake bridge.

Leaving behind me the comforts of Utah, I headed for the bridge, although it is purely for railroad traffic. It was dark before I reached the eastern side. The only house in the neighbourhood would have nothing to do with me.

"Here's a nasty old tramp, father," I heard the girl who answered the door say to the gentleman whom it pleased me to imagine as cosily ensconced in a fireside chair. "He wants to know if he can get lodgings."

A Rule "Never to go Backwards."

One of the resolutions made at the outset of my excursion was, "Never go backwards." Rather than return to Ogden, I started across the bridge, there being sufficient room for passing trains. There were two structures—one the main line, and the other line used, as I was informed later, by a company which was experimenting on the salt from the beach. Of course, I chose the blind alley, and was soon in a sticky salt quagmire. All the hauling I was capable of failed to extricate the machine, and I had perforce to abandon it for the night. Crossing over to the main structure, I climbed up the embankment and walked along until I came to the first repairmen's camp. Italians the lot of them. Their foreman was in Ogden, and not one of them spoke a single word of English. There were three rough and ready

buildings—one which was already overcrowded, a hut for some married folk, and a draughty, ramshackle cookshop. Gesticulating proved useless; all the signs on the calendar were lost on my soft-voiced friends from Italy. At last, in despair, I walked straight in and sat down by the smouldering cookshop fire. The men—who no doubt concluded I was an audacious tramp whose "record" if known would make one shudder and grow pale—stared and chattered, but did not throw me out. Presently they left me lord of my domain, and on two chairs I dozed the night away.

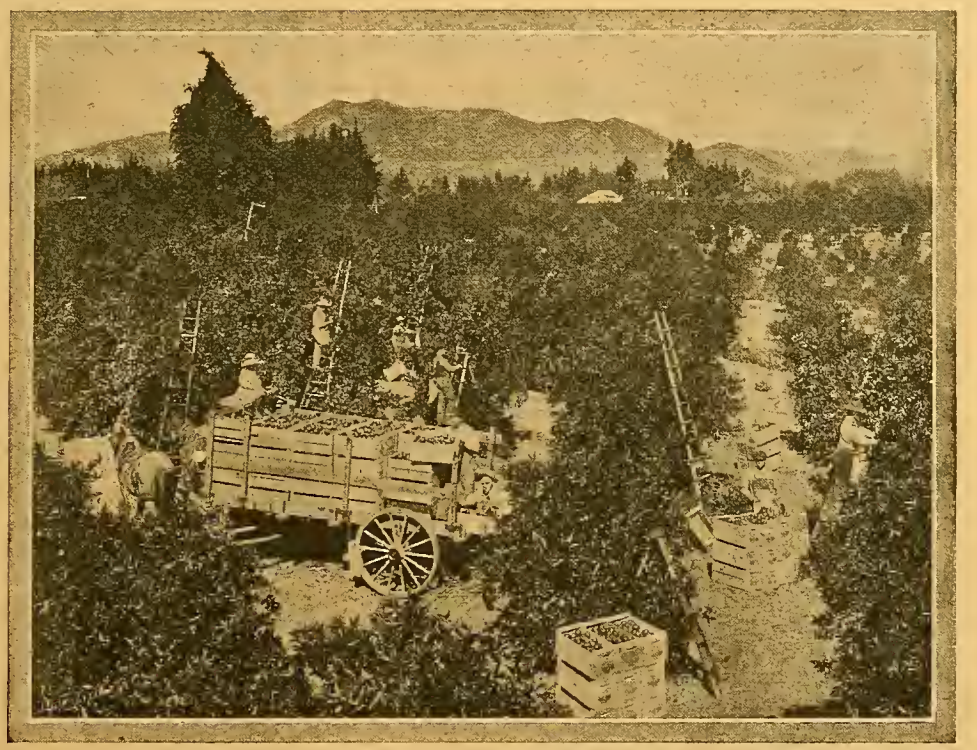
By the aid of planks I extricated the motor before the men were astir. But, early as was my start, engine troubles delayed me so much that at nightfall I was still in "midocean." Another night with Italians—at the Mid Lake Station. The foreman here was kindness itself. He had no spare berth, but gave me the bunk of one of the men on night duty. The cook, too, must have received special instructions. Had there been a trifle more air space—twenty-two of us were crowded in a room about the size of an ordinary double bedroom, and not one of the inmates was smitten with anything so modern as the fresh air fad; the window was jammed down tight—I could have enjoyed a week at Mid Lake. These Italians, I am certain, took me for a railway magnate. Strange to say, I was always mistaken either for a titled nobleman, a half-mad magnate of some description, or a tramp of the criminal class, who to elude the bloodhounds had stolen a motor cycle on which to make good my escape. More frequently—at night invariably—it was the tramp!

The Nevada Desert—A Spacious Workshop.

In looking back over my experiences on the Nevada deserts, there looms above everything a sulky, irresponsive, cumbersome machine. Experience is a good teacher, but the desert is a poor, if spacious, workshop. The parts of the motor of which I carried duplicates appeared to be the only ones that did *not* wear out; cold winds glued the piston; my trip really degenerated into walking to 'Frisco, pushing a motor cycle.

Near Carlton my excursion had a narrow escape from being brought to a sudden and inglorious end by a fast mail train. I was riding between the rails. A strong head wind was blowing, and with it and the throbbing of the motor I did not hear the train behind until the whistle shrieked almost in my ear. The motor was stopped and I dismounted in a second, but in dragging the machine off one of the pedals caught on the high rails. I tugged frantically, bent the pedal, and cleared the line just as the train rushed past. So close a shave was it that the suction took my cap, and my nerves were so shaken that for days afterwards, whenever a whistle blew, I would give a startled jump ready to fly for my life.

The rough roadside accommodation houses were teeming with tramps, devil-may-care ruffians, beating their way to the San Francisco earthquake boom. These hobos, as the Americans call them, never pay railway fares. They know every hole and corner of the States and Canada, and all their travelling they do at night on the roofs of carriages, in freight vans, lying astride buffers, or in the ice boxes of empty fruit and meat cars.



Orange picking in California.

Between Battlemountain and Winnimucca (153 miles) I followed their tactics—joined three of them on a midnight freight train. The motor was out of commission, and there was no repairman in Battlemountain capable of doing the necessary repairs. We loafed in a saloon, watching the roulette players, until a freighter lumbered in at 11.30 p.m. I squared the brakeman, and with the help of my three travelling companions *(pro tem.)*, the machine was quickly and quietly lifted on an empty flat car, and as the train drew out we climbed along the top of the waggons until we reached an empty ice box. There is an ice box at each end of all fruit and meat cars. On account of their cosiness in winter and coolness in summer, they are favourite hiding places with train beaters. Unless the "lid" is propped open they are air tight, and many a tramp has lost his life by being bolted in and his car shunted off at a lonely siding. My companions were quite at home. Two of them soon dozed off, and

Across the American Continent on a Motor Cycle.—

the third told wild tales of adventures and villainies. They were, I gathered, jacks of all trades—all the dishonest and disreputable trades.

Cold troubled me during the last weary stages to Reno, at the foot of the Sierra Nevadas. The smell of winter was in the air, cold winds blew daily; at nights there were biting frosts. At Reno it seemed that, after all, the weather, would beat me. Snow threatened. I worked practically all night priming the motor for

The Final Effort.

Instead of following the rails through the snow sheds and tunnels, I chose the old coach road from Carson City, thirty miles south. The eight miles to the first summit occupied just seven hours. Intermittent drizzly showers occurred frequently enough to keep me soaked and miserable, and the track, which was in a shocking state of repair, was as slippery as a greased floor.

Between the two Sierra Nevada ranges, west of Carson City, there is one of the most beautiful lakes in America, Lake Tahau. I found a ranch house on its shores at night, and long before the sun was up next day was slipping down among the western-slope foothills toward Placerville—my first Californian town. Eldorado, where the first gold was discovered in California, is near Placerville, and I doubt whether his discovery gave the lucky pioneer more genuine satisfaction than I experienced to realise that my journey's end was near.

The Pacific Coast was almost in sight. Sunlit plains, perfect roads, and civilisation in one of the most favoured spots in the world, sent me half delirious with joy. Two short days saw me in the earthquake stricken city of San Francisco—then a wreck, at which (November, three years ago) a myriad hammers were working feverishly building what we now know to be a brighter and better city to stand sentinel and host at the Golden Gate.

Heading West. Snapshot of the author at Chicago, after the first 600 miles had been covered. The motor bicycle was of only 2¼ h.p.

ADVICE TO EASTER TOURISTS.

AS numerous competitions will be held during the Easter week-end, it will be as well to remind motor cyclists who take part in road events that, in the event of their having to dismount to make any adjustment to their machines, it is both courteous and considerate to jack up their motor bicycles as close as possible to the near side of the road. It has been our privilege to watch numerous competitions from the very commencement of the motor cycle movement, and we have noticed on almost every occasion that men who have to stop to effect tyre repairs or other adjustments most curiously persist in jacking up their mounts as near as possible to the centre of the road, thus obstructing other competitors and other vehicles which happen to be on the highway. Very often the offending competitors have excuse, as, owing to the camber of the road, the machine is not so conveniently jacked up at the sides as where it is more level; but we would earnestly request those who are taking part in important road events to consider other users of the road as far as possible. There is yet another point to which we would like to call the attention of those who turn up to witness events which are held partly during the night. Often on the London to Edinburgh run we have noticed crowds of motor cyclists and pedal cyclists at all hours of the night and early morning turn out to watch the competitors go by, with their lamps brightly burning facing directly in the competitors' eyes and seriously hampering them. We sincerely hope that those who turn up to witness the London-Land's End run for the Jarrott Cup, and the London-Edinburgh run (to be held in May), will remember to turn their machines with the headlights facing away from the competitors.

A FASTENER FOR ROUND TWISTED BELTS.

THE belt fastener illustrated by the annexed drawing will especially interest those motor cyclists who use round twisted belts, as it is remarkably ingenious in design. As will be seen, the fastener consists of a couple of conical or tapered plugs, coupled together by a link at their narrow ends. The twisted ends of the belt are opened out and wrapped round the blocks and there secured by conical rings of suitable size to enclose the belt ends and the blocks and to bind strongly thereon when tension is put upon the belt. The greater the tension the more strongly will the rings bind, by reason of the fact that they are drawn towards the larger ends of the conical blocks. The belt fastener shows great promise, since as far as we can tell it is the only fastener which *cannot* pull through.

There is only one fault with metal fasteners of this kind when used with round twisted belts, and that is they make a noise when passing over the pulleys.

Francis Kelway Pope, of Dunedin, New Zealand, is the inventor, but further particulars can be obtained from H. K. Pope, 7, Gloucester Square, Southampton, who has taken out the provisional patent.

Bolton and District M.C.C.

The first event of 1910 will be a three days' tour in the Lake District during the Easter Holidays. Members will leave headquarters at 10 a.m. on the 25th.

Westmoreland M.C.C.

A hill-climbing contest will be held on Friday next on Shap Fell. Meet Low Burrow Bridge 2.30 p.m. Some sixty members are now enrolled, and there are eight special prizes to compete for.

Nottingham and District M.C.C.

The opening run took place on the 12th inst. to Kelham (Newark). The unlucky thirteen sat down for refreshment, the weather being responsible for many absentees. Last Monday evening Mr. R. Vernon C. Brook (hon. sec. Birmingham M.C.C.) gave a very instructive and interesting lecture with lantern illustrations from working drawings, entitled "Variable Gears." A number of questions were afterwards asked and answered.

Ayr and District M.C.

Mr. John Robertson's lecture on the subject of "Magneto Ignition" proved most instructive. A number of electrical experiments were made illustrating the principle of current generation in the magneto. A 1909 and 1910 Bosch model magneto were also shown in motion to illustrate the intensity of the magneto spark in comparison with that of a coil. Interest was added to the evening by a series of limelight illustrations from slides kindly lent by Mr. A. E. Bennett. On Wednesday Mr. Geo. Cocker will discourse on "Two-stroke Petrol Motors."

The A.G.M. will be held in the Photographic Society's Rooms, High Street, Ayr, on Wednesday next, the 23rd inst. Fixtures will be arranged, and other important business discussed.

Streatham and District M.C.C.

The breakdown competition on the 9th inst. proved a great success. The machine used was a 3½ h.p. Triumph, fitted with a Roc two-speed gear and clutch kindly lent by Mr. R. G. Nye. Each competitor was given five minutes in which to locate the trouble, the shortest delay to win. The traps laid by those in charge of the trial showed great ingenuity, water in the carburetter proving the downfall of more than one. C. E. Davis was an easy winner in 2m. 16s., the next best being F. Harvey in 2m. 19⅕s. The judges and timekeepers were H. P. E. Harding, W. Pratt, and R. G. Nye.

Owing to several members having entered in the 500 c.c. class at Brooklands on Easter Monday, the club will hold a run to the track on that day, leaving headquarters at 11 a.m. sharp.

Oxford M.C.C.

Members met under exceedingly pleasant circumstances recently on the occasion of the visit of Mr. Basil H. Davies, who delivered an informal lecture on "Aeroplanes," their construction and the various methods adopted by inventors to overcome air pressure. After giving a short history of some of the men who have made their names famous in the study of aviation, he explained some of the simpler and rudimentary principles which underlay the handling of the aeroplane, this being followed by about fifty lantern slides of absorbing interest. Mr. Davies's complete mastery of the subject was evident, as he kept an appreciative audience spell-bound for an hour and a half, not the least interesting part of his talk being his description of the various types of planes, wind pressures, and the efforts of inventors to cope with them. Then in the matter of locomotive power he pointed to the advance petrol engines had made as a result of experiments with motor cycles and the assistance motor cyclists had been in solving the power problem. Mr. Davies exhibited a number of models which were minutely explained by him.

York County M.C.C.

The fixtures for Easter are as follows: Good Friday, opening run to Richmond (Yorks); March 27-29, Windsor for Brooklands; meet John-o'-Gaunt's Hotel, 8 am.

Southern M.C.

The A.G.M. will be held at Caxton House, Westminster, this evening (Monday). Prior to ordinary business the members will be regaled by two papers. Mr. E. J. Harrison on "Carburation," and Mr. W. J. Jones on "Vulcanisation." The Easter tour is to Eastbourne. The new secretary is Mr. Arthur J. Vickers, 42, Theatre Street, Lavender Hill, S.W.

Newcastle and District M.C.C.

The following competitions have been arranged: Good Friday, team trials to Richmond meeting; six riders to constitute a team. April 16th, slow hill-climb at Benton Bank. May 1st, non-stop run with a hill-climb at finish. June 4th, all night run to Edinburgh and back. July 31st-August 1st, two days' reliability trial for N.S.U. Cup. September 4th, hill-climb.

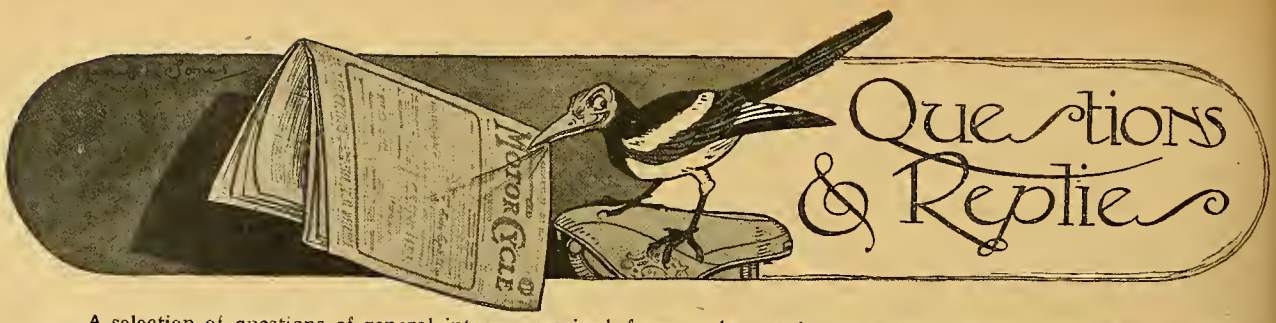
Sutton Coldfield A.C.

The first competition takes place on Saturday, April 9th, when it has been decided to hold a speed-judging competition.

Herts County A.C. (Motor Cycle Section).

Last year the ancient town of St. Albans possessed a motor cycle club of its own, but recently the St. Albans and District M.C.C. decided to throw in its lot with the Herts County A.C., and thus help to make the motor cycle section of that club strong and representative. It was to celebrate the amalgamation that Saturday, 12th March, was fixed upon for the opening run, starting from the new headquarters, the Red Lion Hotel, St. Albans, *viâ* Colney Heath, Hatfield, Welwyn, and Stevenage, to Baldock and back, a distance of about fifty-four miles, club certificates being awarded to those members completing the journey out and home within five minutes of schedule time. The weather was about as bad as one could imagine, a fine rain falling until within a few minutes of the time fixed for the start, when the following hardy enthusiasts were sent off by the timekeeper, Mr. D. K. Hall: W. Cooper (3½ h.p. Bradbury), F. G. Beard (3½ h.p. Scott), W. Pratt (3½ h.p. P. and M. with sidecar), P. G. Batchelor (3½ h.p. Triumph), D. G. Nott (3½ h.p. Brown), C. Cather Cooke (3½ h.p. Triumph), and A. E. Deacock (2½ h.p. Wanderer). The roads were in a very heavy and greasy condition, particularly between London Colney and Hatfield. The Scott had the misfortune to puncture between Hatfield and Welwyn on the outward journey, and the Brown broke an inlet valve at Stevenage, whilst Deacock, on the 2½ h.p. Wanderer, had an encounter with a dog at Hatfield and came off second best, the successful riders being Messrs. Cooper, Pratt, Batchelor, and Cooke. At the conclusion of the run a large number of members, many of whom had since put in an appearance, sat down to tea, and later to a smoking concert which was presided over by Mr. C. Lowery. During the evening prizes won in 1909 were presented.

FURTHER CLUB NEWS ITEMS APPEAR IN THE SUPPLEMENT



A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, **must be accompanied by a stamped addressed envelope for reply.**

Position of Sidecar.

My mount is a 6 h.p. two-speed N.S.U. with Montgomery rigid sidecar (left). I have had an argument with a motorist friend as to which is the correct side for the sidecar attachment. It was originally on the right, and I have had it changed to the left-hand side. Which, in your opinion, is the best; and why do we see more sidecars on the left rather than on the right-hand side?—J. E. L.

There is no doubt that the correct side for the sidecar in England is the near side, so that the passenger is protected from the traffic met on the highway. On the contrary, on the Continent the sidecar is fixed on the offside, as in most Continental countries people drive on the right-hand side of the road. Occasionally one sees sidecars on the roads in England fitted on the right-hand side, but in most cases this is due to the fact that the usual method of mounting by the pedal with the left foot is rendered possible.

Instruction Books on Motors.

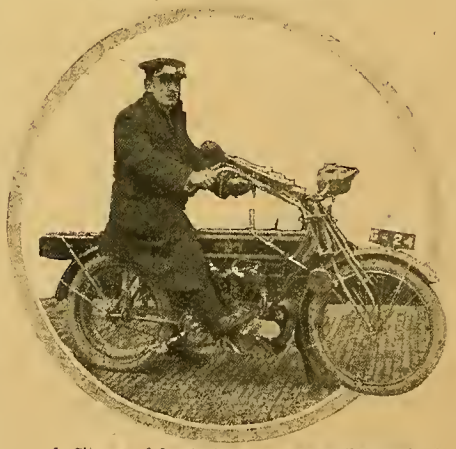
(1.) I am ordering a four-cylinder T.A.C., and not being an expert in motor mechanics, I want you to tell me of any book on motors that would help me in the management of a cycle like the 7 h.p. T.A.C. The motor shops in this country are few and far between. I would like to be able thoroughly to understand the working parts of a motor of the above type, so as to be quite independent. (2.) Can you also advise me as to the best sidecar to use with a machine of this sort?—P. R. P. (Perak, Federated Malay States).

(1.) The T.A.C. motor bicycle rather more closely resembles a car than a motor bicycle, and, in consequence, we should recommend you to buy "The "Autocar Handbook" and "Motor Cycles and How to Manage Them." The price of the former is 2s. 6d. and the latter 1s., postage for the two 6d. Of course, in "The Autocar Handbook" you will find a good deal that does not concern the machine, but the general principle of the four-cylinder engine and clutch, change-speed gear and worm drive, are described in full. (2.) The makers of the bicycle you have selected supply a sidecar attachment to order. If you require a special type, all the standard patterns could be amended to fit.

A Light Four-Wheeler.

I intend building a light runabout (four-wheeler). (1.) What horse-power would you suggest with a variable gear between 3 and 9 to 1 (obtained by V belt and two expanding pulleys on engine and counter-shaft respectively)? (2.) Would ordinary strong sidecar wheels be strong enough for the work (two-seater)? Transmission by V belt to counter-shaft, thence by central chain to rear wheels. (3.) Would a differential be necessary? (4.) Do you advise air or water-cooled cylinders? (5.) What is the largest size of Whittle belt made? (6.) Would 8ft. wheelbase and 4ft. 6in. broad be about the right dimensions?—W. G. A.

(1.) We should suggest a 5 h.p. or 6 h.p. engine, especially if it is to be used for passenger work. (2.) Extra strong sidecar wheels should be satisfactory, but we should require to know more particulars as to weight to advise you definitely. (3.) No, a differential would be desirable, but not absolutely necessary, as you could overcome the difficulty to some extent by driving on one wheel. (4.) If you are going to build the machine up as a miniature motor car it would be much better to fit a small differential and water-cooling. (5.) The largest size Whittle belt made is 1in. (6.) The dimensions you give would be about right.



A. Citroen, of Amsterdam, hon. sec. of the Dutch M.C.C., on his new mount—a 6 h.p. twin Matchless-J.A.P. Mr. Citroen speaks in the highest terms of his motor cycle, and especially admires the flexibility of the engine and the comfortable riding position.

Southampton to Birmingham, avoiding London.

It is my intention to ride this year from Paris to Birmingham. Would it be possible to land, say, at Southampton, and ride from there to Birmingham without passing through London? Are the roads as good as those leading to the capital, and if so, what is the route? Please also give the return journey, which I suppose would have to be *viâ* London and embark at Newhaven to reach Paris *viâ* Dieppe.—A. C.

You are able to travel direct to Birmingham without touching London by an almost entirely straight road, as follows: Southampton, Winchester, Whitchurch, East Ilsley, Abingdon, Oxford, Banbury, Warwick, to Birmingham. The return journey would be to Oxford as outward journey reversed, then Henley, Windsor, Guildford, Horsham, Brighton, to Newhaven. The roads are good but difficult to follow between Henley and Guildford.

A Motor Cycle for Every-day Use.

(1.) Do you consider it possible after a little practice to ride twenty-five miles every day to business, the road being fairly flat and of very good surface, allowing two hours in case of breakdowns, there being one town passed through (viz., Tewkesbury) eight miles from the end of the journey? (2.) Would it be possible to obtain a second-hand machine suitable for this purpose for from £10-£12? (3.) As a novice would a 3 h.p. or 3½ h.p. heavyweight single-cylinder, magneto ignition machine be suitable? (4.) What would you estimate the cost per week (Sunday excluded) in petrol, etc.?—F. J.

(1.) There is no doubt whatever that a novice could ride twenty-five miles each day to business, provided he is equipped with a good machine and takes an intelligent interest in it. (2.) You could not expect a very good machine for the price named. If you increase the amount to about £20 you would get a second-hand of first-class make. (3.) 3 h.p. would suit you well, but 3½ h.p. machines are the most popular. (4.) It is difficult to estimate the cost, but we should imagine that you could easily run the machine for 7s. 6d. per week, provided, of course, you do not have to go in for any expensive renewals or replacements.

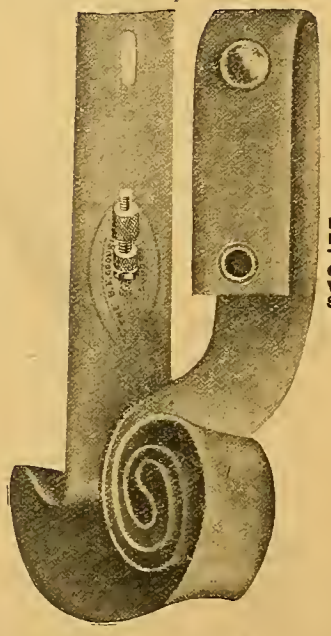
"GOODRICH" SPECIALITIES FOR 1910.

THE "GOODRICH" ALL RUBBER NON-SKID TY



THE NEW "GOODRICH" BUTT ENDED INNER TUBE.

This tube differs from all previous butted tubes and is the only reliable example of the principle.

It fits by compression and retains all the qualities of an endless tube with the advantages of the detachable type.

No joint to pull out or burst, no inequalities of surface, no chance of creeping during wear. Easiest to fit, easiest to detach. A triumph of experience and mechanical skill. Made in one size only, and in one quality, viz.,

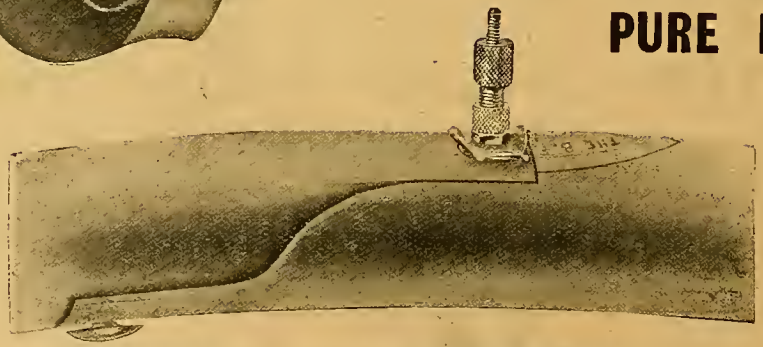
PURE PARA RUBBER,

PRICE

(26 × 2¼) only

16/- Each.

Of all Agents or direct from manufacturers.



BUTTON FASTENED THROUGH SLOT.

SHOWING TUBE INFLATED. NOTE ACCURATE FIT.

Respecting a Sidecar Attachment.

(1.) Is a 6 h.p. twin sufficient, single-geared, for sidecar work? Combined weight of passenger and driver, 19 to 20 stones. (2.) What would be the most suitable gear for ordinary give and take main roads? (3.) Is it necessary to pay a licence for the sidecar as well as for bicycle? (4.) Must the rear number be illuminated? (5.) What should be the approximate petrol consumption with the load mentioned? The engine is a J.A.P., the carburetter an Amac with handle-bar control.—H. R. B.

(1.) The power is certainly ample, but with a single gear you would often find the want of a lower speed, especially when starting on a gradient or when an exceptionally steep hill is met with. (2.) We should recommend about 5 to 1, which is really too low for such a powerful machine. It would enable you to get up most hills. (3.) The present 15s. licence (which may shortly be increased to £1) covers both the bicycle and sidecar. (4.) It is not compulsory to light the rear number when a sidecar is used, but it is advisable to do so for safety's sake. (5.) About fifty or sixty miles to the gallon.

Is an Engine More Powerful when Cold?

One frequently sees it stated that a motor cycle will climb a steep hill better when the engine is cold than when it is hot. And for this reason we continually read of competitors in trials stopping at the foot of test hills in order to cool their engines before making the ascent. My experience, however, is exactly the reverse of this. Can you explain? My engine is a White and Poppe, 1907, 3½ h.p., and I always find that it will pull much stronger up hill after it has been running for six or seven miles, and is consequently nicely warmed up, than it will when cold. I have proved this over and over again. On one particular rise of about 1 in 13, which I have to ride almost daily, I invariably have to give pedal assistance if the engine is cold, whereas I can go up it unassisted and at a good pace if I strike it after the machine has been running for half an hour or so. I shall be glad to know the reason of this, and also whether it denotes any defect in my engine.—(Rev.) G. C. A.

There is nothing extraordinary in either case. Some engines heat up much more quickly than others, and, consequently, it benefits them to cease running, and when they assume a more normal temperature they will climb better. With your particular engine it seems that this is a very efficient one, and cools very rapidly, so that despite the fact that it has been running for some distance, the temperature it attains suits it best, and, in consequence, it climbs better than when cold. Theoretically, of course, the hotter the engine is the better it should run, but, unfortunately, in actual practice this is not the case. The behaviour of your engine does not denote any defect, very much the reverse.

Accumulator Discharging Quickly.

My machine is a second-hand one; in perfect condition, plain coil and accumulator ignition, make and break contact breaker, and Oleo plug. The accumulator is a new 20 a.h., only charged three times. I have had it examined, and assured that nothing was wrong with it. Petrol supply quite clear, and the charge gets to the cylinder all right. My last ride was sixty miles out, which I did without one misfire or involuntary stop. On reaching my destination I removed the accumulator from the tank (as is my usual practice), it then showing full voltage on voltmeter. The following morning I started out for a run. Everything went all right for about a mile, when misfiring commenced, and eventually at about two miles it stopped altogether. I went carefully over everything, and finally tested the battery and found it was only showing 2½ volts. This I could not understand at all, as I could find no trace of any short circuit that might have run it down, and whilst it was out of use it was put away out of reach of anything and not tampered with. I at once took the battery and had it recharged, and the following evening started on my return journey home. The battery showed full voltage on starting, but after I had got the same distance as before (two miles), exactly the same trouble occurred. The battery now showed 2½ volts on one cell but nothing on the other. I have tried different accumulators, with the same result. —B. H.

Your trouble is certainly a mysterious one, and we should be inclined to suggest that the accumulator is not very tightly packed in the compartments of the tank, gets jolted about, and short circuits against the top of the tank. There certainly must be a short circuit somewhere which you are unable to locate, otherwise the different accumulators would be unlikely to behave in this manner. We do not think it is the coil which is at fault, but you might get this tested with a large ampèremeter to show what the consumption of it is. It is always advisable to carry a spare accumulator.

Faulty Carburetter Adjustment.

The power of my 4 h.p. tricar is erratic—sometimes splendid, other times will not take hill on low gear usually taken on top (all in, say, ten minutes' running). Petrol floods over top of mixing chamber on to supply pipe at times, and at other times there appears to be none at all, and if the Longuemare carburetter is "tickled" it sounds empty. After a time petrol appears to resume normal level. With jet removed, the petrol stands about one-eighth from the top of tube. Previously I ran ordinary air full open, extra air inlet half open; now it seems as though it will not have any air one minute, and wants all I can give it next.—G. W.

We should be inclined to think that the trouble is in the petrol supply or carburetter, there being something in the tank or petrol pipe temporarily obstructing the flow. It is also possible that the needle valve stem of the carburetter may have been bent and sometimes sticks, not allowing sufficient petrol to get through.

Reproduction from a picture postcard received last week by *The Motor Cycle*. The wording on the back is: "Viele Grusse von 3 Deutschen Motor-radfahrern, alle Leser Ihrer geschatzten Zeitung sendet. Fr. Reiser." (Many greetings from three German motor cyclists—all readers of your much-appreciated paper).

READERS' REPLIES.

Curious Loss of Compression.

Perhaps the following may be of use to "H. E. A.": At the last show I saw an agent for a lightweight motor cycle showing off its compression. I was struck by the time he could stand on the pedal, and so I looked closer. The cause was, his hands were on the handle-bar and his little finger on the back wheel brake! After some time, skilful manipulation showed the compression leaking, as is usual! I do not infer that the person who sold the second-hand machine did this, but just pen these lines to show one of the tricks of the trade!—BAIN.

Inspection Lamps.

I was guilty of a wee *lapsus calami* on page 185 in my suggestion for a simple inspection lamp fitment for use with electric headlamps. The two yards of flex should be fitted with a plug adapter at one end, and a bulb-holding socket at the other end. This device is much easier to fit when the headlamp is wired on the double pole principle, and standard fittings for application to single pole lamps are not at present upon the market.

The Scottish Motor Cycle Trials.

I hear unofficially that this year's Scottish Motor Cycle Trials, organised by the Edinburgh M.C.C., are likely to take place the first week in June, and I hope that this year many English amateurs will support them with their entries. The special advantage of competing in such a trial, as opposed to a private tour over the same ground, is that the route is picked by men who know the country, avoids police traps as far as possible, and includes the maximum of interesting scenery. In addition one is constantly in the company of real good fellows, instead of riding alone or with a frequently disappearing companion. All arrangements are ready made for one, and at specially cheap terms, which is a real blessing where Scottish hotels are concerned; and the sporting element adds an object and an interest to the tour.

An Olla Podrida.

One of my most practical correspondents sends me a budget of interesting notes. Speaking of the "wet blow back" from the air holes of a carburetter, he contrived to convert his into a "dry blow back" by doing away with the extra air intake on the carburetter, and substituting an extra air inlet on the inlet pipe close to the a.o.i.v. Why this should effect an improvement is not at all easily understood—on paper the blow back should still have been wet in quality, and increased in quantity: however, he says it further reduced the petrol consumption and kept the engine cooler. He is an enthusiast on the geared-down pulley, permitting a huge engine pulley. He says the belt on his 1¾ h.p. has in consequence of the geared-down pulley covered 7,000 miles in all weathers, and looks good for as much again. For a home made non-skid he recommends strips of horse-hide attached in zigzag fashion at intervals round the tread of the back tyre, but he omits to say how they are attached, and how the stitches or rivets are prevented from chafing the inner tube; possibly he has no rim brake, and simply lashes them round the rim between the spokes. The strips of hide are ½in. wide and $\frac{3}{16}$in. thick.

An Ancient Tip Repeated.

The recent sight of several perspiring novices wrestling with misfiring twin-cylinders induces me to reprint a very ancient tip, which is the twin-cylinder man's right-hand friend. When the running of a twin-cylinder engine is unsatisfactory, the first test is to run each cylinder separately, which is easiest done by starting the engine up with the machine on the stand and "shorting" each plug in turn by laying the blade of a wood-handled screwdriver from the sparking plug terminal to any convenient metal portion of the machine. This test shows at once whether one cylinder is weaker than the other—a fault responsible for a tremendous loss of power—or which cylinder is misfiring, or not firing at all. Incidentally it is of great help in locating a fault. If either cylinder will run really well, it is probable that those portions of the mechanism which are common to both cylinders, *e.g.*, the magneto, accumulator, or carburetter, are in good order, and the fault presumably lies in some detail peculiar to the missing cylinder, its plug, or valves, or compression. I have just had a singular example of those rare instances in which this test is misleading. A Moto-Rêve was misfiring slightly on the road. Cutting out each cylinder in turn, I found they both fired perfectly when run separately, but the engine as a whole went dot and carry one with both cylinders firing. The explanation was an obstruction in the flow of petrol in the carburetter, which, so obstructed, supplied sufficient gas for one cylinder to fire on, but ran almost dry with two pistons sucking at it simultaneously.

Weight of Twin-cylinder Touring Models.

When we consider that a 5 h.p. twin-cylinder machine seldom offers an increase of more than 1 b.h.p. in power over the so-called 3½ h.p. tourist machines it is saddening to reflect that it usually weighs about 40 to 50 lbs. more than the single-cylinder rival. I have owned touring machines of 3½ h.p. which weighed under 160 lbs., but I have never owned a good 5 h.p. twin-cylinder touring model which weighed less than 200 lbs., and a good number weigh more. No keen enthusiast who has once owned a good 5 h.p. twin regards a return to a 3½ h.p. single as anything but a recantation and a falling from grace, yet many are guilty of the change, for the simple reason that, owing to its increased weight, the theoretic advantages of the twin-cylinder are largely discounted in actual use, especially in hill-climbing. A new twin-cylinder recently placed on our market weighs considerably less than the average twin, and has caught on chiefly on this account. In many respects it conflicts violently with our notions, but it admittedly offers the special advantages of a 5 h.p. twin without the increase of weight, to which we had grown accustomed in machines of its power. When will some bold English maker step forward and do for the home-made 5 h.p. twin what others have already done for the home-made 3½ h.p. single, viz., increase its efficiency to the uttermost and simultaneously pull back its weight to a lower figure? When that individual at last arrives on the scene he will find a greedy and eager public surging around him ready to unload much cash.

MOTOR CYCLES FOR THE COLONIES.

IT is with pleasure that I read *The Motor Cycle*, and especially the comments of "Ixion" and the hub-bub they sometimes stir up. My motor cycling experience is not very lengthy, dating from 1902 only, but I have ridden in all parts of the U.S., Mexico, and Canada, and so wish to chime in and add my O.K. to "Ixion's" article which appeared in the issue of January 10th regarding machines for the colonies. I have owned, ridden, and seen many English and foreign machines, and lack of road clearance is one very great fault. Most of the American machines are made with a bent down tube which goes under the engine. This certainly does not look as well as the "all straight tube" construction of English machines, nor is it as strong, but how much better is a dented tube than a badly cracked crank case? Even a 5in. clearance is not always sufficient—a 6in. or 7in. is nearer correct, but that either makes the frame too high or else cuts down the tank capacity. So American makers put a protecting tube under the motor base.

Tank Capacity and Engine Economy.

Tank capacity and engine economy are also items for consideration. Heavy, rough, and hilly roads eat up petrol at an alarming rate, as all riders know. This is bad enough when the gasoline costs from 20 cents (10d.) to 75 cents (3s.) per gallon, but add to this the fact that sometimes very great distances—300 miles often—have to be covered before the tank can be replenished, that is why capacity is so important.

"Ixion's" comments on "spills" and road conditions are accurate and to the point. To illustrate: While on a trip in the foothills early this winter, my machine skidded while crossing the Fallen Timber River on an ice-covered dilapidated bridge, which had no hand rails, and plunged 40ft. down in a tangled mass of huge fallen trees, and finally into the water! Good-bye, motor cycle. Fortunately I saved myself by a lucky grab, but it was a near shave.

I have seen the roads up here during the rainy season so muddy that it was hard work for a 3,200 lbs. team of horses to haul an empty waggon over them, and four and six-horse teams had hard work to haul even a moderate load.

On the road from Chicago to South Bend, Ind., *viâ* Westville, I saw a rider wreck a well-known English single-cylinder machine (Triumph) by hard riding alone. This machine certainly was one of the fastest and finest single-cylinders I have ever seen, but the light bars, low engine and magneto position, and light rear stays could not stand the terrific pounding of the rough and sandy roads. The spirit was willing but the flesh weak. The motor was game to the end, and ran well with a cracked crank case and the rear tyre rubbing the stays. The machine was not "fall proof."

Alberta Winter Toggery.

To change the subject rather abruptly, I imagine if I should put in an appearance in London during a cold snap with my Alberta winter motor cycling togs on I would cause a laugh, and maybe get "pinched." Over a heavy corduroy suit of clothes I wore a pair of "chaps," a short heavy fur coat, fur cap and gloves For foot gear, two pair of woollen socks under a pair of long heavy German socks, and over all a pair of Indian fur-lined "mushes." Yes, the outfit certainly was warm, but quite cumbersome. Looks, of course, were not to be considered, for it is often 30° below zero, and not infrequently from 50° to 65° below! The roads are usually at their best during the winter, and the motor runs very well. The lightest spirit only can be used, and the carburetter must be protected.

When once the farmers in this district wake up to the utility of motor cycles, there will be a fine field for some well-known, reliable, and enterprising firm.

A PLEASED READER (Alta, Con.)

AMERICAN RIDERS AND THEIR AMATEUR STATUS.

IT appears that if certain officials in the States have their own way there is very little hope of any American amateur riders coming over here to ride in the T.T. Race and other competitions, as they dare not do so for fear of losing their American amateur status.

Some time ago Mr. Betts, a one time president of the F.A.M., formed an alliance between the F.A.M., A.A.U. (American Athletic Union), and the A.C.U. (American Cyclists' Union), by which motor cyclists were classed with athletes as regards their amateur status. This alliance cannot very well be broken, but the F.A.M. hopes to be able to pass a rule which will enable American amateurs to take part in British competitions. Dr. J. P. Thornley, chairman of the Competitions Committee of the F.A.M., thinks that if the Auto Cycle Union could see its way to adopt some sort of classification that would exclude any man who had ever competed for cash, and called this class an international class, it would enable him to introduce a rule at the summer meeting of the F.A.M. that would subject riders to the regulations of the ruling bodies of the countries in which they compete.

We are afraid no such rule is possible, as it would exclude all Brooklands competitors who have accepted cash instead of trophies, and also all T.T. competitors.

In the early days of motor cycling Sir Charles Friswell's well-known firm was agent for the Peugeot motor bicycle, and one of these machines was ridden in the first A.C.U. trials which took place in 1903. Now Messrs. Charles Friswell, Ltd., have instituted a special motor cycle department in their spacious premises at No. 1, Albany Street, W., which is in the capable hands of Mr. W. H. Hayes, who has for many years followed every phase of the motor cycle movement. A large room on the first floor has been set aside as the motor cycle showroom, and in it such well-known makes as Bat, Brown, Rex, Kerry, Wolf, Magnet, etc., will be on view, so that a permanent motor cycle exhibition may almost be said to be continually in progress there. Accessories will be stocked, and repairs will be executed. Agents will be able to make appointments with their clients at these showrooms, and special offices are provided in which they may transact their business. Owing to the amount of space at their disposal, exceptional facilities are offered by Friswell's to club secretaries for assembling for trials and competitions.

WATER COOLING ON MOTOR BICYCLE ENGINES.

By CYCLOMOTOR.

BEFORE the advent of motor bicycles, or, to be more correct, when the pastime was in the experimental stage and 1¼ h.p. front-driven Werners, with the engine forward of the handlebar, and 1¼ h.p. Minervas were just opening up a new era, we of the early brigade of motor cyclists had, from sheer experience of cause and effect, arrived at the decided opinion that for low gears, such as were necessary on tricycles and quads, water cooling was essential. Many engines were consequently converted to semi-water cooling by fitting water-cooled combustion heads. I write semi-water cooling for the reason that it was only the combustion heads which were converted, the air-cooled cylinders, with their radiating fins, being retained.

Air-cooled Marvels of Efficiency.

There is no question that these old tricycles and quads, fitted with air-cooled engines varying from 1¾ h.p. to 2¾ h.p., fitted on the rear axle and driving direct on to the axle by pinions and spur wheels, and weighing anything between 2 and 4 cwts., were fairly efficient vehicles. They were not fast, in view of the load and the necessary low gear (roadsters were usually geared about 8 or 9 to 1); but they were air-cooled marvels of efficiency. It was only very bad and long gradients that stopped them, and it was in order to obviate the troubles of overloading on steep hills that the fashion set in for water-cooled combustion heads and two-speed gears.

With one or two exceptions the two-speed gears of those days were not an unqualified success, as they were usually unmechanically supported, and absorbed a great amount of power. But if the two-speed gears were somewhat a failure mechanically, water cooling was an unqualified success.

Ancient and Modern Engines compared.

Good as were these little air-cooled engines, semi-water cooling rendered them wonderful little performers, which feared no reasonable hill in the country.

Load for load and gear for gear, I doubt if any modern engines could show better results.

That water cooling had such a useful effect on these old tricycles and quads seems certainly to point to the fact that for motor bicycles under like conditions a similar result would apply. The water consumption was low, averaging in my case about an eighth pint per hundred miles.

The majority of modern single-geared motor bicycles, however, are run under somewhat dissimilar conditions to the old tricycles. The former are higher geared, and, given the speed, air cooling provides almost all that is necessary, and it becomes merely a question of effective cooling by lubrication when the load becomes heavy on gradients. When a two-speed gear is used, and also for medium-geared motor bicycles, there is little doubt in my mind that greater efficiency would be obtained by a useful combination of air and water cooling.

In this respect I recall a motor bicycle which I rode in 1905—a 2¾ h.p. Bruneau, manufactured in France and handled in this country by Hobday Bros., of Great Eastern Street, E.C. It was a most practical and unique design for that period. The engine had a water-cooled head, with thermo-syphon circulation; the water compartment was situated in the front portion of the tank, and held four litres (seven pints). At each side of the tank were vertical gilled tube radiators. A single chain encased in an oil bath was the method of transmission, the one chain being used for starting and pedalling the machine, as well as for transmitting the power from the engine to the road wheel. A good spring front fork was also fitted.

I did not have the pleasure of a long trial, but there was no doubt about it, the Bruneau was the embodiment of efficiency. Hills on which air-cooled machines of similar horse-power were jibbers were a mere nothing to the Bruneau. It was surprising what that 2¾ h.p. engine could do, and it could have done even better had it not been a single lever control, viz., spark, throttle, and exhaust lifter combined—a method not conducive to obtaining the best results from the engine. The absence of loss of power in transmission, owing to the chain drive, no doubt contributed also in some measure to its efficiency, but I attribute it chiefly to the water cooling.

Water Cooling on Motor Bicycle Engines.—

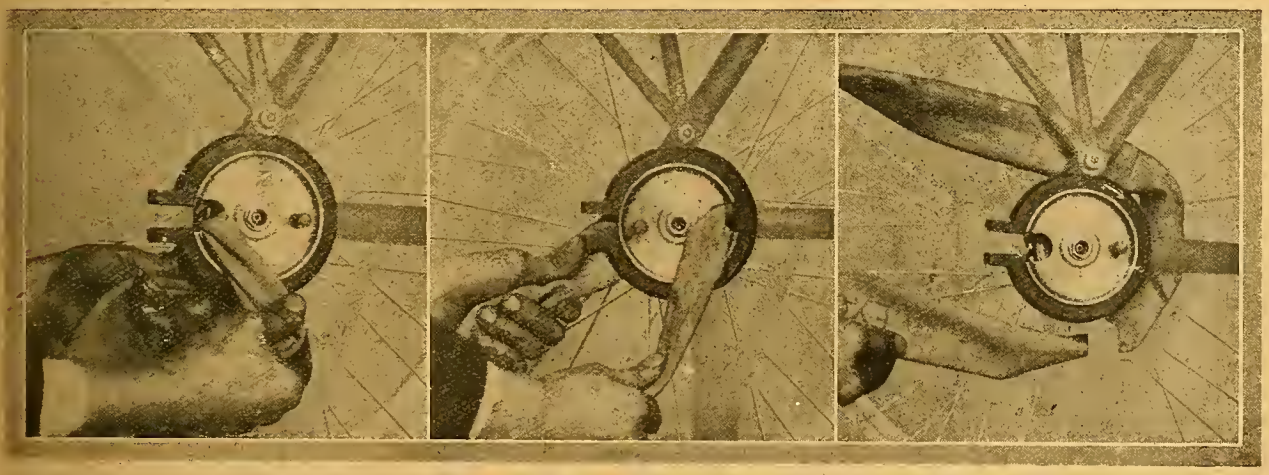
Ease of starting with longer life for valves no doubt followed in due course, but I did not have the machine in my possession long enough to gain experience on these points. It was a great pity that the Bruneau was not actively pushed on the British market; but about the time of its advent the motor cycle business was somewhat depressed, as the industry was suffering from a mild slump, owing to innumerable firms rushing into the business and either overproducing or making unsuitable machines, which the market could or would not absorb. In consequence the Bruneau never got a show in the British motor cycle world. At this time, also, there were other water-cooled motor bicycles on the market, which would have doubtless met with some success, but the slump made their exponents doubtful as to financial results. The Bruneau machine is still sold in France. One bicycle which I well remember, and which was probably frightened off the market by the poor outlook, was made by Green's Patent Syndicate of Bexhill. It was water-cooled by means of a detachable copper jacket, arranged around a specially designed cylinder, and from reports of trials made by the manufacturers did exceptionally well. I have also read letters published in the correspondence pages of this journal speaking well of this engine. It is undoubtedly a good thing, as has been evidenced by the success of similar engines for aeroplane work. The Iris motor bicycle was another water-cooled machine.

Water-cooling Efforts Five Years Ago.

The efforts made in 1905, both air and semi-water-cooled, were perhaps a little before their time, but they were none the less a distinct advance in catering for those motor cyclists who prefer a moderate power with the greatest moderation in the consumption of lubricating oil. I give prominence to the lubricating oil consumption because to my mind air cooling at moderate speeds with heavy loads means also oil (lubricating oil) cooling, and water-cooling seems to be the cheaper and the better proposition, as water is cheaper than lubricating oil.

But, on the other hand, for the speedy brigade with sufficient engine power to maintain a high speed on gradients and under heavy loads, air cooling gives satisfaction, and is minus those winter troubles connected with water-cooling, in the form of cracked water jackets and cylinders, and such like annoying and expensive items. Moreover, troubles with water pipe connections and radiators are not unknown even in summer.

A NOVEL TYRE AND TUBE CHANGING DEVICE.



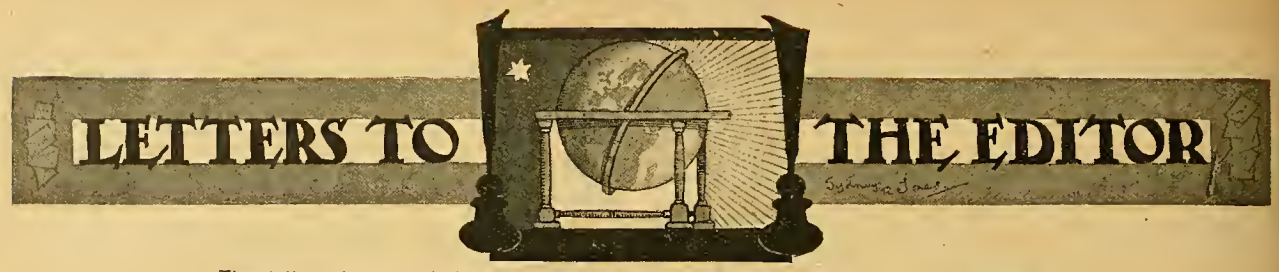
The first operation after removing the bolt clamping the outer ring.

The disc and tube after being rotated a half circle.

One turn of the disc. The tube inside the chain stays ready for fitting.

AN interesting novelty in the shape of a tyre and tube-changing device is clearly shown in the above illustrations. A description of the device is hardly called for, seeing that the photographs are practically self-explanatory, but we may point out some of the advantages of such an arrangement. As every push-cyclist and motor cyclist knows, it is a long operation to replace a cover and endless tube owing to the necessity for removing the wheel and the several connections. This, of course, was the immediate reason for the introduction of butt-ended and detachable air tubes. The clever device illustrated, which is the subject of a recent patent, has been introduced by Mr. Jas. Nuttall, 12, Hillfield, Farnworth, near Bolton. The disc to which the wheel spindle is attached is rotatable in the fork-ends after removing a clamping bolt. The tube or cover is inserted in the groove provided, and the disc is then rotated, causing the tube to be gradually worked inside the forks, without the necessity for undoing any further connections. The air tube may be removed by a reversal of proceedings. The inventor is not at present in a position to make fittings, but is willing to dispose of the invention, or grant a licence for its manufacture.

With reference to the article on rotary engines in our issue of the 7th March, we have just received a communication from Mr. Lamplough, the inventor of one of the rotary engines described, and he informs us that his firm are putting an improved model on the market. The new engine works on the two-cycle principle, and bevels have been dispensed with, an oscillating ring being used instead.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Motor Cycling for Health.

[4644.]—In the issue of December 13th, 1909, is a paragraph headed "More Halfpenny Paper Twaddle," concerning motor cycling and health. I have been a push-cycle rider for twelve years. About twelve months back I took to a motor cycle, and practically gave up the push-bicycle. I ride my motor across country and on very rough roads. The resultant effect on me should be that (according to the author of the article you criticise) I am a nervous wreck; whereas, when I gave up the bicycle I weighed 10 stones. I now weigh 11 stones, and feel better in every way. As regards athletic work, I have not been beaten at tennis, I have won a bat for top average at cricket (batting), and won odd trophies military target shooting, during my motor life.

I do not care about exploiting my performances, but do so in the hope of convincing any doubtful riders that the writer of "Men and Beasts" is "talking through his neck."

South Australia. CHAIN DRIVE.

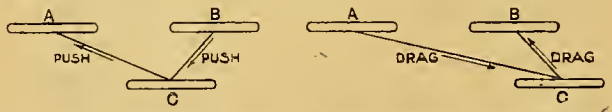
Steering of Sidecars.

[4645.]—*Re* steering of rigid sidecars, perhaps the following tip will be useful to fellow readers. I find the simplest way to learn a beginner is to sit in the sidecar and let the learner start up engine and run alongside for a little while, instead of attempting to mount, when he will quickly learn that the combination has to be steered, and not balanced.

E.S.

[4646.]—I was interested to read the letter of my friend Mr. J. H. Lester [4609] in your issue of February 28th, and to see his instructive diagram as to the probable cause of the trouble experienced by me in steering my sidecar combination to the near side. Mr. Lester is lucky in that he travels on four wheels, though he is perfectly right where it is simply a question of steering round corners; but I venture to think that the "cranked" frame is made by design, as it appears to be, in order that the whole combination will travel in a straight line with the least amount of interference with the front steering wheel. As the chief amount of work to be done is practically in a straight line, this is a more important adjustment than one for turning corners to the near side.

My explanation of this is best explained by the following illustrations, though I am open to correction by others more experienced:



In the above illustrations I have exaggerated the position of the wheels to make my meaning clearer.

In fig 1, the wheel C being in front of B will tend to steer that wheel (B), and as B is pushing C then C will be inclined to push A out of the straight.

In fig. 2, B is dragging C, and being the leading wheel of the two will tend to steer C; as a result C will drag on A, pulling A out of the straight.

The question now arises, at what point between A and B should C be placed in order that A may run straight without wobbling, and as in my case C is 2in. in advance of B, and slightly pointing in to A (see the issue of February 14th), which gives the best running on the straight road, A running quite true with a light touch on the handles.

I am having an adjustment made to carry out Mr. Lester's idea, and will see how this affects the straight running. At present "I hae me doots." HERBERT PORTER.

The Motor Cycle in the United States.

[4647.]—I have read with interest some of your disgusted belt users' letters, including Mr. J. Garvey's. Strange to say, these complaints of belt drive mostly emanate from America, where chain-driven machines are in favour. No one for a moment would believe that the leading manufacturers in this country would stick to belt drives if rubber belts went wrong every five hundred miles, as mentioned by some of your correspondents.

Without wishing to enter into a controversy as to which is the best drive, I can only say from practical experience, both as a maker and user of belts, that the instances given are all contrary to my experience as to the life of a belt, and can only conclude that your correspondents have used either inferior rubber belts or perished ones. As a maker, I have numerous cases where both rubber and leather belts have run over 6,000 miles; in fact, I do not know of a single case where our new Lyso belt has given way under 3,000. Anyway, if your correspondents will order a belt from my firm, I will undertake to return their cash should the belt fail to run 3,000 miles, if they will agree to remit me twenty-five per cent. on the original cost should the belt run over 6,000 miles, and I will accept their word as to distance. I only stipulate that the driving pulley must be true to start with, and be trued up every 1,500 miles (cost 1s.) should it show wear.

EDWARD LYCETT.

Wired v. Beaded Edge Tyres.

[4648.]—I see that in letter No. 4578 Mr. Karslake wants to know what I mean by friction between cover and rim. If there is no friction why is it that tyres creep, and why do people use security bolts? If there were no friction between cover and rim there would be no creeping and no use for security bolts. Personally, I do not use security bolts, as the inner tube is apt to chafe against them, but I use anti-creep powder, which dispenses with bolts and prevents tyres from creeping. The foregoing remarks show that the friction is taken up on beaded edge covers where the tube, being enclosed in the cover, has no rubbing, or at least very little. Now in the wired-on type a lot of the friction is taken up by the inner tube pressing against both cover and rim, and as the tube is the most delicate part of the tyre, the result is that it rubs against the rim, and then you get a rubbed puncture, which is the most difficult to repair, and in spite of paint and tape your inner tube of the wired-on type will always wear out first against the rim. At least, that is my experience of about a score of the best tubes on the market. Mr. Karslake also says that paint and tape are cheap, so are repair patches and rubber solution, but I do not care to have to do much with them, even if they are cheap, as mending punctures, rubbed or otherwise, is a great nuisance. G. V. LOBB.

Balancing Motor Cycle Engines.

[4649.]—We observe in your issue of February 7th a letter signed "L.M.," referring to an engine we balanced for him some months ago, and are pleased to note the satisfaction the result appears to have given. With reference, however, to the surprise he expresses at finding the flywheel under-weighted to the extent of 8½ ozs., it may be of interest to him and other motor cyclists to know that of all the engines we have dealt with in this respect we have never yet found one correctly balanced. The casting of the bob weights even in the best class engines appears to be conducted in a hopelessly slap-dash manner, and the varieties

ALL YOUR REQUIREMENTS ARE CATERED FOR BY THE SERVICE CO., LTD.

Latest Models 1910 Motor Cycles, Second-hand Machines, and Accessories. Terms — Cash, Exchange, or Extended Paymen's. Send for full List Post FREE.

We can deliver at once 1910 Triumphs, Rex's, Indians, M.to-Reves, Douglas's, 2-speed F.N.'s, Enfields, Humbers, Kerry Abingdons, etc. Let us know your requirements. Stock of good second-hand ma chines to clear at low prices.

Lightweights v. Heavyweights.

[4661.]—I beg to express hearty concurrence and sympathy with the Rev. R. Measures. Though I am not honoured by the acquaintance of the reverend gentleman (except by sight) I have frequently seen him speeding along on his trusty mount, waging no unequal contest with the elements of wind and water, slush and snow, frost and fog.

If Mr. Measures has to stop every 117 yards (which of course he has not), then a heavyweight will be the machine he will require. As Mr. Measures says, the heavyweight is both handier and superior to a lightweight in every way.

The heavyweight is relatively easier to uphold than a lightweight, and is no more difficult to take in and out of gates and doorways with one. I think a sportsman is naturally attracted to a big large machine, and prefers it to a puny lightweight with its feeble puff. No; Mr. Measures, I hope there will be plenty of enthusiasts like yourself, and the heavier brigade will triumph all along the line.

B. HIND.

[4662.]—I read Mr. Edgcombe's letter [No. 4588] in your paper with great interest, as his experience corresponds with my own. Ever since I started motor cycling, in 1902, my bugbear has been hill-climbing. When I bought a 1909 Triumph I thought I had done away with this, and I was not disappointed until I went to Devonshire. I certainly failed once or twice on Rectory Hill, but that was through a fault which I discovered and rectified. After doing this I could be certain of riding from London, and without a stop take Rectory Hill at a good pace. My weight is 15 st., and gear used was 5 to 1. When I got to Devonshire, however, I found hills beside which Rectory Hill is child's play. Not only are the gradients much more severe, but the surface of the roads and the bends were, in many cases, appalling. I should like to see a trial of motor cycles between Ashburton and Princetown *viâ* Dartmeet. I would guarantee that no single geared motor cycle would take all hills without the rider dismounting, at least once, if not more often. I made up my mind that I would never tour again in Devon without a two-speed gear, and if possible a chain drive.

At that time I had not properly tried the Whittle belt. I found rubber belts useless with the small pulley, and continued hill-climbing, so I bought a Whittle, but had not then the time or the knowledge to dress it properly, and so suffered from slipping. My subsequent experience with it however, shows me that when properly dressed it can be run very slack, and it is in every way to be preferred to a rubber belt where hard work and small pulleys are concerned. I may say that I was delighted with the Triumph in every other way and its reliability in every part was marvellous, but it wants a two-speed gear to make touring on one in Devon a pleasure.

E. L. SHELLA.

[4663.]—I have read with much interest the correspondence on this subject, and especially the letters which have been published from the Rev. R. Measures and "Rus in Urbe," as, having made the acquaintance of the former gentleman during my motor cycling career, I am in a position to know how well he is entitled to write on such a subject. "Rus in Urbe" has given his imagination a run, and takes it for granted that he is replying to a clergyman who has half a dozen people to visit in a sleepy village when the sun is shining.

Let me at once assure him that he has never made a greater mistake. I do not know a motor cyclist who can speak from more all-round experience than the Rev. R. Measures. He has the necessity to use his Triumph daily (and often by night) in all weathers, over all conditions of roads, up all sorts of gradients, and through traffic of all descriptions. His journeys are often of great length, and include a large number of the busy towns in England, and when occasion arises he does not hesitate to journey through the heart of London. This work he has not been doing for one year, but for five to my knowledge, and, as must be understood, this not only requires the dodging of traffic, but entails numerous stops in the principal thoroughfares of the towns he visits.

What the Rev. R. Measures does is to keep his machine in the same good order as it is turned out from the works, capable of doing anything from walking pace to fifty miles per hour, and of starting at the first attempt, with very slight exertion, on some of the stiffest gradients, and if all riders endeavoured to do this there would very soon be no call for lightweights.

W. M. GUNNETT.

EXPERIENCES WANTED.

"C.H.B." (Newmarket) would be glad to have riders' experiences of the Millennium "Fit-all" two-speed gear, also the Mabon multiple disc clutch.

"H. T." (Chippenham) would like readers' experiences of the Wall Auto-wheel. Is it satisfactory for long journeys of, say, seventy to eighty miles?

A.E.M. (Switzerland) desires owners' experiences with the Wall Auto-wheel as regards fuel consumption, side-slipping, and reliability. Also the 3½ h.p. Scott motor cycle for use on the Continent.

"Sidecar" (Leeds) would like owners' experiences with the Lowen sidecar, particularly with regard to the power required to drive it, use of brake on sidecar wheel, and how best applied, ease of steering, if child is carried in addition to usual passenger whether extra seat in front or extra wide seat is preferable, amount of licence, and if the authorities insist upon a tail light and car numbers being carried.

Will the occupants of a car who assisted two sidecarists between Ripley and Guildford on Saturday, March 5th, write to Messrs. E. K. Plowman and F. Tipping, 34, Church Street, Lee, S.E., stating make and size of car, when they will be pleased to forward the tools which were left behind by the car owners?

Some members of the Herts County A.C. (motor cycle section) who attended the opening meet at St. Albans, and also took part in the reliability run to Baldock and back. (See page 247.)

Prompt Deliveries Assured.

Humber, Ltd., announce that their London depot, 32, Holborn Viaduct, can arrange for prompt delivery of their motor cycles. The demand for Humber 1910 models has been unprecedented.

The East London Rubber Co., 29-31, Great Eastern Street, E.C., report that the pressure of orders for Kerry-Abingdon motor cycles caused them to be rather behind in deliveries, but they have now arranged for a larger output, and can supply on receipt of order.

Vulcanising Motor Cycle Tyres.

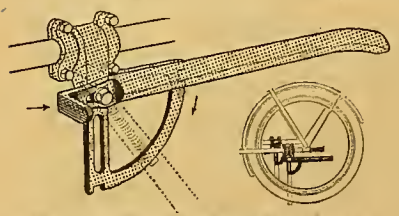
The special H.F. vulcaniser sold by Harvey Frost and Co., Ltd., 39, Great Eastern Street, E.C., for repairing motor cycle tyres, will, in future, be made up complete with tools and material, and will be packed in a special leatherette case. The dimensions will be 6 × 5 × 4½in.

Reasonable Accommodation when on Tour.

We have received a booklet from the Central Public House Trust Association, giving a list of hotels and inns in the various English counties which are under the management of the Public House Trust and People's Refreshment House Association. It will interest motor cyclists to know that the chief feature of the Association is to cater for tourists at a moderate price, and though alcoholic refreshments are sold the Association does not make a point of pushing them to the exclusion of food supplies, but strives rather to derive a reasonable profit from general catering. The inns and hotels are on the whole remarkably well managed, and no better examples in the London district can be found than the Hut Hotel, Wisley, and the Rose and Crown, Tring. We strongly advise motor cyclists to write for the list.

A Quickly Operated Stand.

In the last issue, under the heading of "Accessories and Equipment," we referred to a quickly operated stand made by Smith, North, and Priestland, Holloway Head, Birmingham.

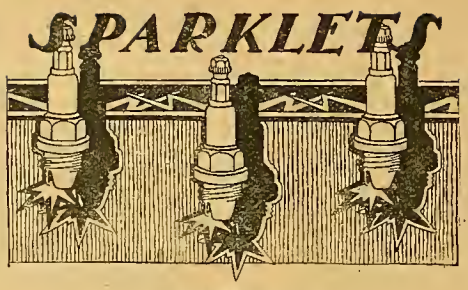


Price's Ukantes Stand made under licence by Smith, North, and Priestland.

Inadvertently this was referred to as the S.N.P. stand, but it should have been called Price's Ukantes stand, as it is made under licence from Price and Co., 25, Rosebery Avenue, E.C., who also make and supply the same article.

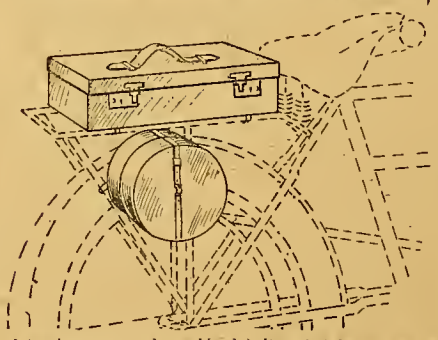
New Birmingham Tyre Depot.

Owing to the increased demand for Kempshall tyres the company have found it necessary to open a depot in Birmingham, at 71, Lionel Street. Mr. Reginald G. Priest will be pleased to hear from Midland motor cyclists who are interested in these tyres.



Touring Equipment.

With the advent of Easter and the touring season, motor cyclists are on the look-out for suitable touring equipment. A lock-up touring case for attachment to the carrier and a combined belt and tube case, sold by the Priory Accessories Co., Priory Mills, Coventry, are shown in the accompanying sketch. The cases are constructed of fibre board and have a covering of pegamoid. Special attention has been given to the matter of suitable fastenings by the manager of the company, Mr. John F. Spencer, who is himself a keen motor cyclist, and consequently knows a rider's requirements. Double locks are fitted to the touring case. The centre compartment in the belt and tube carrier is deep, so that the tube is carried snugly and the edges are unlikely to get chafed or damaged by vibration. The cases are light, strong, and should prove most serviceable, whilst the cost is very moderate. Other specialities for motor cyclists will shortly be introduced by the Priory Accessories Co.



A touring case and combined belt and tube carrier sold by the Priory Accessories Co., Coventry.

Catalogues Received.

The special Continental Tyre and Rubber Co.'s motor cycle tyre catalogue contains particulars of their driving gloves, various types of tyres, magneto covers, belt punches, butt-ended tubes, and other accessories. A copy of this booklet will be sent to any motor cyclists on application to the Continental Tyre and Rubber Co., at 102-108, Clerkenwell Road, E.C.

The 1910 catalogue of Michelin motor cycle tyres contains fully illustrated descriptions of the wired and beaded edge patterns, also the familiar red rubber air tubes, both endless and butt-ended. When ordering tyres the makers recommend that the following particulars be mentioned: Make of machine, horse-power, date of model, make of tyres at present in use, and make of rim. The standardisation of motor cycle rims is referred to specially, and the makers point out the disadvantage to the public on account of the variation in size and form of rims manufactured by different firms. For the wired-on covers the Westwood rim has been adopted as a standard. Copies of the above catalogue may be obtained post free from the Michelin Tyre Co., Ltd., 52-53, Sussex Place, South Kensington, S.W.

The Hendee Mfg. Co., 184, Great Portland Street, W., have forwarded us an advance copy of a catalogue for circulation among British motor cyclists. The first two pages are occupied by an introductory article by Mr. W. H. Wells, in which he explains his reasons for taking up the sale of the Indian machine in this country. The remaining pages are devoted to illustrations of the 4 h.p. single-cylinder and 5 and 7 h.p. twin-cylinder Indian motor bicycles, also illustrations and descriptions of some of the important features of these most excellent machines. Copies will be sent to any reader on application to the Hendee Mfg. Co. at the above address.

Accessories and Equipment.

Phelon and Moore, Ltd., are shortly opening an accessory department at their London depot, Mortimer Street, W.

A Neat Petrol Filter.

The makers of the Brown motor bicycle, Brown Bros., Ltd., Great Eastern Street, E.C., are fitting a very neat petrol filter to the tank. This filter takes the form of a tube which is screwed in place of the ordinary petrol tap union, the tap itself being afterwards screwed into the hexagon nut to which the filter is attached. The tube stands upright in the tank and is provided with fine gauze strainers on each side through which the whole of the petrol must flow on its way to the carburetter. This filter is practically self cleansing, as the wash of the petrol tends to clean off any deposits which may adhere to the gauzes.

A Handy Spare Carbide Tin.

We have received a sample carbide tin from the Union Rubber and Chemical Co., Ltd., Shaw Street, Aston New Road, Manchester. This neat little tin carries one small charge of carbide, and it is most handy to put in the pocket, as it takes up very little space and weighs very little. It is sold filled with Turco carbide, and is always a sufficient reserve in case the ordinary charge in the generator runs out.

An Opportunity for Bargains.

The firm of A. H. Hunt, 115, Cannon Street, E.C., are now clearing a quantity of second-hand goods at extremely moderate prices. Induction coils (plain and trembler), accumulators, plugs, lamps, switches, magnetos, and many other accessories can be obtained at the above address at an extremely low cost.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), on Tuesday morning previous to the date of issue.

When possible advertisements received at Coventry on the Wednesday will be inserted.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Besides those quoted in this space, we can offer other good bargains. Do not fail to get our prices before definitely deciding. Recommended by all the leading makers for exchange business. Terms on application.

WAUCHOPE'S, 9, SHOE LANE, FLEET ST., LONDON, E.C.
Phone, 5777 Holborn. Telegrams: "Opificer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days, and if no sale is effected, each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

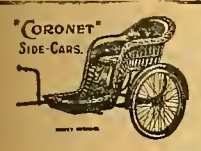
EXPRESS DELIVERY.

We have made arrangements to send these 1909½ TWO-SPEED HUMBERS per first passenger train on receipt of money order or telegraphic money order, so that customers will have full benefit of these machines for their Easter tour. Don't forget we are the only firm offering these new two-speed models to show a clear saving of £12 10s. Also note they carry the usual guarantee.

NO ACROBATIC FEAT

is necessary for starting these HUMBERS. One turn of the handle, and the engine is immediately set in motion. Seat yourself comfortably in the saddle, gently press with your foot the push pedal operating low gear; the machine instantly glides away as graceful as a car costing £500. If you would be the proud possessor of this beautiful mechanism, communicate with us NOW. Why not be in time for Easter?



£54 7 6. for £42 10 0.

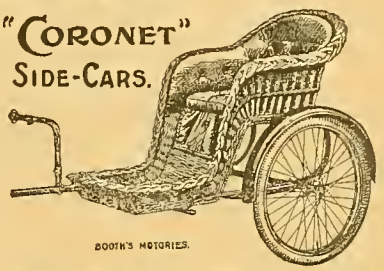
WE CLOSE Good Friday, Easter Monday and Tuesday.

£4 17s. 6d.



We maintain the "Coronet" is the BEST DESIGNED SIDECAR on the Market.

Free from Side-slip.—The "Coronet" Sidecar is attached in three places, the front down tube, bottom stay, and saddle bolt, and can be detached in three minutes. Every tube of attachment is telescopical and adjustable to suit any length wheelbase, any height or width. When attached the combination is as firm and rigid as a Tricar, and entirely free from side-slip, and can be driven safely without passenger if desired.

Price £4 17s. 6d. Discount to trade.

CORONET ADJUSTABLE PULLEY.

12/6

The best variable speed pulley on the market. Loose flange securely held in any position by a simple yet ingenious contrivance. Gear can be altered without the aid of spanners, lock ring easily operated by hand. Buy a "Coronet" pulley and gear your machine suitable for hill-climbing.

Standard makes, such as Rexes, Triumphs, Minervas, supplied without the necessity of sending old pulley for pattern. **Discount to trade.**

"GRIPSKIN" BELTING.

Made from selected parts of hides, correct angle, perfect drive; the best leather belt on the market. Longer life than rubber.

½in., 10d.; ¾in., 11d.; ⅞in., 1/1; 1in., 1/2.

Special terms to the trade.

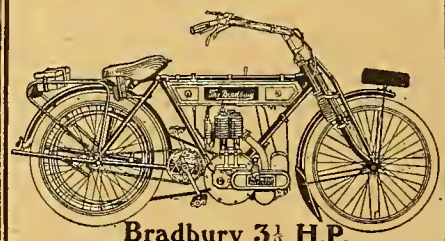
READ THIS

Unsolicited Testimonial from Mr. A. Rudd of St. Helen's as to the merits of the 1910



Bradbury 3½ H.P.

West View, St. Ann's Road,
March 14, 1910. St. Helen's.

After giving your 1910 motor cycle (with free engine in back hub) exhaustive trials, I am delighted with it.

I obtained one of your 1909 machines, and but for an accident should have been riding it to-day, as I was very well satisfied with it, especially with the engine, and its general efficiency and comfort.

When I saw your 1910, I was so attracted by the very great improvements all over the machine, that I decided on having one, and although pleased with 1909, I am most agreeably surprised with this 1910. The engine is more powerful, it walks up hills, and picks up in the middle of steep gradients, which I had to rush when riding one of the best known makes of the same horse power. The plate clutch in the back wheel enabled me to put the engine to a severe test. I let out the clutch on the steepest part of a stiff hill, and came to a standstill. I gently applied the clutch, and glided away in a most gratifying manner. The springs you are now fitting are splendid, and although 1909 was comfortable, 1910 takes the biscuit in this respect. It is like sitting in a car.

I was beginning to think that I was getting past motor cycling, as I am no longer an agile youth, but the clutch has rejuvenated the sport for me.

I have no doubt I shall use this machine more frequently than ever both for business and pleasure. I am not interested in your bicycles any more than that I happily possess one, but I am so pleased with it, that I thought I ought to let you know. You may use this letter where and how you think fit.

Wishing you the success which your machine deserves to obtain for you in the motor cycling world,

Yours faithfully, A. RUDD.

A Bradbury Motor Cycle invariably satisfies the most critical motorist.

CAMEL

Franco-British Exhibition 1908.

3 *Grand Prix.* 8 *Gold Medals.*

As a chain is only as strong as its weakest link, a belt is only as efficient as its least considered essential.

The essential links in motor belting construction—Maximum effective pulling surface; Elimination of stretch; Tensile strength; Flexibility; Centring of core; Prevention of twisting, end breaking, and surface cracking—when evenly considered and supported by suitable materials and experience, ensure a perfect whole.

Camel Belting, owing to its uniform wear, due to scientific construction, is offered and sold as being the nearest possible to the ideal.

Obtainable through all Agents.

DAIMLER, 18h.p., 4-cyl., good tonneau body, with enamework panels, hood and folding screen; great argain, £285.—Heyb.urn, Motors, Maidenhead.

h.p. Darracq, detachable tonneau, seats four, newly upholstered, and new gears just fitted; accept £28; om wanted.—Barker, 34, Oxford Rd., Wertning.

DANHARD, 15h.p., 4-cyl., tonneau body, seats five, white, dark blue upholstery, Stepney wheel, etc.; r quick sale £75.—Heybourn, Motors, Maidenhead.

FORS, 4-cyl., 10-12h.p., 6-seater body, large acetylene headlights, tyres, gears, etc., perfect, dark een; great bargain, £55.—Heybonrn, Motors, Maidenad.

10-12h.p. Phœnix Car, new, delivery from stock, 2-seater, painted blue, complete with lamps and rn; special price £210.—Apply, Little's Garage, Newstle-on-Tyne.

1h.p. Darracq Car for sale; perfect order; guarantee 2 good hill-climber, three speeds and reverse; £27 s.; 4-seater, detachable wind screen, horn, tools, etc.—well, Wells, Som.

1h.p. Humber Car, 2-seater, bucket seats, Dunlop 2 and Clincher tyres, very neat, suit anyone wantg a small car; accept £37 10s., or nearest offer.—20, yde Rd., Tottenham.

SMART 4-cyl. Formau Car, 12h.p., fast and powerful, up to date, push, pedals, forced lubrication, spld order; £70; Triumph motor cycle part payment.—P, iddelsdell, Boxford, Suffolk.

A BARGAIN to immediate purchaser for £45.—10h.p. 2-cyl. car, in excellent running order, four speeds d reverse, Dunl.p grooved tyres.—Address, 4,231, *The otor Cycle* Offices, Coventry.

h.p. Rover, excellent condition, two ignitions, Stepney and waterproof covers, hood, lamps, including acetyne headlight, lock-up boxes, luggage basket, tools, etc., 0 worth of extras; trial; price £85.—John Johnson, rubcrough.

10-12h.p. M.M.C., 5-seated tonneau, upholstering not scratched, body, paint, in splendid order, 2 cyls., imler engine, accumulator and coil ignition, four eeds and reverse, chain drive, good strong hire car, or ike good van up to 15 cwt.; a bargain, £35, or exange for 1909 Triumph motor cycle.—Turvey and Co., e Motor House, Sunderland.

ENGINES.

h.p. De Dion Engine; £7 10s.—143, Church St., Blackpool.

3h.p. Lightweight Engine, splendid running order; 4 25s.—Reeves, 70, Liverpool St., Walworth.

3h.p. Deckert Engine, with pulley, good condition; 4 25s., or offer.—24, College St., Islington.

1h.p. Water-cooled Madison Engine, new; £5, or ex- 2 change sidecar; offers.—Davis, Miller, Lechlade.

ENGINES.—Roc, 4h.p., single-cyl., new 1910 type; 4 early deliveries.—A. W. Wall, Ltd., Birmingham.

[IN] A Twin Engine complete with adjustable pulley, two silencers and inlet pipes; £7 10s.—16 Victoria St., Manchester.

1h.p. J.A.P. Engine (Triumph), new, £4 15s.; 70 by 2 76 De Dion engine, £3; 3½h.p. ditto, £2 15s.—8, High Rd., Tottenham.

h.p. Matchless-J.A.P. Engine, winner of several competitions; lowest £22 10s.; guaranteed.—Ai nuchope's, 9, Shoe Lane, Fleet St., London, E.C.

3h.p. De Dion, not done 300 miles since new cyl. 4 and rings, Brown and Barlow h.b. carburetter, r last August; £4.—99, Southbridge Rd., Croydon.

h.p., Water-cooled, with carburetter, commutator, silencer, £4 4s.; screw-cutting lathe £9; vulcaniser, £1; p. Minerva, £1.—Chivers, Lyte St., Caobridge Heath.

YE'S!—Engine exchange. Your old engine and cash for a new one. Try us. Speciality: Peugeot J.A.P.—Nye's, 69, Leather Lane, Holborn, London.

YE'S!—7-9h.p. Peugeot, good condition, to clear; £6.

YE'S!—5h.p. twin Princeps; £4.—69, Leather Lane, Holborn, London.

PEUGEOT Engines, 2½-3h.p., £8 15s.; 3½-4h.p., £10 10s.; ditto, M.O.I.V., £13 5s.; 3½-4h.p. twins, £11; h.p. twins, £14 5s.—White's, 22, Brooks Alley, Liverl. Royal 3782.

PUCHET, 7-9h.p., twin, A.C., two coils, two accumulators, Longuemare carburetter, Bowden controls all good condition; £10.—H. E. C., c/o Holstein rage, High St., Weyoridge, Surrey.

[MADISON Co., Aerial Wks., Littleover, Derby specialise man-lifting aerial engines, 8 to 10h.p. e latest out in light engines. You must enquire out this for your monoplane. ½h.p. light air or waterled motors. Part machined cylinder, valves, crankes machined, 9s. 9d., for model fliers; prices right; t 4d.

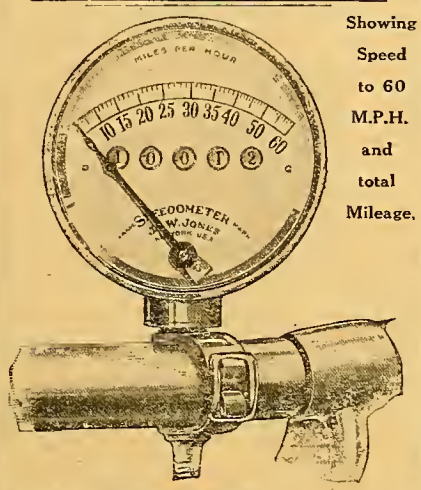
MOTOR CYCLE SPEEDOMETER

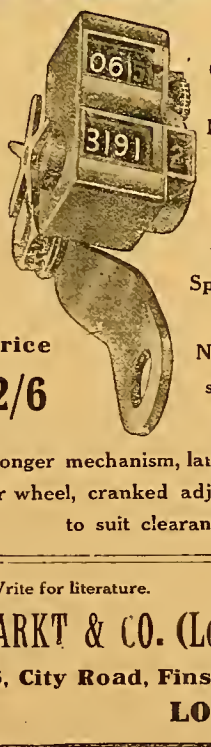
At 3 Guineas?



Showing Speed to 60 M.P.H. and total Mileage.

With Trip Mileage in addition .. .. .. 4 guineas

And with maximum Speed Hand also.. 5 guineas



THE NEW **'VEEDER'** MOTOR CYCLE TRIP CYCLOMETER.

Specially designed.

Price 12/6

Note—Large and substantial case construction.

Stronger mechanism, larger and stronger star wheel, cranked adjustable bracket to suit clearance, etc.

Write for literature.

MARKT & CO. (London), Ltd.,

6, City Road, Finsbury,

LONDON, E.C.

IGNITION APPLIANCES.

MAGNETO. Coil, and Accumulator repairs in two days; guaranteed; low prices.—Fellows, 49, Hertford St., Mayfair.

JEBRON Registered 291-289, vastly superior to platinum, cures misfiring; best contacts for blades, screws, rockers, magnetos, coils. Jebron has no equal.

JEBRON, 2s. 6d. each rivet fitted; Jebron trimmers, 9d.; Jebron screws fit Bosch magnetos DA2, DAY, contact breakers 5a, 5b, 5c, 5s. 6d. pair; old screws Jebronised, 2s. 6d. each. Over 10,000 fitted. Try it.

JEBRON, fitted return post free.—From the inventor, Jebron, 38, Herbert Rd., Plumstead.

JEBRON Contacts were used by Messrs. Collier Bros., Colver, and Martin, in making their recent world's records.

IRIDIUM Champion Contacts. — Any parts fitted returned same day, 1s. 3d. each, warranted pure, special iridium trimmers, 9d.; magneto screws refitted, 1s. 3d. each.—Williams, 16, Wellington St., Woolwich.

ACCUMULATORS. Coils, magnetos repaired, overhauled by expert workmen; a large stock of new and second-hand goods; price list and quotations free.—The Victoria Garage and Electrical Co., Ltd., Coventry.

IGNITION Coils and Magnetos Repaired, any make; accumulators repaired and charged; best workmanship, moderate charges. Tel.: 453.—Glover Bros., Electricians, Coventry.

TYRES.

MAUDES' for Tyres.—Halifax and London.

MAUDES' supply every make of tyre; all tyres we sell are fully guaranteed. We allow from 5s. to 10s. on old covers, and 2s. on old tubes in part payment.—Maudes', 136, Great Portland St., London, W., also Powell St., Halifax.

MOTOR Cycle Tyres retreaded with finest rubber at lowest charges.—See below.

NON-SKIDS fitted to your own covers at very lowest charges.—See below.

WASTE Not, want not; don't discard your tyres in these days of high price new tyres; send them to us and have them made serviceable again; correspondence invited.—City Motor Tyre Co., 1 and 2, Chiswell St., London, E.C.

800 by 80 Inner Tube, new, and perfect; 12s.—Mawson, draper, Morecambe.

ONE Dunlop Cover and Tube, 26 by 2¼, absolutely new and perfect; 35s.—Baker, Waldegrave Rd., Teddington.

CLINCHER Studded Covers, 26 by 2¼in., run about 500 miles; 55s. the pair.—Ernest Haddon, Bridgwater.

MICHELIN Cover, 26 by 2¼, Moseley cover, 26 by 2, beaded edge, brand new; 17s. each.—5, Forest Rd., Forest Gate, E.

26 IN. by 2¼in. Palmer Cord, unscratched, only run 50 miles; cost £3, accept 27s. 6d.—Motor, 10, Bisham Gardens, Highgate.

RE-TREADING with Rubber-studded Treads.—Cycle covers, 4s.; motor cycle 12s. 6d.; sections free.—Fox, 30, John Bright St., Birmingham.

HALIFAX.—New covers, best makes, from 16s. 6d.; tubes, with valves, 4s. 11d.; bargain list free.—Motor Exchange, Westgate, Halifax.

ARDEA Co.'s retreading; all sizes motor cycle covers, heavy, plain, or ribbed, 11s. 6d.; rubber studded 14s.; loose bands, tubes made butt-ended.—331a, King St., Hammersmith.

CHALLENGE Reinforced Inner Tubes, for motor cycles and carriers, all sizes now ready for immediate delivery; illustrated price list on application.—Harvey Frost and Co., Ltd., 27, Charing Cross Rd., W.C.

26 IN. by 2¼in. Clincher A Won New Motor Cycle Covers, 17s. 6d. each; also motor cycle covers and tubes, cheap, all sizes.—Murray, 37a, Charles St., Hatton Garden, Holborn.

NYE'S!—Tyre exchange! Exchange that old cover for a new one and cash difference; liberal allowances; any make of tyre supplied on cash, exchange.—69, Leather Lane, Holborn, London. 'Phone 6299 Holborn.

BASTONE'S.—New rubber studded motor cycle covers, wired edge, 26 by 2, 17s. 6d.; 26 by 2¼, 18s.; 26 by 2½, 19s. 6d.; 28 by 2, 18s. 6d.; 28 by 2¼, 19s. 6d.; beaded edge 2s. extra.

BASTONE'S.—New motor cycle covers, ribbed pattern, wired edge, 26 by 2, 2¼ 11s. 6d.; 26 by 2½, 28 by 2, 2¼, 12s. 6d.; beaded edge, 2s. extra.

BASTONE.—Peter-Union steel studded motor cycle covers, 24 by 2¼; 30s. each.

BASTONE'S.—Tubes, with valves, best quality, and guaranteed, 26 by 2, 6s. 9d.; 26 by 2¼, 7s.; 26 by 2½, 7s. 6d.; 28 by 2, 7s.; approval against cash; subject to being unsold.—Bastone, 215 and 217, Pentonville Rd., King's Cross, London, N.

MICHELIN Covers, brand new, fully guaranteed thick treads, 26 by 2, wired, 14s.; 26 by 2¼ wired, 15s. 6d.; 26 by 2 beaded, 15s. 6d.; 26 by 2¼ beaded, 17s.; new guaranteed Continental tubes, 26 by 2, 8s. 6d.; 26 by 2¼, 10s.; new Continental rubber non-skids, beaded, 26 by 2, 27s. 6d.; 26 by 2¼ 30s.—Stewart 12, Market Sq., Horsham, Sussex.

COUPLINGS.

UNITO Patent Coupling, price one guinea, for connecting motor cycle to pedal cycle. When touring use the Unito. Many people have expressed the opinion they prefer it to a sidecar and for a low power machine it is much more suitable. If you do not know all about the Unito write (Dept. B.) Unito Coupling Co., Brecon St., Cardiff. London Agents, 75, Bishopsgate St. Without.

SITUATIONS WANTED.

MOTOR Cyclist, 28, seeks position in garage showroom dealing in accessories and motor cycles, some clerical work undertaken; moderate salary.—Blenkarne, 64, Forthbridge Rd., Clapham Common.

SITUATIONS VACANT.

MOTOR Cyclist wanted by large dealer in new and second-hand machines to assist in salerooms, must be capable of tuning up, and preference given to one with mechanical knowledge.—Write "L.J.," c/o J. W. Vickers and Co., 6, Nicholas Lane, E.C.

FINANCIAL.

WANTED, motor cycle maker, who is also exchange agent, to take up small commercial venture; no risk.—No. 4,254, *The Motor Cycle* Offices, Coventry.

NYE'S Advance money on good machines left with them on sale. No interest charged. The nicest firm to deal with in London. Many testimonials for quick settlements. Cheques are available for inspection May we do business with you?—Nye's, 69, Leather Lane Holborn, London. 'Phone, 6299 Holborn.

TUITION.

MOTOR Car driving and mechanism taught in one month.—No. 4,072, *The Motor Cycle* Offices, Coventry.

BUSINESSES AND PROPERTY FOR SALE, TO BE LET, OR WANTED.

SPLENDID Opportunity.—Cycle, motor cycle, and car business for disposal, comprising three shops, separate garage and workshops, situated London suburb, on one of the best roads, position commands bulk of the trade enough repairs to keep staff going all the year round, and can be improved; present owner, having another business, has insufficient time to devote to both; price all at £1,200.—Further particulars from Box L1,637, *The Motor Cycle* Offices, 20, Tudor St., E.C.

INSURANCE.

PLEASE send for reduced rates for 1910 policy; personal 5s., inclusive 18s. per annum.—Bass, insurance broker, Ongar.

MOTOR Union Insurance Co., Ltd., give the best terms; prompt settlements; most generous treatment; free legal defence.—Write, G. H. Jones, Talbot House, Lichfield.

REPAIRERS.

PREMIER Motor Co. for all repairs.

PREMIER Motor Co. for Antoine parts.—Aston Rd., Birmingham.

ANTOINE Cylinders, pistons, etc.; prompt delivery. —Premier Motor Co., Aston Rd., Birmingham.

COMPRESSION.—Cylinders ground and new pistons fitted, 24s.; oldest engines restored to highest vitality.—Premier Motor, Birmingham.

OBSOLETE Parts accurately duplicated; irreproachable work; quotations free for all repairs.—Premier Motor Co., Ltd., Aston Rd., Birmingham.

ACER, Ltd., for repairs.—64, Grosvenor Rd., Hanwell, W. Tel.: 433 P.O., Ealing.

COMPRESSION Restored, cylinders ground to .001in. guaranteed; pistons fitted.—Acer, Ltd.

ENGINE Repairs in all branches.—Overhauling, rebushing, replacements.—Acer, Ltd.

RAPID Delivery and reasonable charges. Lists free.—Acer Ltd.

WELDING.—Broken cylinders, flanges, cracked water jackets, valve seatings, pistons, connecting rods, and general castings.—Below.

MOTOR Repairs, cylinders ground new pistons fitted, overhauling, rebushing, replacements, crankshafts trued.—Below.

WELDING.—Aluminium crankcases successfully repaired work guaranteed.—West London Welding Co., Essex Place, Chiswick Telephone, 536.

FOR Accurate Cylinder Grinding, new pistons and rings, send to New Croker-Barnes, Ltd., engineers, Liverpool.

TWISTED Frames, alterations, etc.—Middleton and Co., tube specialists, Watson St., Newington Green, London, N.

ENGINES Overhauled, new bearings and rings. Trow motor cycle, 2¾h.p., 26 wheel, low frame, £16.—Trow, Balham St., Plaistow.

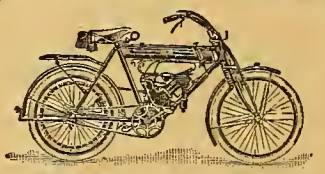
CRACKED Cylinders etc., of motors successfully repaired by Lea's metallurgical process. — Lea and Son, Engineers, Runcorn.

RELIABILITY AND DISTINCTIVENESS.

A customer writes: "Your 'Handy' motor cycle is an exceptionally well-thought out machine, and is a long way ahead of all other lightweights in accessibility."

Splendid performances on hills—no pedal assistance wanted—fast on the level—and a small petrol consumption all the time.

The "HANDY" Light-weight.



Price 35 Guineas, complete.

2½ h.p. Single-cylinder Engine, automatic carburetter, Bosch magneto, Hobart adjustable pulley, Druid spring forks, handle-bar control.

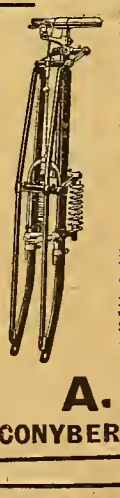
Catalogue and particulars from

HOBART BIRD & Co., Ltd.,

63, Cheylesmore, Coventry.

The Reliable Fork

All wise men frankly concede that there must be CONFIDENCE before there can possibly be comfort, and this principle applies to motor cycle riding just as it does to everything else. It will, therefore, be worth your noting (and well worth it) that the



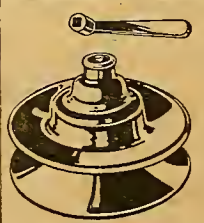
'DRUID'

SPRING FORK

is an appliance on which you can depend with the most implicit confidence, and the sooner you are possessed of the details, the better.

A. DREW,

CONYBERE ST., BIRMINGHAM.



THE "QUICK" ADJUSTABLE PULLEY.

Good appearance, smooth all over. Adjusted in three seconds with one hand without removing belt, dropping stand, or seeking support. As simple as winding up your watch. Remains as set. Why be troubled with a slipping belt when you can dismount, alter your pulley, and be away again in ten seconds. This can be proved

J. Chaplow & Sons, Kendal.

London Agents—The Service Co.

REPAIRERS.

ENGINES overhauled, new bearings, rings, etc.; sm £1: twin, 30s.; work guaranteed.—Phillips and ers, 86, South End, Croydon.

LIVERPOOL.—Re-boring, grinding, balanced pist re-bushing, improvements; expert workmanshi hite's, Brooks Alley, Hanover St. Royal 3782.

REPAIRS of all descriptions.—Pistons, rings, conn ing rods, parts made to specification, cylinders ored, general machining, re-bushing, magneto repa etc.—Pickering and Darby, Belgrave Rd., Birmingham

CCCCCCCC. — Compression means power; cyl. bored and new pistons fitted; guaranteed 1-1,000in., bears 13 stone on pedal; write for lis Gradior Machine Co., Compression Specialists, Staff

COVENTRY.—Motor repairs of all descriptions; cy ders re-bored and pistons fitted, engines re-bus gears, valves, cams, pulleys, or any part duplicate Coventry Motor Engineering Co., Motor Experts, I St., Coventry.

BIRMINGHAM.—Cylinders re-bored and new pist fitted; engines re-bushed throughout; connect rods, cams, pulleys, valves; old high frames cut down rought up to date; first firm in the district to re-b ylinders, and first firm to advertise modernising fram quotations by return, and prompt delivery.—Priest o., 66, Bishop St.

COMPRESSION Specialists are we, with a plant sec to none. Our work is as perfect as experience, c and best tools can make it. Every detail guaranteed a genuine all-embracing guarantee. We charge from 1 6d. for re-boring cylinders and fitting complete new tons; better work cannot be obtained; further parti lars gladly given.—Tennant Engineering Co., 120, I shore St., Birmingham.

EXCHANGE.

EXCHANGE motor cycle for push and cash.—Stew North Main St., Wexford.

EXCHANGE, a new gent's cycle, 24in., for rigid si car.—17, Larkhill, Blackburn.

6h.p. Twin, for smaller power and cash.—E., 19, I acre Rd., Willesden Green, London.

GENT'S push Bike, new tyres, and 30s., for lightwei motor cycle.—64, Davies Mews, Davies St., W.

HALIFAX.—Any exchange considered; send for m ster lists.—Motor Exchange, Westgate, Halifax.

FIELD Glasses and Case, for spring forks, or anythi motorcycle wanted, ⅞ belt, for cash.—Red Lion, Lo ton.

EXCHANGE Humber Motor and cash for Triumph, good magneto machine.—Tapscott, King St., Tiv ton.

EXCHANGE Brand New 2¾h.p. 1910 J.A.P., ridden, and cash for small car.—A. Moyse, Kessi land.

WILL Give 2¾h.p. Pebok Motor Cycle, free engi for sidecar and cash.—785, High Rd., Leyt stone.

WILL Give gent's cycle, just enamelled and plat and cash for sidecar.—785, High Rd., Leyt stone.

EXCHANGE gent's B.S.A. cycle, as new, and cash, 1 twin Douglas.—Particulars, A. Matthias, 76, B tersea Rise, S.W.

SMART 6h.p. De Dion Engined 2-seater, three spee reverse, for magneto bike and cash.—20, Pott newton Lane, Leeds.

10 Guinea Centaur Cycle, and new vertical steam e gine, value £6, for motor cycle.—Webb, Hor Cross, Greenhithe.

EXCHANGE small De Dion car (2-seater), good ord for 3½h.p. motor cycle (magneto), or £20 cash. Guzeley, Penny Stratford.

EXCHANGE for 1909 Triumph motor cycle, M.M. car (see Car advertisement).—Turvey and Co., T Motor House, Sunderland.

WANTED, Triumph, 1909, complete; exchange Goe binoculars, g ld repeater, and cash.—Mdc, 4 Chichester St., Belfast.

WANTED, motor cycle; exchange noted winning Kin Charles toy spaniel.—Box No. 4,287, *The Mot Cycle* Offices, Coventry.

3h.p. Gas Engine, dynamo, lamps, and shafting, f 4 lightweight motor cycle, or sell cheap.—Burton, Lewis Lane, Cirencester.

EXCHANGE 7h.p. Garrard tricar, three speeds, wor drive, wheel steering, for bike and sidecar.—Walke 5, Cross Francis St., Leeds.

NO. 6 Chater Frame, tank; wanted, 5½h.p. J.A.P. e gine, Roc, or Rex gear, cash adjustment, or sel —17, Tamworth Park, Mitcham.

GENT'S £10 10s. Centaur Cycle and gent's £6 15 Rudge cycle, both practically new, for good twi engine.—9, Beeton Rd., Sheffield.

RUDGE-WHITWORTH Lady-back Tandem, practi cally new, unscratched; exchange for good moto cycle.—E. Bateman, South Shields.

LIVERPOOL.—Motor Cycles exchanged for lates models, or sold on commission.—White's City D pot, 22, Brooks Alley. Royal 3782.

2¾h.p. Minerva Carburetter and Silencer, in good con dition, for 5h.p. twin, cash adjustment. — Armitage, Florence Av., Ashley Rd., Leeds.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

The Trade and the Trials.

IN the last two issues we have pointed out that some members of the industry have under consideration the curtailment of trials, and we have already given our views as to why it is inadvisable to curtail these competitions. While this subject is under consideration it may be interesting to compare the numbers of private owners and trade riders in last year's A.C.U. events, such as the Six Days' and Quarterly Trials. Roughly speaking, the private owners represented about thirty per cent. of the entries, which does not by any means account for a tithe of the expert private owners in the country. If, instead of thirty per cent. private owners and seventy per cent. trade riders, we could see the figures transposed, we should be very much more satisfied, and the results of the trials would be far more interesting to the general bulk of motor cyclists. Prospective purchasers want to know how the machines they intend to buy will perform in the hands of average riders, and, although some of the private owners may be nearly as expert as the trade riders, few have the facilities for gaining that thorough knowledge of their machines that the trade rider has in his daily occupation. If, instead of attempting to curtail the trials, the members of the industry would come to some amicable arrangement to subscribe a certain amount to assist the A.C.U. in organising its events, then the A.C.U. would be able to secure an entry composed wholly, or nearly so, of private owners at small nominal entrance fees. At present the trade makes the trials possible by providing the sinews of war in the form of expensive entry fees; it might just as well pay the piper in another way, leaving the competitors to be recruited from the amateur ranks.

Where Improvement is Needed.

CONTINUING the subject, we should like to remind manufacturers (who apparently have the making or marring of the trials in their hands) that reputations have been partly built up or lost in road trials, and that as these competitions have been of service during the last few years, they are equally likely to be advantageous in the future. No machine is so good or reliable that it cannot be improved, and we particularly require improvements in the direction of springing. Motor cycles have now become so speedy that a rough road necessitates better springing both fore and aft. There is no hiding the fact that thousands are waiting for perfection in this direction. There are a few well sprung machines on the market, but the majority of makers have not, up to the present, given that attention to springing which the matter deserves. When the tyres are pumped board hard, as they have to be to support a fairly heavy machine and rider, motor bicycling on a rough road is not so comfortable as it might be. For this reason alone, disregarding other desirable improvements, trials should be continued.

Speed and Multiplicity of Explosions.

ON the above subject we had something to say a week or two ago, but we may be pardoned for returning to the topic in view of an experience we had during the Easter holidays. It may seem puny to endeavour to persuade the police that, because a motor bicycle emits a continuity of explosions, it is not necessarily travelling fast, but we had abundant proof during the holidays that policemen as a whole are easily misled by the sound of the exhaust, and they have become so accustomed to the

single-cylinder "pop, pop, pop," that they are altogether baffled when a machine such as a two-stroke twin-cylinder comes along. We were riding one of these machines at Easter, and on two occasions a policeman held up his hand as a signal for the rider to slow down, and we are confident that the warning was prompted merely by the continuous buzz of the engine, and not by the speed of the bicycle. The surprised looks of policemen in other districts were sufficient to prove to us that they were in a perplexed frame of mind, and hesitating whether to hold up their hands or not. The rider's situation was as amusing as it was serious, for a constable might easily have stopped a rider and unjustly reported him for furious or reckless riding, or however he liked to construe it. In course of time, no doubt, the police will be educated in this matter, but we would again urge motor cyclists to lose no opportunity of explaining that the noise emitted by a motor bicycle has no direct bearing on its speed.

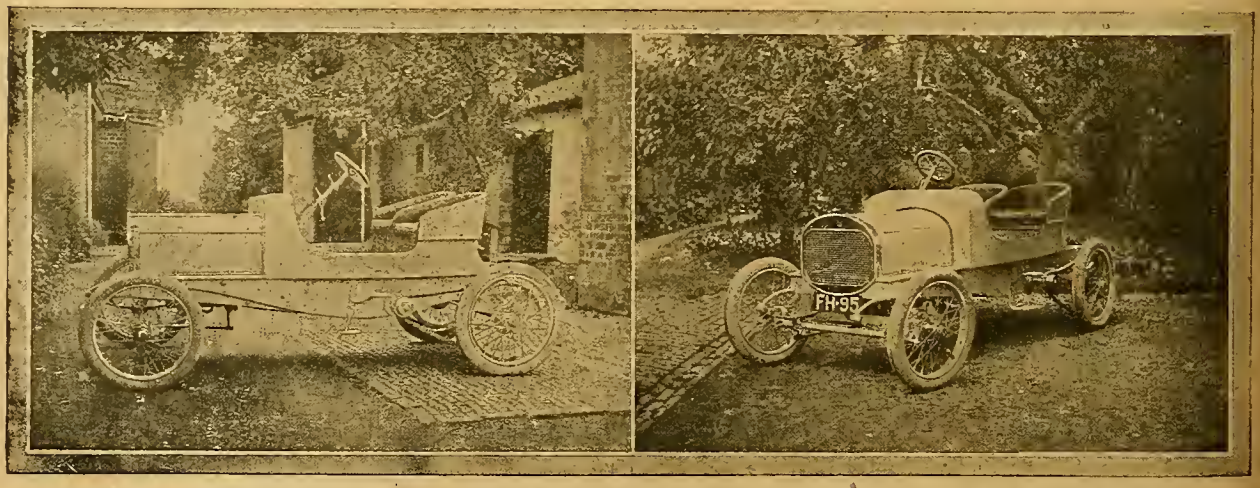
A LIGHT FOUR-WHEELED RUNABOUT.

FROM time to time I have noticed queries in *The Motor Cycle* respecting a light runabout built on motor cycle lines. It may therefore be of interest to readers to know that I have just finished building a small motor vehicle on these lines for my own use. As the illustrations show, it is a two-seater with a 7ft. wheelbase and 4ft. track. In appearance it is a miniature car with bonnet and radiator complete. The latter is, of course, make believe, as the engine is air-cooled. It is, in fact, the well-known four-cylinder F.N. of 5-6 h.p. It is a very flexible engine, and runs smoothly without vibration. It is set in the frame crosswise, so as to give an open drive to the counter-shaft. It also enables all the four cylinders to face the direction of travel. On the crankshaft I have fitted a flywheel, a twenty teeth chain sprocket, and a Mabon friction clutch. The latter is operated by Bowden wire from the steering column, and will pick up the drive smoothly and without difficulty.

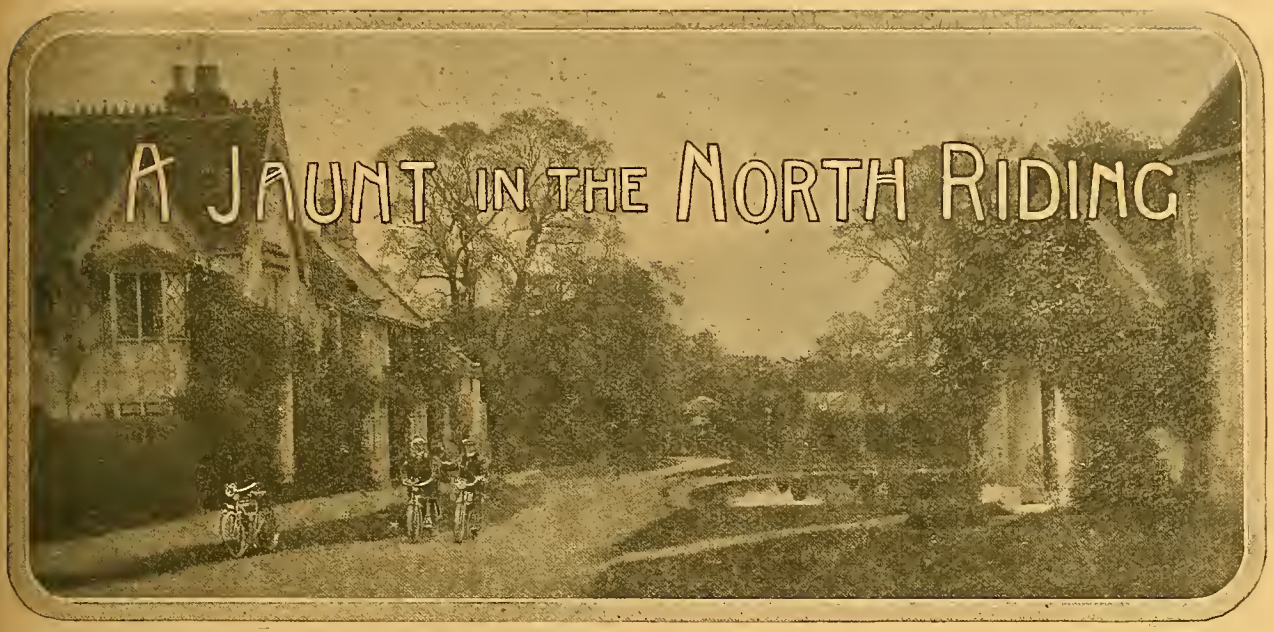
From the engine the drive is by Renold chain to a thirty teeth sprocket wheel keyed solid on the counter-shaft. This counter-shaft runs on ball bearings. Near its centre is a brake drum and band operated by the foot. On each end of the counter-shaft is a Lloyd's Auto-varia pulley. These pulleys drive the two rear road wheels which are fitted with V belt rims. There is no differential. I have not found one necessary, as with this drive the car will take any curve without trouble or detriment to the steering. Of course, one of the belts overruns the other, and the L.M.C. pulleys lend themselves admirably to this requirement.

On a straight road these pulleys act in unison according to the gradient, working at full diameter on the level and automatically reducing the gear ratio on a hill. It is a pleasure to lean over the side of the car and see the way they open and shut on an undulating stretch of road. The rear driving belts are 1in. Whittles. As the total weight of the car is so light, a reverse is not necessary. The machine is geared 6 to 1 normally when the L.M.C. pulleys are working at full diameter. When the machine mounts a gradient these pulleys allow the belts to drop lower in their grooves, and the gear drops to 8 to 1. Further than this I cannot at present reduce the gear, but I am just about to fit an epicyclic gear on the counter-shaft which will give me a further reduction for use in extreme cases. Most of the fittings used in this car are of Chater-Lea make. Tyres are Dunlops 700 × 80 mm. The frame is of specially selected ash, every part throughout is light but strong, and I have driven at all speeds up to 30 m.p.h.

In conclusion, I would strongly recommend all who contemplate building a machine of this type to drive both rear wheels. The strain on the frame is thereby equalised, and the work divided between two belts. I notice a correspondent "W.G.A." proposes to build a runabout and to make the front drive (from engine) a belt one. He will find this very hard work for a belt, and the mechanism he will have to employ for moving the sliding flanges of his pulleys will have to be very strong indeed. He will find a chain more satisfactory for his front drive. Variable pulleys answer in the case of any rear drive, as I have proved by those on my machine. J. J. B.



A smart looking belt-driven runabout built on motor cycle lines, and fitted with an air-cooled engine. (See accompanying descriptive article.)



A JAUNT IN THE NORTH RIDING

HOW many motor cyclists—including Yorkshiremen—are acquainted with the beauties of the scenery in the North Riding? It is undoubtedly neglected by the average touring motor cyclist. Last summer three enthusiastic riders—the writer one of them—decided to spend a week-end exploring the beauties of the district, which had been described to them in eulogistic terms by several of their touring friends.

Leaving the ancient and interesting old city of York, after having spent the night at that old-fashioned hotel, the Windmill, whose buxom and good-natured landlady is so well known to motor cyclists, we were soon whirling away down through Bootham Bar and along the straight flat road leading direct to Gilling and Helmsley—the old-fashioned market town on the east of the Hambleton Hills.

Our party consisted of a 4½ h.p. two-speeded tricar and passenger, and two heavyweights---one mounted on a 2 h.p. lightweight and the other on a 6 h.p. twin—and as the already heavily loaded tricar had undertaken to carry all the luggage, camera, etc., and was considered on that account to be the slowest vehicle of the lot, a rule had been made that it was to form the vanguard of the party and always keep in front. How this rule, excellent though it seemed, led to our party being divided for the best part of our delightful little outing is soon told. For having traversed only about ten miles of the twenty-three dividing York and Helmsley, a mistake in turning to the left instead of to the right caused us to part company with the tricar for the rest of that day, and, greatly to the dismay of the photographer of the party, his camera and apparatus had gone as well!

Ruined mill and roadside spring, Rievaulx.

However, after considering what was the best plan to adopt under the circumstances, and vainly toot-tooting our motor horns for the best part of half an hour, it was at last decided to make the best of our way to Helmsley, hoping to meet the missing tricarist there.

A little further on we began to encounter a series of rather steep hills, which proved a little troublesome for the "little 'un," the rider having

A Jaunt in the North Riding.—

to use his pedals rather vigorously. However, the scenery gradually became more and more interesting, and when nearing Gilling we came across a wild moorland road, and then on through roads bordered with weird-looking fir trees, with a lake or two shimmering in the distance. The two heavyweights were now quite contented except for the lost camera, the lack of which was constantly lamented as view after view worth photographing successively unfolded itself.

Whilst they were thus merrily spinning along it suddenly dawned upon them that they were on the wrong road, and they did not get to know their whereabouts until they passed a beautiful estate, which was afterwards identified as Newburgh Priory—the place where Oliver Cromwell is supposed to be buried in its very walls, and is now the property of one of his descendants, Sir Geo. Wombwell. Arriving in the middle of the beautiful little hillside village of Coxwold, the motor bicyclists' eyes were at once greeted with the sight of the ideal old-fashioned country hostelry, the Fanconbery Arms, half timbered, and covered with a mass of luxuriant creepers.

Inside, the old oak settles and a cheery landlord gave just the touch the place wanted to make it welcome to the now hungry motor cyclists, and they soon were set down to refresh the inner man, and enquire their best and nearest route to Helmsley. This was sooner said than done, for the worthy host had evidently a very hazy notion of what the machines would do to negotiate the various "banks" in the district, and a "bank," he announced with great seriousness, would have to be climbed if they wished to see Helmsley before sundown that day.

The choice of the "banks" included Sutton, Wass, and Kilburn—all of them exceedingly steep, according to local report. At last, after long consideration, it was decided to follow the route *viâ* Wass Bank, although both the riders were afraid of the report of the terrific gradient to be encountered, the twin being badly out of tune, whilst the 2 h.p. was hardly suitable for tackling hills that frightened even big car drivers.

Rievaulx Village and Abbey.

However, they soon were under steam again, and another mile or so along the road brought them in sight of the majestic ruins of Bylands Abbey, standing close to the roadside and situated amongst splendid scenery. This ruin stands right at the foot of the formidable hill, Wass Bank. The hill itself is hidden from view by trees, but a sharp turn through the small village of Wass brought the riders unexpectedly on the gradient. The surface was very peculiar, consisting of a series of step-like rises, caused probably, by the water running across the road during the severe storms which often rage in these hilly districts (any reader who attended the 1908 Sutton Bank hill-climb will doubtless remember one occurring on that day).

Steep hill leading from the Helmsley road into the village of Rievaulx.

The 2 h.p. when about half-way up the hill ceased firing, and as the rider of the twin passed the late rider of the "little 'un," who was rather exhausted by the furious pedalling which he had indulged in, he gave a sickly sort of smile, as much as to say, "All right, wait till you get a bit further on!" And further on,

Rievaulx Abbey, south-eastern aspect.

A Jaunt in the North Riding.—

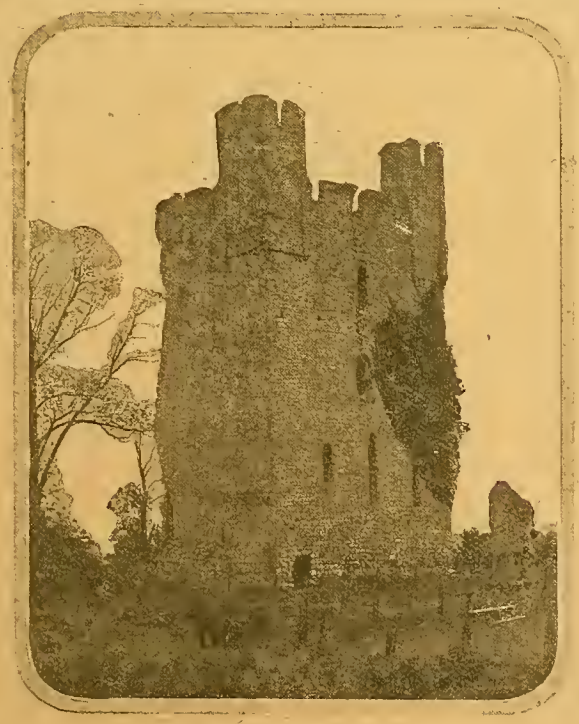
a bad bend and a stretch of about 1 in 4 proved his undoing. As a matter of fact, the 2 h.p. reached the top first, and its rider came down the hill again and helped to push the unwieldy twin the rest of the way to the summit!

When the riders had recovered from their exertions and turned to look back at the grand panorama spread out before them—for, like Sutton Bank, the road has been engineered right up the side of a cliff—a deep ravine covered with trees met their sight when they leaned over the stone wall which protected the road. The views from these "banks" are really grand, as one can trace the roads and villages for miles. It was therefore with reluctance that steps were retraced to the motor cycles, and the journey continued across the bleak moorland road that leads to Helmsley—past the stately herds of deer in Duncombe Park, which runs parallel to the road all the way down to Helmsley. This is a good road for a motor bicycle, but very bad for a tricar, as the ruts on either side of the road, which is very narrow, are sometimes 8in. or 12in. deep.

The Terrace, Rievaulx. One of the small ornamental temples may be seen in the distance.

An Amusing Incident.

Arriving at Helmsley, the first duty was to seek the aid of the local P.C. and ask him if he had seen anything of the missing tricar, which, however, he had not; so he was asked to keep a look-out, and if he saw one to stop it and inform the riders that the party had arrived—which he kindly did. The motor bicyclists afterwards learned that the owner of the tricar had received a shock on entering Helmsley when the man in blue held up his hand and signalled him to stop. Visions of a piece of blue paper and a police court at once appeared before the astonished driver; but explanations were soon forthcoming, and the good-natured officer was warmly thanked for his kindness.



All that remains of Helmsley Castle.

After a good meal at another old-fashioned hotel—the Black Swan, which stands in the old-world market place of Helmsley—the two heavyweights again started their iron steeds, and were soon romping up the gradual incline that leads to that famous little place, Rievaulx, which is three miles distant from Helmsley, and on the direct road from that place to Sutton Bank and Thirsk (nine miles). Arriving at the entrance to the renowned terrace which overlooks the valley, they left their machines outside, paid the entrance fees, and strolled along the beautifully kept velvety lawn, which is half a mile long and has a small ornamental temple erected at either end, the ceilings of which were painted by some famous Italian artist. On looking over the brink of the terrace, the abbey could be seen nestling in the vale below. This is a spot that all motorists visiting Sutton Bank should not fail to see whilst in the neighbourhood it being only seven miles from the top of that famous gradient, and anyone who takes the opportunity of visiting these splendid ruins, will be amply rewarded for his journey, if he only sees this one beauty spot in a charming country.

The Majestic Ruins of Rievaulx Abbey.

At the foot of the terrace previously referred to, one is at once confronted with the majestic ruins of Rievaulx Abbey. The ruins stand in the midst of a group of creeper-covered thatched cottages—which are all pictures in themselves—and the little River Rye, whence the abbey takes its name (Rye Vale), winds its way to the sea through the beautifully wooded valley, whilst on either hand tree-covered slopes shut in this lovely scene, so secluded from the rest of the world. Here—greatly to everyone's surprise—the two riders came across their lost friends, the tricar having come along *viâ* Thirsk and Sutton Bank, which

A Jaunt in the North Riding.

it had gallantly ascended minus its passenger, and soon the re-united party were relating to each other their adventures over an excellent cup of tea supplied by a very old lady at one of the ancient cottages at Rievaulx. After the long-lost camera had been unpacked and a few plates exposed, a start was made for the nearest hotel, where the party rested themselves after an exciting though tiring day in the fresh air amidst lovely scenery. After an evening recounting the many adventures and experiences, and a good night's rest, a grand ride home was enjoyed, and the participants were ready for business next day, thoroughly refreshed in body and mind. S.T.H.

The Northern Meeting of motor cyclists at Richmond (Yorks.) on March 25th. Some of the motor cycles in the old Market Square. Over 350 riders with their machines joined in the assembly, so that the hotel accommodation of the little town was taxed to its utmost capacity.

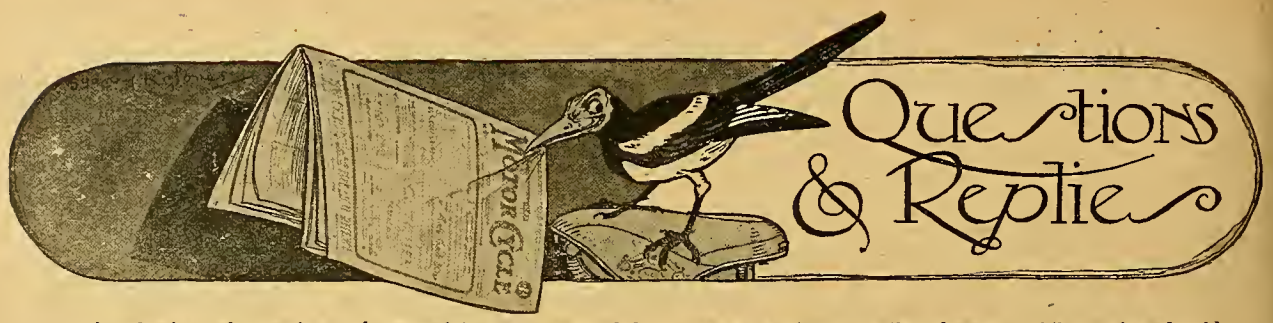
T.A.C. IMPROVEMENTS.

THE Wilkinson Sword Co. are extremely busy at the present moment in turning out T.A.C. motor bicycles, for which a large number of orders have been received. Since its appearance at the Stanley Show the machine has undergone several improvements. The design and material of the starting device have been considerably altered for the better, and the device now works admirably. The inlet pipe and carburetter are extremely neatly fixed to the engine. The pipe is provided with four outlets, which fit tightly against the inlet valve caps, the pipe being held in position by means of two brackets, and of these one end is attached to the cylinder casting and is free to move, and through the other runs a screw with knurled head, which screws into a recess on the top of the pipes. These two brackets hold the pipe on firmly, and enable it and the carburetter to be removed bodily without the aid of tools, so that the valves may be quickly reached. The diameter of the valves has also been increased. The magneto is now provided with an improved distributer, which can be pushed on or pulled off without using tools, as it is held in position by spring clips. The neat little three-speed gear box is provided with a sump or well, at the bottom of which there is a drain plug, so that the dirty oil can be quickly run out. The standard gears now fitted are as follows: First speed, 9.8 to 1; second speed, 6 to 1; third speed, 3.5 to 1. The worm drive has been fitted with a new ball thrust, which has greatly added to the efficiency of the transmission. Altogether things look very hopeful for the T.A.C., and it is a machine with which we hope to have a closer acquaintance on the road at no distant date.

Opening run of the Newcastle Motor Club to Belsay. (See Club News pages.)

SPEED NERVE AND PETROL

BY CHARLES DIXON, R.I.



A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

Restoring Compression.

I should like to know, if I fit new piston rings to my engine to improve compression, whether I must have the cylinder reground? Some manufacturers, I believe, recommend a new cylinder in preference to re-grinding.—C. G.

First of all we should recommend you to try fitting new piston rings. If these do not give the desired result after, say, 200 miles running, it would be better either to have a new cylinder, or to have the old one rebored.

Irregular Firing.

Could you please tell me why my 4½ h.p. twin only runs on one cylinder at any speed, say, under 12 m.p.h.? It is a little better when using the sidecar, but not much.—J.H.C.

The trouble may be due to (1) the setting of the magneto (or contact breaker if accumulator ignition); (2) the design of the inlet pipes, and it may be possible that at low speeds one cylinder gets more gas than the other; also (3) to any difference there may be in the lift of the inlet valves or tension of the springs. We should require to know more details before we could point to the most likely cause of your trouble.

Gear Drive. Fixed Ignition.

(1.) Is the gear drive and clutch of the 2¼ h.p. F.N. lightweight reliable, and can gear be changed easily while in motion, on rough roads? (2.) Is this machine faster than the 1¾ h.p. F.N.? About what pace will it take one on the level? My weight is eleven stones? (3.) Is the fixed position of the magneto satisfactory for low as well as high speeds?—H.C.

(1.) As regards reliability, we refer you to results. One of these machines successfully completed the 555 miles M.C.C. Jarrott Cup Competition run. The gear can be very easily changed. (2.) The machine should be a good deal faster. We should say about thirty to thirty-three miles an hour. (3.) We find the fixed ignition point is satisfactory with this machine, but if after trial you prefer a variable advance it could easily be fitted to the handle-bar, and the magneto contact breaker controlled by means of a Bowden wire.

Attaching a Motor Set to a Push Cycle.

I notice that there are some makers of detachable motor engine sets for clamping on to ordinary roadster bicycles. I am wanting such an engine for my Humber standard 1908 pattern. Can you tell me if the bicycle will be strong enough to carry such an engine, as I am afraid of the spokes and frame getting pulled to pieces with an engine of 2½ or so horse-power. As there is nothing like that pattern out here, I have to rely on what I hear, and decide on your opinion.—J. D. (Durban, Natal).

We are afraid you would not get very much satisfaction from fixing an attachment to your pedal bicycle. Certainly the spokes would not be strong enough if your roads are at all rough, the spindles would also require to be stronger, and the forks fitted with girders. The tyres would soon give out on account of the strain and extra weight, and the machine would not be comfortable. The cost of the attachment would be quite equal to the price of a second-hand lightweight motor bicycle. Consequently what you had better do is to write to some friend or firm upon whom you can rely, and get them to purchase and send you a good second-hand lightweight, which machine you could get for about £15 or £17 in good order.

J. F. Crundall (3½ h.p. Humber racer), who was placed on scratch mark in the Easter Handicap at Brooklands on Bank Holiday Monday.

Assembling a Medium Weight.

I have ordered a 2½ h.p. J.A.P.-Chater-Lea motor bicycle. (1.) I weigh 11½ stones. Will a lightweight frame be strong enough? (2.) What ought the entire machine to weigh? I want it as light as possible without sacrificing strength for weight. (3.) Do you think it might safely be built to weigh about 110 lbs.? (4.) Do you think this machine will take me up hills 1 in 15 without pedalling, and up to thirty miles per hour on level?—L.A.

(1.) The frame should be quite strong enough for your weight. (2-3.) About 110 lbs. limit would enable the assembler to use substantial fittings throughout. A 2½ h.p. machine can be made to scale slightly under 100 lbs. (4.) The machine when in good order will be capable of exceeding thirty miles per hour maximum speed, and of climbing hills of 1 in 15 with the same gear.

Care Necessary with Petrol.

I have had a wooden structure, 10ft. × 6ft. × 7ft. high, erected in the garden of my premises to house my new machine in. This is my first experience in the use of petrol, and I am ignorant of its properties and behaviour under all circumstances. Kindly tell me whether it will be safe, when the warm weather comes, for me to light the interior of the said structure with a lamp, such as a hurricane lantern, so that I can do adjustments there in the evening, and what is the limit of distance within which a naked light should be brought of the machine with the petrol in its carburetter and tank. Of course, I shall not store any other petrol inside the shed. What is the best method of lighting when electricity is not available?—E. G.

You might be able to go for several years without having an accident from using a lamp, but petrol is curious stuff, and one never quite knows what it will do. In the event of any petrol being spilt from the machine when dismounting the carburetter the room might easily be filled with vapour in a short time. The vapour is heavy, and sinks to the ground, so that, if by any chance you set the lamp on the ground to examine some nut or other, a conflagration might occur. Consequently, we think that the best plan is for you

to fit your shed up wtih a small electric lamp, run off a 40 a.h. accumulator, or use a small portable electric lamp. There would then be no danger, and you would have quite sufficient light for ordinary purposes.

The Timing of a Magneto.

[?] I understand the best way to drive a 3½ h.p. magneto motor cycle is by well advancing the spark, keeping it there, and regulating speed entirely by throttle and air lever. With my 1909 machine if I attempt to do this a slight tapping noise at once starts, and to stop it I have to retard the spark to quarter advance. This tapping can be heard above the noise of the engine, and is a much smaller noise than the loud hard click caused by a steep hill. Does this tapping come under the head of knocking? The nearest approach I can get to driving on throttle alone is by first putting the spark lever at quarter advance, getting speed up on throttle, and then getting further speed by very gradually advancing the spark nearly to full. The tapping goes on during the whole of this operation more or less, but dies away as speed accelerates. Having at last got spark lever to desired position (by now I am going thirty to forty miles an hour) I cut down gas and give as much air as possible till I get engine down to a nice hum (instead of a roar) and a comfortable pace. But this lasts a very short time, as the slightest advance to throttle at once starts the tapping again, the slightest rise (as over a bridge) or extra puff of wind has the same effect, and so I have to retard the spark, and the whole operation of getting up necessary speed to avoid tapping has to be gone through again, and so on. It amounts to my perpetually moving spark lever backwards and forwards during whole of journey, just as much as, if not more than, the throttle lever.—E.J.H.

It is very hard to say if the noise is actually "knocking," but we should be inclined to think that it is, and the cause is apparently due to the magneto spark being timed to occur too early in the stroke. Your method of driving seems to be absolutely correct at the present time. It is quite possible to drive with more or less fixed ignition on a motor bicycle within certain limits, but this very much depends upon the setting of the magneto. This leads us to suppose that your magneto is rather far advanced. We should have it retarded slightly as an experiment, and note the effect. It may require setting still later if you are desirous of running at all speeds with the spark lever fully advanced.

A steep section of Sutton Bank immediately after rounding the hairpin bend.

Petrol or Paraffin.

[?] Every time I wish to start my engine from cold I am obliged to inject petrol. Is this objectionable or harmful to the engine? A friend tells me it is, and by washing oil off the piston is likely to cause a seizure.—S.E.H.

Provided you only inject a few drops of petrol in the engine, no harm should result. Thousands of riders adopt this practice, and we have never yet heard of any direct trouble accruing. An overdose might wash away the oil and cause a seizure, or crank case explosion

Current Consumption. Road Dangers.

[?] (1.) Please say if there is any means of ascertaining the amount of current consumed by plain coil with make and break contact? (2.) What symptoms may be expected when magnets of magneto machine are becoming weak, and is this the result of time or the distance in use? (3.) If any liability attaches to the authorities for damage to machine or person caused by (a) manhole cover projecting above road level at least two inches? (b) Tramlines standing above or below paving in places?—P.H.

(1.) By inserting an ammeter between the coil and the contact breaker. See reply to "D.S.," page 266 last week. (2.) Misfiring for no apparent reason and especially difficulty in starting. Weakening of the magnets is the result of time and excessive vibration. (3.) Morally, you can claim damages in both cases. However, those responsible for the neglect at times are apt to stand a good chance of winning their cases, as they have much money behind them. Should you have experienced an accident from either of these causes it would be as well to send those responsible for the neglect a solicitor's letter, but if you are a member of one of the motoring organisations it would be better to lay your case before them. A matter affecting the general welfare of motorists is sometimes taken up.

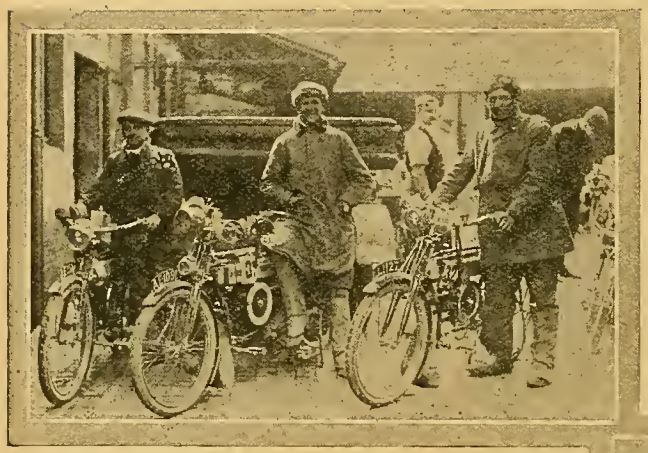
The steepest part of Sutton Bank, showing the road winding away in the distance. A motor cyclist is seen topping the gradient at a good pace.

HINTS ON CARBURETTER ADJUSTMENTS.

By B. H. DAVIES.

THE novice is generally beset by a hankering notion that his carburetter is wrongly adjusted, and even if he has patronised a firm which can be trusted to send out the carburetter adjusted to a fair all-purpose compromise, the keen rider will want to make fresh adjustments to suit varying climatic and road conditions. The following notes give details of some simple methods I have found very serviceable for obtaining maximum efficiency,

M.C.C. JARROTT CUP COMPETITION AT EASTER.



Three riders of Douglas machines who survived the 555 miles run. W. W. Douglas, E. Kickham, and P. Phillips.

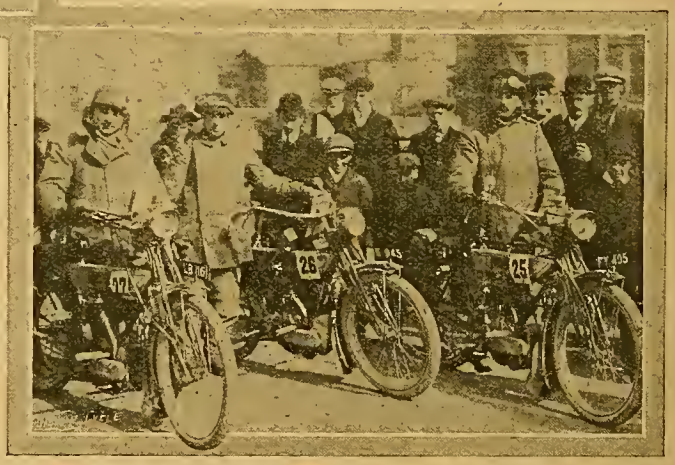
and this method conquers most of the obvious difficulties. It may be taken for granted with every carburetter of good make that the extra air orifices and the fixed air choke tube are roughly suited to the engine in question. A choke tube equal to one-sixth the diameter of the inlet pipe affords a fair working compromise of efficiency and flexibility. The adjustments which may be advantageous are generally confined to the size of the jet and the level of the petrol in the jet. The level of the petrol is the point most likely to repay attention, and the most awkward thing to verify or alter. Up to this year I have always tested mine by a very quick and simple method. It is obvious that the level of spirit in the jet is affected by unscrewing the milled cap of the float chamber a turn or two. On almost every carburetter the unscrewing of this cap *raises* the level in the jet, for it lifts the bobweights of the float needle higher from the float, and therefore a higher level of petrol is required in the float chamber to press the float against these bobs, and cut off the supply by jamming down the needle. Very well.

Testing the Engine on the Stand.

I first make sure that the petrol does not flood out of the jet with the machine at rest and the engine stopped. If so, it is scarcely probable that the level is too high. The engine is then started on the stand, and the lid of the float chamber unscrewed a turn or two, and the behaviour of the engine noted. If the engine gains in speed and sharpness of bark, the higher level thus obtained evidently suits it. To make the higher level permanent, either of two adjustments may be employed at will. One is to lock the float chamber lid in its new position by packing it up with a washer. The other is to mark the amount by which the level has been increased, and to shift the collar of the bobweights on their needle to suit. Thus the correct level for maximum efficiency is swiftly obtained. The setting of the jet is even easier. Most carburetters nowadays possess either interchangeable or variable jets, and an hour spent at the nearest test hill will soon decide which jet is the one to use when out for a medal. Otherwise a long tapered needle (a fairly long stocking needle is usually the best), a millimetre gauge, and a single spare jet are all that are required.

Reamering out the Jet Tube.

The spare jet in the above-mentioned case should be of narrow bore, with a single hole of the slenderest diameter through it. Take your original jet, and make a road test with this jet on the worst hill to be found. If not satisfied, reamer this jet out a little; the needle may be used, but a triangular reamer is preferable. Begin by increasing the size of the jet very slightly indeed. Test the enlarged jet on the hill till dead certain whether the alteration is an improvement or not. If any difference is noticeable, remove jet, stick needle through hole as far as it will go, and measure the



The Bradbury contingent—A. T. Stanton, G. Wray, and Hugh Gibson. The two last-mentioned completed the run, Stanton suffering tyre troubles almost within sight of the finish.

amount by which the needle protrudes with the millimetre rule. Some jets are not reamered with a parallel-sided reamer, but taper, usually from the under towards the upper orifice. If so, be careful to gauge size of hole by passing the needle up the jet from beneath, and to do any reamering enlargements from the under side. Make a note of the amount of projection of needle in your pocket book, and next see if a further enlargement increases the efficiency still further. At each fresh test, measure and note the projection of the needle. After three or four tests you have arrived at a certain fact, viz., that the engine climbs fastest or farthest with a jet of such a size that your gauging needle projects so many millimetres when pushed tight in from the under side. Take the spare jet and reamer it out till the needle projects the exact number of millimetres

Hints on Carburetter Adjustments.—

arrived at by the test; and, hey, presto! you know that your jet is just right. With an interchangeable or variable jet no tools or notes are required; you simply make a couple of trial ascents with each jet or setting, and judge the effect by the pulling powers of the engine.

No anxiety need be felt about the extra air adjustment. Its verification is absurdly simple. If the supply is right, the engine will just, and only just, accept all the air you can give when the engine is

SUTTON BANK HILL-CLIMB. F. Mackay (Harrogate M.C.C.) travelling well on his Rex. He is just above the bad bend, and the road he has traversed may be seen winding upwards in the background.

running at its very fastest speed on the hottest of days. If an engine will take all the air available at half speed, or even at full speed on a cold day, it is certain it could do with more air at full speed on a hot day, and the orifices need enlarging. If an engine will never under any circumstances take full air, the probability is that it always gets a trifle too much, and it may then be awkward to start. As the upper air can be shut clean off by lever, either a narrower choke tube or a larger jet is obviously required. A medium choke tube is essential to flexibility. A large choke tube may spell power when used with a large jet, but cannot give flexibility.

Insufficient air supply on most twins.

I have never owned a twin which was not improved by adding a second air intake in the inlet pipe, and my first attention to a new twin is to drill a hole in the inlet pipe and fit a sliding collar over it. Some of my twins have started from cold in summer with a hole ½in. by ¼in. wide open in the inlet pipe. The above notes make it plain that I regard the use of a spring snap lid to the float chamber as a retrograde step in design, since it deprives riders of a very convenient mode of verifying the petrol level, and, needless to say, the petrol level on the best machines needs resetting from time to time as the needle and bobs wear.

An Experience.

I remember in one Auto Cycle Union trial my machine began to run comparatively feebly, and baffled me for a time, till at last one day in the preliminary rush at a test hill I bent down and unscrewed the float chamber cap a turn or so. It simply shot away with me. I never had time to reset the bobweights on the needle, but I got two or three copper and asbestos valve cap washers, and finally by threading two of them round the thread of the cap was

The starting point in the Sutton Bank hill-climb on March 26th. H. Wheater (holding the flag) is starting the unlucky Indian rider.

able to restore the correct level, which had been spoilt by rapid wear of the float needle and bobweights. Since then I have noticed one or two ingenious devices for altering the level by means of an adjustable float chamber lid, provided with an arrangement for locking it in position when correct adjustment is obtained.

Members who attended the ManchesterMotor Club opening run on the 19th ult.

THE BROOKLANDS APRIL HANDICAPS.

THE B.A.R.C. will hold the following motor cycle races at Brooklands on the 27th and 28th of this month.

THE WEDNESDAY APRIL HANDICAP.—For all classes of motor bicycles the cubic capacity of whose engines does not exceed 670 cubic centimetres. Starters barred. Entrants to state on their entry forms whether or not their engines are furnished with drilled cylinders or auxiliary exhaust ports. Distance, about eight miles.

THE WEDNESDAY WEYBRIDGE HANDICAP.—For all classes of motor bicycles the cubic capacity of whose engines exceeds 500 and does not exceed 1,000 cubic centimetres. Starters barred. Entrants to state on their entry forms whether or not their engines are furnished with drilled cylinders or auxiliary exhaust ports. Distance, about eight miles.

THE THURSDAY APRIL HANDICAP.—For motor cycles that have been entered for the Wednesday April Handicap. The handicaps to be the same as for the Wednesday April Handicap, except that the winner of that race will be penalised 40 secs., the second 35 secs., the third 30 secs., the fourth 20 secs., the fifth 15 secs., and the sixth 10 secs. Starters barred. Distance, about eight miles.

THE THURSDAY WEYBRIDGE HANDICAP.—For motor bicycles that have been entered for the Wednesday Weybridge Handicap. The handicaps to be the same as for the Wednesday Weybridge Handicap, except that the winner of that race will be penalised 40 secs., the second 35 secs., the third 30 secs., the fourth 20 secs., the fifth 15 secs., and the sixth 10 secs. Starters barred. Distance, about eight miles.

In each race the entrant of the winner to receive 10 sovs. or cup at option, the entrant of the second 5 sovs. or cup at option, and the entrant of the third 3 sovs. or cup at option.

There must be twenty-five entries for each race, or the race may be void at the option of the executive, or the number and value of the prizes reduced.

Entries close April 14th at twelve noon. Entrance fee 10s. 6d. p.p. for each event.

The B.A.R.C. Committee is to be commended on its action in increasing the number of motor cycle events, as these races always secure a good number of entries.

The inaugural run of the newly formed Redditch and District M.C.C. was well attended. The members are shown assembled in the yard of the Unicorn Hotel.

NEW BLOOD ON THE A.C.U. COMMITTEE.

THE new A.C.U. Committee, which has recently been elected, should be a particularly strong one. In addition to the valued workers who have made the A.C.U. the powerful body it is, the following newly elected members have been added as representing the R.A.C., Major Lindsay Lloyd and Mr. J. R. Nesbit. Than Major Lindsay Lloyd the committee could not find a better man. Being an officer who was formerly a Royal Engineer, he understands the technical side of motor cycling far more deeply than the average individual, while the fact that he holds the position of clerk of the course at Brooklands is sufficient proof that in helping to organise a public body no better man could be found, since to make a success of this post, as Major Lloyd undoubtedly has, needs no small amount of tact, diplomacy, and general ability. Mr. J. R. Nesbit is chairman of E. M. Bowden's Patents Syndicate, and is in consequence closely in touch with motor cycling, and on the Scottish A.C. is one of those members who work indefatigably, and by his powers of organisation has worked up that club to the high position it now holds. Representing the private members, Mr. R. O. Mitchell is a young and energetic member of the trade who should bring into the Union a healthy strain of new blood, which cannot but help to invigorate the A.C.U. Committee. Mr. W. H. Wells is an old member his fellow committeemen are glad to see back again. In the past he has done excellent work, and has proved himself to be a valuable mouthpiece of the trade on the committee. A few trade men on the committee of any motoring body are, in our opinion, absolutely necessary ably to voice the views of the trade on such important matters as trials and competitions. Mr. Hawkins is a private member of whom not much has been heard in the past, except that he regularly attends all the council meetings. We do not doubt that he, too, will do valuable work in the new position which he has lately taken up. Altogether, we consider the A.C.U. Committee to be stronger this year than it ever has been before, and we heartily wish it success in its labours.

OCCASIONAL COMMENTS.

By "IXION."

Was it a Turbine ?

A motor cyclist asks me to give publicity to the following weird yarn in the hope that the individual concerned will supply some further details for publication in these columns. I accept no responsibility for it. He says a stranger he met by the roadside bet him that his (the stranger's) machine would propel itself with the belt off. The stranger then removed his belt fastener, and went back a hundred yards or so up the road, substituting a piece of twine for the belt hook. He came back driving at about eight miles per hour. Opposite the observer the belt fell off, as the twine broke, and the engine popped merrily on for a quarter of a mile beltless. The mysterious motor was provided with an unusual metal box where its silencer ought to be, and my correspondent believes he has seen the first motor cycle turbine. Turbinists, please roll up, and send line drawings of your patents to the editor. The machine is said to have had a Precision engine.

Automatic Carburetters.

I believe the next important alteration in motor bicycle specification will be an automatic carburetter. Excellent as present-day carburetters are, few of them claim to be automatic. The type I am using at present will choke from too rich a mixture unless I am particularly spry in jumping on when I start, so as to get a little extra air supplied at once, while on hills the air lever requires quite clever management if Birdlip is to be climbed. One or two so-called automatic carburetters sell in fair quantities, but the expert users of them mostly add a leak valve to obtain maximum efficiency. Practised riders no doubt enjoy fiddling with levers, but the prize duffers, who, after all, form the majority of our ranks, dislike it intensely, especially when a mistake means a false start or a failure on a bad hill, as would inevitably be a frequent occurrence with a novice riding my own machine, for instance. I hope truly automatic carburetters will be numerous at the next shows, if only as alternatives or, as the Yankees call them, "options." I have just had a very ingenious device of the type submitted to me by a working man, which has no springs or other parts liable to derangement. I have also been helping a friend to tune up a three-jet car vaporiser, which is automatic and derangement-proof. It takes in all its air at the bottom through choke tubes, and when these are correctly set no leak valve can effect any improvement, while the fuel economy is superior to that obtained with the best adjusted single-jet device. Consequently automatic carburation need not spell any decrease in efficiency, and it will therefore be extremely popular with the lazier type of rider. It does reduce the interest in driving, but if it is fitted as an "option" the club expert can continue to disdain it.

Tyre Gaiters.

The tyre gaiter is an item that very seldom figures in a motor cyclist's kit, and yet it is not infrequently wanted, and when wanted is very badly wanted indeed. Two of my acquaintance have had their Easter holidays spoilt for want of this light and inexpensive device. One of them ran over a broken jam pot, and sliced his back tyre pretty well down to both beads; the other was using a new back cover with a fault in the fabric, and, though both were experts in tyre repairs, neither was able to proceed far on the proposed journey simply because his small kit did not contain proper articles for repairing bad holes in the covers.

A Carburetter Adjustment Tip.

A correspondent asks me to mention his method of testing his carburetter adjustments. Riders use various means. One man keeps putting his machine at a favourite hill till his ascent becomes most rocket-like. A certain technical professor attaches a tube and gas bag to the exhaust port, takes a sample of the waste gas, and analyses it. The writer in question removes his silencer and exhaust pipe, and runs his engine on the stand in the dark until he has got a colourless exhaust. We all know that the hottest part of a flame of a common gas jet is the non-luminous portion. My correspondent thought his carburetter was beautifully adjusted until he made the above test, when he found that his exhaust flame was wholly coloured. Various adjustments transformed the flame through the whole gamut of colours until at last he got it practically non-luminous, which as he says, signifies perfect combustion. He admits this only applies to the flame when the engine is running "all out," but he hopes by various radical alterations in the design of his carburetter to obtain a colourless exhaust flame at all speeds of the engine.

A Hint to Buyers.

When a salesman is enlarging upon the merits of his adjustable pulley it is wise to discover by actual test what is actually the lowest gear obtainable with it. Some engines have crankshaft bosses of such dimensions that no adjustable flange can be screwed out to give a gear much below 4½ to 1. Most riders buy adjustable pulleys with the idea of using them as emergency substitutes for variable gears when their summer tour brings them face to face with an abnormal hill. Now 5 to 1 is a gear that an ordinary rider will need for such common or garden hills as Dashwood or Rectory if his machine is not in super-excellent tune, and is loaded up with a heavy touring kit. Such favourite touring grounds as Devonshire and Scotland bristle with hills in which a 5 to 1 gear is nowhere near low enough for the sort of rider described. An adjustable pulley is in no sense a true emergency gear unless it can on occasion supply a gear as low as 6½ to 1. This point should therefore be verified before spending a guinea or so. Some engines do not admit of such small pulleys, and some cheap pulleys, which are made from castings, require such a thickness of metal at the boss to avoid bursting that, no matter how slender the crankshaft bearing on the engine may be, the pulley will not allow of a really low gear. With the capacity of a 6½ to 1 gear even a duffer should be tolerably confident upon the hills he may strike on tour, even when his machine is a heavily laden 3½ h.p. somewhat out of tune. A 5 to 1 gear is, of course, low enough for a very powerful twin-cylinder machine in such emergencies.

B.M.C.R.C. SECOND 1910 MEMBERS' MEETING.

ON Wednesday next, the 13th inst., the following events will be held at Brooklands by the British Motor Cycle Racing Club :

2.30 p.m. RECORD TIME TRIALS, first of the 1910 series. Distances : Kilometre and mile. Each competitor will be allowed one trial flying start. Performances will be classified in accordance with the undermentioned engine sizes : Class E.—Engines not exceeding 275 cc. Class B.—Engines not exceeding 350 cc. Class C.—Engines not exceeding 500 cc. Class D.—Engines not exceeding 750 cc. Class E.—Engines not exceeding 1,000 cc. Certificates will be issued for the best performance made in each class and the Club's gold medal will be awarded in each class for the best aggregate performance made during 1910. In order to be eligible for the latter award, members must have taken part in all but two of the series of time trials held by the Club during 1910. Entry fee, 1s. each class.

3.30 p.m. RELAY RACE. Open to members in pairs, one of each pair to enter a single cylinder and the other a multi-cylinder motor cycle, the total capacity of the two engines not to exceed 1,170 cc. Either of the pair may elect to start, and that competitor will be provided with a bracelet that must be worn whilst riding. On completing a lap the rider must stop and then hand the bracelet to his partner, who will ride a lap and hand the bracelet back to his partner in similar fashion. The race will consist of four laps in all, each partner riding two alternate laps. The starting, the three changes, and the finish to take place at the fork. First prize, two gold medals; second prize, two silver medals. Starters barred. Entry fee, 5s. each pair.

4 p.m. ONE HOUR TOURIST TROPHY RACE, for motor cycles complying with the 1910 T.T. regulations, except that purely touring accessories such as mudguards or tool-bags may be removed. First prize, silver cup presented by Mr. H. H. Collier; second prize, the Club's gold medal; third prize, the club's silver medal; and certificates to all finishing. Starters will be permitted in this event. Entry fee, 5s.

Entries close last post this evening (Thursday), and should be addressed to the hon. sec., Mr. T. W. Loughborough, A.M.I.A.E., Ashleigh House, Erith. Kent.

NORTHERN LEAGUE OF MOTOR CYCLE CLUBS.

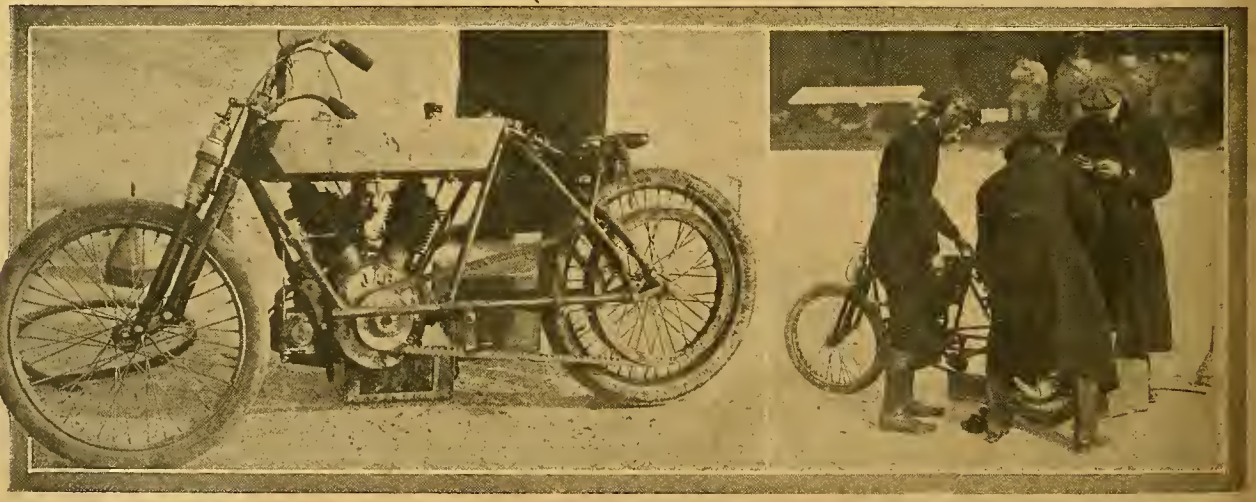
After the hill-climbing competition at Staxton on Easter Monday afternoon, a large number of members of the Northern League adjourned to the Balmoral Hotel, Scarborough, where tea was provided, after which a smoking concert was held, Mr. James R. Kelly, of the Leeds Motor Cycle Club, presiding. An interesting address on "Some Points in the Theory of Belt Transmission" was given by Mr. D. Bradbury, the hon. secretary of the Sheffield and Hallamshire Club. This was followed by an exhibition of lantern slides of the aviation meetings at Doncaster and Blackpool, and several slides of last year's Staxton hill-climb. These were shown and explained by Mr. J. W. F. Tranmer, of the Scarborough Motor Club, the lantern being ably worked by Mr. H. Kettle. It was proposed by Mr. J. E. Brooke, of the Harrogate Motor Cycle Club, seconded by Mr. E. Dent, of York, and unanimously carried, that Mr. H. Frain, of Snainton, be appointed hon. secretary of the Northern League, and that a conference be called, to meet at York at an early date, to consider the position of the Northern League in relation to the Auto Cycle Union. The meeting closed with unanimous expressions that the proceedings of the whole day had been a huge success. It was also decided to hold a flying kilometre contest at Whitsuntide.

The *Yorkshire Evening Press* contained the following paragraph : "One of the amusing features of the afternoon's contest was the appearance of an A.C.U. official, who warned each competitor of the dire results of his participation in the competition. It is said this same official himself defied last year the body which he yesterday represented."

The impression among the motor cyclists at Staxton was that if the Auto Cycle Union would ask for a reasonable inclusive sum to hold an inter-club hill-climb, they would be quite ready to recognise the Union as the authority of the sport.

MARTIN AGAIN ATTEMPTS RECORD.

A communication reached our office on Friday last to the effect that Harry Martin had designs on the two hours' 750 c.c. record at Brooklands Track that afternoon. Martin, who rode a twin-cylinder A.S.L. with J.A.P. engine, started just before three o'clock, but after being on the track for threequarters of an hour, and travelling at a good speed, was compelled from various causes to abandon the attempt. Messrs. Straight and Ebblewhite were the timekeepers.



The air-sprung frame A.S.L. on which H. Martin again attempted to break record last week. The engine is a J.A.P. twin-cylinder.

Immediately before the start. The attendants are inflating the air-springs to the desired pressure — a good point of the A.S.L. suspension.

RESULT OF M.C.C. JARROTT CUP COMPETITION.

WINNER OF THE JARROTT CUP AND CLUB GOLD MEDAL.

1. Sir R. K. Arbuthnot, Bart. (3½ h.p. Triumph).
   Error on outward journey ... ... 1m. 14s.
   Error on homeward journey ... ... 55s.
   Total error ... ... 2m. 9s.

WINNERS OF CLUB GOLD MEDALS.

	Rider and machine.	Total error.
2.	S. G. Frost (4½ h.p. Minerva, twin) ...	3m. 14s.
3.	Stanley Webb (3½ h.p. Triumph)	3m. 55s.
4.	H. C. Griffin (3½ h.p. Griffin-Simplex-Premier)	4m. 13s.
*5.	G. L. Fletcher (2¾ h.p. Douglas, twin) ...	4m. 25s.
6.	S. C. Perryman (3½ h.p. Ariel)	4m. 59s.
7.	A. J. Stevens (3 h.p. Wolf, twin)	5m. 58s.
8.	W. W. Douglas (2¾ h.p. Douglas, twin) ...	7m. 3s.
9.	R. O. Clark (2¼ h.p. F.N., two-speed) ...	7m. 9s.
10.	E. Gwynne (7 h.p. V.S., twin)	8m. 47s.
11.	P. G. E. James (3½ h.p. Triumph)	9m. 8s.
12.	Hugh Gibson (3½ h.p. Bradbury)	11m. 17s.
13.	Eli Clark (2¾ h.p. Douglas, twin)	11m. 56s.
14.	E. Kickham (2¾ h.p. Douglas, twin) ...	12m. 0s.
15.	P. Phillips (2¾ h.p. Douglas, twin) ...	12m. 40s.
16.	E. Wray (3½ h.p. Bradbury)	15m. 17s.

*Winner of P. H. Trotman's prize for best performance on a lightweight.

WINNER OF SILVER MEDAL.

17. F. C. Dee (7 h.p. V.S., twin).

History of the Jarrott Cup Competition.

The Jarrott Cup has been presented to the Motor Cycling Club for three consecutive years by Mr. Chas. Jarrott. Each year the winner has beaten the previous best performance, and the percentage of riders to complete the double journey has improved.

S. G. Frost on a 4½ h.p. Minerva twin won the first event held in 1908, when the contest was more severe than it has been since, on account of the outward and homeward journeys being completed in two consecutive days.

In 1908 S. G. Frost's total error from punctuality at the several secret checking and timing stations was 4m. 9s.. F. G. Smith (3½ h.p. Triumph) won last year with a total error of 2m. 22s.; Sir R. K. Arbuthnot, this year's winner, 2m. 9s. Twenty-five entries were received for both the 1908 and 1909 events, which were held during the August Bank Holiday, but this year the club's decision to hold the competition during the Easter holidays resulted in an increased number of entrants, totalling thirty-six, thirty-five of whom actually started. Easter therefore apparently suits members of the club better than August.

Taking into consideration the extremely arduous test, it is interesting to compare the smallest and largest machines which took part in the competition. The smallest was R. O. Clark's 2¼ h.p. F.N., with a cubical capacity of 249 cc., the largest being the three 7 h.p. twin-cylinder V.S. machines which were ridden by E. Gwynne, V. Olsson, and F. C. Dee and the 7 h.p. Peugeot ridden by O. L. Summers, the cubical capacity of these being 944 cc.

It is reported that one competitor who arrived back at Cranford Bridge in the small hours of Tuesday morning, March 29th, was so tired that he went to sleep on a seat outside the Berkeley Arms, and was found there by the hotel proprietor when he opened the premises to resume business at the usual hour.

INTER-TEAM RELIABILITY TRIAL.

HERTS. COUNTY A.C. WINNERS OF THE SERVICE CUP.

THE marks awarded in the above reliability trial from London to Harrogate and back cannot be announced at present, as there is another joint committee meeting to be held, at which the marks awarded will be approved. We are, however, in a position to announce that the Herts. County A.C. are the winners of the Service Silver Challenge Cup for the first year.

The competition will be an annual one for at least three years, and it is necessary for a club to win it three years in succession before becoming the actual owner of the trophy.

The following were the riders who represented the competing clubs, and it is worthy of note that all except two completed the run:

HERTS COUNTY A.C.

J. S. Harwood (3½ Phelon and Moore)
E. A. Colliver (3½ Triumph)
E. M. Down (5 Indian)
*W. Cooper (3½ Bradbury)
W. Pratt (3½ P. and M.)
F. A. Hardy (5 V.S.)
*H. B. Karslake (3½ Dreadnought)
F. J. Beard (3½ Scott)
A. V. Deacock (3 Wanderer)
A. H. Colliver (3½ Triumph)
B. Marians (3½ P. and M.)
C. Cather Cook (3½ Triumph)
Mrs. Cather Cook (3½ Triumph)

N.W. LONDON M.C.C.

W. Davenport (3½ Triumph)
H. Bean (3½ Triumph)
C. M. Simpson (5 V.S.)
G. E. Purchase (3½ Triumph)
H. V. Bate (5 V.S. and sidecar), retired at Harrogate
C. S. Westacott (3½ Triumph)
G. A. Stern (3½ N.S.U.), retired at Grantham
G. H. Hollis (3½ Triumph)
R. G. Goslett (3½ P. and M.)
A. J. Browne (9 Bat and sidecar)
Glyn Rowden (7 Bat and sidecar)

*Outside schedule at Harrogate.

Gathering on the occasion of the Southampton and District M.C. opening meet.

CURRENT CHAT

Time to Light Lamps

(GREENWICH).

April	7	..	7.41	p.m.
„	9	..	7.45	„
„	11	..	7.48	„
„	14	..	7.53	„

Police Trap.

We have received information of a police trap which is in operation between Andover and Weyhill on the main road to Wincanton.

A Road Danger.

The Finchley and Barnet Centre of the Motor Union is organising a petition protesting against the erection of central tramway standards on the Great North Road.

The M.C.C. Team Trial.

Six clubs have already decided to send teams to compete for *The Motor Cycle* challenge cup in the Motor Cycling Club's Team Competition near Daventry on June 18th. The Edinburgh Motor Cycling Club will again be represented. Last year four of its team gained full marks. The list of competitors will be found each week in our "Future Events."

A Lucid Explanation.

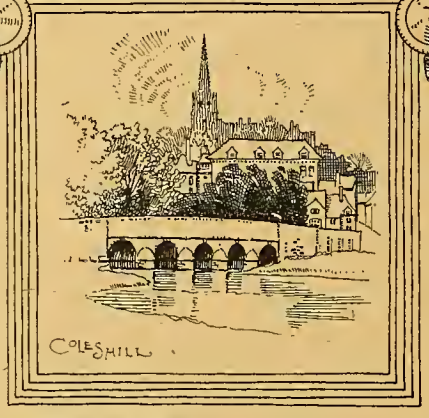
Joshua Wheelrim in *Motor Cycling* (Chicago) gives the following lucid explanation of pre-ignition: "When there is carbon in ther cylinder it gets red-hot and stays that way until a fresh charge of gas mixture is admitted ter ther cylinder, when it fires ther stuff before it is time and catches ther piston coming the wrong way. When ther regular spark gets ter work there ain't any gas ter explode."

A.C.U. Lecture.

A lecture on "The Role of the Motor Cycle in Campaigning" will be given by Capt. C. Battine this evening at 8.30, at the Royal Automobile Club, 112, Piccadilly, W. Any reader may obtain a ticket upon application, or admittance to the lecture on presentation of his visiting card.

Another T.T. Aspirant.

F. Mackay, of Harrogate, has, we hear, decided to compete for the Tourist Trophy. He would have competed in the Staxton Hill-climb but for fear of being suspended by the A.C.U., the Staxton event being banned. His brother, J. Mackay, was a competitor in both the Sutton Bank and Staxton hill-climbing competitions.



Special Features

Sydney R. Jones

A JAUNT IN THE NORTH RIDING. Illustrated.
CLUB NEWS FROM ALL PARTS.
HINTS ON CARBURETTER ADJUSTMENTS.

Martin's Win Upheld.

At the recent race meeting of the British Motor Cycle Racing Club, on the 16th ult., there was some doubt as to the validity of Martin's win in the All-comers' Handicap Race, owing to his trembler blade breaking just short of the finishing line. The judge decided that he won, but the matter was gone into formally at a committee meeting held recently, with the result that the judge's decision was upheld.

A Praiseworthy Performance.

G. L. Fletcher's performance in the M.C.C. Jarrott Cup Competition was distinctly praiseworthy. He not only carried off P. H. Trotman's prize for the best performance on a lightweight motor bicycle, but he came very near to the leaders, actually finishing fifth, only 1m. 16s. separating him from the cup winner, Sir R. K. Arbuthnot. Fletcher rode a lightweight twin Douglas. A. J. Stevens, riding a twin-cylinder Wolf, was next in order of merit for the lightweight prize, his total error being 5m. 58s.

Hill-climbing contest on the famous Shap Fells organised by the Westmoreland Motor Cycle Club. (1.) Scene at the starting point. (2.) A competitor crossing the finishing tape.

Danger of Level Crossings.

A peculiar accident took place at the level crossing over the Great Northern and Great Eastern Railways at Beckingham the other evening. A clergyman who had ridden his motor cycle from Oldham took the red danger lamp on the closed gates for the tail light of a traction engine, and in turning aside to pass the vehicle, as he thought, he crashed into the closed gates. His machine was wrecked, but he escaped with a severe shaking.

Another Score for Two-stroke Engines.

Staxton Brow and the Staxton Hill, it should be noted, are two entirely different gradients. Staxton Hill is the rise on which the competition was held on Easter Monday, the average gradient of the steepest portion (which measures 1,550ft.) being 1 in 6.9. Staxton Brow is the steeper ascent; in fact, according to the *Scarborough Post*, it had not been surmounted on a motor cycle until Easter Monday morning, and only one car has negotiated the hill. The motor cyclist who performed the feat was Wm. Fawcett, of Harrogate, and the machine he rode is a twin-cylinder, two-stroke, two-speed Scott—a veritable hill-eater. By the way, we shall have something to say with regard to the Scott in an early issue.

M.C.C. Hill Climb at a Secret Venue.

The next event of the Motor Cycling Club is a hill-climb for cars and motor cycles (members only) to be held on the 30th inst., on a gradient north of the Thames, and in the district lying between the Oxford Road and the Great North Road. All machines must be standard tourist models. Three classes for motor bicycles and one for passenger motor cycles have been included.

A.C.U. Second Quarterly Trial of 1910.

The next Quarterly Trial is to be held on April 20th (Wednesday) over the usual course from Uxbridge to Banbury and back. Entry forms are now ready.

T.T. Race Fund.

Donations to the Tourist Trophy Race Fund have been received as follows: Kent Automobile Club, one guinea; Dr. E. W. Brewerton, one guinea; Western District M.C., half-guinea; *The Motor Cycle*, £5.

Entries for the T.T. Race.

Further entries for the Tourist Trophy Race on May 26th have been received from J. H. R. Loxham, C. Goulding (machines not stated), and Howard Smith (3½ h.p. Triumph), bringing the total to forty.

Motor Cycle Exhibition at Olympia.

At a meeting of the Management Committee of the Society of Motor Manufacturers and Traders on Thursday last, the agreement with the Cycle and Motor Cycle Manufacturers and Traders Union, Ltd., for their tenancy of Olympia for the purpose of holding an exhibition in November next, was executed on behalf of the Society.

The Jarrott Cup Competition.

Capt. Sir R. K. Arbuthnot's Jarrott cup win is an extremely popular one, and is a just reward for his consistent performances in various long distance trials promoted by the Motor Cycling Club. The London-Land's End-London course is exceptionally severe, and the fact that 555 miles have to be ridden in two days, with a rigid adherence to schedule times at different points, renders the trial probably the most arduous of any, excepting perhaps the double journey London - Edinburgh-London competition.

Hill-climbing in the Antipodes.

The Sydney (N.S.W.) Motor Cycle Club held a hill-climb open to amateurs affiliated to the N.S.W. Cyclists' Union on the hill at Eastwood on February 26th. Fourteen started, racing in pairs through heats, semi-final, and a final. O. Clafton, who has recently joined the ranks of motor cyclists, rode a 5 h.p. Sarolea, received 18s. start, and won from H. Knight-Eaton (3¾ h.p. Premier), 12s. D. St. Clair (5 h.p. Rex) did fastest time from scratch, 50s. The hill is three furlongs long, and of an average gradient of 1 in 10.

An Unfortunate Collision.

A member of the Western District M.C., Robert King, met with an unfortunate accident in Uxbridge Road last Saturday afternoon, colliding with a girl aged 7. Both the girl and the motor cyclist received injuries of a minor character, but were able to proceed to their respective homes. Mr. King won a gold medal in the End-to-end run of 1908, and a silver medal in the Six Days' Trial last year. Being confined to his room he is disappointed at the prospect of not being able to enter for this year's End-to-end trial

Motor Cycle Racing in N.S.W.

The Australian championship was run for the first time at a race carnival at Sydney, organised by the Motor Cycle Club of New South Wales, on February 16th. H. Jenkins, a representative of the Victorian Motor Cycle Club, proved victorious, riding a 3½ h.p. Tourist Trophy Triumph. In the first heat Jenkins covered two miles in 2m. 30⅘s., and won the final in 2m. 32⅖s.

At the same carnival, a mile scratch race for motor cycles up to 2¼ h.p. resulted in a win for J. Thury (2 h.p. Moto-Rêve) in 1m. 43⅘s. J. Williams (2 h.p. Moto-Rêve) was second.

H. Jenkins (3½ h.p. T.T. Triumph), holder of the Amateur Motor Cycle Championship of Australia.

A two-mile scratch race for machines up to 4 h.p. was won by J. E. Yee (3½ h.p. Triumph), N. Saunders (3½ h.p. Bradbury) being second. Winner's time, 2m. 35⅖s.

In a scratch race for machines of 4 h.p. and over, distance two miles, H. Jenkins scored another win, the time again being 2m. 32⅖s. for two miles.

Motor Cycle Exhibition in Leicester.

From Wednesday to Saturday last week there was an exhibition of motor cycles at the Association Hall and Buildings, Leicester, and the attendance of visitors greatly exceeded anticipations. The show was representative and up-to-date, most of the leading models, which are familiar to our readers, being on view. The most imposing and attractive combinations were probably the four-cylinder T.A.C. and sidecar, the 7-9 h.p. V.S. and sidecar, and the 6 h.p. twin N.S.U. sidecar machine. Other motor cycles represented included the chain-driven P. and M., Corah-J.A.P.'s, Hobart, Triumph, Arno, Rex, Moto-Rêve, Wolf, Clyno, Excelsior, Kerry Abingdon, Indian, Clyde, and Royal Enfield. Accessories were shown by the Utopian Cycle Works, Clarke Bros., Paskells, Ltd., and Sutton and Co., whilst W. and A. Bates, Ltd., exhibited a full range of tyres. There is every prospect of this show, which is being organised by the local traders, increasing in interest and becoming a strong annual local enterprise. The first exhibition reflects much credit upon the organising secretary, H. E. Smith.

A Reply to Various Correspondents.

"C. W.," who recently wrote that he had seen a lightweight machine fitted with a change-speed gear perform wonders in hill-climbing in the neighbourhood of Bishop's Stortford, advises us that the gear is one of the old type Clément-Garrards.

A Prospective Competitor in 1910 Events.

J. Morris, of Retford, who won a silver medal in the last year's Six Days' Trials on a 3½ h.p. Bradbury, is unfortunately in the Sheffield Infirmary suffering from acute appendicitis. He writes that he is now going on splendidly, and hopes to be fit in time for the London-Edinburgh Run and the Six Days' Trial.

The Richmond Group.

A number of motor cyclists who attended the Richmond meeting have expressed a desire to procure a copy of the group photograph taken for *The Motor Cycle* in the Market Square. Any others who would like a copy may have one for 1s., either the 1909 or 1910 groups; 12in. by 10in. size, 2s. 6d. Envelopes containing applications for prints should be marked "Richmond Photo."

Exhibition in Birmingham.

On March 21st an exhibition was opened at Bingley Hall, Birmingham, called the National Trades and Industries Exhibition, and naturally motor cycles are represented there. On the stand of the Colmore depot, Colmore Row, Birmingham, are ten machines, three twin-cylinder Premiers, two single-cylinder Premiers, two Douglas, and three Royal Enfields. The exhibition will remain open until May 28th, and will doubtless be visited by many Midland motor cyclists.

nter-team Reliability Trial.

The competition between the Herts County A.C. and the North-West London M.C.C. to Harrogate and back was very keen, as proved by the close result (which, unfortunately, we are not at liberty to publish until approved by the committee). It is, however, known that the Herts County A.C. (Motor Cycle Section) are winners of the Service cup for the first year.

East Sussex M.C.C.

The opening run was to Bexhill, and was well attended. It is proposed to hold a sports meeting at a future date on Bexhill track. The club committee would be glad to arrange inter-meets with clubs in the neighbourhood.

Newcastle and District M.C.C.

On April 16th a slow hill-climb is to be held on Benton Bank (near Armstrong Bridge). There will be four classes, viz., singles, multi-cylinders, variable gears, and passenger machines—no entry fee. An enamelled bronze medal will be awarded to the winner of each class.

Edinburgh Waverley M.C.C.

The A.G.M. was held on the 23rd ult., when the office bearers for 1910 were elected. President, G. F. Hamilton; vice-president, G. W. Muirhead; captain, W. Sharp; secretary, R. H. Moodie. The members who had been successful in competitions were presented with the medals won in 1909, and the secretary announced that two additional medals and another trophy had been presented to the club.

Streatham and District M.C.C.

Mr. A. E. Bennett, A.M.I.A.E., A.M.I.E.E., has kindly consented to give a lecture on "Carburation" to the members at headquarters on Wednesday next at 8 p.m.

The club is holding its first hill-climb on Saturday, the 16th inst., and intending competitors are requested to apply for forms of entry without delay. There will be three classes—one for machines whose cylinder capacity does not exceed 500 cc., one for machines of over 500 cc. capacity, and one for passenger machines. A.C.U. formula will be used. Competitors will meet at the Clayton Arms, Godstone, at three o'clock, when the hill selected will be announced.

Birmingham M.C.C.

The above club held a very successful opening meet at Stratford-on-Avon on Saturday last. Some fifteen members started from Birmingham at intervals of a few minutes in order to avoid each other's dust, whilst other members joined the gathering at the Swan's Nest at Stratford. In all some thirty members and their friends partook of tea. For the benefit of new members and those who did not join in this meet, it is announced that an attendance prize will be awarded at the close of the season for the highest number of attendances at the Saturday runs. Motor cyclists wishing to join the club are requested to write to Mr. R. Vernon C. Brook, Oakdene, Cambridge Road, King's Heath, Birmingham, for full particulars. The run on Saturday is to Rose Hill (Lickeys), meet top Griffin's Hill 2.45 p.m.

Norwich and District M.C.C.

On Easter Monday the Norwich Motor Cycle Club held a 100 miles reliability trial for a cup presented by the president, Mr. Thorn. The result was: 1, Mr. Everard, Triumph; 2, Mr. Chapman, Triumph; 3, Mr. Brown, Triumph.

Westmoreland M.C.C.

A successful hill-climbing competition was held on Hucks Brown, on the road from Kendal to Shap. The course measured just short of 1½ miles. Fastest time was accomplished by W. Westwood on a 3½ h.p. Triumph; time, 2m. 8⅘s. The handicap was won by V. G. Blackburn (3½ h.p. Rex), W. Westwood (1909 Triumph) being second and R. Hutchinson (1910 Bradbury) third.

Edinburgh M.C.C.

During the past year the membership has doubled, and there are now about 100 members. Fixture lists for 1910 are now in the hands of members. On the 23rd inst. there is the opening run to Lauder, and on the Saturday following an open hill-climb has been arranged. The annual Scottish Five Days' Trial is fixed for June 6th to 10th. On June 18th a team will represent the club in the M.C.C. team trial at Daventry for *The Motor Cycle* challenge cup. Mr. R. J. Good is the new trials hon. sec.

Motor Cycling Club.

The next event in the club's active programme for 1910 is the members' hill-climb on Saturday, April 30th. The event will start at 4 p.m.; the weighing-in time is three o'clock. The start has been made as late as possible consistent with the carrying out of the event before darkness sets in, and it is hoped by this arrangement many more members will be able to compete. The event promises to be a good sporting affair, free from special machines. The venue of the hill is being kept secret until the last moment.

Southern M.C.

Those members not present at the A.G.M. will be pleased to hear that Lieut.-Col. Mark Mayhew has accepted the presidency of the club. The paper recently read by Mr. E. J. Harrison on "Carburation" caused so much discussion that the whole evening was given to it. In consequence of this Mr. Jones's paper on "Vulcanisation" will be read at a future date, due notice of which will be given.

A committee meeting is to be held at headquarters to-night (Thursday) at 8.30. Intending members should write Arthur J. Vickers, hon. sec., 42, Theatre Street, Lavender Hill, London, S.W.

At Stratford-on-Avon. The Birmingham M.C.C.'s opening run on Saturday last.

Club News.—

Ripon and District M.C.C.

There are now about twenty riding members in this club, which was only formed a month ago. The opening run was to Richmond (Yorks). Competitions and other runs will be arranged in order to make the club more interesting to its members. Riders in the district should write for particulars to the hon. sec., Fred W. Taylor, 14, Market Place, Ripon.

Hull (Kingston) M.C.

The opening run was to Richmond (Yorks) on Good Friday, and the club then commenced a three days' tour through the Lake District, finishing up at the Staxton Hill-climb, near Scarborough.

Bishop Auckland, Darlington, and District M.C.

Forty-four members of this club assembled at Piercebridge for the opening run to Richmond (Yorks), and later in the day rode up as far as Reeth.

Newport (Mon.) and District M.C.C.

The first run of this newly-formed club was to Hereford, where lunch was partaken of at the Mitre Hotel, and a most enjoyable day was spent.

Inaugural run of the Hull (Kingston) M.C. This newly formed organisation boasts 22 members.

Newcastle M.C.

This club held its opening meet at Belsay (Northumberland) on Good Friday, when about forty members assembled for luncheon at the Pavilion, Belsay. Afterwards a speed-judging competition was held on a six mile course on the Belsay-Ponteland Road. There were seventeen entries, and the results were: 1, Robt Rowntree (3½ h.p. Bradbury); 2, H. Mason (4½ h.p. Bercley and sidecar); 3, T. W. Hilton (3½ h.p. Bradbury); 4, J. Jones (7 h.p. Clyde); 5, J. S. Rees (2¾ h.p. Bradbury).

Hertfordshire County A.C. (Motor Cycle Section).

A members' hill-climb has been arranged for the 23rd inst. at Aston Hill. The following classes will be included. (1.) For members who own old-pattern machines only, and who have never won a prize in a hill-climb. No machine of a later date than 1907 will be allowed to compete in this class. (2.) Single-cylinder machines with fixed gears. (3.) Multi-cylinder machines with fixed gears. (4.) Variable speed class. (5.) Open to any class of machine, fastest time to win. All machines must be standard touring models except in class 5.

Western District M.C.

A flexibility hill-climb was recently held on Rectory Hill, Amersham. The event was run off in glorious weather, and proved popular with the members of this energetic club. The hill, although not exceptionally steep, was quite steep enough to bring failure to some of the competitors in the slow climb. The spirit of the competition was that a competitor could use any size engine and gear, but that the same gear was to be used in both the fast and slow climbs, the greatest difference between the times to decide the winner. Quite the best performance from the spectators' point of view was that of F. H. Mullett (3½ h.p. Triumph), and he deservedly proved the winner in his class. His handling of the machine was quite masterly as he went from side to side of the road with the engine running quite slowly. H. J. M. Hughes (5 h.p. V.S.), the club's sports secretary, proved a popular winner of Class II. An amusing incident was witnessed in the slow climb. W. F. Ritchie, on a 5 h.p. V.S., when about twenty yards from the finish called out in a cheery voice, "I'm not up yet." He was not destined to reach the top, for he almost immediately accidentally stopped his engine, which caused much merriment amongst the group at the finishing line. Mr. D. Steeves, on a 5 h.p. Indian, made fastest time of the day, but, unfortunately, failed in the slow climb.

Class III., for variable geared machines, was not run off, as there were not sufficient entries.

CLASS I.—Single-cylinders, any capacity.

	Competitor. Machine.	Fast climb.	Slow climb.
1.	F. H. Mullett (3½ Triumph) ...	28⅕s. ...	1m. 37⅕s.
2.	J. V. Armstrong (3½ Triumph) ...	27⅖s. ...	1m. 26⅘s.
	D. W. T. Holloway (3½ Triumph) ...	32⅘s. ...	Failed
	H. T. Crook (3½ N.S.U.)	31⅗s. ...	Failed
	H. H. Buckmaster (3½ Triumph) ...	32⅗s. ...	1m. 2⅖s.
	H. Vowler (3½ Triumph)	38⅕s. ...	0m. 56⅘s.

CLASS II.—Twin-cylinders, any capacity.

1.	H. J. M. Hughes (5 V.S.)	32⅖s. ...	1m. 43⅗s.
2.	L. E. Holloway (6 N.S.U.) ...	41⅘s. ...	1m. 50⅗s.
	C. H. Dobson (5 Rex)	Failed ...	——
	D. Steeves (5 Indian)	20⅕s. ...	Failed
	F. W. Ritchie (5 Indian)	25s. ...	Failed
	W. F. Ritchie (5 V.S.)	24⅘s. ...	Failed
	C. R. Taylor (5 Indian)	23⅗s. ...	Failed

Surrey M.C.C.

On the 10th inst. there is to be a club run to Brighton, leaving headquarters at 10 a.m.

Assembly on the occasion of the first run of the Newport (Mon.) and Dist. M.C.C. Hereford was the destination.

AMERICAN RELIABILITY TRIAL.

THE third annual endurance run of the New Jersey Motor Cycle Club, sanctioned by the F.A.M., will take place on May 29th and 30th. Readers of *The Motor Cycle* may doubtless like to peruse the regulations for an American reliability trial; we accordingly publish below extracts from the programme.

Classes 1 and 2.—Private owners' and trade riders' classes as defined by the F.A.M. rules.

Class 3.—Passenger class includes sidecars, tricars, tandems, etc. Passengers must weigh 110 lbs. or over.

Class 4.—Ladies' invitation class. No entrance fee. Any lady finishing the entire course, either passenger or individual rider, will receive a special medal. No time limit.

Gold medals will be awarded for scores of 1,000 points; silver medals for 980 points and over; bronze medals for 950 points and over.

For failure to adhere to schedule the following penalties will be imposed: One point for each minute late at any control; two points for each minute in advance of schedule; thirty minutes in advance shall entail disqualification.

There will be a hill-climbing test at Cushmall Hill. At this hill (near Singac) riders will be required to register, but no time will be taken, although consistent running time will count in case of ties for special cups, etc.

When nearing foot of the grade selected for the hill-climbing test, competitors shall dismount and, in the order of their arrival, undergo the hill-climbing test by making the ascent of the hill without regard to time, but under the observation of officials stationed thereon.

Penalties will be imposed at the hill as follows: Single-cylinder machines—25 points for dismounting, 10 points for making the ascent with pedalling assistance. Multi-cylinder machines—50 points for dismounting, 25 points for pedalling. *Two-speed geared machines in their respective cylinder classes will receive double the above penalties.* (The italics are ours.)

Speed limit in State of New Jersey is 25 m.p.h. Average speed first day, 17 m.p.h. Average speed second day, 15 m.p.h to Monroe and 17 m.p.h. from there to Newark.

Riders may check controls five minutes earlier or later than schedule, without penalty.

No repairs or adjustments allowed in controls until after rider has checked.

Riders coming within sight of control must continue to control and check in. Riders failing to comply with this rule shall immediately be disqualified.

At Philipsburg machines will be locked up over night, and owners cannot have access to them until 5.30 o'clock the next morning. Six o'clock starting time.

The total distance is 353 miles.

Geoffrey W. Liddle (with Mrs. Liddle), of Middlesbrough, organiser of the Richmond conference, with the youngest motor cyclist at the meeting The machine is a two-speed V.S.

"THE LION AND THE LAMB."

A title suggested for this photograph by our Northern representative. From left to right: F. Straight (A.C.U. secretary), Jas. R. Kelly (Leeds M.C.C.), and Felix Scriven (Bradford M.C.C.), at the Inter-club Hill-climb at Sutton Bank.

THE NORTHERN LEAGUE OF MOTOR CYCLE CLUBS.

The following letter has been addressed to Mr. F. Straight, secretary of the A.C.U., by Mr. Felix Scriven, Bradford Motor Cycle Club: "Referring to our conversation which took place at Sutton Bank on the 26th of last month, I herewith beg to make the following suggestion, which I trust you will put before your committee. Having been present at the conference of the Northern League of Motor Cycle Clubs at Richmond on Good Friday last, I am of the opinion that some agreement should be come to between the League aforementioned and the A.C.U. I would suggest that a conference be convened at which one or more representatives of the A.C.U. should meet the secretaries of the Northern clubs concerned, and that the conference should consider the advisability of the clubs forming the League being affiliated to the A.C.U. for a lump sum, instead of so much per head, on the same lines as the North-eastern Automobile Association has been admitted. I trust that your committee will see their way favourably to consider the above."

FUTURE EVENTS.

April 13th (Wednesday).—B.M.C.R.C. Race Meeting at Brooklands.
,, 20th.—A.C.U. Second Quarterly Trial—Uxbridge to Banbury and back.
,, 27th-28th.—Brooklands A.R.C. Meeting.
,, 30th.—M.C.C. Members' Hill-climb.
May 4th.—B.M.C.R. Meeting at Brooklands.
,, 4th.—Herts County A.C. (motor cycle section) Open Hill-climb.
,, 13th, 14th, and 16th (Whitsun).—M.C.C. London-Edinburgh and London-Edinburgh and back Runs.
,, 26th (Thursday).—International Motor Cycle T.T. Race in the Isle of Man.
,, 27th.—Open Hill-climb in the Isle of Man.
June 18th.—M.C.C. Team Trial for *The Motor Cycle* Challenge Cup. Competing teams: Motor Cycling Club (holders), Coventry and Warwickshire M.C., Bristol B. and M.C., Streatham and District M.C., Sutton Coldfield A.C., and Edinburgh M.C.C.
,, 25th.—Bradford M.C.C. Open Hill-climb.
July 4th-9th.—A.C.U. Six Days' End-to-end Trials.

Messrs. Mann, Egerton, and Co., Ltd., of Norwich, have been appointed agents for the sale of Premier motor cycles throughout the whole of Norfolk with the exception of Thetford and Diss.

WHERE TO GO AT WHITSUNTIDE: NO. I

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Military Motor Cycling.

[4682.]—I send in my name as one willing to join a military body, but not altogether at my own expense.

Congratulations on Thursday publication.

ARTHUR JNO. STROUTS.

A Hint to Advertisers of Second-hand Machines.

[4683.]—The shortsightedness of advertisers in not giving full particulars of the articles they offer for sale is much to be regretted. What offers? Nearest offer. Seen here. No ignition mentioned, nor date. Belt offered, no size nor length; and so on.

W. H. PASSMORE.

Our New Publishing Day.

[4684.]—Please accept, both to yourself and your staff, my heartiest congratulations on the result of your referendum. I am particularly pleased with the fact that Sunday work will be avoided. You may count on me as a regular subscriber to your useful and interesting paper.

C. A. ELLIOT.

[Numerous letters in much the same strain as the above continue to reach us.—ED.]

Auxiliary Exhaust Release Ports.

[4685.]—I notice in letter 4659, in your issue of March 21st, Mr. Gasston, jun., has something to say on the above subject. Your readers may be interested to know that I have three ⅜in. holes in the front of my cylinder with a 1in. copper pipe to lead the exhaust gas into the silencer. My conclusions are that they very much increase the power, especially over long distances of speed, that they lower the petrol consumption, that the engine is appreciably more powerful at slow speed, and keeps cooler, and runs with less vibration. Other details are that the exhaust valve does not scale at all, and that a out one-third more lubricating oil is necessary to compensate for that lost through the holes. As to the holes being open to the crankcase at the top of the stroke, I avoided this by having my new piston made with a lip on it, and a corresponding piece cut out of the baffle plate in the crankcase. The ports certainly have no disadvantage, excepting the loss of oil, and a lot of this can be avoided by oiling a little at a time and often.

HAROLD KARSLAKE.

[4686.]—It may be of interest to many to know that I have fitted my 1905 3½ h.p. Rex with an auxiliary exhaust port with every success. The engine hauled a sidecar with passenger and luggage, total load inclusive 5 cwt. 14 lbs., fixed drive (belt), gear 5½ to 1.

Since fitting the exhaust release port the engine has gone about its business with ease and grace, will run slowly (four miles per hour), and how fast I do not care to try, as 20 m.p.h. is plenty for me with a sidecar. Engine keeps cooler, does not require more oil or gas, runs more smoothly, but requires more silencing.

The port has a ½in. bore, and is completely uncovered ⅛in. before piston has reached end of firing stroke. It is placed between the two valves, and has a separate exhaust pipe to silencer. I am not troubled with a smoky exhaust.

W. H. MUSKETT.

Finish for All-weather Machines.

[4687.]—Following the correspondence on "Finish for All-weather Machines," and noticing that Mr. A. Dean [4629] wants to know how to make aluminium paint more permanent, I gladly address you this letter just to let him and the "many others" he suggests know of a hint which I trust he will find of good service.

Once the old enamel has been completely scraped off, he should apply first one or two coats of boiled linseed oil to which he may add a small quantity of white or black enamel to enable him to see that an equally thin coat is given. When perfectly dry, any kind of enamel, not stoved, French grey, or aluminium paint, applied upon the oil surface, will be found to wear exceedingly well, standing vibration and even light hammering without coming off.

I must thank you for the good advice and many hints I have read in *The Motor Cycle*.

JUAN L. DE CASTRO.

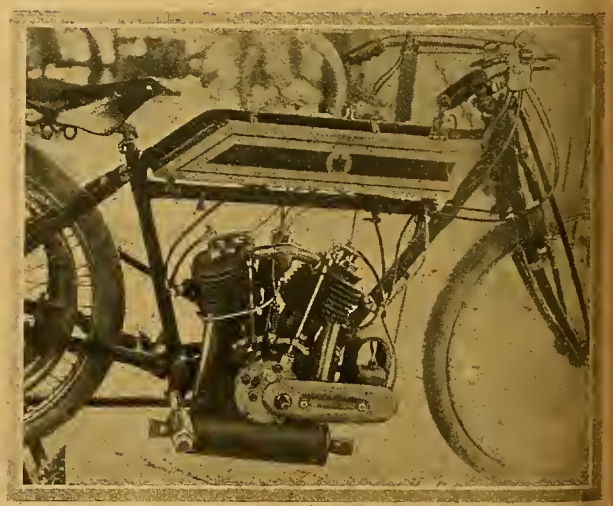
Spain.

Lightweights v. Heavyweights.

[4688.]—I have been much interested in the discussion of the advantages of lightweights over heavyweights. I have tried both, and am of the opinion that the latter are infinitely preferable.

Last year I spent part of my summer holiday touring on a 2 h.p., and lived to regret it. On any stiff hill of moderate length I had to pedal hard, and as there were many very stiff climbs (for I was touring in the Lake District) my task was not an easy one. And when, finally, the near pedal broke off and disappeared into the ditch, I determined that lightweights and I should part for ever.

I now have a 10 h.p., which when equipped for touring, but without rider or luggage, weighs close on 3 cwts. It starts easily, and is exceedingly comfortable to ride. It is a positive pleasure to meet a really steep hill. Belts are expensive, but that is made up for in tyres, with which I have never had any trouble, either with punctures or sideslips, although I use 2½in. smooth treaded Clinchers and ride in all weathers, wet and fine. Another great advantage in a heavy twin is its capability to take plenty of luggage, and so overcome the nuisance of sending on luggage in advance.



A new pattern Rex twin-cylinder engine was referred to in our Brooklands report last week. It is illustrated above. The cylinders measure 77½ × 71 mm., and overhead mechanically operated inlet valves are used. These extremely fast engines will be used in the Tourist Trophy Race next month, and chain transmission may also be fitted.

I think, if this meets the eye of a certain motor cyclist whom I met one dark, wet night, gloomily preparing to push his machine four miles to the nearest railway station, and who, with the help of a length of rope, arrived there fifteen minutes later, he will agree with me when I say, "Give me a heavyweight and powerful twin."

TWELVE STONE.

Road Dangers at Night.

[4689.]—One hears so much about road dangers at night that I think the following tip of having two burners in the lamp instead of one may be worth knowing. I think that if some burner manufacturers made an article something like the one illustrated it would have a ready sale.

LARGE LIGHT.

Wear of Canvas and Rubber Belts.

[4690.]—In December last I bought a canvas and rubber motor cycle belt. After 200 miles it came to pieces and I sent it to the makers. After examination they offered to supply a new one for 5s. This, as I pointed out, would have been a reasonable offer if it had run one-third its normal life, the original cost having been some 15s. I offered 2s. 6d. to settle the matter, as I calculated that if letting the engine fire till you have begun to master the tendency to drive into the hedge. When this stage of proficiency has been reached you may drop the valve lifter and allow the engine to do its own work for a short distance, raising the valve again whenever a "wobble" appears imminent. If you try to mount with the engine started you may overturn the whole combination, as I did at my first attempt, or if you succeed in mounting you will most likely charge the nearest lamp post, as a friend of mine did. Steering down hill with exhaust valve lifted is the only safe way, and will make anyone proficient in a very short time.

Rubber belts, however efficient on a "solo" machine, are a perfect nuisance on a powerful twin with sidecar. Of course, if one's pulleys were always perfectly true (but whose are?), a new rubber belt might do well for a time; but I find that the life of rubber belts is short on a passenger machine compared with that of a good leather belt. Personally, I have found complete satisfaction in a Phänomen girder belt (three-ply chrome leather with steel girders between the two lowest plies). The Phänomen costs no more than a good rubber belt, and never requires to be dressed—two great advantages over some other popular leather belts. I have often used it to convey heavy passengers in a very hilly border district, with a single-geared 5-6 h.p. twin and Millford sidecar, and it has never pulled through in 2,000 miles, though it has broken some of the

M.C.C. JARROTT CUP COMPETITION AT EASTER.

A secret checking station at Yeovil. The rider is F. Smith (5 h.p. Clyno).

An incident near Honiton, snapped from the seat of a car following. It may be of interest to know that this photograph was taken through the wind screen.

Stanley Webb (1910 Triumph) negotiating the unrolled stones near Land's End. These stones unfortunately unseated several of the competitors

,000 miles were its normal life, and it had only run 200, a ayment of one-twentieth of its cost would meet the case. This offer was refused.)

Putting this before the makers, they say 3,000 miles is n average life. I accept this estimate as being more accuate than my own. They say the belt has been in stock a ear, and attribute its failure to that fact. Granting that a elt deteriorates by being kept, is it not reasonable to sug- est that the makers should warn intending purchasers not o buy their belts without a guarantee that they are fresh tock?

Kodak photographic films, for instance, have a notice ttached that they are not to be used after a certain date, o that buyers are safeguarded against buying worthless tock. I suggest that some such notice should be attached o belts which deteriorate by being kept, as it is an absurd lemand for makers to insist on payment of one-third cost rice for worthless belts which fail after running only one- ifteenth their normal life. H. S. PHILLIPS.

Sidecars, Belts, and Other Matters.

[4691.]—The best way to learn to steer a rigid sidecar s as follows: Get a friend who can steer it to drive you s a passenger to some place where there is a moderately teep and long down gradient. Arrived at the top, your riend and you change places. He takes the sidecar seat, ou sit upon the bicycle, have exhaust valve, and steer he combination down as of this type if necessary, but not strongest fasteners made. I don't suppose I shall ever manage to break this belt, and I am sure it is good for twice 2,000 miles.

All leather belts, however, are great pulley grinders unless one keeps them scrupulously clean. But, after all, "truing up" does not cost more than a shilling, while even a new pulley is cheaper than a new belt.

Another disadvantage of the leather belt is that one often has to use it tighter than a rubber one, which will cause more wear in course of time at the engine axle bushing.

Automatic inlet valves on a twin should not be allowed to open more than $\frac{1}{8}$th of an inch. A thin washer or two slipped over the valve stem, above the guide, inside the spring, will cure a good deal of the unsatisfactory running that occurs with automatic inlet valve engines after a prolonged period of wear. "Ixion" and the other people who have been complaining lately about wasteful blow-backs of petrol through the air inlet should turn their attention to the lift of their automatic inlet valve, and reduce the space of possible opening to $\frac{1}{8}$th inch where they find it exceeds that. They will lose less petrol through the carburetter air holes after they have attended to this simple point.

May I be allowed to correct a minor point in your reply to "W.G.A." in a recent issue? The Whittle belt is made $1\frac{1}{4}$in. broad, and I believe even of larger sizes to order.

Wishing long life to your most useful and interesting paper, (Rev.) J. GORDON.

Automatic Carburetters.

[4692.]—Whilst I agree with many of "Ixion's" remarks in the last issue on the subject of automatic carburetters with single lever control I should like to take exception to his comparisons between the carburetters fitted to cars and those fitted to motor cycles.

Whilst the automatic carburetter will give first-class results on a car engine which is run at practically a constant speed, it is no argument to say that the same results would be obtained if it were fitted to the motor cycle engine, which, through it not having a train of gears, has to run at all speeds from 200 to 3,000 or more revolutions a minute in order to meet the varying conditions constantly met with on the road.

The average motor cyclist strives after the absolute efficiency of his engine to a much greater extent than does the car owner, simply because he desires the smallest, lightest, and handiest vehicle that will take him up hill and down dale without having to resort to pedalling and other means of assisting his machine, and such being the case the form of carburetter that will give the greatest efficiency must always be the most popular one in spite of the extra "tap twiddling" that has to be resorted to.

HOWARD SMITH.

American Records.

[4693.]—I was greatly amused to read the letter of your Toronto correspondent in the issue of February 21st, who signed himself "Another Colonial." If he be a colonial he is evidently not a disinterested one, and is probably concerned in the handling of some American machine. As an amateur I protest against the fallacies of this individual. "Another Colonial" must think we are all fools. His letter

Inter-team Trial to Harrogate and back. At the George Hotel, Grantham, during the luncheon interval on the outward journey.

is rash and childish, and he seems to have his nerve with him when he says "we Canadians."

We give Peary the credit of reaching the Pole. Did America wait for verification of Cook's story? Oh, yes! And did he receive no reception in the States? Oh, no! If America did want verification, why should one man be treated better than another, or are the Americans still doubting Peary's story too?

I trust the big 7 h.p. Indian will meet with the success it deserves during the coming season. American motor cycles will not drive English machines from the track, or beat "all creation," as your correspondent would have us believe. I fully appreciate the merits of the Indian motor cycle, but before purchasing my present English mount—which is not my first—I saw many machines, English, Continental, and American, amongst them the Indian, on the streets of Toronto.

I am very pleased to see that in England "American hot air" does not go. Watch American records, and American stories—believe me they need it. It was but last week that I heard of an American automobile that made seventy-five miles per hour for twenty-four hours. Look out for your laurels, Mr. S. F. Edge. It is not infrequent to read in the press of the fastest mile ever accomplished—the one done in Florida by Curtiss on a motor cycle in twenty-six and a fraction seconds. Strange to say, Americans believe these stories.

In reply to our colonial friend's question, why English firms do not send racing machines to America, I would point out that as the duty into U.S. on motor vehicles is almost fifty per cent., the advantage, therefore, in favour of the Hendee people is considerable.

We have all formed our opinion of "Colonial's" reference to British prestige. The Empire has lived a long time, and if it continues to do in the future as well as it has done in the past we shall be satisfied.

Touching the remarks of another correspondent, I might say that English belts in Canada are not afflicted with "galloping consumption," as we are told they are in the south. Like all English productions they are first-class, "all wool and a yard wide." CANADIAN.

Winnipeg, Canada.

The Steering of Sidecars.

[4694.]—I have been much interested in the recent correspondence on the "steering of sidecars." It surprised me to find that so many riders of sidecar combinations experience a side pull on the handles, some when proceeding in a straight line, others when turning corners.

As I have never experienced this trouble during the two years I have driven my sidecar, I thought it sufficiently interesting to find out the reason. Assuming the sidecar to be on the left hand side of the bicycle, I proceeded to reason as follows:

Disregarding the front wheel for a moment, what would happen if the two back wheels were free to move at their own sweet will? The driven wheel of the cycle would at once turn to the left and continue to circle around the idle wheel of the sidecar. Hence there must be a continual pull to the left on the head of the machine, and also on the front wheel.

What condition must be fulfilled in order that this pull shall not affect the steering, or shall not pull the handlebars round? It is that the centre line of the stem of the front fork shall, when produced, pass through the point of contact of the front wheel with the ground. This is necessary to prevent any castor wheel-like movement on the part of the front wheel.

This was my reasoning, and I found that my machine exactly satisfied the above condition. I may mention also that the spindles of my back wheels are in the same straight line and the wheels are set parallel to each other, as so clearly described by Mr. J. H. Lester. This is necessary for easy steering round corners, and to avoid undue wear on back tyres.

If Mr. Herbert Porter can arrange his wheele as I have described I am sure he will much appreciate the easy steering and longer life of tyres resulting therefrom. O.J.P.

SUMMARY OF CORRESPONDENCE.

"FE 523" wishes to point out to readers the kind treatment he received at the hands of Meeson Bros., Wormley, Herts. He says: "I requested a gallon of spirit, with which I was duly supplied, by their breaking open a two-gallon can. Whilst pouring it in the tank they informed me they had no licence at present to sell spirit, but rather than inconvenience me they preferred to give it to me."

EXPERIENCES WANTED.

"Patent" (Bristol) is anxious for users' experiences and opinions of the Lowen two-wheeled sidecar.

"Dr. W." would like readers' experiences with the 4-5 h.p. Norton with or without sidecar, and also the Bramson rear-car.

A REMINDER.

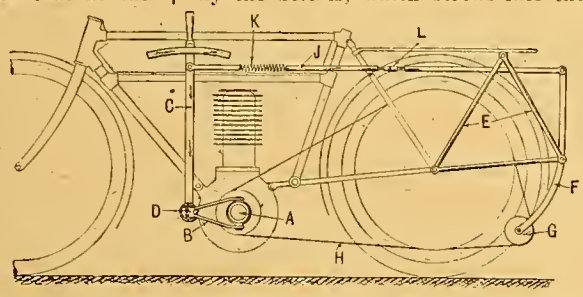
We would like to remind readers that every letter [illegible] *Motor Cycle* requiring an answer must be [illegible] and addressed envelope. Readers [illegible] and mechanical others must always send [illegible] engines will be [illegible] chain transmission [illegible]

RECENT PATENTS.

By ERIC W. WALFORD F.C.I.P.A.

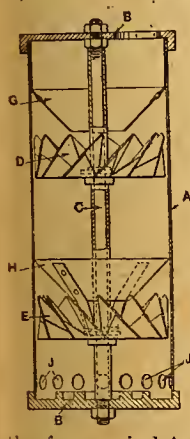
A Belt Tensioning Device.

The construction illustrated is intended for use with expanding pulley gears, and is so arranged that as the lever is moved to vary the effective diameter of the pulley it automatically operates a jockey pulley, whereby the belt is maintained at its correct tension. Adjustment of the pulley A is effected by a fork B actuated by the operating lever C through bevel gearing D. Mounted at the rear of the machine is a structure E, which forms the pivot for a rocking arm F carrying the jockey pulley G which engages the belt H. The other end of the rocking arm F is connected to the operating lever C by a rod J, in which is inserted a spring K to afford a resilient action, and the length of which may be adjusted by a right and left-hand screw device L. Thus as the lever is moved to lower the gear the rocking arm and jockey pulley are simultaneously moved to take up the slack of the belt, and *vice versâ*.—T. R. S. Kynnersley, No. 9,646, 1909.



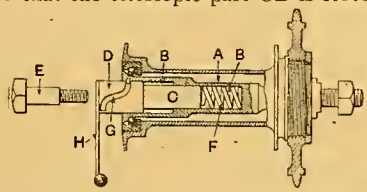
An Exhaust Silencer.

Elimination of back pressure is the object aimed at by this construction, which comprises a cylindrical casing A, mounted between end plates B, secured upon a spindle C. Mounted upon the spindle C are two fans D E, which have their blades set in opposite directions. These fans are retained in their correct positions by distance pieces F mounted around the spindle C. A clearance is left between the peripheries of the fans and the interior of the casing A, and to prevent the exhaust gases passing directly around the fans conical baffles G H are used, which deflect the gases to the centres of the fans. The usual outlet holes are provided at J.—T. Brooks, No. 14,608, 1909.



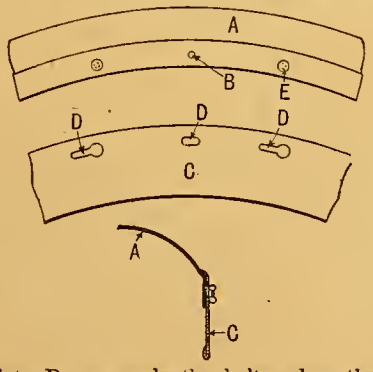
To Facilitate Tyre Removal.

The changing of tubes and covers on motor cycles is rendered difficult by the fact that the tyre parts cannot be completely removed from the wheel owing to the presence of the fork. A few constructions have from time to time been produced whereby the tyre can be completely removed without removing the rear wheel. These constructions involve a collapsable or two-part wheel spindle, and the construction under consideration is of this type. The major portion A of the spindle is bored out at B, and the part C D telescopes in it. The spindle is completed by the bolt E, which screws into the part D. The part C D is held outwards by the spring F, and a helical groove G is formed in the part C, this being engaged by a projection carried by the spindle part A. A lever H is attached to the part D to enable it to be rotated. To remove the tyre or tube, the bolt E is slacked off, and the lever H rotated so that the telescopic part CD is forced back into the part A. A gap is now left between the end of the spindle and the fork end allowing the tyre to be removed. At these times the wheel is only supported on one side so that the parts have to be restored to their normal position immediately.—A. J. Ginestes, No. 25,750, 1909.



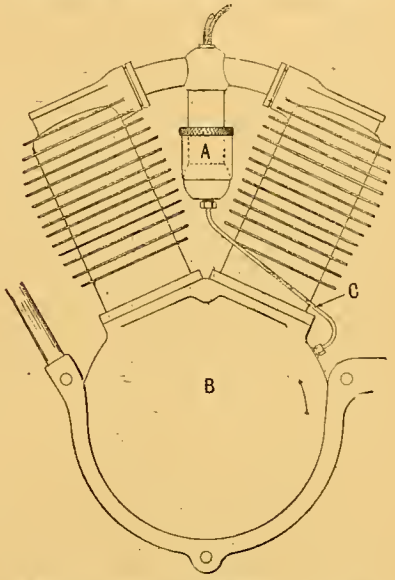
Mudguard Extensions.

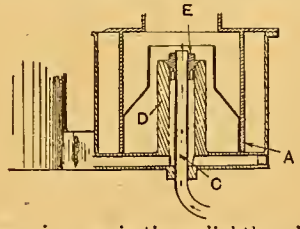
The mudguard A is provided with a number of studs B, and an extension piece or flange C is fixed to the mudguard by these when required. The extension piece is formed with slots D of a special shape to drop over the studs and over the bolts E. When in position the flange is moved lengthwise, so that the narrow part of the slots D surrounds the bolts when the nuts on the bolts are tightened up. A deep side flange is thus detachably fixed to the guard when required.—F. T. Jackson, No. 2,429, 1909.



Lubrication and Carburation.

Each combustible charge taken into the cylinder is accompanied by a small quantity of oily vapour drawn from the crankcase *viâ* the carburetter. The carburetter A is put into communication with the interior of the crankcase B by means of a pipe C. Several methods of connecting the pipe C to the carburetter are shown in the specification, but in that illustrated a jet D of the Longuemare type is bored out to receive it, the end E of the pipe projecting slightly above the level of the jet D.—Rex Motor Mfg. Co., Ltd., and H. Sarginson, No. 16,511, 1909.





One of the most important stands at the recent Aero Exhibition was that on which Green's engines were shown. If one looked very hard for it a water-cooled motor cycle cylinder was to be seen, and a conversation with Mr. Green, the clever inventor, made it clear that he was by no means likely to neglect its manufacture. Several standard makes of machines can be fitted with the engine without difficulty. Mr. Green assures us that on all sides the cylinders have given the greatest satisfaction, and he is thoroughly convinced that the water-cooled motor bicycle will soon become popular. He is now giving the matter his serious attention, and in the near future we shall probably hear more of water-cooled motor cycle engines.

Agencies Wanted in Eastbourne.

Motor cycle manufacturers who are on the look-out for an agent in Eastbourne should send lists and particulars to Mr. V. Yates, Motor Cycle Exchange, Cavendish Place, East bourne.

An Appointment Wanted.

Mr. G. Holland, who for over thirty years was with the Singer Cycle Company, and represented their interests in London, is at liberty for a fresh engagement. Communications should be addressed to him at 5, Queen's Club Terrace, West Kensington, W.

Second-hand Machines.

The Moto-Rêve Co., Ltd., 183, Acton Vale, W., have several 1908 and 1909 second-hand Moto-Rêve models for sale at various prices which have been taken in exchange for newer mounts. These machines may be examined and trials arranged at the above address.

The Advance in Rubber.

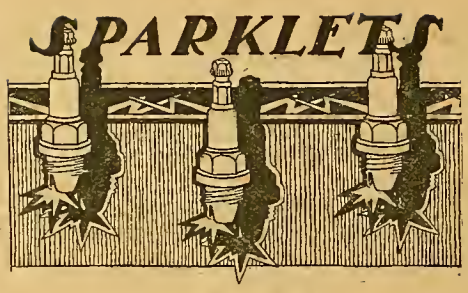
Owing to the continued advance in the price of raw indiarubber, the Rich Detachable Air Tube Co., Crawley, have slightly increased the price of all sizes of detachable air tubes.

A New London Firm.

Mr. H. Taylor, who was for twelve years with the Service Co., Ltd., has taken premises at 21, Store Street, Tottenham Court Road, lately occupied by Horner and Co., and will there deal in complete motor cycles of the best known makes, and all types of accessories, while business will be done in exchanges and on the extended payments system. The firm will be known as H. Taylor and Co.

The Class D Fifty Miles' Record.

When C. E. Bennett brought the Class D fifty miles record down to 49m. 55⅖s. on March 16th at Brooklands, he was using Shell motor spirit, whose purity and regular vaporisation are greatly appreciated by motor cyclists.



A Good Opening.

We know of a good opening for a keen motor cyclist who is capable of taking over the management of an old-established business dealing in complete motor cycles and accessories. Capital is not essential, but preference would be given to applicants prepared to take a financial interest in the business, and for whom a seat on the board of directors would be provided. Letters addressed to "Keen Motor Cyclist," c/o the Editor, *The Motor Cycle*, will be forwarded to the right quarter.

Catalogues Received.

Messrs. Alfred Dunhill, Ltd., 359-361, Euston Road, N.W., are seriously taking up the question of equipment for motor cyclists, and have now published a special motor cycle catalogue, which will be sent to readers upon application. This catalogue not only deals with motor cycle clothing, but it also lists almost every motor cycle accessory known.

The Lloyd Motor and Engineering Co. have just issued a complete 1910 catalogue illustrating and describing most of the L.M.C. improvements. Special pages are devoted to descriptions of the Auto-varia pulley and free engine device, the pedal-operating exhaust lifter, the double lamp bracket, etc. Two views of the workshops in which the L.M.C. motor cycles are made are also included, and a number of testimonials from satisfied purchasers. Copies can be obtained from the Lloyd Motor and Engineering Co., 132, Monument Road, Birmingham.

A Profusely Illustrated Booklet.

Brown Bros., Ltd., have issued an interesting booklet to mark the majority attained by the firm. It is the biography of a big business, and, indeed, the immense proportions to which the business has grown will come as an eye-opener to many on perusing the booklet. All the different departments are depicted in illustrations, and there is very little reading to tire the reader. Copies are obtainable from Brown Bros., Ltd., 22 to 34, Great Eastern Street, E.C.

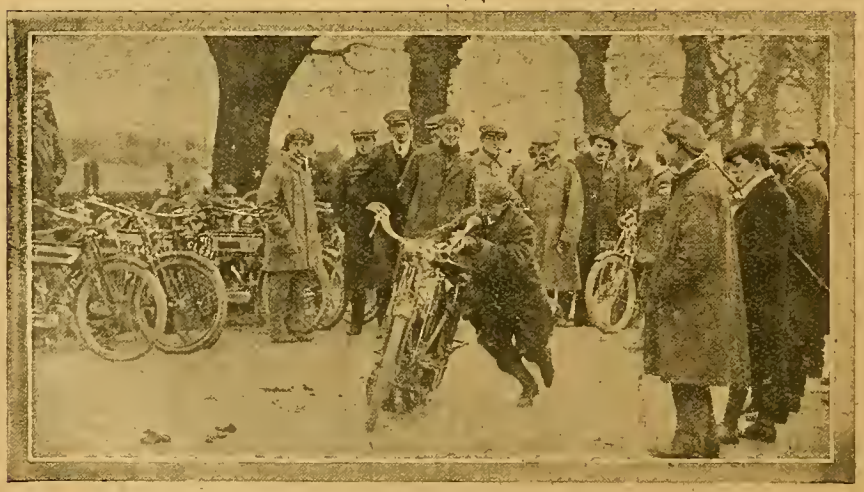
Touring Equipment.

The 1910 catalogue of Brooks motor cycle saddles, tool-bags, touring bags, etc., has just reached us. Like all things turned out by this firm, the catalogue is representative of the best style and quality of printing. It includes excellent illustrations and descriptions of such articles as the B104 motor cycle saddle, with backrest, which we illustrate. Practically every possible type of tool-bag is included for attachment to carrier, saddle, or frame. Brooks touring bags, particularly the latest type with removable inside cases, are splendidly designed for the purpose for which they are required. The firm also make spare belt and tube cases, and for those who require them tool and touring bags can both be supplied with good locks and keys. Copies of the catalogue can be obtained on application to J. B. Brooks and Co., Ltd., Great Charles Street, Birmingham.

Brooks B104 saddle with backrest.

"Continental" Items.

We have received from the Continental Tyre and Rubber Co., Clerkenwell Road, E.C., four different sections of their well-known rubber motor cycle belts, grooved pattern. These belts are considerably improved in construction, and the grooves are much deeper than previously. Continental belts are made in the following sizes: 1in., ⅞in., ¾in., and ⅝in. Arrangements have been made by the company to retread motor cycle covers of any make, with rubber non-skid treads at their Willesden works. All work entrusted to them will be carried out in a similar style to their motor car tyre repairs, for which they are justly famous. All goods should be plainly addressed to the repair works, Hythe Road, Willesden. By the way, Harry Martin was using Continental motor cycle tyres when he won the Easter motor cycle handicap at Brooklands on March 28th.



Scene at the start of the Norwich and District M.C.C. reliability trial for the President's Cup. A competitor on a 1910 Ariel pushing off. (See Club News pages.)

WARNING!

n't pay £48 for a gearless machine. BRADBURY

3½ h.p. MOTOR.

An expert opinion declared it to be ahead of anything yet turned out in the Motor World.

Owing to its special frame construction, no other Motor Cycle is as rigid, as well balanced, as steady on the road, or provides the same accessibility for repairs or re-adjustment to engine parts.

PALMER.—9h.p. Jackson, 2-seater, bucket bod erul condition like new; £85.

PALMER.—9h.p. taxicab, latest style, landaulet seating four inside, very smart; £150.

PALMER.—8h.p. Buchet chassis, late type, long fast running engine; £75.

PALMER.—16-24h.p. De Dietrich Chassis, late M.O.V., pressed steel frame; bargain, £85.

PALMER.—12-16h.p. Mutel, chassis, 4-cyl., drive, late type, like new throughout; £60.

PALMER.—16-20h.p., Anglian, side entrance lim all Aster fittings, and engine, silent and p £135.

PALMER.—14-16h.p. 1910 Darracq. I mak largest possible allowance for old car; £22

PALMER.—Bleriot type monoplane, splendid m has flown; price, less engine, £75, with engine

PALMER.—All above seen at L. N. Palmer Trevelyan Rd., Tooting. Garage one minute Rd. tram terminus, Tooting. 'Phone, 208, Stre Photos, details. Easy terms Exchanges.

JACKSON, 6h.p. De Dion, on the road daily; 26, Bristol Rd., Birmingham.

ARGYLL Car, 8h.p., three speeds and reverse, 4 good running order; £45, or part exchange Motor, 31, Woodside Gardens, Bruce Grove, Tott

CARS FOR SALE.

TONY-HUBER, 10-12h.p., 4-seater, hood, Stepney, everything in splendid condition; trial; £55, bargain; take bike part payment.—4, Frances St., Woolwich.

TUMBERETTE, 2-seater, 5h.p., two speeds and reverse, fast, reliable, smart little car, painted green, lamps, tools, etc.; £35.—Owen, Cottage, Melbourne Lodge, Ealing.

SMALL Humberette Car, complete, less engine, back axle wants little repair, 2-seater, in splendid condition; £10 the lot; tyres in excellent condition.—Topp, Carlisle St., Soho.

A BARGAIN to immediate purchaser for £45.—10h.p. 2-cyl. car in excellent running order, four speeds and reverse, Dunlop grooved tyres.—Address, H., 2, Rochester Rd., Earlsdon, Coventry.

STANLEY Steam Car, 10h.p., boiler just re-tubed, everything overhauled at cost about £60, tyres first-class, Model EX, 1907, many extra fittings, paraffin burner; take good 1909 or 1910 motor bike part exchange value £80.—Rossiter, 57, Walter Rd., Swansea.

BARGAINS.—We do not sell "auction cars." Ten years practical experience of motors enables us purchase sound machines, overhaul them carefully, and offer with guarantee of satisfaction to our customers. Appeal a selection. Fullest details on application.—Below.

12h.p. Darracq, smart little 4-seater, £30; 10-12h.p. 2 Aster, m.o.v., side entrance, powerful and fast, 15h.p. Star, 4-cyl., Stepney and lamps, four speeds and reverse, mechanism as new, £60; 10-12h.p. Speedwell very nice medium size car, 2 cyls., runs like 4-cyl., £55; 8-10h.p. Deschamps, four speeds and reverse, good, £42 10s.—Below.

TWENTY Minutes from Bank by tube will land you here for inspection of above and other cars.—Sully and Co., 10, Old Town, Clapham, S.W. 'Phone, 1781 Battersea.

10-12h.p. M.M.C., 5-seated tonneau, upholstering not scratched, body, paint, in splendid order, 2 cyls., Daimler engine, accumulator and coil ignition, four speeds and reverse, chain drive, good strong hire car, or take good van up to 15 cwt.; a bargain, £35, or exchange for 1909 Triumph motor cycle.—Turvey and Co., The Motor House, Sunderland.

ENGINES.

4h.p. Engine, carburetter, perfect order; 35s.—Gibson, Howth View, Merrion, Dublin.

1h.p. M.M.C. Engine, £3 5s.; 2h.p. Werner, 17s. 6d. 2 —59 Cranfield Rd., Brockley, S.E.

ENGINES.—Roc, 4h.p., single-cyl., new 1910 type; early deliveries.—A. W. Wall, Ltd., Birmingham.

4h.p. N.S.U., with magneto, m.o.v., perfect condition; cash offers.—Alcock Cranmore, Meads, Eastbourne.

NYE'S!—Engine exchange. Your old engine and cash for a new one. Try us. Speciality: Peugeot, J.A.P.—Nye's, 69, Leather Lane, Holborn, London.

4h.p. Humber w.c. Engine, complete with silencer, carburetter, clutch, and pipe connections, etc., perfect, and equal new; 10 guineas.—Topp, Carlisle St., Soho.

4h.p. Air-cooled M.O.V. Engine, expanding pulley, perfect condition, with Chater frame and front wheel (no tyre); 27s. 6d. to clear.—Ashdene, Enslin Rd., Epsom.

4h.p. Antoine Engine, 85 by 85, fitted with new clutch, also starting handle, cost £3 16s.; accept £4 15s. exchange lower power and cash; also inch Whittle belt.—Grosvenor Rd., Walthamstow.

4h.p. J.A.P., 85 by 85, A.O.V., with magneto, complete with chain drive, and adjustable pulley, very new; £11, or nearest offer.—Parsons, Seeburg, Herne Hill, South Woodford. 'Phone, Wanstead 60.

6h.p. Twin Antoine, Longuemare carburetter, exhaust pipes, and silencers, all fitted, very powerful, guaranteed perfectly sound, £7 10s.; Mabon clutch to fit same, perfect order, 30s.—Wallis, grocer, Hills Rd., Cambridge.

IGNITION APPLIANCES.

SEVERAL 20 amp. C.A.V. accumulators, nearly new, charged; 6s. 6d.—White, 94, Copeland Rd., Peckham.

SPECIAL Offers in accumulators, 4 volt 20 amp., 10s. 6d.; approval.—A. Collis, 53, Brighton Rd., Bristlale.

MAGNETO, Coil, and Accumulator repairs in two days; guaranteed; low prices.—Fellows, 49, Hertford St., Mayfair.

JEBRON Registered 291-289, vastly superior to platinum, cures misfiring; best contacts for blades, screws, rockers, magnetos, coils. Jebron has no equal.

JEBRON, 2s. 6d. each rivet fitted; Jebron trimmers, 9d.; Jebron screws fit Bosch magnetos DA2, DAV, contact breakers 5a, 5b, 5c, 5s. 6d. pair; old screws Jebronised, 2s. 6d. each. Over 10,000 fitted. Try it.

JEBRON, fitted return post free.—From the inventor, Jebron, 38, Herbert Rd., Plumstead.

JEBRON Contacts were used by Messrs. Collier Bros., Colver, and Martin, in making their recent world's records.

IRIDIUM Champion Contacts. — Any parts fitted returned same day, 1s. 3d. each, warranted pure. Special iridium trimmers, 9d.; magneto screws refitted, 1s. each.—Williams 16 Wellington St., Woolwich.

BELTS

IGNITION APPLIANCES.

IGNITION Coils and Magnetos Repaired, any make; accumulators repaired and charged; best workmanship, moderate charges. Tel., 423.—Glover Bros., Electricians, Coventry.

ACCUMULATORS, Coils, magnetos repaired, overhauled by expert workmen; a large stock of new and second-hand goods; price list and quotations free.—The Victoria Garage and Electrical Co., Ltd., Coventry.

COUPLINGS.

UNITO Patent Coupling, price one guinea, for connecting motor cycle to pedal cycle. When touring use the Unito. Many people have expressed the opinion they prefer it to a sidecar and for a low power machine it is much more suitable. If you do not know all about the Unito write (Dept. B.), Unito Coupling Co., Brecon St., Cardiff. London Agents, 75, Bishopsgate St. Without.

TYRES.

MAUDES' for Tyres.—Halifax and London.

MAUDES' supply every make of tyre; all tyres we sell are fully guaranteed. We allow from 5s. to 10s. on old covers, and 2s. on old tubes in part payment.—Maudes', 136, Great Portland St., London, W., also Powell St., Halifax.

RE-TREADING with Rubber-studded Treads.—Cycle covers, 4s.; motor cycle 12s. 6d.; sections free.—Fox, 30, John Bright St., Birmingham.

BARGAINS.—A number of motor cycle covers and tubes all sizes, to clear cheap, wired and beaded.—Murray, 37a, Charles St., Hatton Garden, Holborn.

BASTONE'S.—New rubber studded motor cycle covers, wired edge, 26 by 2, 17s. 6d.; 26 by 2¼, 18s.; 26 by 2¼, 19s. 6d.; 28 by 2, 18s. 6d.; 28 by 2¼, 19s. 6d.; beaded edge 2s. extra.

BASTONE'S.—New motor cycle covers, ribbed pattern, wired edge, 26 by 2, 2¼, 11s. 6d.; 26 by 2¼, 28 by 2, 2¼, 12s. 6d.; beaded edge, 2s. extra.

BASTONE'S.—Tubes, with valves, best quality, and guaranteed, 26 by 2, 6s. 9d.; 26 by 2¼, 7s.; 26 by 2¼, 7s. 6d.; 28 by 2, 7s.; approval against cash; subject to being unsold.—Bastone, 215 and 217, Pentonville Rd., King's Cross, London, N.

ARDEA Co.'s retreading; all sizes motor cycle covers, heavy, plain, or ribbed, 11s. 6d.; rubber studded, 14s.; loose bands, tubes made butt-ended.—331a, King St., Hammersmith.

NYE'S!—Tyre exchange! Exchange that old cover for a new one and cash difference; liberal allowances; any make of tyre supplied on cash, exchange.—69, Leather Lane, Holborn, London. 'Phone 6299 Holborn.

FOR Sale, two Clincher covers and tubes, 26 by 2¼, in first rate order, one cover rubber studded, only run about 1,200 miles on Triumph motor cycle; price £2 the lot.—A.R.B., Stony Yarrows, Mayford, Woking.

MICHELIN Covers, brand new, carrying makers' guarantee, thick treads, 26 by 2, wired, 14s. 6d.; 26 by 2¼, wired, 16s.; 26 by 2, beaded, 16s.; 26 by 2¼, beaded, 17s. 6d.—Stewart, 12, Market Square, Horsham, Sussex.

TUITION.

MOTOR Car driving and mechanism taught in one month.—No. 4,072, *The Motor Cycle* Offices, Coventry.

"THE Model Engineer" Laboratory and School of Mechanics.—Private instruction given in lathe work, fitting, repair work, practical electricity. Pupils can make or repair their own engines, motors, or apparatus under the supervision of a competent instructor; tests made and technical advice given.—Write for illustrated prospectus, post free, or call, 26-29, Poppins Court, Fleet St., London, E.C.

INSURANCE.

PLEASE send for reduced rates for 1910 policy; personal 5s., inclusive 18s. per annum.—Boss, insurance broker, Ongar.

MOTOR Union Insurance Co., Ltd., give the best terms; prompt settlements; most generous treatment; free legal defence.—Write, G. H. Jones, Talbot House, Lichfield.

INSURE Your Motor Cycle with Hugh J. Boswell, Insurance Broker, Norwich, who is in the position to offer the cheapest rates ever offered, viz., fire 2s. 6d., third party 7s., accidents to cycle 14s. 6d., accidents to rider, 19s.; inclusive policy, 17s. 6d.; please write for particulars.

BUSINESSES AND PROPERTY FOR SALE, TO BE LET, OR WANTED.

STABLING, for tricar, or motor cycle, with bench and vice; 6s. month.—72, Harrowgate Rd., South Hackney.

SEMI-DETACHED House for sale, three bed, two reception rooms, bath, h.c., 4-foot sideway, motor shed, suit tricar; £315; 97 years.—18, St. John's Avenue, Friern Barnet, N.

FOR Sale, old-established cycle and motor business, main thoroughfare, provincial town, good hiring trade; reasonable price accepted for stock; good reason for selling.—Apply, Rivers and Milne, 88, Gracechurch St., Cornhill, E.C.

THE OIL THAT DOES

even under adverse conditions ensure a beautifully cool, sweet running engine The outcome of many months of close lab ratory research and ultra severe practical tests under varying conditions out on the road.

It is a perfect boon to the motor cyclist.

Your engine can only work ideally under ideal conditions, and the use of an ideal oil is absolutely essential.

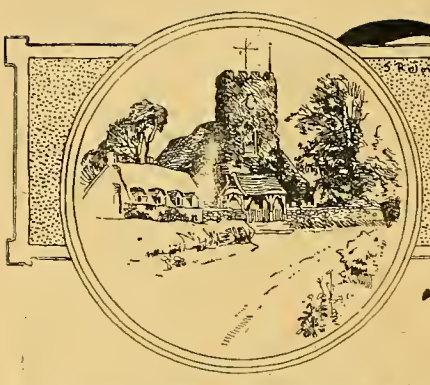
ADDRESS—20, TUDOR STREET, LONDON, E.C.

Variable Compression Ratio.

AN article in this issue on the ratio of compression in motor cycle engines shows that an internal combustion engine is working under most unfavourable conditions, particularly in the case of single-geared machines. If all motor cycles were variably geared, and particularly if they were provided with three or four speeds, the ratio of compression could be higher with good effect than in the case of single-geared motor cycles. This question of ratio of compression recalls the great advantages that would accrue from a device to vary the compression. The first engineer who succeeds in making an internal combustion engine with a practical system of variable compression will have accomplished a very great stride in the direction of eliminating the variable gear question. Numerous devices have been patented at various times for varying the ratio of compression, but none of them, so far as we are aware, have ever been perfected. As the contributor of the above mentioned article points out, compression is variable by means of the throttle, or, to be more explicit, by the amount of gas the rider allows to enter the cylinder. It is also variable to some extent by the position of the piston with regard to the time at which the spark takes place and explosion occurs. Putting these two means of varying the compression on one side, it will readily be seen that on level roads, the ratio of compression might reasonably be raised to a considerable extent. For hill-climbing purposes, when the greatest power is required, the opening of the throttle and admittance of as full a charge as possible raises the compression. This is a disadvantage, because it occurs when the engine is revolving comparatively slowly, and has difficulty in overcoming the increased compression at the slow speed at which it is forced to run. If the compression ratio could be varied in the engine to such an extent that a variable gear would not be required on a moderately powerful motor bicycle, it is one of those improvements which would tend towards greater simplicity and increased comfort.

The M.C.C. Inter-team Competition.

ON page 317 we publish the 1910 rules and regulations for the Motor Cycling Club Team Competition for *The Motor Cycle* Challenge Cup. Two improvements in the rules which we think might well be introduced for 1910, and which we recommend to the notice of the organisers, are: (1) Pedalling might reasonably be prohibited. The course is only 100 miles in length, and any motor cycle ought to be able to cover this distance without the rider having to resort to pedal assistance. The competition is promoted to bring out the driving skill of riders, and the trophy goes to the team whose members take care that the mechanism of their machines is in perfect order previous to the start. There is, therefore, no reason why belts should not be run in beforehand to obviate any possibility of slipping through stretching. It is a common sight to see competitors pedalling on the steeper hills to relieve the belt. (2) The members of each team should wear a distinctively coloured armlet as well as a number. We think this would simplify the duties of the officials as well as making the event more interesting from a spectacular point of view. We recommend the secretaries of clubs intending to enter for the competition to bring the matter before their committees without delay.



Westward Ho WITH A SIDECAR

BY B.C de W SIFFKEN

THE broad white road, winding Devonshire lanes, high banked and gorgeous with violet and primrose below, gorse and blackthorn above, plough and pasture, river and streamlet, busy market town and sleepy hamlet; the "puttah-puttah" of a well-tuned twin, slipping belt, punctures, shying frantic horses, cream and cider—such are the outstanding memories of a sidecar tour in the spring in the Garden of the West.

On the Thursday morning after Easter, my wife and I set out upon our trip from London. Our equipment consisted of a 5 h.p. Rex de Luxe motor cycle and Montgomery sidecar (flexible or rigid at will), 2¼in. Palmer Cord tyres on sidecar, 2in. Michelins on the twin-tyred driving wheel, Roc clutch and single gear with adjustable pulley. We took with us a big expanding basket on the carrier, a well filled dress suit case under the sidecar body, and odds and ends of all kinds under the cushion and mat of the car; the whole outfit, including passengers, weighing exactly 6 cwts.

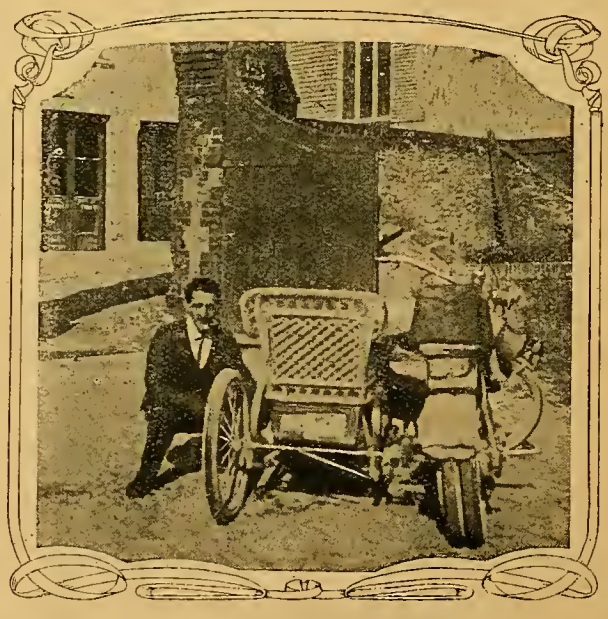
A leisurely progress, delayed by the loss of a small handbag which dropped out of the car, but which was subsequently recovered, brought us to Hungerford about five o'clock. Extensive building operations were going on here, and one of the contractor's pet rocks went through one of my back tyres. This necessitated a somewhat lengthy repair, and here I took the opportunity of lowering the gear and fitting a new Whittle belt which I had with me. The stretch of this incurred continual shortening at first, and delayed us so much that we only reached Marlborough that night. We stayed at one of the best hotels of the town, which I will not name. The comfort of the place left nothing to be desired, but the bill somewhat neutralised the pleasure.

Marlborough to Bristol.

Thence on the Friday we set off for Bath and Bristol. All went well until we were approaching Calne. I may mention that the sidecar, which had begun the journey rigidly fixed for the better negotiation of London traffic, had been made flexible the day before (only a five minutes' job). The consequence of this was that a shower having come on, we made a gallant and determined attempt to knock down two stone cottages in Calne by means of a wild skid at a dangerous corner. Conversion to rigid once more brought us to tea with friends at Bristol, and from there we ran to Brent Knoll, on the road to Bridgwater, and were most pleasantly received at a little wayside inn called the Fox and Goose. Here we were made most comfortable, and the cost of our night's entertainment was considerably less than half what we had paid at Marlborough. Next day we had an uneventful ride through Taunton to Minehead and Porlock.

A Circuit to Avoid Lynmouth and Parra ombe.

At Porlock we stayed till the Tuesday, spending our time in rambles upon Exmoor and the shore. Our hope was to continue our journey to Ilfracombe, but the intervening mass of headland and mountain forbade us the direct road. We might have got to Lynmouth, but we should never have got out of it again, and much the same might be said of Parracombe, so we were compelled to make a circuit. This we did, starting on the Tuesday afternoon back to Dunster and then by Wheddon Cross to near Bampton, and then turning to the right to S. Molton by routes 791, 729, and 792 of the Contour Book (Western Section). On this day we encountered our first engine trouble. Hitherto, our few involuntary stops had been caused by belt, tyres, and wet on the magneto.



The writer's Rex de Luxe motor cycle and Montgomery sidecar.

This day, the weather and the engine were both hot, and there was a lack of power consequent upon a warped and pitted exhaust valve, and a considerable deposit of carbon in the front combustion chamber. The passenger had a two-mile walk on the last portion of the eight-mile hill to Wheddon Cross, which is considerably more trying than Gall and Inglis would lead us to suppose. After that we went on without further trouble to South Molton, where we stayed the night. The village constable here has a mission to reform the world, and holds stringent ideas upon the time that is

The Trusty Triumph again wins the Jarrott Cup.

EASTER, 1910.

M.C.C. London - Land's End and Back Reliability Trial, Jarrott Cup.

Capt. Sir R. K. Arbuthnot, R.N.,
3½ Triumph - - Winner.

His total time error over the double journey was only 2 min. 9 sec.

Mr. Stanley Webb,
3½ Triumph - - - 3rd.

The Absolute Reliability of the Triumph is again proved by these splendid performances.

In answering this advertisement it is desirable to mention "The Motor Cycle."

allowable for a motor cycle to stand in a street totally devoid of traffic. If he were transferred to London, the rates would go up and prison accommodation have to be doubled. The police force of S. Molton gives one the impression that it consists of five men, of whom four are superintendents longing for something to happen that would mean promotion.

A Wayside Overhaul.

Next morning was fine, and a mile or so along the road to Barnstaple I took down the engine and give it the attention that it sorely needed. Then I broke the oilpipe. I bestowed a few words of benediction upon the genius at Coventry who had ordained that that oilpipe should enter the crank case directly behind the magneto, and necessitate the removal and retiming of the latter when anything had to be done to the pipe. I drove on to Barnstaple (about ten miles) without oil, and there had a new pipe made and fitted it myself, retiming the magneto. That afternoon, after sundry

The Taw at Barnstaple. The road to Bideford is over the bridge.

lug troubles, caused by detached particles of carbon islodged during my wayside overhaul, we reached Ilfracombe. The Thursday was wet, and I took dvantage of that to fit a new B. and B. handle-bar ontrolled carburetter, of which I had failed to get elivery at Easter.

On the Friday we made our way back through arnstaple to Bideford—the furthest point of our ravels.

Here, perhaps, a few general remarks will not be miss. It is impossible to do justice in words to the cenery of this part of the world. Porlock and the Exmoor country have a charm of their own, and the illage itself is one of the most beautiful in the king-om. The combined fragrance of a Devon or Somerset illage, compounded of spring flowers, cows, and eat smoke, is a thing that one may experience and ver after remember, but never adequately describe. he rolling wastes of Exmoor, the only home in ngland of the wild red deer, the tiny gurgling trout reams, the larch-clad dales, lush green pastures in he valleys, crowded with skipping toy-like lambs and their sober mothers—for what more ideal country could the jaded city-dweller hope?

Of course, we missed a good deal of beautiful country by avoiding the Lynmouth road, but the scenery of the Exe Valley between Wheddon Cross and Bampton well repays one for the long *détour*.

Bideford, with its sister villages of Appledore and Instow, forms a little western world of its own. The gleaming whiteness of the buildings, the characteristic smell of tar and ozone-laden mud, and the ample trousers of the seafaring men and lads who lounge upon its broad boulevard quay, and, above all, its puffing little street railway, give Bideford the appearance of a Dutch or Flemish, rather than an English, town. But when you come to mount the streets which lead up from the quay—1 in 3½ some of them—the illusion passes and you are

In Devonshire once more.

On the Saturday afternoon we meant to pay a visit to Clovelly, so the passenger set off by herself, and I got the machine up the aforementioned streets by clutch slipping and the following of many circuitous back alleys. But we were doomed to disappointment, for having travelled successfully enough some five miles on our course, we came upon stones—no ordinary stones, mind you, but great aggressive rocks that would not have passed through a 12in. ring—sharp arrow heads of the Stone Age, apparently others—stones of every conceivable shape, size, and description, as they stretched from side to side of the road as far as the eye could see. With a reluctant sigh we turned back to Bideford, and did not see Clovelly. We now started on our homeward way, and reached Crediton that night. It was a splendid run, and the glories of the setting sun lighting with a hazy splendour the purple masses of Dartmoor, forty miles away to our right, gave an impression that we shall never forget. From this mid-Devon road one can see at the same time, northward, round-topped rolling Exmoor, and the wild rocky tops of Dartmoor far to the south.

Crediton we found recovering from its annual cattle fair held that day, and the streets were awash with

Westward Ho! with a Sidecar—

disinfectant, and the farmers with another liquid, taken, no doubt, purely as an antiseptic. We were well catered for, however, at the Ship Inn, and the next morning saw us threading our way through

High Street, Hungerford.

Exeter, which seemed a clean and comfortable city. We had meant to attend service at the cathedral, but, finding ourselves out on the Honiton Road without having so much as seen the cathedral, we gave up the idea.

From here to Ilminster we found the most trying section of our whole tour in the matter of hills. The gradients are not terrific, but the hills are very long and trying to an engine already overloaded. We left the London-Plymouth and Land's End route after Honiton, and followed routes 689 and 682 of the Contour Book to Andover. I think that the organisers would find this a better route than the other for long-distance trials. Shortly after passing Ilminster the worst mishap of the tour came to us—the front spindle broke. My wife and an assortment of village children groped about in the road for escaped balls, what time I took out the wheel and coaxed the cones on to a spare spindle. These were stiff on the thread, and gave a great deal of trouble, but finally the job was done about 7 p.m., just as it was coming on to rain.

Ilchester was but seven miles away, and I reckoned on stopping the night there and getting our things dried, so I did not trouble to unpack and put on my rubber overalls. We discovered two inns at Ilchester. Both the landlords regretted that it was quite impossible for them to do anything for us, "the missis" in both cases being at church. The display of a golden sovereign and the jingling of many keys in the pocket proved of no avail. I could not even have a room to change my breeches in until the "better halves" should have finished their devotions. So on we went another six miles in the rain and came to Sparkford. Here at the Sparkford Inn mine host was in the same predicament, namely, that his wife was at church, but he took us in regardless of the conjugal wrath that might fall upon his devoted head, as a consequence of his having extended hospitality to two poor soaked travellers. Here we spent the last night of our tour and right comfortable we were.

Our greatest distance in a day so far, had been a potter of about eighty miles. The Monday night saw us home in Essex with a day's mileage of 130 to our credit. We came through London at night, as I advise all others in like circumstances to do, and arrived home in the rain at 11 p.m.

Throughout our trip we experienced nothing but consideration and courtesy from road users and police, with the exception of one incident. A big limousine car, with a London number and, unfortunately, no club badge did its best to annihilate us on a greasy hill near Calne, owing to the wild way in which it was driven.

All over the West Country we seemed to be a subject

Down Devonshire way.

THE 'SILENT' INDIAN IS ESSENTIALLY A ROAD MACHINE.

ROAD OR TRACK- IT'S ALL ONE TO THE INDIAN.

Any expert motocyclist will agree that racing on Brooklands track for one hour at a speed of sixty miles per hour is a harder test on a motocycle than running from London to Edinburgh at an average speed of 20 miles per hour, for witness the failures of many who attempt long distance records at Brooklands.

Do not forget that INDIAN motocycles have received the highest awards for the past three years in the A.C.U. Six Days' Reliability Trials.

The INDIAN was a Gold Medal winner in the 1909 London to Edinburgh Run.

The INDIAN was the winner of the Cup in the Essex Motor Club's London to York and back 24 Hours' Reliability Trial, 1909.

And also winner of the highest awards in many Club Reliability Competitions on the road during 1909.

Don't forget that it is an actual fact that the machines which run so successfully on Brooklands are absolutely standard roadsters as delivered to the public.

For track work they are merely stripped of superfluous parts, equipped with gears suitable for high speed on the track, and fitted with racing handle-bars.

We remind you of these facts, as we have occasionally heard it mentioned that the INDIAN—while it may be fast on the track—is not a road machine.

The best proof that this is an erroneous impression is proved by the fact that the 5 h.p. INDIAN which went through the Six Days' Reliability Trial last year, and won Gold Medal, with the Auto-cycle Union's Seal still intact, went on to the Brooklands Track and established what is still a world's record for the flying kilometre for the 750 c.c. class, viz., 65 1/8th miles per hour.

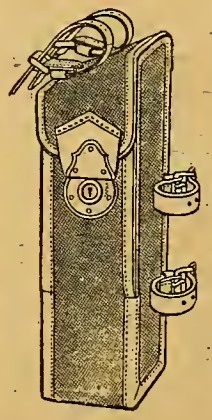
Talking of Tools

We would impress upon you that we have spent many years in a study of how best to carry them, and in the bags we have designed we claim to meet the Motor Cyclist's every need.

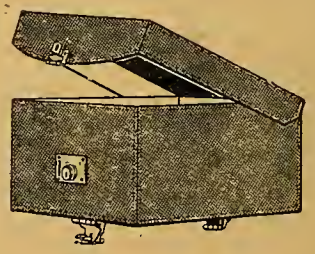
Here are two.



B9482. This bag is made of stout brown waterproof Canvas of the finest quality. Special fibre board is used in its construction, and it has fall front fitted with good lock. It holds set of tools and spares, and fits between back down-tube and rear mudguard. Its size is 10½" × 2¾" × 3½" and it can be obtained at two prices—

8/9 and 11/6.

B9685. A carrier Bag which will be found an exceedingly handy and commodius receptacle for the carrying of tools and spares of all descriptions. It is strongly made of the finest waterproof Canvas on special three-ply board, is attached to the Carrier by means of two wing-nut clips, and fitted with strong English Lever Spring Lock. Size 10" × 9" × 5"—price **9/6.**



There are many more in the BROOKS BOOK, of which we will send you copy on request.

J. B. BROOKS & Co. Ltd.,
49, Criterion Works, BIRMINGHAM.

of great wonder to the natives, animal and human. Horses shied wildly at us, and sometimes I had to stop the engine for them as often as twice or three times in a mile. Sheep and lambs courted death from exhaustion by the panic-stricken stampede in which they indulged at their first sight of us; cows fled in lumbering terror at our approach, and the local worthies held deliberative council round the Rex whenever we stopped.

A Mistake not Warranted by Appearances.

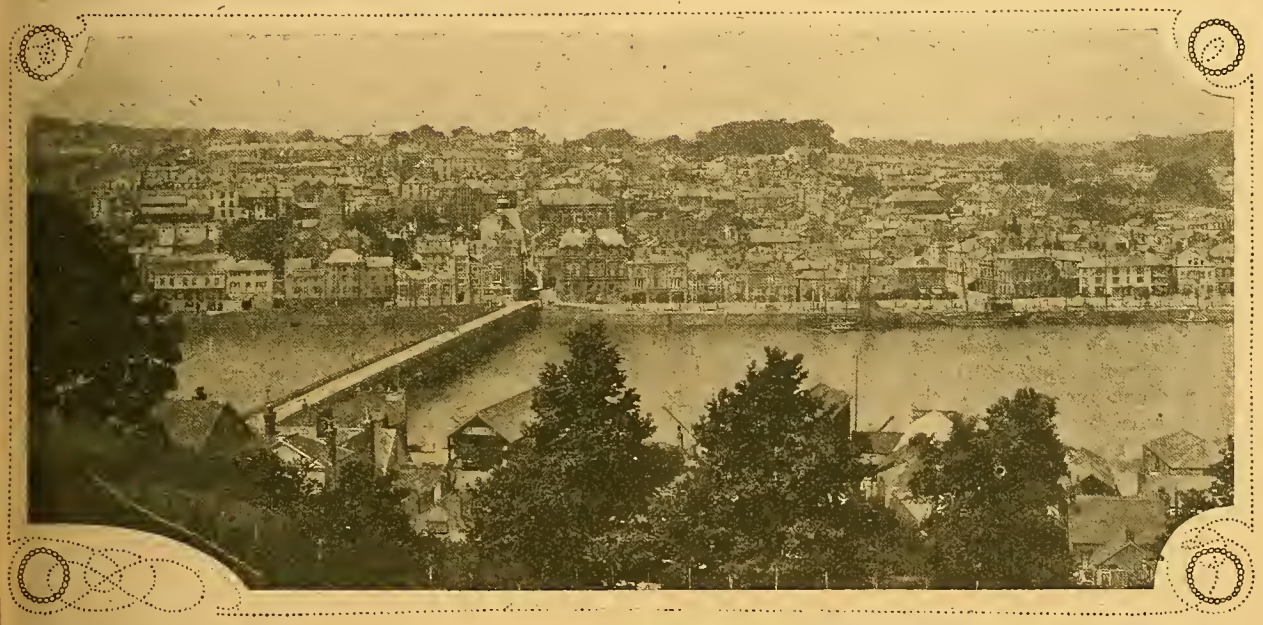
The following is a true story—the mistake, I need hardly say, was *not* warranted by my appearance at the time. Elderly yokel, pointing out to his cronies the Rex transfer on the tank: "Zee heve got his crest and coronet put on 'un."

The machine really behaved splendidly. The passenger had to be dropped more than once on hills, I admit, but considering the most trying nature of our route I think that its performance may be considered as a triumph (no pun intended) for the Rex material and design. It was painfully overloaded for its single gear, and, moreover, it was under-tyred. Only the 2in. Michelins were punctured, but of actual wear they showed hardly a trace. The steering wheel and sidecar tyres did not even require pumping up the whole time. The two breakages were to the oil pipe and front spindle. Both these details have been better designed since.

Our expenses, which worked out to less than we expected, and including very heavy bills at Marlborough and Bideford, averaged 16s. a day inclusive for the two of us. The running expenses of the machine came to between 15s. and £1, but this, of course, takes no account of wear and tear, or depreciation.

A year or more ago the sidecar question was much discussed in these columns. I have already said that mine is a Montgomery, rigid or flexible at will by a small contrivance of my own, and, taking all things into consideration, I prefer it rigid. I would never go back to a flexible sidecar pure and simple. The flexible form is faster and pleasanter to drive for both driver and passenger so long as the conditions suit it, but it is unhandy and clumsy when running very slowly or stopped, and necessitates the use of a non-skid on the *steering* wheel, and even then is a most awkward affair on tramlines or in dense traffic.

The rigid variety has its drawbacks also. It is uncomfortable and awkward in crooked winding lanes, and on roads that are irregularly cambered, and it takes appreciably more power to drive than the other form, but, in combination with the clutch, its steadiness in performing intricate movements gives it a distinct pre-eminence, while the fact that it *cannot* skid under any circumstances, alone, is sufficient recommendation. My experience is all in favour of rear wheel brakes only for sidecar work. I never used but one of mine on this tour—a foot-applied leather-lined band brake—and it sufficed to bring the 6 cwts. to a standstill on single-figure gradients.



Bideford, the most westerly point reached on the tour. The famous bridge over the river Torridge may be seen in the foreground.

For the assistance of those who contemplate what I may call a married outfit such as mine, I may say that my machine and sidecar complete cost me under £30 second-hand. Compare this holiday of ours with the conventional middle-class trip for a fortnight to the seaside, and then you will realise something of the immense sphere of usefulness that there is for the motor cycle. Some day we mean to get a new two-speed Rex and tour on the Continent, by way of showing what the British industry can do.

A Few Words of Advice.

In conclusion, I would give a few words of advice to tourists, for there must be many inexperienced readers who hope to tour this summer. Take waterproof overalls and put them on when it *begins* to rain—you never know how long it will last. Use the Contour Books intelligently, and you will not go far wrong, but do not judge your hill-climbing capabilities by the gradient in figures—these, as the books explain, are usually the average gradients, and steeper pitches are met with.

Occasional Comments

"By Ixion"

The Engine of a Speed Mount.

I rather regret to notice that motor cycling is passing through a feverish period analogous to that from which pedal cycling has already emerged. Most of us can remember when every young cyclist aped the genuine speed men by specifying a pair of ram's horn bars, a short steering head, open-sided sprint tyres, and an apology for a saddle. He might not be a speed merchant, but he had to look like one, or pass for an old fogey. Much the same is happening in certain sections of motor cyclists. Long, low, light machines, with very little silencer and lots of hooter, are the thing; if you carry a toolbag more than an inch thick you are written down as a potterer and no sportsman, because certain racing jockeys and their track equipment are the models upon which the hero-worshippers of the day mould themselves.

Well, externals do not matter so very much, and if it amuses "the boys" to ape a Brooklands record-holder in general get-up and outfit, nobody will be much the worse; but unless I am much mistaken quite a number of peaceful and secretly rather timorous clubmen are yielding to the craze so far as to purchase special speed mounts fitted with special speed engines. They do not intend to touch "sixty on the road," though they may very probably brag of having done so; they simply want to be in the fashion, and a barking, buck-jumping T.T. is the fashion in their club. I have been riding this type of mount a good deal lately, and I assert emphatically that it cannot compare with the standard touring types for ordinary use.

I am not now speaking of the machines we were so familiar with last year, carrying engines of high compression ratio, which shot away from the mark like a projectile from the muzzle of a 4.7, and which died away in a glow of plum-coloured heat within a couple of miles. I am thinking of something much more up to date.

I sat last week over perhaps the most efficient engine I have yet sampled. It was perfectly controllable, in that it would start easily and run at speeds from six to sixty miles an hour; it had quite a normal compression ratio, and showed no dying away symptoms after a long burst of speed; it was a topping hill-climber, and would roar up Sutton Bank at racing speed, and, what is more wonderful, take the same climb at a comparatively moderate speed. But it was absolutely devoid of balance. Mounted on a frame of normal design, provided with the usual springing at saddle and forks, it was misery to sit on it at all speeds. The engine is experimental, and no duplicate exists—possibly its posterity will achieve balance, as well as the other merits. I only mention it because it strikes me as being typical of a class. The average touring engine of high grade, capable of from 4 to 45 m.p.h. with a touring gear ratio, combines all the touring essentials, except the power to climb exceptional hills without adjusting the pulley.

The special speed-merchant machines marketed by some firms afford higher speed capacities and climb better, but some of them do not possess a single engine speed which is vibrationless and smooth; and this last merit is that with which the average rider can least conveniently dispense. I advise riders who have no sincere lust for speed to be content with tourist pattern engines.

We shall recover our sanity in time, just as the pedal cyclists did; and balance, comfort, and smoothness will within a few years be combined with an even greater efficiency than the best makers can give us to-day.

Belts and their Fasteners.

I was out with one of my clubs down South the other day, and witnessed the usual exhibition of futility, discrediting both makers and riders. The leader for the day tricked the fleet of riders into swooping gaily down a most formidable hill, which had to be ascended on the return journey, and quite a large proportion of the company failed to negotiate the ascent. Why? For want of engine power? Not a bit of it. To take the single-cylinders first, every one of them had an adjustable pulley, which needed opening out for the abnormal climb. Not one had provided himself with either an adjustable fastener or a spare bit of belt. The unlucky wights had to choose between shortening their belts down to a 5½ gear and going home on an ultra low gear or else pushing up. Most of them chose the latter alternative. What is the good of the maker sending out a machine or the rider starting to ride a machine with an adjustable pulley and a single non-adjustable belt fastener? In my opinion, all makers should educate purchasers by supplying a really good adjustable fastener and fitting it as a standard, or the belts should be cut down to the length required for the lowest gear, and two extra lengths of different dimensions should be added, with a half fastener at each end. Riders will then utilise their adjustable pulleys, and show up well on very steep hills in their private rides, which will do the sport more good than all the racing in the world.

Secondly, the twins. These had power enough to roar up the ascent at forty miles per hour if required, and, of course, the daredevils in their saddles meant to create a small sensation. But the machines were new; their belts were tight; the fasteners were of the light order, identical with those fitted to the tourist single-cylinders. Two fasteners and one belt snapped in these tumultous ascents, and the three riders concerned had to walk to the summit, borrow bits of belting or spare fasteners, return to their machines, and make a fresh ascent at a slower pace. The moral is obvious enough. A machine possessing an adjustable pulley ought to be sent out with all requisites ready for the immediate use of the adjustments, and most twins demand wider and stronger belts, and, above all, stronger belt fasteners.

DUNHILL'S MOTORITIES

FOR MOTOR CYCLISTS.

TROUSER OVERALLS. Made from Finest Double Texture Waterproof Material. 16/6.

MOTOR CYCLE VALISE, 9/-.

SINGLE TEXTURE FAWN WATERPROOF CAPE, 7/6.

M.C.C. INTER-TEAM TRIAL.

THE rules governing the 1910 competition for *The Motor Cycle* fifty-guinea challenge cup have now been circulated among the various clubs, and applications for entry forms are beginning to flow in to the trials hon. sec., Mr. J. Van Hooydonk. This year's competition, which is to take place on Saturday, June 18th, will be the seventh consecutive event. Last year there was a record entry of eighteen clubs, and the gathering at Daventry of competitors, reserves, and enthusiasts was believed to be the largest purely motor cycle gathering for an open event that has yet been held. In 1909, for the first time in the history of the competition, the trophy was awarded to a club making the maximum score (all six riders covering the 100 miles course without a stop). The name of the winning team—the Motor Cycling Club—is the first inscribed on the new trophy, the old one having been won outright by the Coventry and Warwickshire Motor Club.

Again the competition is to start at 1 p.m., so as to enable most of the teams to travel to the scene of the start on the morning of the trial. This arrangement was appreciated by clubs generally last year, as proved by the record entry. The A.C.U. having granted a special permit for this trial, motor cyclists are free to compete without an A.C.U. licence. The details and venue of the competition will be substantially as last year, and clubs should lose no time in forwarding their entries. At the time of writing, more than two months before the date of the competition, six clubs have already decided to compete.

Various clubs have different methods of selecting their teams, but we do not know of a better system than a preliminary trial of one hundred miles on similar lines to the Motor Cycling Club's trial of last year. A proof of the soundness of this scheme is that the M.C.C. won the cup in 1909.

Following are the rules for 1910:

1.—This cup is a challenge trophy, entitled *The Motor Cycle* Challenge Cup, of which the Motor Cycling Club are trustees and administrators.

2.—It is to be the award in a competition between teams of riders, members of, and nominated by, recognised automobile clubs, motor cycling clubs, or cycling clubs. In case of doubt as to whether any entrant is or is not a "recognised" club, the Motor Cycling Club shall adjudicate. No club may enter more than one team.

3.—If the cup be won three times, not necessarily in succession, by the team representing any one club, it shall become the absolute property of that club.

4.—Each team shall consist of six riders, at least one of whom shall drive a two-seated motor cycle with passenger attachment, such as tricar, sidecar, or quadcar. A passenger must be carried. Passengers for the two-seated motor cycles must be provided by the entrants. Such passengers shall travel and act as observers on the machines appointed to them by the officials. A passenger shall not leave his seat during any part of the competition, shall not assist the driver in any way whatsoever, and shall furnish the official in charge with a written report at the close of the competition. The joint weight of passenger and driver shall not be less than 20 stones.

5.—The competition shall consist of a 100 miles non-stop run; a circular course, to be covered four times, will be selected in the Midlands.

6.—The number of miles, up to 100, accomplished by each rider of each team without stoppage other than stoppages due to the exigencies of traffic, will be added together, and the team scoring the highest mileage thus arrived at shall be the winner. Unavoidable stoppages due to traffic must be reported, and will not count against the rider. No adjustments are permissible during any such stop.

7.—A period of not less than one hour and twenty minutes, or more than one hour and thirty minutes, must be occupied over each section of twenty-five miles; transgression of this rule over any section will disqualify the rider from scoring on that particular section. These times apply to the distance as given on the map and route card, with which competitors will be supplied, which distance must be taken as correct for the purpose of this competition.

8.—The competition will start at 1 p.m.

9.—The entry fee shall be two guineas per team.

10.—Clubs must send an entry form, duly filled in, together with the entrance fee, to J. Van Hooydonk, trials hon. sec., Spring Villa, North Finchley, N., on or before June 11th.

11.—The judges shall be three in number, one nominated by the donors, one by the Motor Cycling Club, and one by the Auto Cycle Union. The judges' decision shall be absolute and without appeal.

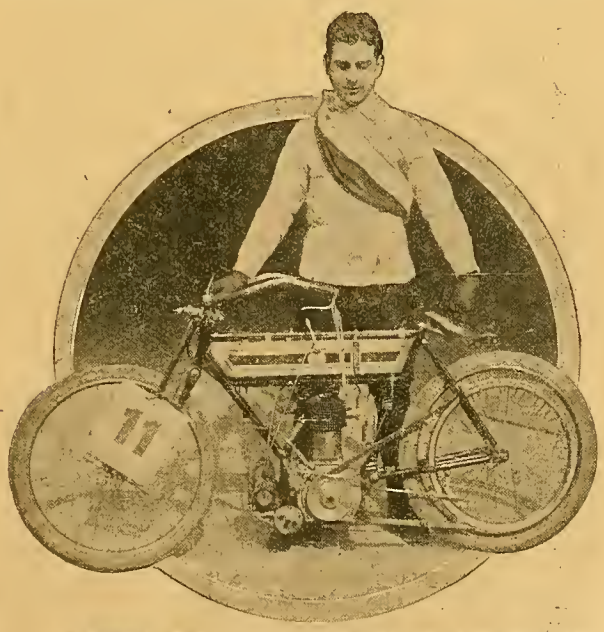
12.—In the case of a tie between two or more teams the tie shall be run off under the same conditions at a date to be fixed upon between the teams.

13.—The Motor Cycling Club reserve the right to refuse any entry.

14.—Should it be deemed advisable in the interest of the competition, these regulations may be revised or added to by the Motor Cycling Club.

15.—The Motor Cycling Club shall not be held liable for any damages caused accidentally or otherwise to the competitor's machine whilst in charge of the officials of the club.

The Motor Cycling Club will award a silver medal to each of the members of the winning team.



P. W. Bischoff, a hard worker on behalf of the Auto Cycle Union, and who is also greatly interested in the scheme for the formation of a military motor cycle corps. Mr. Bischoff occasionally delights to disport himself at Brooklands on his Tourist Trophy Triumph.

COMPRESSION: THE LIMIT.

PROBABLY but few of the amateur riders who enter for hill-climbs and similar contests would deny the superior skill of the trade riders with whom they have to compete. The majority recognise that such superiority is only the inevitable result of lengthy experience in driving under all kinds of conditions. Very many amateurs, however, wax plaintive on the subject of the special machine; they contend that in most cases they have to cope not only with highly specialised talent, but with the additional advantage given by machines expressly designed for the particular event in view. Many and various are the machinations of which makers are accused in their efforts to assist their nominees to put up creditable performances, but the count upon which they are most frequently indicted is the high compression engine, it being considered possible, apparently, to accomplish anything by its agency.

The Influence of Compression.

The crowding of fifty odd miles into the hour with a 76 × 76 mm. engine, the fuel economy shown by tiny engines whirling at turbine speeds, or a specially brilliant hill-climbing performance, all are discounted to the level of the ordinary when it is explained that the engines used were designed with very high compression ratios.

High compression is undoubtedly of immense importance, but it is a little difficult to accept its presence as the sole explanation of these various feats, particularly as their performance would in most cases have been impossible without the nicest judgment in driving.

The effect of squeezing a charge of gas before firing is simply to pack together its constituents so closely that when combustion commences the resultant flame is transmitted throughout the body of gas with the least possible loss of time, and the entire charge is thus able to be burnt within the small space of time available when an engine is running at high speed. That is the beginning and the end of the influence of compression. The charge of gas has got to be burnt within limits; the quicker the burning is carried out the better.

Slow Burning and Rapid Explosions.

Nevertheless, this more rapid combustion will not reduce by a fraction the quantity of petrol required for a stated amount of power, any more than it will enable one ounce more power to be obtained from a specified bulk of fuel. Given a cylinder full of gas exactly proportioned for perfect combustion, its burning at atmospheric pressure will yield as much heat as if it had been compressed to 90 lbs. per square inch before ignition. The difference will be merely that between a slow burning and a rapid explosion. The successful operation of the petrol engine demands that combustion shall be as rapid as possible within the limits beyond which piston speed cannot well be increased, because when a body of gas is burnt and expanded rapidly there is less time for loss of heat by radiation, and it is the object of preliminary compression to provide this necessary rapid combustion.

The Effect of Throttle Opening on Compression.

Compression ratio, however, is not the only, or even the dominant, factor in determining the pressure at which the gas is actually ignited. There are several conditions besides the purely mechanical one of piston displacement. A partly closed throttle, by reducing the bulk of gas admitted to the cylinder during a given cycle, will correspondingly reduce the pressure attained when firing takes place. Then there is the amount of heat absorbed by the walls and returned to the fresh charges, which may easily make all the difference between a healthy degree of compression and the unpleasant extreme when so much heat and pressure are produced that ignition takes place spontaneously and knocking or a backfire results.

Obviously, the slower an engine is running, the longer the flaming gases are in contact with the cylinder walls before being released by the exhaust valve, and therefore the greater will be the proportion of pressure which is dispersed in the form of heat *viâ* the radiating fins; also the fresh charges will have a longer time during which to be affected by the high temperature of the cylinder. Conversely, a fast-running engine will burn its charges rapidly and quickly release them, so that most of the waste heat will be got rid of through the exhaust valve, having little time allowed it to radiate through the walls; and the correspondingly short time occupied by the two succeeding strokes will give but a short time for the fresh gas to become heated by contact with the cylinder.

Consideration shows that these two factors not only influence the degree of compression reached by any given charge of gas, but they operate automatically so that the variations produced are just those which are undesirable if the best results are to be obtained. Throttle manipulation, by maintaining maximum compression practically only when an engine is labouring, causes combustion to be far too rapid for the slowly-moving piston to take advantage of, and the explosion being completed long before the piston has finished its downward stroke, the pressure has escaped in the form of heat through the cylinder walls and is worse than wasted.

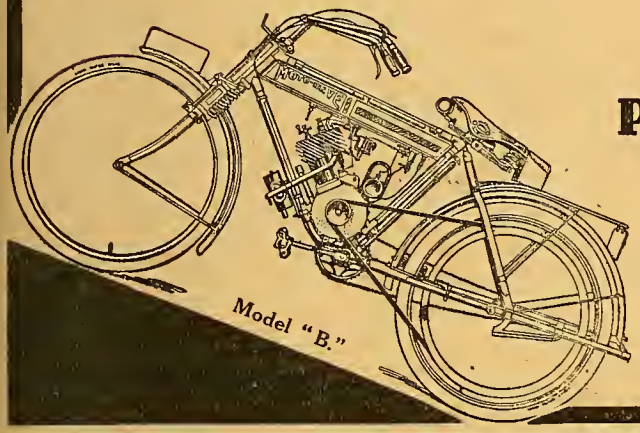
Light Loads at High Speed.

On the other hand, in the case of an engine dealing with a light load at high speed, the throttle is probably half closed and compression correspondingly reduced, in spite of the fact that what is required is a very rapid expansion of the gases to keep pace with the flying piston. The same perversity is apparent in the

MOTO-REVE

LIGHTWEIGHT.

"The man who prefers a high-powered machine for solo work under any conditions is welcome. I do not want it, nor does the average man, and it would be exceeding folly to advise the neophyte to try his 'prentice hand at it." ALEX. J. M. GRAY in "Fry's Magazine."



The machine for solo work under any conditions is the genuine lightweight MOTO-REVE.

SIR W. A. ROSE & CO., 66, Upper Thames St., E.C.

The simplicity of the

SINGER

Moto-Velo

is one of its distinctive advantages. You can take the engine off to overhaul it, and every engine part is readily accessible. You can mount from the pedal, or from the kerbstone, just as in the case of an ordinary bicycle; and if, on an abnormal gradient, pedal assistance becomes necessary, the machine is so light—it weighs only 84 lbs.—that no great exertion is required, and the assistance is really effective.

It is a 1¼ h.p. motor cycle, fitted with Bosch high-tension magneto, gear driven from engine shaft. The control is all from the handle-bar.

Let us give you a demonstration.

Singer & Co. (1909), Ltd., Coventry.

London Showrooms: 17, Holborn Viaduct, E.C.

"All about the Singer Moto-Velo" is an interesting booklet which we send post free.

WISDOM in the choice of a non-skid suggests the alternate steel and rubber studded tyre, because it shows

HOW TO AVOID SKIDDING

and how to keep down the tyre bill.

The following is an extract from a letter received from one of our clients using LIVERSIDGE TYRES.

82, *Drayton Road,*
30/3/10. *Harlesden, N.W.*

Dear Sirs,

You will be pleased to hear that I was successful in the 400 miles RELIABILITY TRIAL promoted by the HERTS COUNTY AND NORTH WEST LONDON MOTOR C.C.
(London to Harrogate and back).
I had no trouble at all with the tyres during the run, and after about 600 miles use are scarcely scratched and show no perceptible wear. As a non-skid they are very effective, and I have never felt so safe before on greasy roads and tram lines. Taken all round they are the best tyres I have come across.

Yours faithfully,
W. C. DAVENPORT.

Compression: The Limit.—

behaviour of the factor of residual cylinder heat. When an engine is pounding at reduced speed uphill and every ounce of power is wanted, the course of events will be roughly as follows: The throttle being open, the engine is taking full charges, and compression is therefore maximum. The burning charges will heat the cylinder, which in turn will transfer its heat to the fresh gas, until compression becomes suffocation, and the respiration of the engine is rendered more stertorous stroke by stroke until it eventually stops, either through pre-ignition, or because the difference in the pressures of the charge before and after ignition is so small that it does not supply a margin of power to drive the machine. The process will be accompanied by an increasing amount of "knock," caused by the extremely rapid spread of flame through the charge. Briefly, the very conditions which demand a slow burning speed of the gases, and therefore a low compression, actually combine to cause a rise in the speed of combustion till a point is reached when the charge is exploded with such rapidity as to produce no useful thrust upon the piston.

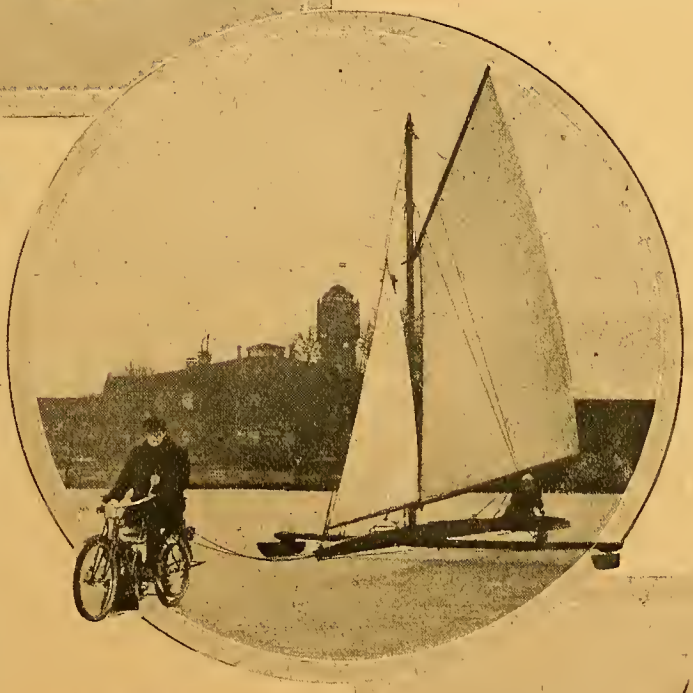
It is fairly clearly demonstrated, then, that in order to secure the greatest possible benefit from the fuel used it is imperative that combustion should progress at a speed sufficient to ensure its completion before, but not long before, the piston commences its scavenging stroke. It is evident, too, that though a high rate of combustion is an advantage from the point of view of fuel efficiency, as mechanical considerations make it impracticable to increase piston speed beyond a certain point, and rapid combustion is only of value when accompanied by a suitably high piston speed, then the limit of the one is perforce the limit of the other, and both decide the point at which raising of the compression ratio ceases to yield an increase of power. Indeed, we are told that during the experiments leading up to the production of some of the marvellous high-speed voiturette engines of last year it was discovered that useful increase of compression ceased at about 90 lbs. per square inch. Preliminary compression of the charge is, of course, purely on the principle of using a sprat to catch a mackerel, and development of the idea finds the size of the sprat increasing so much faster than that of the mackerel that presently there is no advantage in the exchange.

It being agreed that the three factors mentioned are responsible for deciding the pressure attained by the charges before ignition, there is yet another most potent influence which determines what, if any, rise of pressure shall take place between the instant of ignition and the moment the piston commences its downward stroke. This influence is spark advance, which, acting as it does to burn a portion of each charge while compression is still progressing, so that its heat and expansion

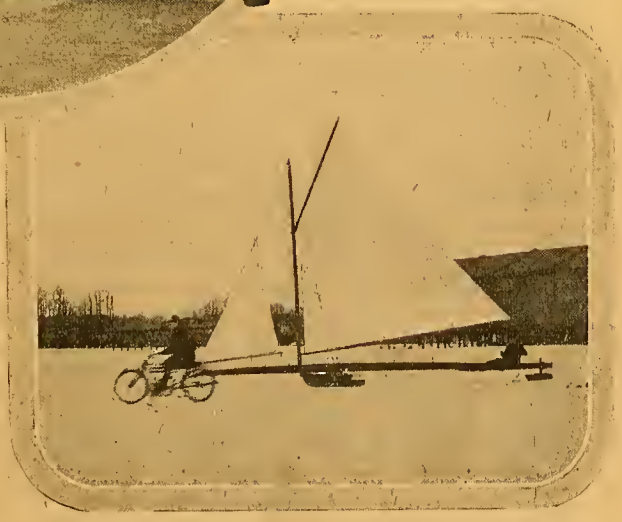
ICE YACHT *v.* MOTOR CYCLE.

AN INTERESTING TEST AT THE MOUTH OF THE NEVA LAST MONTH.

In spite of the ice, it was found that a motor cycle could with ease keep pace with a racing ice yacht.



Owing to the wind dropping, the motor cyclist performed a service by towing the vanquished yacht home again.



Getting up speed. The ice, with its hard crust of frozen snow, provides a very good riding surface, we are told.

Compression: The Limit.—

may be added to the compression given mechanically by the piston, can be made to partly compensate for the vagaries introduced by throttle variation.

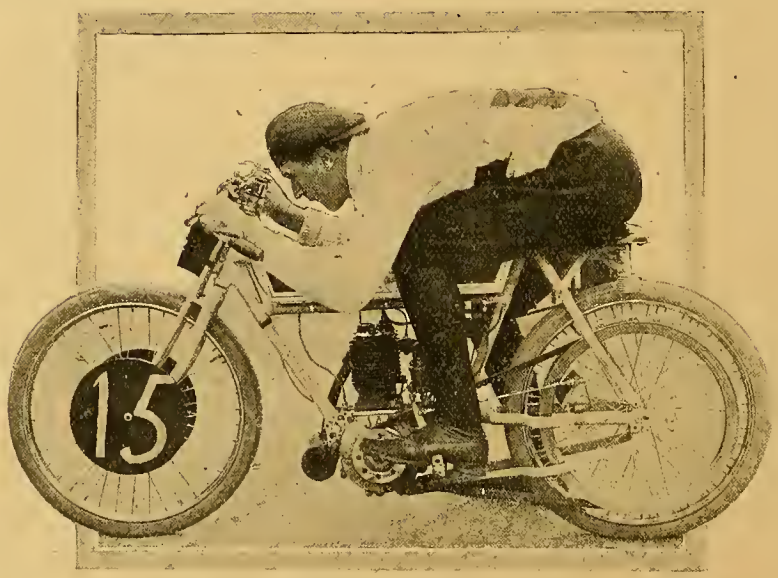
A judicious advance of the firing moment when an engine is running fast on light charges will produce the necessary amount of compression to give the rapid explosions required. On the other hand, a retarded spark will often help a struggling engine by causing the gases to burn slowly, as well as by putting off the moment when the compression of the fresh charges, expanded by the heat retained by the cylinder, becomes too much for the overloaded engine. It is difficult to over-estimate the importance of this principle of ignition control in the evolution of the motor cycle.

The points dealt with are those which affect the burning of the gases before ignition has commenced, or at least before the piston has begun its power stroke. There are other factors helping to determine the speed at which combustion progresses after commencement, such as form of compression space, size and position of spark, as well as the arbitrary one of piston speed, which tends always to create the conditions least suitable to itself. None of these matters, however, affect compression proper, and they are therefore outside the scope of this article.

To summarise, it may be taken that compression has reached a point beyond which it is unlikely to go. It is a necessary evil which, heretical though the suggestion may seem at the present time, may be discarded in the march towards perfection.

SUCCESSES ON ROAD AND TRACK.

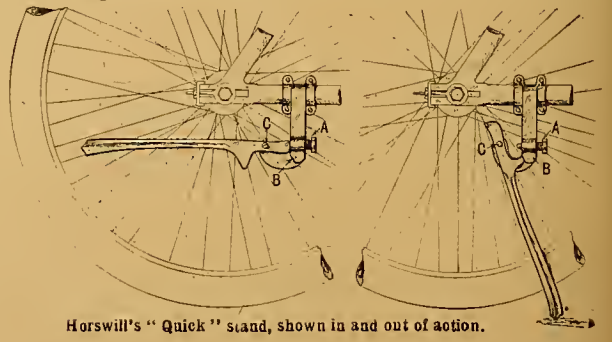
A MACHINE which, till last year, was little known is the Trump-J.A.P. In 1909 this machine was extraordinarily successful in two A.C.U. Quarterly Trials, and also at many B.A.R.C. and B.M.C.R.C. meetings, where the honours gained have been quite numerous. The machine is constructed principally on standard lines, and is a pleasing - looking mount which is particularly well designed. The frame is low and strong, and Druid spring forks are fitted to the touring model to absorb the road vibration. The J.A.P. engine is so well known that it needs no further comment. We may, however, draw attention to the extra tubes from crank case to rear fork ends. The machine is sold fitted either with Bosch gear-driven magneto or with Hellesen-Hunt battery and coil system, which Mr. McNab, the able exponent of the Trump-J.A.P., strongly recommends, especially on the racing model. The touring model is fitted with a Davison tank with that maker's patent tapless oil pump. The handle-bars are long and upturned, and are fitted with Hill's patent horn grips. With every machine a complete set of tools and spares are supplied. From stem to stern the machine is thoroughly practical and deserves popularity.



F. A. McNab, probably the heaviest and tallest racing motor cyclist on record. The photograph proves that he knows how to compress his bulk into small space.

A NEW MOTOR CYCLE STAND.

THE latest motor cycle stand which has been submitted to us is named the Quick. This stand has separate legs, which are clipped to the chain stays as shown in the accompanying illustrations, the legs being pivoted at C. When the stand is in use and the leg down, a projection on the leg fits a recess at B, which prevents side play. When the leg is raised out of action, it is held firmly in a horizontal position by the spring bolt A, which latter is automatically forced back when the leg is raised. The action of the spring causes the rounded end of the bolt to fit into a recess on the top of the leg. The stand is made by J. Horswill, jun., 74, Brook Street, Chester, who also makes a very handy tyre lever bearing the same name as the stand. This tyre lever has specially shaped single and pronged shaped ends, and is much better for detaching covers than a screwdriver or other implement as it is unlikely to damage the air tube.



Horswill's "Quick" stand, shown in and out of action.

The ROC

CLUTCH. Patent TWO-SPEED GEAR. Hand-starting.

WITH 1910 IMPROVEMENTS.

Transforms your machine into a motor vehicle of pleasure and comfort. Starts away from rest like a car.

THE SCOTTISH SIX DAYS' TRIALS.

WE have just received details of the regulations for this year's Scottish open reliability trial, commencing Monday, 6th June, and desire to draw the attention of English riders to a most sporting and enjoyable trip, in the hopes that more entries will be received from this side of the Border. Mr. B. H. Davies was one of the few English enthusiasts who went through the first big Scottish reliability trial for motor cycles, organised by the Edinburgh M.C.C. last year, and was greatly struck by the attractiveness of the event from an amateur rider's point of view. He considers that the following points distinguish it from the A.C.U. trial :

1. There is great freedom from vexatious regulations. The entry is smaller, the controls much longer, and the speed a trifle higher. Consequently the trial resembles a hard rider's touring run much more than a cut and dried reliability trial.

2. The scenery is infinitely superior. No part of England contains such constant and prolonged panoramas. Only Devon and Wales afford even a faint approach to the Scotch scenery, and dull intervals are much briefer and less frequent.

3. The hotel terms are exceedingly cheap, and the quarters are comfortable, as the party is comparatively small, and there is no overcrowding. Exorbitant hotel bills are the chief drawback to touring in Scotland on one's own, but in this trial the organisers arrange terms as cheap as can be obtained anywhere in England, and that at good class hotels.

In a word, the Scottish trials enable a motor cyclist to traverse the picked portions of the most sporting motor cycling country in the world "on the cheap," and with the minimum of red tape. The date—June 6th-11th— will suit many riders who cannot get off in July for the A.C.U. End-to-end. The accompanying map shows the route. The distances are as follows :

First day	173 miles
Second day	164 ,,
Third day	176 ,,
Fourth day	157 ,,
Fifth day	122 ,,
Sixth day	105 ,,
Total	897 miles

The chief hills are Rest and Be Thankful, Amulree (from Sma' Glen side), Devil's Elbow, Tomintoul, Berriedale (going north), and Glendoe (near Fort Augustus). There are to be no compulsory timed hill-climbs, but there will be an optional timed hill-climb at Glendoe, for which competitors may enter or not as they like. There will be special prizes for this hill-climb, and as the riders have to ascend the road in any case, most of them will probably have a try for the extra prizes. Altogether the Scottish trials bid fair to live up to the high reputation they won last year, as a delightful sporting outing for hard riders. About one thing there is no doubt whatever—that the Scottish trials will again afford a very searching test of the machines. The Scotch officials plump for bad hills—the English trials seldom include more than one genuine precipice.

FIRST DAY (173 miles).—Edinburgh—Stirling—Drymen (on Loch Lomond)—Arrochar (on Loch Long), lunch—Inveraray (hill-climb at Rest and Be Thankful, passing Loch Fyne)—Dalmally—Killin—Aberfeldy.

SECOND DAY (164 miles).—Aberfeldy—Amulree (hill-climb up Sma' Glen side, returning to Aberfeldy)—Pitlochry—Kirkmichael (thence crosscut of four miles to Persie Inn, where join Perth to Braemar Road)—Devil's Elbow (hill-climb)—Braemar (lunch)—Tomintoul—Grantown—Carrbridge—Inverness.

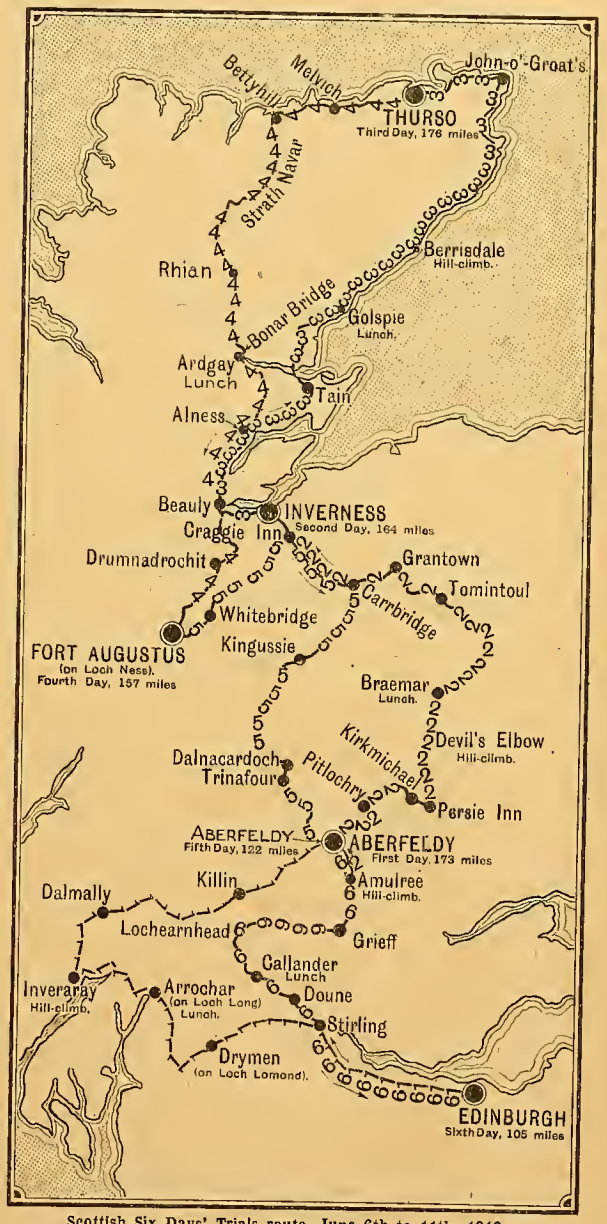
THIRD DAY (176 miles).—Ordinary End-to-end route *viâ* Beauly and Tain up to John-o'-Groat's, lunching at Golspie, proceeding on to Thurso to sleep. Hill-climb at Berriedale.

FOURTH DAY (157 miles).—Thurso—Melvich—Bettyhill—Strath Navar—Bonar Bridge—Ardgay (lunch)—Alness—Beauly—Drumnadrochit—Fort Augustus.

FIFTH DAY (122 miles).—Fort Augustus (on Loch Ness), proceed along south shore of Loch Ness over Glendoe to Whitebridge, rejoin End-to-end route at Craggie Inn, turn south—Kingussie—Dalnacardoch—Trinafour—Aberfeldy.

SIXTH DAY (105 miles).—Crieff—Lochearnhead—Callander (lunch)—Doune—Stirling—Edinburgh.

The rules are left almost exactly the same as last year, but the route has been revised to take the riders through all the finest scenery in Scotland, practically all the famous lochs being visited.



Scottish Six Days' Trials route, June 6th to 11th, 1910.

Moors £1 1s.) ; R. E. S. Spender, 5s. ; Vacuum Oil Co., £5 5s. ; Continental Tyre Co., £3 3s. ; Bowden's Patents Syndicate, £5 5s.

WHERE TO GO AT WHITSUNTIDE: No. 2

THE MOTOR CYCLE IN WARFARE.

LAST Thursday evening at the Anto Cycle Union and R.A.C. associates' premises. 112, Piccadilly, Captain Battine (late 7th Dragoon Guards and 15th Hussars) delivered an interesting and instructive lecture on "The Rôle of the Motor Cycle in Campaigning." Lieut.-Col. Aspinall presided

Captain Battine said there was a tendency on the part of persons ignorant of military matters to exaggerate what could be done with motor cycles in war. It was always the unexpected that happened, and not only commonsense was required in war, but special knowledge, and the special knowledge which the owners of motor cycles could bring to the aid of the authorities would be of the greatest use. One great weakness of motor cycles was the tremendous length of room which they would take up on a road, thus offering easy targets for the enemy. Field guns were now trained to such a pitch of accuracy that they could sweep at a range of four miles any given space. Hence he thought that the proper rôle of motor bicycles in war was to be attached to other units rather than be a unit in themselves. For reporting and carrying despatches the motor bicycle had been found in the recent manœuvres invaluable.

Some Duties of a Military Motor Cyclist.

In war motor cyclists could also be used to rush a bridge or hold a railway station temporarily, hold a defile, or ascertain in advance whether a particular pass was open or not. No doubt they would assist in reconnoitring, but he did not think the motor cyclist would be able to go beyond the line of his own outposts. Undoubtedly the best way in which they could be employed would be upon the lines of communication, and not as fighting machines themselves. For police work also the value of the motor cycle would be immense. Those unacquainted with military matters did not realise the great practical difficulty of moving troops in concert or getting the different units at a given spot at a given moment. The employment of motor cycles to carry orders to different generals and transmit news of what was occurring was self-evident and needed no emphasising. The real difficulty in getting troops to act in concert was felt most on the battlefield itself, and although space was now overcome by telephone, telegraph, and in the future perhaps by wireless, there was still nothing like having the verbal report from the man who had actually seen the position with his own eyes. With regard to bringing up ammunition, he did not think that motor cycles could do more in this respect than was at present done by motor car. Artillery and modern rifles consumed ammunition at such a rate that large and heavy supplies were indispensable. What could be carried on a motor cycle would practically be of no use whatever to the firing line. A great deal of the work which had hitherto fallen on cavalry would in future fall on the motor cycles. Of course, there was the question of the supply of petrol, and a system would have to be devised for storing it at proper spots and in sufficient quantities. No doubt that would be a feature of modern organisation in war. Personally he was not one of those who believed in the danger of invasion, though, of course, this country had been invaded before and might be invaded again. The probable points of invasion would be as before, the east and south coasts. He urged that we should take a lesson from the experience of the Franco-German war. In this country there should be a complete and efficient organisation so that motorists of all sorts would know where to go and what to do in case of invasion. Without such preparation all would be confusion, and the splendid material and machines at the disposal of the military authorities would be of no avail. (Cheers.)

Captain Trapmann (25th County of London Territorials), from personal experience with the manœuvres, testified to the disadvantage of motor cycles for scouting purposes on account of the noise being heard a long distance away. He referred to the hindrance to swift communication owing to troops monopolising the whole of a roadway, and suggested that commanding officers should insist on a road being kept open to the right of a marching column for fast traffic.

Mr. P. W. Bischoff endorsed the view that some knowledge of military matters was required by motor cyclists before they could be of use even for despatch work.

Mr. Summers urged that there was plenty of material for the military authorities to work upon, but he thought a new type of machine was required for military purposes. This, however, would not be forthcoming until there was a definite status for motor cyclists in the field.

Mr. Stafford urged the importance of motor cyclists being able to read a map quickly and accurately.

Mr. Hart said that from what he had seen from the Thames Valley manœuvres last year the pedal cyclists would be of no use on roads cut up by marching troops and heavy mechanically-propelled transport waggons. A specially equipped machine with puncture-proof tyres was essential.

The Lecturer's Reply.

Captain Battine replied to the various points which had been raised. He explained the difficulty of keeping large bodies of men to one side of the road. A column of cyclists would be an extremely difficult body to manage, and along a white road would present the most excellent target for modern field artillery. In fact, they would be annihilated. If the A.C.U. were made the centre for organisation he thought something could be done in the direction of organising motor cyclists for military purposes. There was no doubt that just as in civil life motor traction was asserting itself, so in military affairs motor traction must also assert itself, for the problem of obtaining a sufficient and constant supply of horses was becoming every year more difficult.

AUTO CYCLE UNION OFFICIALS.

At a committee meeting of the A.C.U. last week, the following officers for 1910 were elected: Chairman, Mr. Robert Todd; vice-chairmen, Messrs. J. Lyons-Sampson, C. A. Smith, H. P. E. Harding, and V. Hart; hon. treas., Mr C. A. Smith. The above are *ex-officio* members of all committees. The following are the A.C.U. sub-committees for 1910:

COMPETITIONS.—Messrs. J. W. G. Brooker, A. G. Reynolds, A. Sharp, F. A. Hardy, E. J. Bass, R. G. Booth, D. K. Hall, C. C. Cooke, E. M. P. Boileau, and H. B. Renner.

AUTO CYCLE LEGION SUB-COMMITTEE.—Messrs. H. A. Wildy, H. P. E. Harding, D. K. Hall, W. Cooper, and I. J. G. Babbage.

FINANCE COMMITTEE.—Messrs. E. P. Hawkins, F. A. Hardy, E. J. Bass, and H. B. Renner.

RELATIONS AND LEGISLATIVE SUB-COMMITTEE.—Messrs. E. J. Bass, F. A. Hardy, J. W. G. Brooker, H. G. Cove, and W Pratt.

REPRESENTING THE A.C.U. ON THE R.A.C. GENERAL COMMITTEE.—Messrs. Robert Todd, G. F. Sharp, V. Hart, H. G. Cove, H. P. E. Harding, A. G. Reynolds, D. K. Hall, R. G. Booth, and F. Straight (secretary).

MIDLAND MEET OF MOTOR CYCLISTS STRATFORD-ON-AVON.

On Whit-Monday next the third annual meet of motor cyclists will be held at Stratford-on-Avon as arranged at the meeting of club delegates last year. On the last occasion 150 motor cyclists gathered together, and a very enjoyable time was spent. It is hoped the number will reach 250 at least this year. A special large dining room has been booked at the Swan's Nest Hotel with balcony overlooking the river, and boats and a motor launch will be reserved. A full programme will be issued shortly, but in the meantime club secretaries who have not received particulars are requested to write Mr. R. Vernon C. Brook, Oakdene, Cambridge Road, King's Heath, Birmingham.

In our report of the M.C.C. Jarrott Cup competition on March 31st, it was stated that F. C. Dee (7 h.p. V.S.) had suffered tyre troubles. This, he informs us, was not the case, as the Peter Union tyres he used did not cause him the slightest trouble, and during the three or four years he has used these covers they have given him every satisfaction. Considering that Mr. Dee was riding a powerful twin, the length of the course, and the loose condition of the roads, the behaviour of his Peter Union tyres was remarkably good.

CURRENT CHAT

Time to Light Lamps

(GREENWICH).

April 14	7 53	p.m.
„ 16	7.56	„
„ 18	8.0	„
„ 20	8.3	„

The Lightweight Prize in the Land's End Trial.

Last week we credited A. J. Stevens with being second in the running for the lightweight prize in the Jarrott cup competition, but we now find that his Wolf engine exceeded the limit of 340 cc. W. W. Douglas comes next in order of merit to G. L. Fletcher (2¾ h.p. Douglas), R. O. Clark on the 2¼ h.p. lightweight F.N. being third.

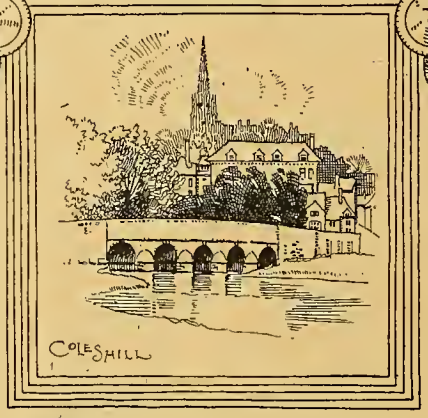
An Unfortunate Occurrence.

C. Rice-Oxley, of Shrewsbury, will have the sympathies of all motor cyclists. He was returning home from testing his twin-cylinder machine on Wenlock Edge, when it caught fire owing to the waste petrol tap turning on. The motor was totally destroyed. The rider escaped with a shaking sustained through jumping out of the saddle to avoid the flames.

The T.T. Race.

Prospective competitors in the International Motor Cycle Tourist Trophy Race on May 26th should note that entries finally close on Saturday, April 30th.

So far, the Tourist Trophy entries are represented by machines of three countries — England, America, and France. Before the list closes, we hope the entries will bear a more International aspect.



Special Features

Sydney R Jones

WESTWARD HO! WITH A SIDECAR.
Illustrated.

M.C.C: INTER-TEAM TRIAL RULES.

COMPRESSION: THE LIMIT.

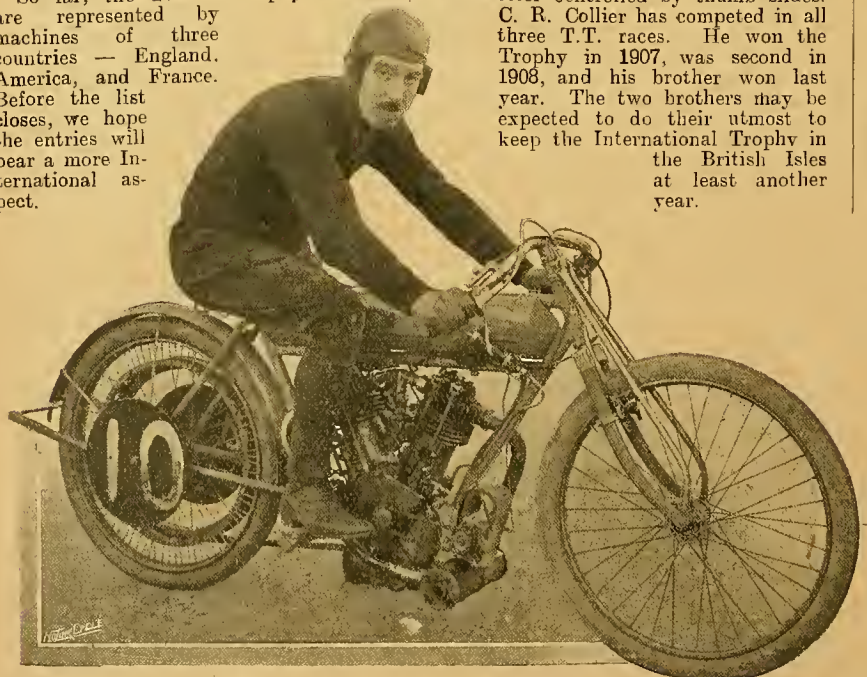
Permit.

A permit has been granted by the A.C.U. to hold motor cycle races at the Tunbridge Wells Sports on Whit-Monday.

Collier's Choice for the T.T.

Charles R. Collier, whose photograph is published below, has already decided upon his Tourist Trophy mount, and, in fact, has covered several hundred miles on it. Again C. R. will pin his faith to the short stroke engine, the dimensions of his J.A.P. being 85 by 58.5 mm. = 664 cc. capacity, *i.e.*, 7 cc. short of the limit. In design, the engine is very similar to the one his brother, H. A. Collier, used when he won the Trophy last year. It has mechanically-operated overhead valves, magneto ignition, and a Longuemare carburetter controlled by thumb slides.

C. R. Collier has competed in all three T.T. races. He won the Trophy in 1907, was second in 1908, and his brother won last year. The two brothers may be expected to do their utmost to keep the International Trophy in the British Isles at least another year.



C. R. Collier and the Matchless-J.A.P. he will ride in next month's Tourist Trophy Race. The engine has overhead valves, and the bore and stroke are 85×58·5 mm. The machine is fitted with Bosch magneto, Shamrock-Gloria 1in. belt, and Hutchinson 26×2¼in. tyres.

Inter-team Hill-climb.

F. A. Hardy, who was a competitor in the inter-team hill-climbing competition at Sutton Bank on March 26th, wishes us to point out to our readers that the reason he and other riders were disqualified in Class V was because they had entered two-speed geared machines in a class intended solely for machines with fixed gears. Mr. Hardy's intention was to use only one gear, and if required to have the change gear lever sealed. He says that, in his opinion, a two-speed geared machine should be allowed to compete against single-geared machines provided the gear lever is sealed, otherwise the additional cost of the gear may deter some riders from equipping their machines with what many regard as an indispensable accessory.

Imports of Motor Cycles.

There was a big revival in the imports of motor cycles and parts last month, as may be seen by the figures below culled from the Board of Trade returns :

1908.	1909.	1910.
Value of motor cycles imported—		
£2,998	£4,018	£4,754
Parts thereof—		
£2,614	£1,947	£6,131
£5,612	£5,965	£10,885

The import figures for the three months ended 31st March were £17,190, £13,359, and £24,797 in 1908-9 and 1910 respectively.

Exports of British Machines.

British exports show a corresponding increase, easily eclipsing previous figures for the same periods. Last month's exports were represented as follows :

1908.	1909.	1910.
Value of motor cycles imported—		
£2,463	£4,357	£7,560
Parts thereof—		
£1,858	£3,272	£2,901
£4,321	£7,629	£10,461

The rapid increase in our exports is illustrated by the under-mentioned figures for the three months ended 31st March, and it will be seen that in two years exports have more than doubled.

1908.	1909.	1910.
Value of motor cycles imported—		
£6,183	£10,876	£22,818
Parts thereof—		
£7,046	£7,720	£8,088
£13,229	£18,596	£30,906

A Good Suggestion.

Anent the discussion on the suggested curtailment of motor cycle trials, a correspondent this week suggests that the Auto Cycle Union and the Cycle and Motor Cycle Manufacturers' and Traders' Union should co-operate, the one body representing motor cyclists and the other manufacturers. Trials and competitions could then be promoted jointly.

Dangers of "hanging on."

Early last week, a pedal cyclist was badly injured by colliding violently with a car. It appears that the cyclist in question was riding behind a motor cyclist with his head down. The motor cyclist safely passed the oncoming car, but the cyclist swerved, and dashed right in front of the car, and was thrown through the glass screen. He now lies in a precarious condition. The motor cyclist was John F. Keller, of Birkenhead, and he writes that he had warned the cyclist several times.

Quarterly Trial Entries.

The following entries have been received for the Spring Quarterly Trial, which will be held over the usual course, starting from Uxbridge at 9 a.m. on Wednesday next.

W. Cooper (3½ h.p. Bradbury).
W. Pratt (3½ h.p. P. and M.)
H. Roberts (3½ h.p. P. and M.)
The Clyno Eng. Co. (5-6 h.p. Clyno).
E. A. Colliver (2½ h.p. P. and M.)
E. H. Lees (7 h.p. Indian).
E. B. Dickson (7 h.p. Indian).
B. A. Hill (3½ h.p. Kerry-Abingdon).
C. K. Wigram (5 h.p. Rex).
G. L. Fletcher (2¾ h.p. Douglas).
J. G. T. Firth (3½ h.p. P. and M.)
R. Sampson (3½ h.p. Precision).
W. A. Lockwood (3½ h.p. P. and M).
F. Phillip (3½ h.p. Scott).

Police Traps.

Police traps are in operation between London Colney and St. Albans, and between St. Albans and Redbourne, on the main road from London to Dunstable, *vid* Barnet.

FUTURE EVENTS.

April 20—A.C.U. Second Quarterly Trial.
„ 27-28—Brooklands A.R.C. Meeting.
„ 30—M.C.C. Members' Hill-climb.
May 4—B M.C.R.C. Meeting at Brooklands.
„ 4—Herts. County A.C. (motor cycle section) Open Hill-climb.
„ 13, 14, and 16 (Whitsun)—M.C.C. London-Edinburgh and London-Edinburgh and Back Runs.
„ 26 (Thurs.)—INTERNATIONAL MOTOR CYCLE T.T. RACE
„ 27—Open Hill-climb in the Isle of Man.
June 4—Motor Cycling Club second private race meeting & gymkhana at Brooklands.
„ 6-11—Scottish Six Days' Open Reliability Trial, organised by Edinburgh M.C.C.
„ 18—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CHALLENGE CUP. Competing Teams: Motor Cycling Club (holders), Coventry and Warwickshire M.C., Bristol B. and M.C., Streatham and District M.C., Sutton Coldfield A.C., and Edinburgh M.C.C.
„ 25—Bradford M.C.C. Open Hill-climb.
July 4-9—A.C.U. Six Days End-to-end Trials.

The Next Brooklands Meeting.

Four handicap races have been included in the Brooklands programme for the two-day meeting on April 27th and 28th. Entries close to-day at 12 noon.

The Staxton Hill-climb.

The Auto Cycle Union has written to the clubs who organised the Staxton Hill-climb, and to the riders who took part in it, to ask for an explanation as to why they were associated with or competed in an unauthorised event.

Tenth Anniversary of the 1,000 Miles Trial.

The first one thousand miles trial promoted by the then Automobile Club took place on April 23rd, 1900. A committee has been formed to organise a celebration of the pioneer event on Friday, April 22nd, and those who took part in this trial and others who would wish to participate in the celebration should send their names to Mr. Claude Johnson, c/o Rolls Royce, Ltd., Derby. It is suggested that the celebration should take the form of a luncheon at a conveniently situated town. The motor cycles which competed in the 1,000 miles trial of 1900 were three Ariels (a quad and two tricycles)—one with trailer, one Century tandem, one Empress tricycle, one Royal Enfield quad, one M.M.C. tricycle, and one Simms tricycle.

M.C.C. Race Meeting and Gymkhana.

The second private race meeting of the M.C.C. is to be held at Brooklands on Saturday, June 4th. The skeleton programme includes the undermentioned events for motor cycles: Six handicap races, a hill-climbing competition (handicap), skilful driving competition (Mrs. Jarrott's prize), four gymkhana races, and a great sporting match. With regard to the latter, it will be between well-known racing members, and the idea is to arrange a race for a Rex, Triumph, and Indian (and others if they can be found) machines to be picked from stock.

Another interesting event proposed is a push bicycle race, one lap (handicap) If only Edge, Stocks, Jarrott, Schafer, Platt-Betts, Hooydonk, and Ilsley, who were all prominent cyclists at one time, will turn out, a good race is assured. The hon. sec. is S. H. Fry, 5, Highbury Grove, N.

J. Gibson. A. J. Moorhouse. C. B. Taylor. C. E. Bennett. D. R. Clarke. W. O. Bentley.

A group of six well-known riders of Indian motor cycles, W. H. Wells, the London manager of the Hendee Mfg. Co., standing in the centre. Of this group, Moorhouse, Bennett, Clarke and Bentley are to compete for the Tourist Trophy.

CLUB NEWS.

Auto Cycle Union (Midland Centre).

The annual general meeting will be held this day (14th inst.) at headquarters, when the A.C.U. inter-club championship will be discussed, and other business transacted.

Bradford M.C.C.

The minor climb has been postponed until the 23rd inst. on account of difficulty *re* hill. The Rex Cup 150 Miles Reliability Trial will be run on the 24th inst. over a sealed course. Previous gold medallists are barred.

Worcestershire M.C.C.

A general meeting will be held at the new headquarters, the Hop Market Hotel, Worcester, on Saturday evening next at 8.30, for the purpose of electing an hon. secretary, committee, and other officials. Motor cyclists hailing from Worcester, Malvern, Evesham, and Pershore will be cordially welcomed.

Winchester and District M.C.C.

A general meeting was held at the Tichborne Chambers on Tuesday, last week, Mr. C. E. Godwin in the chair. The opening run was fixed for to-day (Thursday), starting from the Market Hotel, Winchester, at 2.30 p.m., to Basingstoke (*via* Alresford and Alton). Tea at Basingstoke at 5 o'clock. A series of interesting events will be arranged during the summer, and a successful year is anticipated.

Middlesbrough and District M.C.C.

The first competition—a hill-climb on Burke-Brow, near Guisbro'—is to be held on Saturday next. An appeal is now made to all motor cyclists in the district to join the club, and particulars will be sent to anyone interested by the hon. sec., Geoffrey W. Liddle, 367, Linthorpe Road, Middlesbrough. The sports hon. sec. is W. A. George, 27, Nelson Street, South Bank.

Shropshire M.C.C.

The above club held its opening run to Hereford. Owing to the inclemency of the weather the attendance was rather poor, but notwithstanding the elements the few who went thoroughly enjoyed the run. The following runs have been chosen for April: Thursday, 14th inst., Llanrhaida, start 2.30; Sunday, 17th inst., Lake Vyrnwy, start 10.30; Thursday, 28th inst., Tong *via* Shifnal, start 2.30.

Sheffield and Hallamshire M.C.C.

Owing to pressure of business, J. Haslam has been compelled to resign the secretaryship of the above club. The new secretary is Daniel Bradbury, 3, Fulmer Road, Sheffield. He would like the names and addresses of club secretaries in the North to facilitate the arrangement of inter-club meets, competitions, etc. At a meeting held at headquarters on the 7th inst. it was decided to re-affiliate to the Motor Union.

Leicester and District M.C.C.

This young club has now a membership roll of forty-six active riders; it is going strong, and the weekly runs are well attended. The competition season will be opened with a paperchase to-day (Thursday), meeting at Groby Road terminus at 2.30. The members will have to follow the hares over an intricate route in the Bosworth district. A smoking concert will be held some time this month at headquarters, and Mr. Spring, hon. sec. of the Nottingham M.C.C., has kindly promised to give a lantern lecture on that occasion.

Bristol Bicycle and Motor Club.

The first of three reliability trials arranged for 1910 will be held on Saturday next, starting 2 p.m. sharp. The following is the route. Start—Stoke Gifford (Beaufort Arms), thence Hambrook, Winterbourne, Iron Acton, Rangeworthy, Cromhall, turn left top of Charfield Hill to Falfield, thence main Gloucester Road to Thornbury, Alveston, Almondsbury, Patchway, turn left before reaching fourth milestone to Stoke Gifford. The circuit to be covered three times, the last one being reversed. Entrance fee, 2s. for each of the three trials. Entries should be sent to E. J. Prosser, 1, Brecknock Road, Knowle.

York County M.C.C.

On the 17th inst. there is a run to Hull, meeting at Roundhay P.O. at 10 o'clock, and journeying *via* Hull. The consumption trial is fixed for the 23rd inst.

Southern M.C.

Club run on the 17th inst. is to Worthing; lunch, Railway Hotel; tea at Dog and Bacon, Horsham. As the handbook of the above club is now nearing completion, the hon. sec. will be pleased if any change of address, members' telephone numbers, or any information likely to be useful, is sent to him at once.

Birmingham M.C.C.

The second Saturday run of the season was held last Saturday, the venue being Rose Hill on the Lickeys. Several members went with the idea of trying their machines up the hill, but unfortunately the "law" ordained otherwise, as a plain clothes policeman and one in uniform were on the hill. Some fifteen members sat down to an enjoyable tea

Next Saturday the run is to Sudbury, *via* Lichfield. Meet, Perry Barr Station, 2.45; distance about 30 miles.

On the 17th inst. there is a whole day run to Farlow Bank. Meet, Fonntain, Hagley Road, 10.30 a.m.

Nottingham and District M.C.C.

A speed-judging trial was held last Saturday over a distance of eight miles. Competitors assembled at the Red Lodge, Fosse Road. It was decided to hold this particular event, because so early in the season few members have as yet tuned up their machines to concert pitch, and this kind of trial is a sort of go as you please event. The result was:

Name.	Machine.	Time declared previous to run. m. s.	Actual time taken. m. s.	Error of judgment. m. s.
C. R. Smith	(3½ C.C.R., Smith)	26 30	26 36	0 6
J. Fairburn	(3½ C.C.R., Smith)	27 0	27 10	0 10
Geo. Brough	(3½ Brough)	25 0	25 43	0 43
Jos. Mitchell	(3½ Triumph)	26 30	25 39	0 51
F. P. Johnson	(7-8 Matchless)	26 30	24 39	1 51
J. W. Cox	(3½ T.T. Triumph)	48 0	45 38	2 22
J. E. Trueman	(7-8 Matchless)	27 0	24 36	2 24
R. G. Toplis	(3½ Triumph)	30 30	33 50	3 20
G. W. Canham	(3½ Rex)	27 0	34 6	7 6

Pontefract M.C.C.

At the monthly meeting at the Queen's Hotel, Pontefract, on the 6th inst., it was announced that there are four trophies for competition. They were allocated as follows: Trophy by Col. Shaw (president), for an annual reliability trial to be competed for in July; Mr. W. J. Robson's cup, for a hill-climb in June; prize by Dr. Dolan (captain), for a speed-judging competition in August; and members' trophy, for a reliability trial in September.

Gathering on the occasion of a run of the newly-formed Ripon and District M.C.C.

Perfection?

One constantly reads of the perfection of the modern motor cycle, and it may be granted to a few firms that workmanship and finish fall little short of it; but, respecting design and material, there is a good deal to be done yet.

Now where does this perfection lie? Is it in cylinders cast with an altogether superfluous amount of metal in the radiating fins, which, to conduce to good radiation, should present a maximum surface of metal with a minimum amount?

Is it fitting a cast-iron piston, when a steel one could, for strength, be made much lighter, which is very much required in moving parts of high speed? Or perhaps it is in fitting pistons with eccentrically-turned rings, which means that one side of the ring is much thicker than the other, so that, when the cuts are in one line, the piston is forced over to that side of the cylinder where the rings are thinnest; loss of compression takes place, and uneven wear of both cylinder and piston.

Is it in the breakage of valves, which seems to be a common defect, re which, in writing some time ago, I suggested that if valves were drop forged of tough steel, with a very small amount of carbon (as high percentage of carbon is simply asking for erosion), thus having the tensile resistance runing from spindle to valve lip unbroken, there would be less complaint, providing the horizontal planes of valve seating and valve head were truly right-angled to perpendicular planes of guides and spindles respectively; otherwise, no matter how well the valve was made, it must break?

Is it in the flanges of exhaust pipes coming adrift so commonly? This defect is always put down to vibration, which, by the way, is an excuse for many defects. No; bad brazing is the cause, for no amount of vibration will sever a soundly-brazed joint. Outside bearings or timing pinions, in some machines, get very sparse lubrication. The spindles could be drilled blind, and a small hole drilled at right angles about centre of bearing, which would ensure lubrication, and, at the same time, lighten the pinions. The exhaust valve pinion spindle, to which is attached spur wheel for driving magneto, could be drilled right through. The writer had that done, and has no complaint on the score of lack of oil. If the spindle is too small to bear a small hole being drilled, fit a ⅛in. or ¼in. Rotherham oil cup exactly over magneto spur wheel, and if bore is so large that oil runs through too quickly, choke it with worsted or piece of wire, so that oil will drop.

Do we see perfection in holes for bushing being out of alignment, the defect being dodged by boring bush eccentrically, so that ¼in. thickness of bush may be 1-16in. on one side and 3-16in. on the other? Or is it in the parts which should be thoroughly case-hardened, but which, from the wear, seemed to have only smelt some prussiate of potash—a lazy and indefensible method, only to be used as a makeshift?

One can hardly pass through a town without seeing an old Humber or Excelsior running; yet where are the 1904, 1905, 1906 machines of their contemporary makers? And what 1907 machines there are have mostly been re-engined. Time alone gives proof of material and workmanship.

Perfection must unquestionably mean reliability, and the large amount of faith both the authorities and riders placed in their machines was fully borne out by the one allowing an hour every day for a week to bility, and reliability means perfection.

NOVICE.

In answering this advertisement it is desirable to mention "The Motor Cycle."

Oxford M.C.C.

The members' opening hill-climb will be held on Saturday, May 7th, at 3.30 p.m., when the headquarters for the day will be the Unicorn Hotel, Teddington.

Sutton Coldfield A.C.

Mr. H. R. Lane having resigned the post of hon. secretary to the club, Mr. Howard Smith, "The Dingle," Four Oaks, the former trials hon. secretary, has taken up the position of general hon. secretary.

A speed-judging competition was held on Saturday last. Each competitor balloted for a ticket on which was stated the speed in m.p.h. he was to average throughout the run. The route was from headquarters *viâ* Stonebridge to the Abbey Hotel, Kenilworth. The result was: 1, W. B. Clayton (3½ h.p. Bradbury); 2, Howard Smith (3½ h.p. Triumph); 3, J. W. Leno (3½ h.p. P.M.C.)

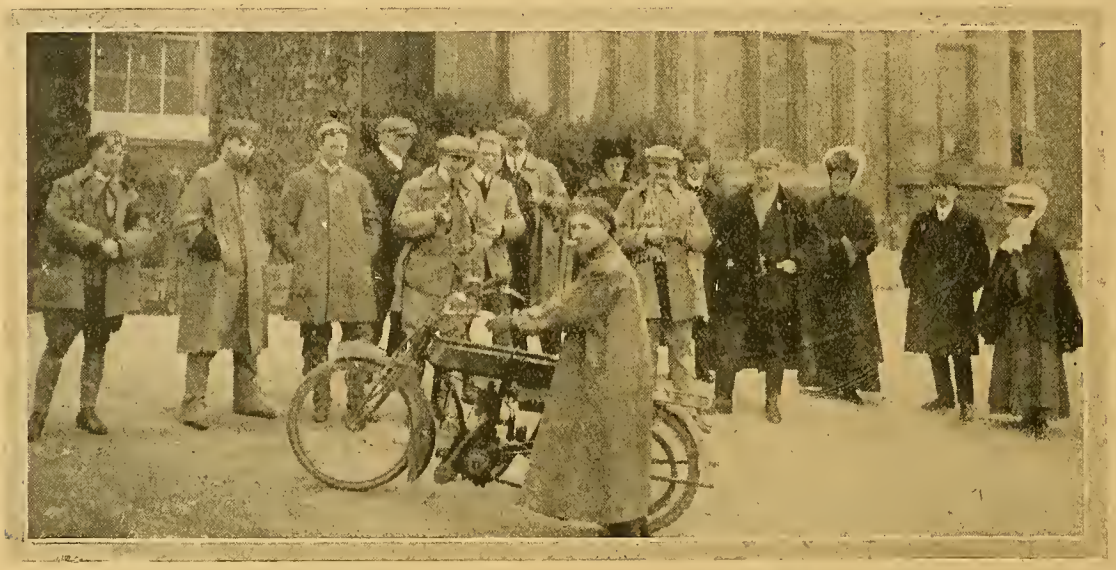
Bolton and District M.C.C.

A speed-judgment competition is to be held on the 23rd inst. to Blackpool (37 miles). Entries close on Thursday next. Gold and bronze club medals will be awarded.

Coventry and Warwickshire M.C.C.

The organisation of the motor reconnaissance, to be held on April 30th, is well in hand, and at a committee meeting on the 6th the routes to be occupied by the defending force were explained.

The club wishes to secure the assistance of as many motor cyclists as possible, and cordially invites members of local clubs within a radius of 25 miles of Coventry to participate in the event, when positions will be allotted to them as near as possible to the districts in which they reside. Intending participants should communicate with the hon. sec., E. W. Walford, 19, Hertford Street, Coventry.



Sutton Coldfield A.C. speed judging contest last Saturday. Timing in J. W. Leno, the last to finish, outside the Abbey Hotel, Kenilworth. He was third in the competition.

INTER-TEAM RELIABILITY TRIAL.

The officials results of the above trial to Harrogate and back for the Service Cup are given hereunder. Last week we announced that the Herts County A.C. were the winners of the cup for the first year, and the marks lost by the riders representing the competing teams are detailed below.

The first nine in each club (omitting Mrs. C. Cooke, who did not wish to be in the team), form the team, and the cup has been awarded on these results:

HERTS COUNTY A.C.

Name.	Marks lost.
C. C. Cooke (3½ Triumph)	6
F. A. Hardy (5 V.S.) ...	7
B. Marians (3½ P. & M.)	9
A. H. Colliver (3½ Triumph)	12
E. A. Colliver (3½ Triumph)	17
W. Pratt (3½ P. and M.)	17
E. M. Down (5 Indian)	20
Mrs. C. C. Cooke (3½ Triumph)	21
A. V. Deacock (3 Wanderer)	23
J.S. Harwood (3½ P. & M.)	31
F. G. Beard (3½ Scott)	50
H. Karslake 3½ Dreadnought)	100
W. Cooper (3½ Bradbury)	104

NORTH-WEST LONDON M.C.C

Name.	Marks lost
R. G. Goslett (3½ P.& M.)	6
A. J. Browne (9 Bat and sidecar)	7
G. Rowden (9 Bat and sidecar)	13
C. S. Westacott (3½ Triumph)	13
H. Bean (3½ Triumph)	18
G. S. Purchase (3½ Triumph)	18
W. Davenport (3½ Triumph)	21
G. H. Hollis (3½ Triumph)	27
C. M. Simpson (5 V.S.)	32
H. V. Bate (5 V.S. and sidecar)	110
C. A. Stern (3½ N.S.U.)	retired.

HERTS COUNTY A.C. AWARDS.

Silver Cups.—Messrs. Cooke, Hardy, E. A. Colliver, A. H. Colliver, Pratt, Down, Mrs. Cooke, Deacock and Harwood.

Silver Medal.—F. G. Beard.

Bronze Medal.—H. Karslake.

B.M.C.R.C. SECOND 1910 MEMBERS' MEETING.

THE following were the entries for yesterday's B.M.C.R.C. meeting at Brooklands, details of which were given on page 298 last week:

RECORD TIME TRIALS.

Class A.—C. Patteson (Moto-Rêve, 50 by 70 mm.); W Chitty (Givaudan, 70 by 70 mm.)

Class B.—H. Martin (Martin, 85 by 60 mm.); G. L. Fletcher (Douglas, 60 by 60 mm.); W. Chitty (Martin, 85 by 60 mm.)

Class C.—F. A. McNab (Trump-J.A.P., 85 by 85 mm.); A. C. Maitland (Trump-J.A.P., 85 by 85 mm.); R. C. Griesbach (Triumph, 84 by 86 mm.); F. A. Applebee (Rex, 83 by 89 mm.); R. T. Exshaw (Zenith-Gradua, 85 by 85 mm.); S. A. M. Whitham (Triumph, 85 by 88 mm.); S. Findlater (A.S.L., 85 by 85 mm.)

Class D.—H. H. Bowen (Bat, 85 by 58 mm.); W. O. Bentley (Indian, 70 by 83 mm.); C. E. Bennett (Indian, 70 by 83 mm.); W. H. Wells (Indian, 70 by 83 mm.); G. Lee Evans (Indian, 70 by 80 mm.); D. R. Clark (Indian, 70 by 83 mm.)

Class E.—G. Lee Evans (Indian, 82.5 by 83 mm.)

RELAY RACE.

McNab and Bowen; Maitland and C. R. Collier (Matchless, 85 by 58 mm.); Griesbach and Colver (Matchless); Exshaw and H. A. Collier (Matchless); Applebee and Geiger (V.S.)

ONE HOUR TOURIST TROPHY RACE.

F. A. McNab; H. H. Bowen; A. C. Maitland; C. R. Collier; R. C. Griesbach; H. V. Colver; B. Yates (Humber, 85 by 88 mm.); W. O. Bentley; R. T. Exshaw; M. Geiger; C. E. Bennett; C. Patteson; G. Lee Evans; J. Gibson; D. R. Clarke; H A. Collier; A. G. Fenn; T. A. Carter (Humber, 84 by 70 mm.); J. F. Crundall (Humber, 85 by 88 mm.)

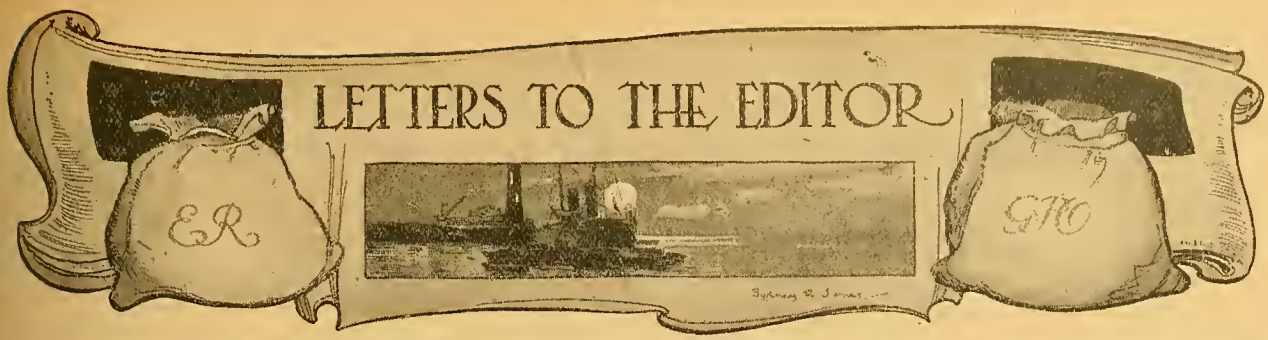
TYRES



Combining Business and Pleasure.

[4695.]—I am commercial travelling at present per motor cycle, and have ridden from North Wales down to Merthyr. My return trip includes Abergavenny, Brecon, Builth, Llandrindod, Welshpool, Chester, and home. I have saved pounds in railway fares, and find the motor cycle much faster than the railway train, and, of course, more convenient. Some of the scenery that I have passed through has been magnificent. H. GIBSON.

How to Overhaul a Motor Cycle.

[4696.]—A small detail regarding an interesting article under the above heading in *The Motor Cycle* has lately occurred to me.

The reader was recommended to have the exhaust valve seating "trued up" when a "pocket" formed after repeated grinding in. Then a bigger headed exhaust valve fitted restores the power. But the user must note if the valve cap opening is big enough to allow of a larger diameter valve being passed through it before he sends cylinder away to have alterations carried out. (Dr.) T. S. WATSON.

Motor Cycle Tyres.

[4697.]—I was pleased to see letter 4680, signed J. F. Briggs, in the issue of *The Motor Cycle* for the 31st ult., as I suffered from the same trouble five weeks ago. In seven days I had my tube cut four times, without having any weight on whatsoever through sharp spoke heads. I cured the trouble by fitting a band two inches wide, made of green baize, and made the join with elastic, which keeps the band tight and prevents it from moving when taking a tube out. Half a yard is sufficient when cut in strips and sewn together for two wheels. I have not had a puncture since fitting these bands. BERNARD LEE.

Automatic Carburetters.

[4698.]—I notice in "Ixion's" Comments of March 31st that he refers to a carburetter suitable for the "unmechanical duffer."

It may interest your readers to learn that a carburetter with one lever control was patented by me, and is at present used by the Quadrant Motor Co., Ltd.

This carburetter is, I believe, the simplest that has, up to the time of writing, been put on the market. It is so designed that it is impossible for the most inexperienced rider to get a wrong mixture, and although the Quadrant Co. fit two types of carburetters, most of their riders prefer the single lever control, and I myself at the present moment am experimenting with a single lever control carburetter which I believe, when finished, will give as perfect a mixture at all speeds as it is possible to obtain.

T. SILVER.

The Taxation Question.

[4699.]—Your correspondent in letter No. 4670 suggests that the tax on small cars is not sufficient according to the tax on motor cycles, but when we consider that an 8 h.p. tricar or motor bicycle is only taxed at present 15s., and a 6 h.p. car £2 2s., merely because it has one more wheel, I don't quite agree with him. He also says that motor cycles should be taxed according to h.p. Now the petrol taxes the large machines much more than the small ones, and I must say I think it would be better to tax all motors according to their market value if it were possible. A man who can afford a £50 machine can afford to pay more in taxation than he who pays £15 for a second-hand one. This plan would give many of the poorer class a chance in the sport, and would help to make trade better, as the old machine could be disposed of easily. I should like to see other correspondence on this matter. J. COTTON.

The Trade and the Trials.

[4700.]—If the various trials for motor cycles are done away with or curtailed as is suggested, the average amateur will have no idea at all of the capabilities of new pattern machines.

I congratulate you on your alteration of the publishing date. What we enjoy are criticisms on trials—real criticisms. HENRY KEAN.

[4701.]—The Motor Cycle Trials might be made interesting and successful both from the point of view of sport and the point of view of the trade by the adoption of some such arrangement as that suggested in your first leading article last week. The practical object of trials is to improve the breed, so to speak, of the motor cycle. This in the long run benefits both rider and manufacturer, so that there is no conflict of interest in the matter. The only question is how best to promote the trials so as to bring about the desired result. If this community of interest be not recognised, the makers, viewing the matter solely from their own point of view without reference to riders' wishes, will say that they do not consider it worth while to spend money on trials which will only demonstrate what they themselves and the public already know, namely, that their own machines are reliable and stand in no need of improvement. This is what is commonly known as advertising bluff. There is no machine so perfect as not to be open to improvement.

Now that the whole question has been reopened it may not be out of place to suggest that an opportunity presents itself for reconsidering it in the light of your suggestion, which contains the nucleus of a complete reorganisation of the system of promoting such trials. The matter might be dealt with on a broader basis than hitherto by co-operation between the A.C.U. as representing riders and the Cycle and Motor Cycle Manufacturers' and Traders' Union representing manufacturers. Trials promoted jointly by these bodies would attract competitors, and the best interests of both riders and manufacturers would be served. The best interests do not necessarily mean, as is so often presumed to be the case, the merely temporary advantage of individual firms of manufacturers. C.J.

A Puzzle or a Poser?

[4702.]—With reference to the article by "Ixion" on petrol spray blowing back, I wonder whether amongst the hundred odd machines he has tried, he has tried one fitted with a J.A.P. automatic carburetter?

I have one, and I cannot detect the slightest moisture with it. I imagine "Ixion" is aware that the J.A.P. has an automatic air supply, but no springs or valves, simply brass balls that lift and let air through the holes on which they are seated when the speed, and so the suction, becomes great enough to require more air. My trouble used to be to run the engine slow enough, but now with this carburetter I can crawl along with the throttle almost shut.

A little device is fitted which consists of a sort of slide plate that has to be set by experiment by turning a milled nut until the exact amount of petrol flows that will give the correct mixture for slow speed. It is a bit tricky to set, but half an hour's work the first ride I had did it. I have not touched it since, and engine fires regularly at a speed one would think not fast enough to overcome the compression. Also it starts easily and slowly, no rushing away as with previous machines I have owned.

CHAS. D. FITZGERALD.

[4703.]—"Ixion's" article under the above heading opens up a question on which I hope we shall have a lot of correspondence, as when reading his article I had one of a similar nature to send on to you.

I use a B. and B. 1909 3½ h.p. Fafnir, and have tried everything in my power to stop the spraying out, which in my opinion exceeds twenty-five per cent. I have now fitted a gauze over the extra air, which prevents it to a large extent, but the gauze requires cleaning at every stop. On a 2¾ h.p. Lurquin et Coudert, with a Longuemare, in the fine warm weather I used to fit a gauze cap (made like an inverted mantle) over the jet, and this prevented the spraying out, and gave me quite twenty miles a gallon more and wonderful flexibility, but, alas! unless it was a fine warm day condensation clogged it.

"Mélange" described some weeks ago how he inserted a coil spring in the inlet pipe, and I used a fan device in the inlet pipe last summer during some fine hot weather, but it clogged up and throttled the engine on cold or damp days; but when used the difference in power and mileage per gallon was wonderful. I sat in the train with a man who said he got 150 miles to the gallon with a 3½ h.p. engine and B. and B. carburetter. I average seventy, but he declined to tell me how he did it.

I have a 3½ h.p. Fafnir engine, governed on inlet, but although I have reduced size of jet till I lose power, it is very extravagant with petrol, owing chiefly to the spraying out, and overheats and knocks on a long hill or at slow speed in traffic. LN 3980.

The Transmission Question.

[4704.]—In some of your recent issues I notice some letters dealing with the question of transmission. Some of your readers coming out here would perhaps like to know which type is best suited to Indian conditions.

I have ridden both belt and chain-driven machines in this country for some years, and I most certainly consider the latter drive, as put into the P. and M., the most satisfactory here. Our extremely hot season (when roads are inches deep in grit and sand), and the following months of heavy and almost continuous rain, simply play havoc with both leather and rubber belts, no matter what care is taken of them.

Chain-driven machines are gradually being introduced, and I make no doubt will surely displace belt-drivers in the near future, especially where garages and repair shops are not.

Berhampore, India. T. H. C.

Increase of Power when Exhaust Valve is Slightly Raised.

[4705.]—From time to time one sees in your excellent paper a variety of reasons for the increase in power when the exhaust valve is slightly raised, and my experience with this phenomenon will probably interest your readers, as the solution appears to be still distant.

When first I purchased my machine I found that a light lifting pressure on the lifter trigger improved the running, and on watching the lever on the crank case that is actuated by the Bowden wire, I noticed when running on the road that this lever was dancing in such a manner as to bump up against the descending exhaust valve cotter with sufficient force to neutralise materially the closing force of the exhaust valve spring.

After fitting a small spring in tension between the lever on the crank case and the footrest in order to prevent the dancing, the engine ran much better, and pressure on the exhaust valve trigger has now no effect except of course to stop the engine. Possibly this may be the explanation of this peculiarity in other cases. W. NETTLESHIP.

Water Cooling on Motor Bicycle Engines.

[4706.]—I was surprised to read the articles by "Ailette" and "Rotator" in *The Motor Cycle* of January 3rd and 10th suggesting that designers should cudgel their brains for the best means of artificial cooling, because we (South Australians) have been riding a very successful water-cooled motor cycle of 3 h.p. for several years.

I have been riding a Lewis water-cooled motor bicycle for the past two years, and my experience is no trouble from overheating, which means we never stop at the foot or part way up a hill to allow our engine to cool, neither have I ever had an inlet or exhaust valve break.

You will note on page 29 of the Lewis catalogue, a copy of which I enclose, a certificate from the Automobile Club of South Australia for the annual hill-climb run on the R.A.C. formula. This hill is about two miles long, has twelve severe bends, and for a short distance a gradient of 1 in 4½. I may add that some of the best British and Continental machines competed in the same competition.

No doubt a water-cooled engine is of more advantage to us than to you, as our summer heat is usually fairly high. The average heat for eight days, viz., from February 13th to 20th, was 101.5 Fahr. in the shade. Our hills on the main roads are usually also severe. On the Mount Barker Road in a distance of twelve miles from Adelaide the rise is over 2,000 feet, and yet I can travel this road on the hottest day without overheating of the engine.

I have no interest in the Lewis Cycle Works otherwise than a satisfied client. ALFRED MOYLE.

Northfield, South Australia.

[The Lewis motor bicycle is fitted with a neat looking single-cylinder water-cooled engine. The water tank and radiator are arranged saddlebag fashion on the forward part of the petrol and oil tank, and the water circulates on the thermo-syphon principle.—ED.]

MOTOR CYCLE TYRES.

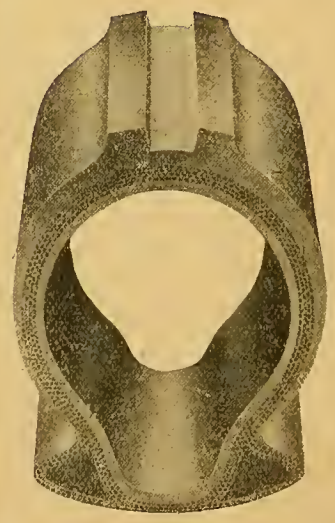
Well-known Riders' Opinions.



Twin-ribbed Type.

F. C. DEE, Esq., writes March 23:

"I have used P.U. for last six motor bikes, and the only time I had to retire from a competition was through continual bursts of outer cover of one other make I tried. Your tyres took me successfully through London—Edinburgh run, London—Plymouth, 1,000 miles trials—(to say nothing of two extended tours in France), without so much as pumping during the various runs."

VIVIAN OLSSON, Esq., writes March 30:

"I am very pleased with the twin-ribbed tyres you supplied me with for the London—Land's End and back ride of the M.C.C.

"I think the tyre is unusually fast and comfortable taking the weight and strength thereof into account. It is one of the most comfortable tyres I have ridden.

"Beyond two small nail punctures, which after all is a matter of luck, they gave no trouble whatever."

J. HATHWAY, Esq., writes:

"I must congratulate you upon the durability of your twin ribbed motor cycle tyre.

"I have used various made tyres during the six years I have ridden, but can fairly say none has given me such satisfaction. During last season and all through the winter I have ridden your tyres on a 5 h.p. Twin Rex without the unpleasant experience of side-slipping or punctures.

"I have recommended these to several of my friends and they form the same opinion as myself."

A. VICTOR DEACOCK, Esq., writes April 4:

"I have much pleasure in informing you of the behaviour of the two Twin-rib Peter Union tyres with which you supplied me last September. Up to the present it is impossible to detect any more wear on the cover fitted to the back wheel than the front, although these have now done nearly 4,000 miles.

"I have used these covers exclusively on a Wanderer motor cycle which you know is not a slow machine by any means.

"In conclsuion, I may mention that I shall most decidedly continue to use these covers, as up to the present I have not had a single puncture of any kind."

The Twin-ribbed Type—illustrated—has become extremely popular. In addition to being fast, comfortable, and durable, the corrugated tread forms a most effective non-skid. Unequalled for single and twin-cylinder machines.

A Suggestion from a Motor Cyclist in Mexico.

[4707.]—As a reader of your paper for the last four years in England, and now out here (where it seems even more interesting), I wonder if you could find room for the following in your correspondence columns.

It has always seemed to me that the exhaust opening for motor cycle engines is never large enough, so I made the following experiment: I timed both m.o. valves as exhausts, and fitted an a.i.v. into one of the valve caps, and provided an extra exhaust pipe, and the difference in power was most marked, and it was impossible to overheat the engine. It also has the advantage of only costing a very little. Let somebody try it in the hill-climbing competitions or at Brooklands, and he will be surprised. Also one can have a higher compression without overheating.

There are a few motor cycles out here, mostly four-cylinder F.N.'s, some lightweights of the same make, a few Indians, Peugeots, and I saw one Humber. There are very few roads, and they are very humpy.

Mexico. P. H. T. HOARE.

Two Tried Tips.

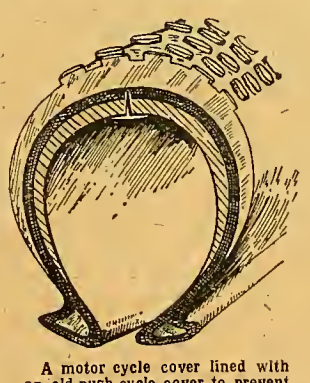
[4708.]—I offer for the benefit of your readers two tips which I have for the last year seen doing excellent service on a heavy motor cycle with sidecarriage, also on a tricar:

First—Belt Stretching and Breaking.—This has been entirely overcome in a most simple manner. The V belts used were ordinary three and four-ply leather, usually called low-priced variety, one ⅞in., the other 1in. Two ordinary ½in. pitch pedal cycle chains were procured and a gross box

The belt tip mentioned in letter from J. Copland.

of ⅝in. screw nails, round heads. These chains were placed round the outside centre of the belts, and secured by a screw every three links or so, the first link at each end being included with the belt fastener bolt (see sketch).

A Tyre Tip.—Recognising that even the best motor cycle covers are liable to puncture from a hundred and one metal objects, not to speak of thorns, the writer has resorted to the following preventive, which does not to any marked degree destroy resilience nor slow the pace. The tyres or covers treated are 2¼in. by 26in. Each was lined with an ordinary pedal cycle outer cover of comparatively smooth variety, the size for above, 26in. by 1¾in., the beads or wires cut clean off, and ¾in. cut out of the circumference. These are squarely fitted inside the motor covers by about one dozen very small artists' drawing pins with thin flat heads (see sketch).



A motor cycle cover lined with an old push cycle cover to prevent punctures.

A very cheap class of cycle cover serves the purpose, or even pretty well worn cycle covers. The writer is perfectly aware that this is perhaps ancient practice, but ninety-nine out of every hundred motor cyclists do not try the plan, but spend time and patches instead. J. COPLAND.

A Protest against the High Prices of Tyres.

[4709.]—When is the rise in the price of tyres likely to stop? Who knows? It seems to me that manufacturers of rubber goods are reaping unreasonable profits. The big dividends that some tyre manufacturers pay yearly prove that lower prices could be charged for covers and tubes. These high prices cannot stand for long, and it is my firm opinion that great harm is being done to motoring generally, and hundreds deterred from joining the ranks. I know two friends who were on the point of buying new motors but the high prices of tyres frightened them. Tyres are the chief source of expense and worry in connection with motoring to my mind, but people will not stand continual replacements at high figures for ever. Once bitten, twice shy, and rubber manufacturers would be well advised to go into the matter of prices at once. What with the increased tax, high prices for petrol, and other incidental expenses, I am honestly considering whether to give up motoring altogether, or to revert to the more economical motor cycle. I have just given up a car solely on account of the expense and the trouble with tyres, and I have heard of others doing the same. The remedy is in the tyre makers' hands. D. C.

Lightweights v. Heavyweights.

[4710.]—A somewhat interesting discussion has been going on week after week in your columns on this subject. I have hesitated to take part in the controversy, as it seems to have taken rather a personal tone. The evolution of the motor bicycle is, despite the opinion of a somewhat hide-bound section of manufacturers, still in an indeterminate stage. When in April, 1904, I started the first of the 60,000 miles of motor travel which I have experienced, the form of the motor bicycle which I then bestrode was absolutely different from that of the little twin which now carries me, although the nominal h.p. was the same.

Since then I have ridden singles, twins, and four-cylinders of high and low power. My work necessitates day and night riding summer and winter in a hilly county where even the main roads are in such a condition that £60,000 has just been voted for their repair. Under these circumstances handiness and easy starting are of more importance than speed, and therefore I have found the machine I have ridden just over a year the most satisfactory investment in the motor cycle line that I have ever struck. I refer to the 1909 Douglas with ⅞in. belt rim and adjustable pulley.

On this I have covered 11,536 miles in twelve months with the consumption of three gallons of D oil (Société de Colombes) and 104 gallons of petrol, including that used for cleaning, etc. These figures are not guessed. With the exception of 423 miles the distance covered has been on local roads, where every foot is known to me, and my mileage has been entered up daily. I can start my machine on 1 in 25 with a push or two on the ground on each side when seated in the saddle, and as I am on the wrong side of forty and weigh over fourteen stones I have fitted a step, and can mount by the step on any gradient under 1 in 15. I certainly could do with an emergency second speed for heavy pitches (1 in 6 to 1 in 9) in the winter, but rarely find the need in the summer.

In conclusion, I would suggest to my fellow motor cyclists that the various classes of machines now on the market fill certain requirements, or they would not find purchasers. The machine which runs on for a day at a time at a speed sometimes touching fifty-five miles an hour, and rarely below twenty, would be of no value to me, as there are few roads where over legal limit is safe or comfortable, while many journeys necessitate over half a mile of cart track or a mile of open downs, often in the dark. On the other hand, if I were a despatch rider I would prefer the fastest machine made that would give the least chance of a skilful shot at the running deer bowling me over.

I am not writing this letter for the purpose of puffing Douglas Bros., but because I think it right where others have given their experiences of machines ridden a few hundred miles to state what a lightweight (for anything under a hundredweight is a lightweight) and a heavy man can do in a difficult county in a continuous twelve months' riding in the course of professional work.

CHAS. L. PATTERSON, M.B., M.R.C.S.

SUMMARY OF CORRESPONDENCE.

Will L. C. Cuffe send his address, not necessarily for publication, but as a guarantee of good faith?

EXPERIENCES WANTED.

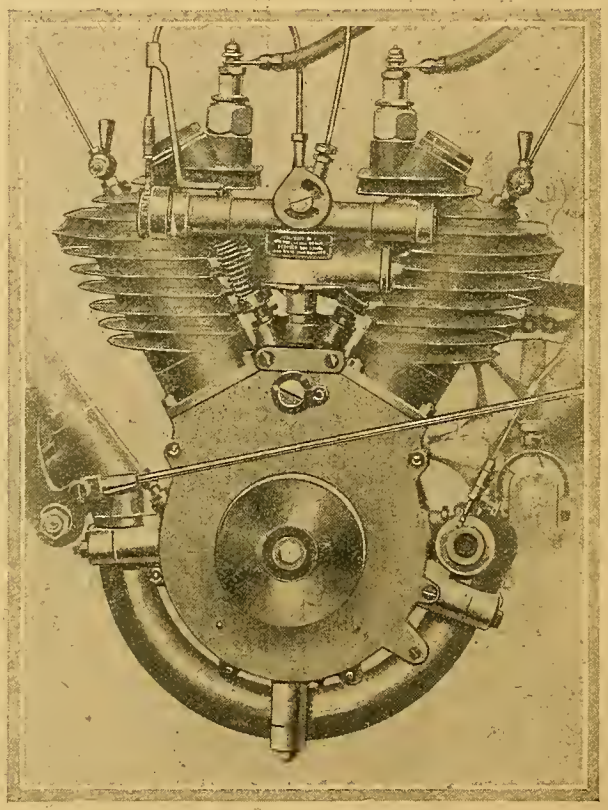
"T.E.G." (Yorkshire) would be glad of owners' experiences with the Lowen sidecar.

"E. S." (Derby) would like users' experiences with the A.S.L. motor cycle, and especially as to the comfort of the air springs, and if they are thoroughly reliable.

"V. A." (Hampton Wick) would like an amateur rider's opinion of the 1910 Triumph plate clutch. On what gradient will it start the machine, and is it useful in traffic?

Improvements in the Royal Enfield Lightweight.

MOST of our readers will remember the introduction at the last Stanley Show of the Royal Enfield twin-cylinder lightweight, which was described and illustrated in our show numbers. Since that time the Enfield Cycle Co., Ltd., has steadily progressed with the manufacture of its motor cycles, and these machines are now being turned out in considerable numbers. When we last visited the works a week or so ago Mr. J. W. Davis, the managing director of the company, showed us a shop full of these well-designed and excellently constructed lightweight machines which were ready for despatch to customers. The Enfield Cycle Co., Ltd., has on its books an enormous number of agents both at home and abroad, who are all keenly interested in the latest production of the firm—an article which is certain to add to the very excellent goodwill already enjoyed by this old-established concern, which has always borne a reputation for good workmanship, material, and design, and an honest desire to produce nothing that will cause dissatisfaction among its wide *clientèle*.



The compactly designed and beautifully made V twin-cylinder engine fitted to the Royal Enfield lightweight.

The only British Private Testing Track.

Everything possible has been done to ensure the machines giving satisfaction when they are delivered to customers, as we saw quite an army of testers tuning up the machines which had been handed to them from the finishing shops. In addition to that, and before going on the road for a final test, the company has built its own private testing track at the rear of the works; this, we believe, is the first track owned by a British firm of motor cycle manufacturers. We reproduce on the next page a picture of this midget motordrome, whereon is depicted a team of testers going through their daily occupation of encircling the track on motor bicycles preparatory to taking them on the road. The testing shop is close alongside the track, and after machines have been run for a short time on the stand to ascertain that all is in order, they are taken on the track to test the flexibility of the engine, acceleration powers, etc. If the track test proves satisfactory, the machines are then taken for a final run on the road and tried on some of the extremely stiff hills which abound in the neighbourhood of Redditch.

We had a short spin on one of the new models, and found it to be speedy, considering its power, and particularly quiet. With a ten to eleven-stone rider in the saddle the machine takes a gradient of about 1 in 8 without pedal assistance—in fact, we saw one climb a particularly steep hill near Beoley Cross, which it romped up without any difficulty whatever.

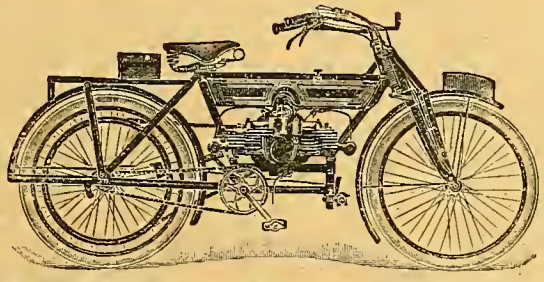
To return to the actual machine, since it was described and illustrated in *The Motor Cycle* several improvements have been made—notably the pedal for the belt rim brake is now pivoted on a separate bolt attached to the frame just behind the bar carrying the footrests. A fall, or skid, even if the footrest be bent, has no effect on the working of the brake. It may seem surprising, but it is nevertheless true, that the paraffin pipes and pump which were fitted as a refinement—and one which we should have thought would have appealed to all motor cyclists—have not proved as satisfactory in use as one might at first imagine.

Some of the Recent Additions.

In the hands of an expert rider or anyone who understands the running of the machine, the paraffin pipes and pump are doubtless a great saving of time and trouble; but novices have been known to leave the taps partly open, with the result that the engine has overheated. In consequence the paraffin pipes and pump will shortly be dispensed with and a small oil tin provided for injection of paraffin through the compression cocks. The latest innovation in connection with the rear wheel hub strikes us as a great advance. Everyone knows how troublesome a free-wheel clutch can become on a dusty or muddy road. The Enfield Cycle Co. has designed and made a special hub for motor cycles, the free-wheel mechanism not being contained, as usual, in the sprocket. To obtain the free-wheel action and retain the pedalling gear for starting and assisting the machine up very steep hills the back hub is provided with a coaster mechanism, which allows a free-wheel action, but no back-pedalling brake. This coaster or free-wheel mechanism is contained in the barrel of the hub itself, and it cannot become clogged with dust or mud, nor can grit or dirt affect its wearing qualities, as there is no place for the dust to enter. Between the chain wheel and the hub a dust-excluding cap is fitted. This method of obtaining a free wheel and pedalling gear without the drawbacks of an ordinary free-wheel clutch is one that all

THE

DOUGLAS



Engine, Bicycle, and Tyres made in England.

which was admittedly the most successful Lightweight in 1909, winning numerous Cups and Gold Medals in all kinds of competitions, continues its success in 1910 by winning

MR. PERCY TROTMAN'S

SPECIAL CUP

AND

Five Gold Medals

IN THE

London to Land's End and Back

COMPETITION.

No other make gained more than three gold medals. **DOUGLAS LIGHTWEIGHTS** were 5, 8, 13, 14, 15, showing marvellous consistency and reliability of the twin opposed engine.

Mr. G. L. Fletcher gained Mr. Trotman's Cup for **BEST PERFORMANCE** by Light-weight, coming in Fifth, and beating thirty competitors riding machines up to 7 h.p., over exceptionally severe course of 555 miles. Only varied 4m. 25s. from schedule; best performance by heavy-weight, 2m. 9s.

We claim that the above performance once more proves the equality of the Douglas Lightweight to machines of greater power and weight without their corresponding disadvantages.

DOUGLAS BROS., Kingswood, BRISTOL.

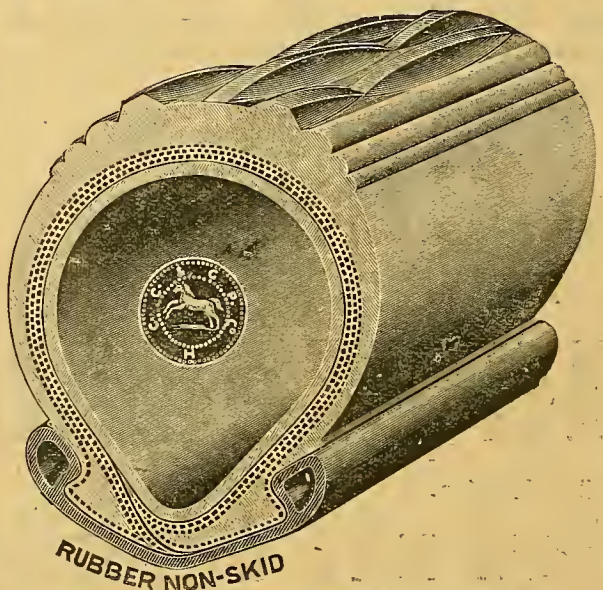
THE FAVOURITE TYRE
WITH MOTOR CYCLISTS IS THE

Continental

RUBBER NON-SKID.



Special wired on Rubber Non-Skid M/C Tyres for F.N. Motor Cycles.

SPECIFY THIS TYRE ON YOUR NEXT MOUNT.

Brooklyn, Bolton Gardens,
Teddington.

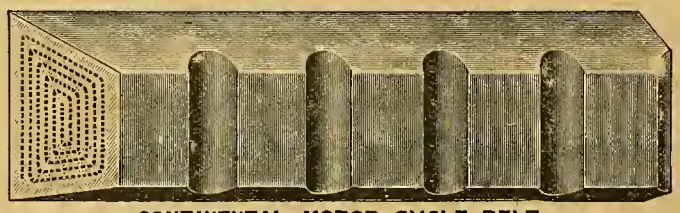
Messrs. The Continental Tyre & Rubber Co., Ltd.

Dear Sirs,

I wish to write you these few lines to let you know how very pleased I am with the Rubber Non-skid Motor Cycle Tyres you supplied me with. I have now covered about 6,000 miles and the treads show very little wear indeed. As a Non-skid it is perfect, and I strongly advise any one who uses a motor cycle, for hard work, in all weathers, to use no other tyres.

Yours faithfully,
G. BIANCHI.

HAVE YOU TRIED THE NEW IMPROVED GROOVED MOTOR CYCLE BELTING.



CONTINENTAL MOTOR CYCLE BELT

Illustrated Booklet Post Free.

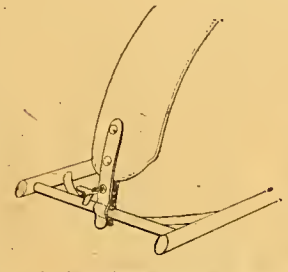
Continental Tyre and Rubber Co. (Gt. Britain), Ltd., 102-108, Clerkenwell Rd., London, E.C.

In answering this advertisement it is desirable to mention "The Motor Cycle."

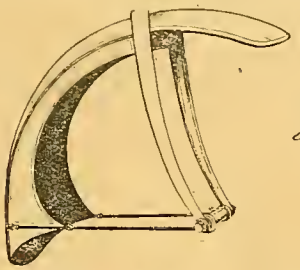
Improvements in the Royal Enfield Lightweight.— motor cyclists will recognise as an excellent feature, free-wheel clutches being so liable to become clogged on a motor cycle unless provided with some sort of dust-excluding device or protector.

A notable improvement to the front wheel is a metal splashguard. This consists, as will be seen by the illustration, of two curved metal sides, which are rolled on to the ordinary mudguard during the process of manufacture. Near the mudguard stay the splashguard is swept forward, and below the stay back again to the mudguard, so providing a very efficient protector, which should keep all mud, wet, and dust from the rider's feet and the engine. The exhaust valve lifter wire is now provided with an adjustment, which enables stretch in the cable to be taken up, and the stand is provided with a spring clip attachment, which permits the stand to be kicked down and up. The clip, which is adjustable by a wing nut, is both simple, neat, and effective, and holds the stand quite firmly, no matter if the machine is ridden on rough roads.

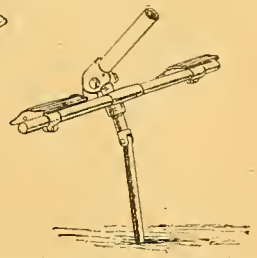
The Royal Enfield motor bicycle is certainly one of the neatest and lightest twin-cylinder motor bicycles on the market. The engine (which has mechanically operated inlet valves) is beautifully made, and is fitted with a special device by means of which the magneto spark can be advanced and retarded to suit varying engine speeds, while obtaining a maximum spark in any position.



(1.) The adjustable spring clip fitted to the rear mudguard for the kick-up stand.



(2.) Detail arrangement of the metal front splashguard.



(3.) The advantages of a fron wheel stand are numerous, and the Enfield Co. has not been slow to recognise them.

Mr. Davis informed us that his firm was turning out about twenty-four of these motor cycles per week at the time of our visit, and that two hundred of them had already been sold.

The company has a staff of demonstrators on the road, and any motor cyclist who contemplates the purchase of one of these machines can obtain a trial run by first making an appointment with the Enfield Cycle Co., Ltd., Redditch, Worcestershire.

A private testing track has been installed at the Enfield Cycle Co.'s works at Redditch—the only one of its kind in England. A batch of Royal Enfield lightweight motor cycles may be seen undergoing their preliminary test.

NO SIDECAR NEEDED.

Mary had a little lamb,
But that was long ago;
For Mary's grown up with the times,
While lambs but sheepish grow.

So Mary's bought a motor bike,
That's warranted to go;
And go it does when Mary rides,
For none could call her slow.

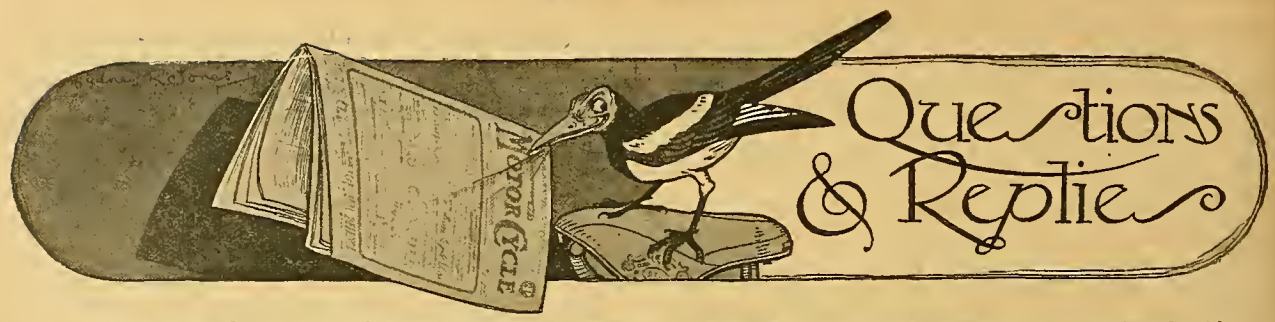
She's most enthusiastic, too;
You'll see her at the Show:
You'll meet her down at Brooklands, and
You won't in Rotten Row.

A member of a dozen clubs,
She's done the Edinbro',
The Thousand Miles, the Quarterlies,
As oft as any pro.

I'm pretty often there myself,
And that is how I know.
In fact, they call me Mary's Lamb,
Because I'm "sure to go."

And so I am, and by her leave,
I always will be so.
And, faith, we'll need no sidecar when
It's Mary, Lamb, and Co.

M.'s L.



A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

A Broken Carbon Brush.

I have a 5 h.p. V.S. fitted with Bosch magneto ignition (D.A.V. twin). Whilst removing the back cylinder carbon holder for the purpose of cleaning I, unfortunately, broke the carbon brush into two pieces, and one piece fell into the magneto. (1.) Will it do the magneto any injury to run machine with the broken piece of carbon inside? (2.) Can I remove the same without taking the magneto down; if so how? If the magneto must be taken down, please inform me as to the best way to proceed.—T. B. W.

The broken carbon brush should certainly be removed before you run the machine again, or shorting will result. There are two ways of removing the broken part. Remove the magneto from the bicycle and take out the carbon holder; then shake the magneto until the piece falls out. If this method does not succeed, it will be necessary to take off the brass end plate (which is not a difficult matter), and the broken part may then be removed. This is probably the quickest way. The Bosch booklet of your magneto will show you its internal construction and with this before you the method of procedure is quite obvious.

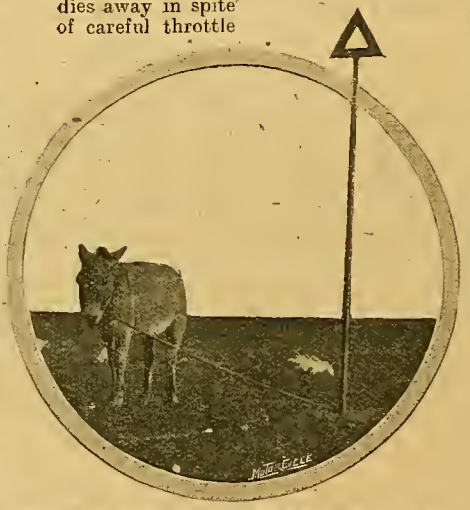
Buying a Second-hand Mount.

(1.) I am about to purchase a second-hand motor cycle. What is the total amount of the licences? (2.) Would a 3½ h.p. Fafnir with adjustable pulley take a sidecar with passengers, total weight eighteen stones, over moderately hilly roads? Should like to know if it would be able to take me with passenger as far as Brighton? (3.) Could I get a reliable machine for £15, and what age would it be?—R.C., Wandsworth.

(1.) The cost of licences is 25s., made up as follows: 5s. registration, 5s. driving licence, and 15s. local taxation licence. (2.) The machine would take a sidecar in fairly level country if geared low. It is, however, underpowered for general passenger work. It would take you probably to Brighton with occasional pedal assistance, but you might have trouble in getting it up Handcross Hill on the return journey. (3.) You should get such a machine for £15, but it would be about four years old.

Mixture Probably Too Rich.

I have a new two-speed 5 h.p. twin-cylinder with sidecar. As soon as ever I open the throttle the engine chokes itself to a standstill. A wait of ten minutes suffices to get under way again, and if the road is a little bit up hill, the same thing occurs in about threequarters of a mile. I have changed the inlet springs and reduced the opening a fraction. Also changed the jet from 31 to one of 29; slight improvement. There is no deposit on the cylinder head, and the engine does not knock, but simply dies away in spite of careful throttle manipulation. To change down to second speed only means that it stops very much sooner.—A. T.



New use for a danger sign. Snapped on the road last week-end.

We should say that your trouble is due to the engine choking itself with an over abundance of petrol. In other words, either the jet is too big, the level of the petrol too high, or the air supply altogether insufficient. If the consumption exceeds fifty to sixty miles to the gallon, you may be sure that the carburetter is wrongly adjusted. When the throttle is half open, can you make the engine misfire by opening the air lever wide? If not the extra air inlet should be enlarged, or a smaller jet substituted. It is unlikely that the trouble is due to any fault in the engine, but do not omit to oil frequently until the bearings are well run in.

Cutting Out One Cylinder.

Kindly give me the correct wiring diagram for interposing a switch in the electrical circuit of a magneto twin motor cycle, so that either cylinder can be "cut out" independently whilst riding. Would the switch wire connections be made direct to the magneto or the plugs, or would the h.t. cables require cutting into? The magneto is the DA2 type Bosch.—N.S.

Unfortunately, a switch to cut out either of the cylinders would present some little difficulty. The ordinary earth connection cuts out both cylinders, and it would therefore mean that you would have to bring the current flowing down over the plug wire to earth, and probably the simplest way to do that would be to have one of the many cut-out switches for attaching to plugs, which can be obtained from Gamage's (Holborn, E.C.), H. M. Hobson, Ltd. (29, Vauxhall Bridge Road, S.W.), and other accessory dealers. It would be far better to arrange your exhaust valve-lifter so that one valve could be lifted before the other, and so run on one or two cylinders at will.

Cracks in Exhaust Valve Seating.

I recently purchased a second-hand 3½ h.p. motor cycle, and on removing the exhaust valve I discovered two minute cracks across the seating in the cylinder casting. They are situated in two separate places where the wall of the valve aperture is thin, and are so faint that they have almost the appearance of scratches. Can you tell me—(1.) The likely cause? (2.) Whether there is a remedy, and if not is there any great disadvantage? (3.) Are they likely to extend? The cycle goes fairly well, but will not climb Westerham.—G.C.

It is difficult to account for the cause. Probably there was a slight flaw in the casting causing the cracks. It is quite possible that these cracks will extend, and we should not advise you to ride the bicycle very long without getting a new cylinder. The best thing to do would be to order a new cylinder at once, but we do not think there would be any harm in riding the machine while you are waiting for delivery, although you may get stranded through complete loss of compression.

Accumulator Charging.

We have in our workshop a 105 volts dynamo for lighting the workshop and some houses, also the village streets. The lamps are 25 c.p. The question is what should I do so as to be able to charge my motor cycle accumulators, which are four volts? Also which way are they to be connected?—R.E.R.

You first of all want to find out the capacity of your accumulators. When you know how many ampère hours they are you should arrange to charge at a ten hour rate, that is to say, you charge the accumulators just sufficiently fast to be fully charged at the end of ten hours. Next, you must see that the current is continuous. When the necessary resistance has been inserted the positive of the accumulator should be connected to the positive of the charging wire, and the negative of the accumulator to the negative of the charging wire. It is a good plan to use a switch controlling two lamps and connect up directly to the switch. You should insert a block of wood or vulcanite between the contact plates of the switch so that it cannot be switched on, attach the wires to the small plates so that the wires make contact with the metal portions, and are insulated from one another by the wood or vulcanite. The two lamps will then offer the necessary resistance. Accumulator charging is the subject of a chapter in "Motor Cycles and How to Manage Them."

Carburetter Query. A Rustproof Covering.

(1.) My 1909 Moto-Rêve does not seem to get enough petrol supplied to the carburetter, working jerkily on level and stopping dead on stiff hills, although this can be altered by depressing needle valve. I have adjusted float to give highest possible petrol level, which is well up to top of jet. Would enlarging needle valve orifice or weighting float improve matters? (2.) Would one enlarged jet act as well as the two now fitted, as even very fine sediment getting past gauze in bottom seems to choke them up? (3.) What would be the cost (approximately) for galvanising or other rustproofing of present machine, not having seen any advertisements for such in *The Motor Cycle*?—W. B.

(1.) We should think that the trouble could be overcome by having the jets slightly enlarged, but you could easily try the effect of weighting the float slightly, which would raise the petrol level. It would appear that there is some obstruction in the feed pipes preventing the flow of petrol. (2.) We should not recommend you to fit one larger jet in place of the two already fitted. What you had better do is to get into communication with the makers. (3.) Probably about £2. We regret we cannot tell you the exact cost of galvanising or other means of rustproofing the machine. Your local agent could probably give you an estimate.

A Question of Engine Power.

I am about to purchase a two-speed free engine Indian motor cycle, and am not sure which would be suitable. I would like to be able to take a sidecar with a 12 st. passenger during the summer months when required, but the greater bulk of my riding will be alone. (1.) Is the 4 h.p. two-speed free engine powerful enough, and what are the steepest hills it would mount with car? (2.) Would there be much difficulty in cost of petrol, wear and tear of tyres, etc., between the 4 h.p. and the 7 h.p.? (3.) Is the 7 h.p. two-speed, etc., any easier to manage in traffic than, say, a 3½ single-cylinder? (4.) Would there be much difference in and heavy to ride alone? (5.) Can one start from a standstill without fear of damaging clutch?—C.T.

(1.) If you propose doing much sidecar work we should strongly advise the 7 h.p. twin. If, however, you only intend to use a sidecar occasionally the 4 h.p. should be sufficiently powerful with a two-speed gear. Hill-climbing depends entirely on passengers' weights and gear ratios of machine. (2.) There should not be very much difference in the cost of running the two, say, about £7 to £10 per annum. Tyres are the chief source of trouble with powerful passenger machines, so the plan is to have heavy covers fitted in the first instance. (3.) We should say that the machine fitted with two-speed gear would be easier to manage in traffic than a single-cylinder with fixed gear, although we have not yet tried the two-speed twin. (4.) You might find the 7 h.p. rather more difficult to control alone, but it would have a great advantage when used with a sidecar (5.) Yes.

Formalities for taking a Motor Cycle into Germany.

I am going over to Germany shortly to stay for about six months, and wish to take my motor cycle with me. (1.) If I joined the A.C.U., would I need to pay a high tax to get it into the country? (2.) Would I need to take out a licence for keeping it and driving it? If so, how would I get the licences? (3.) Would I need to alter my number plates? (4.) Are the petrol, oil, and tyres any dearer than in England? (5.) Which would be the best route?—D.N.D.

(1-2.) Yes, certainly you ought to belong to the Auto Cycle Union, or some similar body. The following are the formalities for taking a machine into Germany: Copy of the entry of your machine in the County Council register should be taken to the German Consul, 49, Finsbury Square, E.C. The copy must bear the official stamp of the registration authorities. Provided this copy has been endorsed, it is not necessary to obtain German licences after arriving in that country. If you send a copy of registration licence to the Auto Cycle Union before 10 a.m. it is generally possible to get it endorsed the same day. A sum of 7s. must accompany this application to cover the fees, expenses, etc. You might read an article entitled "A Fortnight's Tour in Rheinland," which appeared in *The Motor Cycle* of November 22nd, 1909. In it you will see that the cost of Steuerkarte is three guineas, which is recoverable at any frontier customs house when leaving the country any time within a year of entry. (3.) We do not think so for a short stay. (4.) Petrol, oil, tyres, etc., are about the same as in England. (5.) Harwich to the Hook of Holland.

Quarterly Trials competitors stopped at the foot of Dashwood for the "test of hill climbing." The regulations for next Wednesday's Trial remain unaltered, so that riders will again be stopped at the foot of the test hills and allowed to climb them with cool engines. We shall be glad when the A.C.U. sees its way to stop the riders two miles further back, and prevent the competitors overtaking one another until the actual hill is reached, under pain of disqualification.

A Handy Tube Changing Device.

The novel tyre and tube changing device illustrated in the issue of March 21st has been named the "Nuttall and Birtles" patent.

Opening for an Assistant.

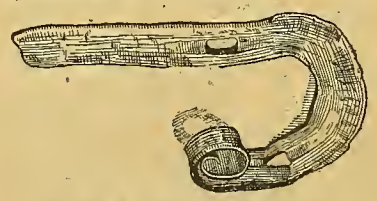
We know of a firm which is desirous of engaging the services of a motor cyclist as assistant in the motor and accessories trade. Letters addressed to the editor, and marked "Assistant," will be forwarded to the firm in question.

A New Contour Map.

Messrs. George Philip and Co., 32, Fleet Street, E.C., have lately published a contoured motoring map of the British Isles. The map, which is on a small scale, clearly shows by different colours the various altitudes obtaining throughout the United Kingdom, and should be useful to motor cyclists planning an extended tour in England, Scotland, or Ireland.

A Puncturing Instrument.

The accompanying sketch shows a Lancashire clog iron which entered one of the tyres of a Motosacoche while being ridden in a Northern town by A. D. Tyler, one of the Motosacoche Co.'s representatives. The article was



The clog iron referred to in the accompanying paragraph.

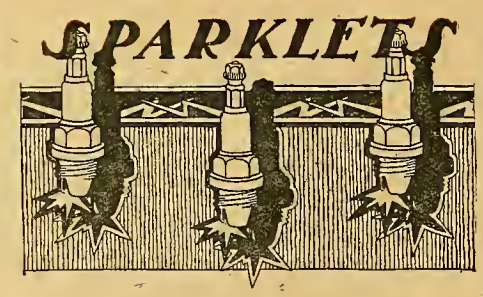
originally the shape of a horseshoe, and one end entered the tyre and tube and curled up as shown. The streets of some Northern towns are notorious for puncture-providing instruments, not only due to clog irons, but also to the nails which fasten them on to the clogs.

Improvements in Motor Spirit Cans.

The Anglo-American Oil Co., Ltd., proprietors of Pratt's spirit, have introduced another improvement in their well-known green cans. The faucet is now set in a dome-shaped stamping on the top of the can, so that when inverted every drop of its contents is emptied. This renders it easier to clean the can before refilling, and also ensures no waste of the precious fluid.

Catalogue Received.

The Bowden Album contains illustrated descriptions of the Bowden patent wire mechanism which is applied to levers and fittings used in connection with the control of motor cycle engines, brakes, carburetters, etc. Many new devices are introduced for 1910, and any motor cyclist who contemplates additions to his machine in the way of two-speed gears, handle-bar control of carburetter, magneto, etc., should make a point of sending to E. M. Bowden's Patent Syndicate, Ltd., Baldwin's Gardens, Gray's Inn Road, Holborn, E.C., for a copy of this useful and well illustrated catalogue.



Increase in Price of Rubber Goods.

In consequence of the rise in the price of raw rubber, Lycett's Rawido Belt Co., Ltd., Bromley Street, Birmingham, have been compelled to increase the price of the Lyso rubber belts ten per cent.

Prize Competition.

The Tennant Engineering Co., 120, Pershore Street, Birmingham, are offering a prize of £1 1s. for the best advertisement setting forth their merits on the reboring of cylinders and the fitting of new pistons.

Exhibition in Birmingham.

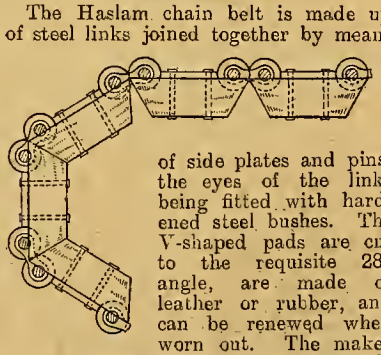
The Colmore Depot, 31, Colmore Row, Birmingham, who are exhibiting motor cycles at the Bingley Hall Trades and Industrial Exhibition, Birmingham, have purchased a certain number of admission tickets, and are willing to send one to any motor cyclist who is on the look out for a new machine and would like to make a thorough inspection of this firm's exhibit.

Useful Information Concerning Sidecars.

A treatise on sidecars has just been issued by W. Montgomery and Co., Coventry, in which all the popular types are dealt with, viz., (1) flexible, (2) castor wheel, (3) spring wheel, and (4) rigid. The question "Which is the best sidecar?" has many times been threshed out in our columns, and it is worthy of note that Messrs. Montgomery and Co. consider that there is no immediate answer to the question, because no one type can embody all the desirable points. They therefore wisely set out in the catalogue the features of each type, leaving the question to be settled by individual judgment.

A New Chain Belt.

The Haslam chain belt is made up of steel links joined together by means



of side plates and pins, the eyes of the links being fitted with hardened steel bushes. The V-shaped pads are cut to the requisite 28° angle, are made of leather or rubber, and can be renewed when worn out. The maker is Mr. James Haslam, 9, Racton Road, Fulham, S.W.

Reinforced Inner Tubes.

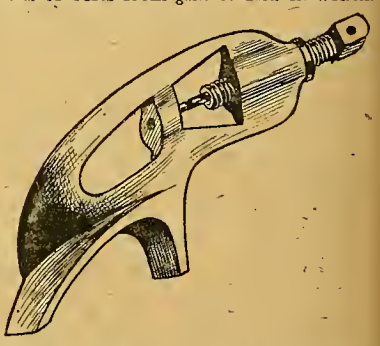
Challenge reinforced tubes for motor cycles are now made in 28in. × 2¼in. as well as the 26in. × 2¼in. size. Brown Bros, Ltd., keep a stock of the above at their showrooms in Newman, Street, Oxford Street, W.

The London-Land's End and Back Run.

R.O.M. tyres did exceedingly well in the Land's End and back competition recently organised by the M.C.C. It will be remembered that the roads were very dry and loose, and consequently severe on tyres. A lightweight machine shod with R.O.M. tyres won the Trotman prize, and 50% of the club gold medals awarded were to riders who also used this make of cover.

Multum in Parvo.

The appended sketch is practically self-explanatory. Our readers are doubtless familiar with that excellent accessory, the Ukantes belt remover, and it will be seen by the above that, incorporated with this, is an excellent belt punch. The whole tool is made in four separate sizes to suit all dimensions of belts from ⅝in. to 1in. in width.



The tool is sold by Price and Co., 25, Rosebery Avenue, E.C.

A Dressing for Leather Belts and Clutches.

Those who are troubled with slipping leather belts, fierce or slipping leather-lined clutches, or leather-lined band brakes which do not grip properly, should make a trial of Motiphos, a material made by the Motiphos Co., 34, New Bridge Street, E.C., which is a special cure for leather. To keep leather in good order it is essential that it should be dressed at intervals. Motiphos is composed of materials which preserve leather and restore it to its original state. It is a viscid substance, resembling liquid glue in appearance and consistency, and, according to an analytical chemist who thoroughly tested it, it is composed of an oily basis of a non-mineral origin and of a non-corrosive character. It is practically unaffected by temperature. On the occasion of this test several strips of disused belting which had become stiff, hard, and dry, were painted over with the substance, and after twenty-four hours the material had been absorbed, and the leather had become soft and elastic. Motiphos is sold in small tubes and costs very little. A properly-dressed leather belt may be used a great deal more slack than a belt which has been neglected.

HUNT'S

The City Motor & Cycle House, NEWGATE ST., LONDON, E.C.

RELIABLE ACCESSORIES AT

London's Lowest Prices

THE NORTH ROAD DUST AND RAINPROOF OVERALLS.

These meet a long-felt want; they can be instantly slipped on over the ordinary trousers, they fasten round waist with a leather strap and buckle. Being made in one piece they are a great protection to the stomach, also it is impossible for the rain to drive in as with the ordinary overalls. Made in three lengths—short, medium, and long. Shaped to go over boot. Patent Side fasteners. Price, in fawn waterproof material, **13/6**; best quality, **16/6**. Postage 6d. Double texture waterproof coat with collar and rain and windproof sleeves to match above, **21/-**

THE "ACME" WATCH HOLDER

Will not rust. Made in aluminium. Will fit all handle-bars. Complete with Ingersoll watch that is specially constructed to stand vibration. Watch can be set and wound without removing same from case. Each watch has a written guarantee given with it for 12 months. Price, complete, **8/6**. Case only, **3/6**. Post free.

THE LODGE PLUG.

Suitable for magneto or accumulator ignition. Spark brought well away from all cold metal surfaces, enabling **maximum power** to be obtained from spark and extremely weak mixtures to be fired. Three spark points and centre rod all of **absolutely pure nickel** and substantial in size. The spark will not burn them away. Porcelain sleeve round central electrode, which keeps hot enough to prevent the deposit of soot or any condensation, and this without the possibility of preignition common to plugs with projecting porcelains. Each plug guaranteed. Price **4/-**. Post free.

THE HUNT HELLESEN DRY CELL.

No corroding terminals. No acid. No charging. Always ready, clean, and dry. The **"Flash."** Height 6½×4×2½in. Approx. mileage, with single-cylinder engine, 1500. Price **6/6**. The **"Flight"** ditto. Height 5⅛ × 5½ × 2½in. Price **6/6**. The **"Midget"** emergency ditto. Height 5⅛×4⅜×1⅜in. Will run approx. 300 miles. Price **4/4**. Postage 6d. extra.

BOWDEN HANDLE-BAR CONTROL LEVERS.

Single lever only, **4/6**; ditto, with 4ft. of combined cable and stop, **6/4**. Double lever, **6/-**; ditto, with two lengths each 4ft. of combined cable and two stops, **9/8**. Post free.

THE HUNT MAGNETO COVER.

Manufactured of best patent leather, far superior to rubber as it does not crack or perish. Will fit all types of magnetos. Price **2/3**. Postage 2d. extra. Protects the magneto from dust, dirt, rain, etc.

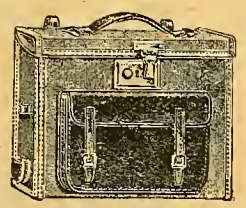
The H.S. All-rubber Goggles, including one set each of smoked and plain glasses. Price **1/11**. Postage 2d.

THE HUNT EXHAUST WHISTLE.

A splendid road clearer. Easily fitted. Operated by foot. Effective on one or two cylinders.

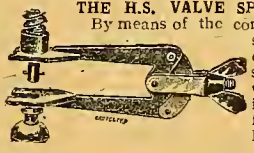
Price complete, in brass, with foot pedal, **10/6**. Post free.

THE "COMPACT" PANNIER BAG.



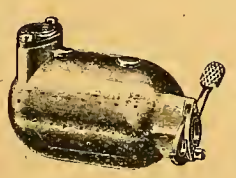
Manufactured of strong waterproof brown canvas, fitted with two small outside pockets to take oil can and petrol squirt, and large leather pocket for spares. It is adapted for strapping on the side of a Lycett tubular carrier. This bag will carry all tools, oilers, etc., also a spare tube and belt. Size 12 × 9 × 3in. Price **12s. 6d.** Carriage paid.

THE H.S. VALVE SPRING LIFTER.



By means of the compound action the stoutest spring is easily raised by a slight turn of the winged nut, leaving both hands free. Price **2/6**. Post free.

THE HUNT SILENCER.



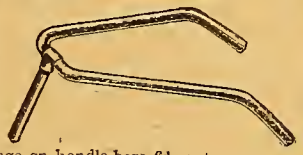
Manufactured of aluminium. No back pressure. Very light. Guaranteed silent. Price **14/6**, with cut out **18/6**. Ditto, with whistle, **24/-**. Post free.

THE HUNT EXHAUST CUT-OUT.

Increases the power on hills. Easily fitted. Worked by the foot.

Price in brass with foot pedal, **4/6**. Post free.

HANDLE-BARS.



Best quality only. Length, 23ins. Price **6/9**. The **P.M.** pattern, as illustrated; length 18in., stem ⅞in. or 1in. Price **7/6**.

Postage on handle-bars **6d.** extra.

THE "COMPACT" TOOL ROLL.

Size 15 × 7½in.

A useful little accessory, keeps all the tools clean and separate. Can be carried in the ordinary toolbag, is fitted with pocket for spares, manufactured of soft pliable leather and has a strong leather binding strap.

Price **3/-**. Postage 2d.

THE R.O.M. PUNCTURE PROOF COMBINATION RUBBER AND STEEL NON-SKID COVER.

Give absolute immunity from skidding under any road conditions.

Are long of life, and yet resilient.

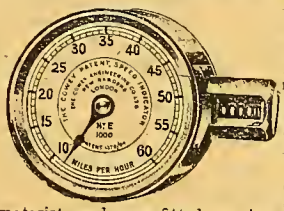
Are capable of being ridden equally well in summer or winter.

Present the greatest possible resistance to puncturing materials, and yet have no leather in its composition (leather making the tyre "dead").

Price, 26 × 2, **52/-**; 26 × 2¼, **55/-**; 26 × 2½, **57/6**; 24 × 2¼, **53/-**; 24 × 2½, **54/6-**; 28 × 2, **54/-**; 28 × 2½in., **60/-**. Carriage paid.

THE COWEY SPEED INDICATOR AND MILEAGE RECORDER (Guaranteed).

Protection from Prosecution.—To the careful rider the Cowey is invaluable, for the exact rate at which the cycle is travelling can be seen at a glance, and it is impossible to unknowingly exceed the maximum legal speed. Motorists generally know the difficulty of correctly estimating the speed at which they are riding, and have been "trapped" when travelling—as they imagined—well within the limit.



Registers a speed up to 60 miles per hour. Mileage recorder registers up to 10,000 miles, then automatically starts again.

The indicator can be easily attached by any motorist, and once fitted requires no attention or adjustment whatever. It will continue to render good service as long as it is attached to the cycle, for it is constructed throughout of the best and most suitable materials by expert British mechanics at Kew Gardens.

Price, in Nickel, **84/-**, carriage paid.

THE NEW MODEL MUD PROTECTOR.

With Side Wings.

Manufactured of best patent leather, strengthened with iron supports. It is attached by means of thumb screws to front mudguard, and can be fitted to any make of machine in one minute; protects both rider and motor from all dust and mud thrown up by the front wheel.

Price **5/-**.

Postage 4d. extra.

THE "PATCHQUICK" REPAIR OUTFIT.

Containing "Patchquick" patches, which amalgamate with the tyre, and are not affected by heat

or friction. Used in conjunction with the "Patchquick fix," a repair can be executed that is equal to any vulcanising process. Price **3/-**. Post free.

1910 Catalogue now ready, gratis and post free.

A33

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland. Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.
Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.
Norfolk, Suffolk, Cambridge Huntingdon, and Bedford.

SECTION VI.
Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan Carmarthen Cardigan and Pembroke.

SECTION VII.
Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.
Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.
Somerset, Devon, Dorset, and Cornwall.

SECTION X.
Scotland.

SECTION XI.
Ireland and Isle of Man.

No. 2315.—5 h.p. VINDEC Special, T.T. model; **£60 10s.** Guaranteed.

3½ h.p. new 1910 HUMBERS, two-speed gear, free engine models; **£50.** Immediate delivery.

No. 1939.—8 h.p. MATCHLESS Racer, J.A.P. engine; winner of several competitions; price **£22 10s.** Guaranteed.

No. 1664.—3½-4 h.p. ROC, Druid spring forks, magneto ignition; **£15.** Guaranteed.

No. 1822.—2¾ h.p. ARIEL, shop-soiled only, 1909 model; **£15.** Guaranteed.

No. 1599.—1¾ h.p. F.N. Lightweight, magneto, spring forks; **£15.** Guaranteed.

A few only 1910 Two-stroke 3½ h.p. REXES, new; price **£48.**

No. 2307.—3½ h.p. 1909 Free-engine TRIUMPH, separate generator lamp, horn, spare valve, complete, condition as new; price **£42.** Guaranteed.

No. 2308.—5 h.p. VINDEC Special, 1908 model, two-speed gear and free-engine clutch; **£28.**

No. 2318.—4½ h.p. Twin-cylinder MINERVA M.O.V. Motor Cycle, fitted with Roc two-speed gear and free engine, spares, lamp, horn; **£25 15s.** Guaranteed.

2 h.p. MOTO-REVE, 1910 model; **36 Guineas.**

3¾ h.p. PREMIER Twin, 1910 model. Offers.

No. 2247.—3½ h.p. VINDEC, magneto, good tyres, F.N. engine, toolbag, horn, footrests, stand, carrier; **£15.** Guaranteed.

No. 2248.—3½ h.p. Magneto MATCHLESS, J.A.P. engine and carburetter, Rom back tyre, in excellent condition; **£25.** Guaranteed.

No. 2249.—3½ h.p. WOLF, Clincher tyres, horn, toolbag, etc., enamel, plating, engine, etc., as new; **£15.** Guaranteed.

No. 2260.—2 h.p. 1909 MOTO-REVE, standard model. Continentals, lamp, horn, toolbag, etc.; **£24.** Guaranteed.

Two 5 h.p. 1909 Twin REX DE LUXE, two-speed gear, standard models, new; **42 Guineas** each. Guaranteed.

No. 2224.—New 2¼ h.p. 1910 ROYAL ENFIELD, standard model, Palmer Cord tyres. **Offers.**

No. 2208.—2½ h.p. BRADBURY, h.-b. control, Clincher tyres, excellent condition; **13 Guineas.** Guaranteed.

No. 2234.—2 h.p. PEUGEOT, good tyres, lamp, horn, toolbag, etc.; **9 Guineas.** Guaranteed.

No. 2021.—3¼-4 h.p. MATCHLESS, J.A.P. engine and carburetter, 26 × 2½in. Dunlops, magneto, spring forks, specially built machine; **27 Guineas.** Guaranteed.

No. 2039.—4 h.p. 1909, Roc two-speed gear, lamp, horn, tools, etc, new condition; **34 Guineas.** Guaranteed.

No. 2164.—7 h.p. BAT, Mabon clutch, good tyres, stand, carrier, toolbag, good passenger machine; **£38.** Guaranteed

No. 2185.—1¾ h.p. Magneto MOTOSACOCHE, 1909 model, Clincher tyres, usual spares, almost new; **£27 10s.** Guaranteed.

No. 2024.—3½ h.p. 1909 MINERVA, Bosch magneto, spring fork, Continental tyres, horn, stand, carrier; **23 Gns.** Guaranteed.

A few left, 3½ h.p. new 1909 Standard REXES, complete with lamp, horn, etc. **£38.**

No. 2193.—5 h.p. NORTON, Druid forks, adjustable pulley, handle-bar control, Rom tyres, front and back stand; **£25.** Guaranteed.

No. 2046.—2¾ h.p. 1909 Magneto ARIEL, handle-bar control, spring forks, in new condition; **£22.** Guaranteed.

No. 2075.—3¾ h.p. 1910 Twin PREMIER, standard model, not ridden twenty miles; **42 Gns.** Guaranteed.

No. 1796.—1¾ h.p. MOTOSACOCHE, Clincher tyres, Druid forks, new condition; **16 Gns.** Guaranteed.

No. 1857.—3½ h.p. 1908 Two-speed Magneto BROWN, very good passenger machine; **20 Gns.** Guaranteed.

No. 2150.—4½ h.p. 1908 Twin MINERVA, with rigid sidecar, **£27 10s.** Guaranteed.

No. 2125.—5 h.p. 1907 Two-speed VINDEC, standard model, very good sidecar mount; **£28 10s.** Guaranteed.

No. 1899.—3½ h.p. 1908 BROWN, magneto, new tyres, enamel, plating, etc., very good; **19 Gns.** Guaranteed.

We have the following New Motor Cycles ready for immediate delivery

3½ h.p. REX Speed King, new model, spring forks	£44 0
3½ h.p. REX Tourist, plate clutch	£54 0
5 h.p. REX DE LUXE Two-speed machine	£62 0
3½ h.p. KERRY-ABINGDON, 1910 model	£43 0
3½ h.p. 1910 DOT	£47 10
5 h.p. VINDEC Special, 1910 model, two-speed and free engine model	£64 0
3½ h.p. L.M.C., two-speed and free engine model, 1910	£48 0
3½ h.p. 1910 QUADRANT	£47 0
3½ h.p. Two-speed 1910 HUMBERS	£50 0
3½ h.p. BRADBURY, new, 1910 model	£46 0
3½ h.p. 1909 Tourist REXES	£35 0
5-6 h.p. BAT, M.O.V.	
3½ h.p. EXCELSIOR, free-engine clutch, 1910 model	£54 0

Besides those quoted in this space, we can offer other good bargains. Do not fail to get our prices before definitely deciding. Recommended by all the leading makers for exchange business. Terms on application.

WAUCHOPE'S, 9, SHOE LANE, FLEET ST., LONDON, E.C.
'Phone, 5777 Holborn. Telegrams: "Opificer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days, and if no sale is effected, each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

SECTION I

Northumberland, Cumberland, Durham, and Westmoreland.

1910 Triumphs in stock.—L. Smith, The Garage, Barnard Castle.

MAGNETO Motor Cycle, 2¼h.p. (74 by 74), built 1909, few parts missing; £15, to clear.—Edw. Irving, Great Dockray, Penrith.

2¾h.p. Lamberjack, Zedel engine, Xtall spring forks, **4** good covers, splendid condition, very low built; £12; can be seen London.—Rennett, Scaleby Castle, Carlisle.

TRIUMPH Motor Cycle, 1910, free engine, new, for sale; also F.N., second-hand, 2h.p., splendid condition; trial.—Robinson and Co., Motor Depot, Belford, Northumberland.

CENTAUR, 3½h.p., magneto, new 26in. wheels, Palmer back Clincher front; good condition, chain driven, compression good, stand; £15. offers.—Hawley, Corporation Rd., Workington.

3½h.p. Rex, M.O.V., Brown-Barlow, handle-bar controlled carburetter, adjustable pulley, brand new 2½in. tyres, stand, sound, and perfect condition; £12, lowest.—23, Hope St., Crook.

SECTION II.

York and Lancashire.

3¾h.p. 1910 Twin Premier; listed by makers £52 10s. my price £47 10s.—Hitchen.

1910 Douglas, just in; 38 guineas; no waiting, immediate dispatch; cash or exchange.—Hitchen.

TWO-SPEED Humbers, exhaust under engine, perfectly new; £45 cash, or exchange terms; offers wanted for the Humber and sidecar complete.—Hitchen, 163, Euston Rd., Morecambe.

DOUGLAS, 1909, as new, tools, spares; £27, lowest.—Rodgers Broom Lodge, Rotherham.

4½h.p. 4-Cyl. F.N., 1908, 2¼ Palmer cords, new Bosch magneto; £22.—Potter, Bleabeim Sq., Leeds.

3½h.p. 4-stroke Scott, unpacked, cannot accept delivery; £53.—4,422, *The Motor Cycle* Offices, Coventry.

1910 3½h.p. Humber, two speeds, as received in crate; £45.—R. Blezard, 26, Bank Hey St., Blackpool.

2¾h.p. Minerva, very low, and in good condition; trial given; £8.—Forrest, Smallwood House, Standish.

DOUGLAS, 1910, the King of lightweights, in stock; sole agent for Manchester district.—Gourley, Fallowfield.

WOLF Lightweight, 1909, practically new, spares accessories; £15.—Adamson, engineer, Spring Bank, Hull.

3½h.p. N.S.U., 1908, magneto, excellent condition; nearest £25.—Illingworth, 345, Newport Rd., Middlesbrough.

LIVERPOOL.—Motosacoche, Moto-Reve, Wolf, the only veritable lightweights; Phelon and Moore heavy end light.—Sole official agents, British Cycle Co., 1, and 3, Berry St.

1908 N.S.U., 1¾h.p. Magneto Lightweight, perfect; any trial; winner most prizes recent Harrogate Club Gymkhana; £14 14s.—Crossley, 25, Claremont Terrace, York.

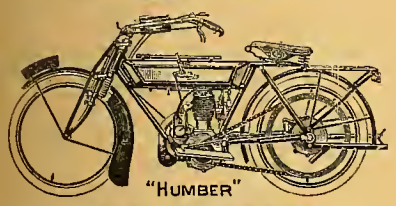
1 SPEED v. 2 SPEEDS

We cannot imagine anyone paying £48 for a machine fitted with one speed, when we can offer a **NEW TWO-SPEED HUMBER and CORONET SIDECAR for £42 10s.** It is equivalent to throwing money "down the gutter." Remember, the usual price of the above "Combination" is £55, showing a clear saving of £12 10s. It is like

MONEY FOR NOTHING.

These "Combinations" will pass a £500 car anywhere at any time. A turn of the handle suffices to set in motion the mechanism of these beautifully designed machines. They are designed to take two passengers speedily, comfortably, and stylishly at a minimum cost; and they do it. Please note, we have only a few left.

£54 7 6. for £42 10 0.



1909½ HUMBERS

brand new. These you can hardly tell from 1910 models, being fitted with improved pattern silencers, spring forks, larger pulleys, Roe licensed two-speed gear, h.-b. control, registered tank, high tension magnetos, Dunlop tyres, oil pump operated by foot, stand and carrier, toolbag with all tools fitted to handle-bar. Fully guaranteed.

£42 10s., complete with sidecar.

We maintain the "Coronet" is the BEST DESIGNED SIDECAR on the Market.

Free from Side-slip.—The "Coronet" Sidecar is attached in three places, the front down tube, bottom stay, and saddle bolt, and can be detached in three minutes. Every tube of attachment is telescopical and adjustable to suit any length wheelbase, any height or width. When attached the combination is as firm and rigid as a Tricar, and entirely free from side-slip, and can be driven safely without passenger if desired.

Delivery from stock to suit TRIUMPHS, REXES, P. & M.'s, N.S.U.'s.

Price £4 17s. 6d. Discount to trade.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

NORTHERN CLUBS AND THE AFFILIATION QUESTION.

By GEOFFREY W. LIDDLE, Hon. Sec. Middlesbrough and District M.C.C.

THE meeting of Northern riders of 1911 at Richmond or elsewhere must not, in my opinion, be run on the same lines (perhaps I should say "want of lines") as this year. I mean by this statement that the committee must organise a good programme of some kind, and not hold a conference of the nature of the recent one. Personally I should say that better results would accrue if the Good Friday meeting were taken in hand, and organised by those who are responsible for the working of the Northern League of Motor Cycle Clubs, and the meeting made the opening event of each year.

To Discuss the Affiliation Question.

With regard to the most suitable venue for leading motor cyclists representing Northern clubs to meet and discuss the affiliation question, I have received communications from several hon. secretaries that York would be a better centre than Leeds. I would be very glad if club secretaries would let me have their views on the matter. All clubs are invited to elect a representative on the committee, as it was decided at the Richmond conference that the Auto Cycle Union should be approached with a view to affiliation of all the Yorkshire clubs for a stated lump sum on the same lines as the North-Eastern Automobile Association. I shall be pleased to have the addresses of the nominees of all clubs interested, so that I can notify them of intended meetings. I think all will agree that the possibilities of advancing the general welfare of riders of power-propelled cycles arising out of the Northern Meet of Motor Cyclists are almost inestimable, especially if some scheme could be devised whereby the gathering would be in the hands of, or at least under the government of, the A.C.U. The Easter meeting would, I think, be a fine opportunity for that body to hold some form of competition in which the Northern motor cyclists (who, I think, are left somewhat in the cold by the A.C.U., except for permit and licence fees and proclamations, which latter are forgotten, evidently, as soon as made) could take part.

Work for the Governing Body.

As a member of the Committee of Eight two or three years ago, I stated my views that the A.C.U. should not expect a club to pay for permission to hold its own competitions, but should manage its own affairs as a club, and devote the funds received from affiliated clubs to the improvement of the lot of the general body of motor cyclists, viz., in efforts to reduce the exorbitant licence and taxation fees, or take up cases of unreasonable fines inflicted on unfortunate riders who can only just afford ordinary running expenses.

As a member of the aforesaid Committee of Eight, I was once dubbed "the silent member," but I thought at that time anything I might venture to say would be waste of breath. However, I now think the time has arrived when the whole of the clubs in the country should be pressed to combine for their mutual good, and here let me openly avow that the Middlesbrough Club has not at any time been directly invited to become affiliated to the A.C.U., nor have any advantages derived from such affiliation been pointed out to the officials. This may read somewhat strangely, but it is nevertheless true.

Tenth Anniversary of the Thousand Miles Trial.

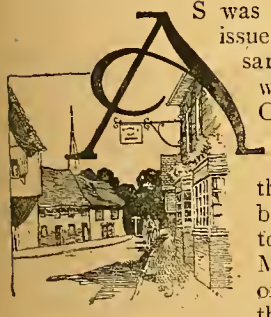
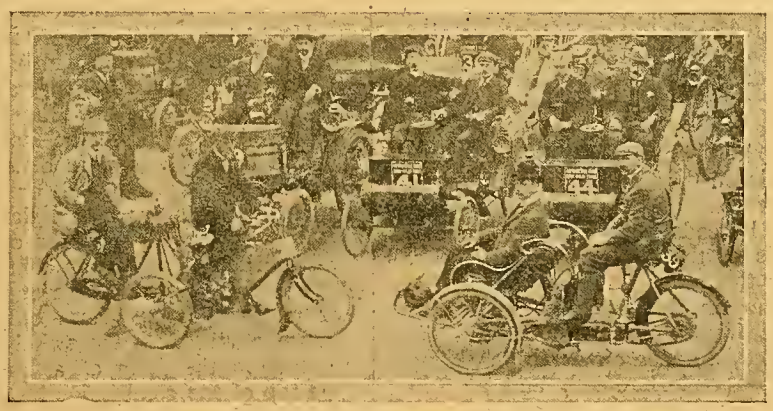
TENTH ANNIVERSARY OF THE THOUSAND MILES TRIAL.



AS was briefly mentioned in the last issue, this year is the tenth anniversary of the Thousand Miles Trial, which originated with Mr. Claude Johnson, the secretary of the then Automobile Club. It has now been arranged that a celebration luncheon will be held at Northampton, the town at which the Thousand Miles Tour competitors lunched on the last day of the tour on their journey from Nottingham to London. It has been suggested, among other items, that the participants in the gathering should bring with them number plates, prizes, photographs, and other trophies of the event, and that a collection of photographs of the participants, together with a record of the original event and of the celebration, should be placed in an iron box and deposited with the Royal Automobile Club.

A Brief History of the Thousand Miles.

The Thousand Miles, as it was called, was the first British long distance motor trial. The Club had previously held tours and awarded prizes for the best performances, but nothing in the nature of an organised trial and demonstration had previously been attempted. Present day motor cyclists will naturally be interested to know if there were any motor cycles which took part in this historic event. In 1900 there was no Auto Cycle Union, but the Automobile Club, recognising the importance of fostering the motor cycle movement, graciously permitted motor quadricycles and tricycles to take part, these being the only forms of motor cycle which were on the market in 1900. Motor bicycles were even then in use, but they had not emerged from the experimental stage, and beyond a few early models which were in the hands of a few enthusiasts who had imported them from abroad motor tricycles and quadricycles were the vogue among those who favoured the motor cycle type of vehicle. Below will be found a list of the tricycles and quadricycles which started from London on April 23rd, 1900, with the names of the riders. Among the latter was J. W. Stocks, now the manager of De Dion Bouton, Ltd. With him as passenger was Cecil Edge, brother of S. F. Edge, who, our readers will perhaps remember, succumbed to a serious chest complaint in July, 1908. E. S. Cheel has not been heard of in motor circles since the trial, but his Ariel tricycle, with Whippet trailer, which was practically a lady's push bicycle frame without the front fork but with the rear wheel and pedalling gear, and was attached to the rear of a tricycle, made some very fast times on the hills. Buck (2¼ h.p. M.M.C. tricycle), the rider of the Simms motor wheel, and Herbert Ashby (Empress tricycle) have dropped out of motoring circles. S. Begbie (Century tandem) is still connected with the industry, as also are A. J. Wilson (Ariel tricycle) and E. M. Iliffe (Enfield quadricycle).



The Century Tandem and Ariel Tricycle with Whippet trailer at one of the exhibitions.

A List of Starters.

No. 3, 3⅛ h.p. Ariel quadricycle, driver J. W. Stocks, passenger Cecil Edge; No. 4, 2¼ h.p. Ariel tricycle with Whippet trailer, driver E. S. Cheel; No. 12, 2¼ h.p. M.M.C. tricycle, rider Buck; No. 20, 2¾ h.p. Simms motor wheel (a tricycle with two wheels in front, one behind, front driving, and rear steering); No. 39, 3 h.p. Century tandem, driver S. Begbie; No. A 16, 2¼ h.p. Ariel tricycle, rider A. J. Wilson; No. A 20, 2¾ h.p. Empress tricycle, rider Herbert Ashby; No. A 28, 2¼ h.p. Royal Enfield quadricycle, driver E. M. Iliffe, passenger W. Grew.

The makers of the Enfield quadricycle and the Ariel quadricycle and tricycle are to-day making modern motor bicycles, and the makers of the Simms motor wheel are at work on magnetos. F. T. Bidlake, although not a competitor in the tour, accompanied the *cortège* for some considerable distance. I believe he finally retired somewhere near to Kendal, and completed the tour per motor car.

The route was: First day, London to Bristol *viâ* Marlborough and Bath. Second day, an exhibition of all the competing vehicles was held in the Drill Hall, Bristol. The third day was occupied in journeying from Bristol to Birmingham, a short stay being made at the Winter Gardens, Cheltenham, where another informal exhibition took place.

The First Hill-climb.

The fourth day was entirely devoted to another exhibition in Bingley Hall, Birmingham, and on the fifth day the competitors tackled the first serious hill on the journey, viz., Taddington Hill on the day's route between Birmingham and Manchester, *viâ* Matlock and Buxton. In this hill-climb A. J. Wilson on his Ariel tricycle made an astonishing performance, beating the Panhard car driven by the Hon. C. S. Rolls, which was the fastest vehicle on the road in England at that time. Needless to say, pedalling was not barred in 1900. If it had been, the writer does not hesitate to say that very few of the quadricycles or tricycles would have completed the journey.

Tenth Anniversary of the Thousand Miles Trial.—

On the Saturday following (the sixth day) another exhibition was held in the Manchester Botanical Gardens. Monday (the eighth day) was devoted to a hill-climbing competition on Shap Fell, the journey from Manchester to Kendal being taken in the morning and early afternoon of that day. The Empress motor tricycle and Ariel tricycle and trailer were first and second respectively of the motor cycle vehicles, the steepest portion of the ascent being used for the purposes of the competition.

Ascent of Dunmail.

On the ninth day another hill-climb was held on Dunmail Raise between Kendal and Carlisle, when the Ariel and Enfield quads and Empress tricycle did well, and finished near the top of the list. In this as well as most of the other hill-climbs, the quadricycles had to drop their passengers, and both tricyclists and quadricyclists gave more than L.P.A. to their single-geared steeds. It will thus be seen that the two-speed gear problem was with us even at that early period. On the tenth day in the ascent of Birk Hill, between Carlisle and Edinburgh, the motor cycles occupied the following positions: Ariel quadricycle second, Ariel tricycle and trailer third, M.M.C. tricycle fourth, and Enfield quadricycle fifth. The speedy motor cycles were only beaten by one car, the 12 h.p. Panhard belonging to the Hon. C. S. Rolls.

On the eleventh day an exhibition was held in the Waverley Market, Edinburgh. On the twelfth day the route was from Edinburgh to Newcastle-on-Tyne, and the writer particularly remembers what a stiff ride that was along the Berwickshire coast and against a strong gale of wind. The thirteenth day was devoted to an exhibition in the Cambridge Drill Hall, Newcastle-on-Tyne, and on the fifteenth day, *en route* between Newcastle and Leeds, the vehicles were displayed in the grounds of the Railway Hotel, York. On the sixteenth day there was an exhibition at the Drill Hall, Leeds, and on the seventeenth day the participants journeyed from Leeds to Sheffield *viâ* Harrogate and Bradford, an open air exhibition being held in both Harrogate and Bradford, and also in Sheffield on the following day.

Speed Trials at Welbeck.

On the nineteenth day, while most of the competitors journeyed from Sheffield to Nottingham, some diverged to Welbeck, and indulged in speed trials. In this event the Ariel tricycle and trailer was third and the Century tandem sixth. The twentieth and last day was the longest run of the whole tour, viz., Nottingham to London *viâ* Northampton, 123½ miles.

At the end of this article will be found a list of those who finished the trial with an average speed of twelve miles an hour throughout. Of those who did not get through, the rider of the 2¼ h.p. M.M.C. tricycle, who pluckily stuck to his task, was eventually forced to retire somewhere in Yorkshire, either at Leeds or Bradford. The 2¾ h.p. Simms motor wheel was *hors de combat* rather early in the tour, and, as far as the writer can remember, was not seen after Birmingham. A. J. Wilson (Ariel tricycle) retired on the Scotch border through the batteries running down—a frequent source of trouble, particularly if accumulators were used. The pioneers of the motor tricycle, De Dion Bouton, Ltd., always recommended dry batteries, and it would appear that their experience was correct, and is now being borne out by the reintroduction of dry batteries in cases where the high-tension magneto is not fitted.

Alternately Motoring and Repairing.

Although it was not the original intention of the organisers that the exhibitions should have served any other purpose than a public display of the competing vehicles, exhibition days were often the saving clause with more than one of the vehicles; in fact, it has been said since the tour was held that it was a case of one day motoring and one day repairing, which in many instances was very true. If anything like the stringent regulations of modern times had been applied to the Thousand Miles Tour it is more than probable that no awards could have been made.

As an instance of what the tour did for motoring generally, it may be mentioned that the year 1900 was quite a boom year as far as the sale of motor tricycles and quadricycles was concerned. Comparatively large numbers of these machines were bought, but the introduction of the motor bicycle about 1901-1902 and other circumstances proved disastrous to the popularity of tricycles, and with the advent of the bicycle came the forecarriage attachment, and then the tricar, so that "trikes" and "quads," as they were called, very soon became back numbers.

Spectators on the Route.

No motor cyclist who witnesses a modern trial and did not see the Thousand Miles Tour can have any idea of the thousands of spectators who lined the roads. People drove and rode horses and were otherwise conveyed miles to see the motors pass. The crowds in the large towns were densely packed, and only a narrow lane was allowed for the vehicles, the drivers often experiencing great difficulty in getting through.

Riders of modern motor cycles fitted with exhaust valve lifters, handle-bar control, variable gears, and free engine clutches will sympathise with the pioneers of motor cycling, whose only means of controlling the machines were the switch handle and an exhaust release in the form of a small compression tap on the top of the combustion head, through which a portion of the exploded charge escaped with a loud spitting noise. The rider pedalled to get going, and then the tap was closed (it was operated by a long rod and a lever on the top tube), and the engine took up the drive.

The Survivors of the Trial.

No. 3, Ariel Quadricycle, J. W. Stocks; No. 4, Ariel tricycle and trailer, E. Cheel; No. 39, Century tandem, S. Begbie; No. A 20, Empress tricycle, H. Ashby; No. A 28, Enfield quadricycle, E. M. Iliffe.

So ended the pioneer reliability trial, from which have grown all the modern events, such as the Six Days, the Quarterlies, the London-Edinburgh, etc. It is safe to say that no modern event has done so much for motoring generally as the Thousand Miles, or been more enjoyed by participants. W.G.

The nett imports of foreign motor cycles during the first three months of 1910 showed an increase of 87%. The exports of British-made motor cycles showed an increase of 66%.

A Nasty Smash.

The following incident contains a moral which some of our readers should take to heart. A motor cyclist was racing a car, and he had a passenger seated on the rear carrier. He was nicely ahead of the car, when his back tyre burst. Such a mishap would be of small importance if the machine had but one man on board, but under the circumstances it skidded right across the road, and threw both men off. To avoid the men the car had to be steered clean across the recumbent machine and on to the grass at the roadside, narrowly escaping an overturn in the process. High speeds with the weight of an additional passenger on the machine are suicidal, and any rider who utilises this method of giving a friend a trip should keep the pace down to rational limits, especially when he has not got the road to himself.

Springing.

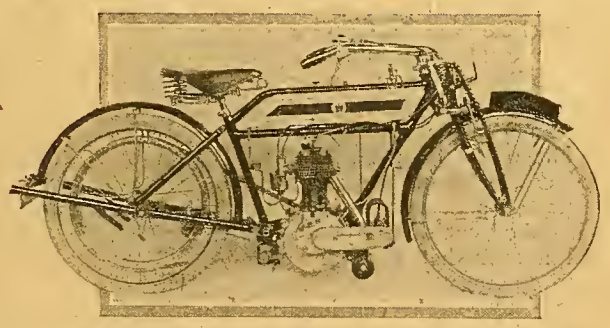
I recently enjoyed several rides on machines with special fittings for reducing vibration, and a subsequent return to the standard type with no rear springing of any sort and only a very moderate spring fork in front has made me extremely discontented. I fear some firms do not realise what extreme comfort can be provided on a motor cycle. Within a year or two a few thousand riders will have enjoyed personal trials of a few good springing devices on the road, and unless those firms who have not up to now studied the question do not begin to cater for the consequent demand they will suffer. I personally do not intend to purchase another machine which is not sprung in some manner both fore and aft, and many hundreds of riders will take similar vows in the next two years. Standard motor bicycles are a great deal more comfortable than the ontside public ever imagine, but they are very, very far from perfection in this respect.

The Scottish Trials.

I have just amused myself by traversing the route of the Scottish Trials with Inglis's contour book and in the comfort of my study, and I see that the hardy sportsmen of the North have a distinct penchant for hills. There is scarcely a practicable precipice north of the border which has been omitted from the trials, and any English riders who fancy they can round corners at speed and that their engines can keep on plugging up miles of stiff gradient will learn something if they enter for these trials. Given a good hill-climber for one's mount, I can imagine no jollier holiday than making the round with the keen spirits of the Edinburgh M.C.C., whether as an assistant official or as a competitor. I understand the officials desire some help along the route in the way of checkers, marshals, and observers, and any southrons who would like a truly sporting jaunt should offer their services to Mr. Macmillan. No previous motor cycle event has ever traversed such a wealth of gorgeous scenery. All the finest lochs in Scotland will be visited, and the minor officials will have ample leisure to look about them, though the competitors will be concerned with more strenuous things. The trial bids fair to be the most severe in history. Tyres should be particularly large and stout for this job.

The Motor Bicycle and Automatic Carburation.

I see Howard Smith [letter 4692] rather disagrees with my view that many motor cyclists desire an automatic machine which makes the minimum demand upon their intelligence and attention. That is admittedly a matter of opinion, although the existence of a few thousand riders who regard "tuning" as a bother would justify the listing of automatic carburetters as an "option." But I must take the strongest exceptions to the ground on which he bases his difference of opinion. Time was when the designer of a car planned his vehicle to be worked at a constant engine speed, leaving variations in the work to be met by a change of gear, just as Mr. Smith asserts; but those days are over for the present, though they may return when the infinitely variable gear comes along. At the present time the engines



A new Rex Speed King, model No. 2. It is finished black, and has 2¼in. non-skidding tyres and spring forks.

of the most up-to-date cars are as flexible as a good motor bicycle engine. F. Hulbert once drove a Triumph motor bicycle at speeds ranging from five to fifty miles per hour in a non-stop trial; there are now many cars which can surpass this performance. It may interest Howard Smith to know that last week I drove a 12 h.p. two-cylinder car at speeds ranging from ten to forty-five miles per hour on its top gear, and that this feature is considered the car's best "talking point" by its makers. What will interest him most of all in the performance is that it was achieved with an *automatic* carburetter, and so far the car in question has failed to equal the performance on any hand-controlled carburetter. Moreover, the carburetter in question is devoid of any springs or other devices capable of derangement and demanding periodic adjustment.

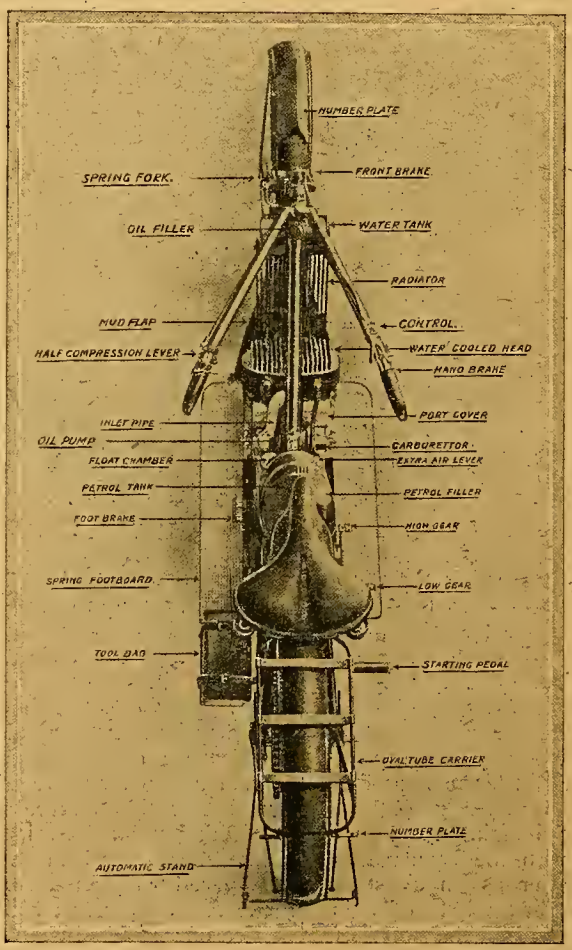
AN EXTENDED TRIAL OF A SCOTT.

EVER since the two-stroke Scott motor bicycle carried all before it in the Coventry Motor Club's hill-climb of 1908 we have longed for a lengthy trial of this fascinating machine. Short runs mean nothing really, and are not reliable guides, for it is within the bounds of possibility that a good motor cycle may develop a fit of the sulks and give one a bad impression, whereas a really doubtful quantity may run at the top of its form for a short period, and thus give a false impression of its general qualities. The true test is an extended trial under normal conditions day in and day out, and it is of this the average rider is most anxious to hear. The Scott was probably the most talked of motor bicycle at the last Stanley Show, and it was partly to allay criticism and doubt concerning its strikingly original design that Mr. Eric S. Myers accorded us the opportunity of an extended trial, and we are now in a position to dilate upon its good qualities. It was rather a tall order to endeavour to embody all motor cyclists' ideals in one machine, yet that was the ambition of Mr. Alfred A. Scott when he designed his two-stroke, two-cylinder, two-speed motor bicycle.

A Fast-running Engine.

It so happened that on the occasion of our first trial of this machine the roads were thick in mud, and although the stability of the machine left nothing to be desired, we must candidly confess we were not altogether happy. The speed of the engine surprised us—3,000 r.p.m. was nothing to it—and consequently we found it somewhat more difficult to control at slow speeds than a four-stroke engined mount. This, however, was almost entirely due to our inexperience with the Scott, for, since we have become accustomed to the manipulation of the half-compression lever (on the left handle-bar), the spark and throttle levers (right handle-bar), and the change-speed pedal on the right footboard, we have developed a great liking for the machine, and are quite at home with it in thick traffic or on winding roads.

As regards its running, it may be compared to four-cylinder machines, the two-cylinder two-stroke engine being equivalent in torque to the four-cylinder four-stroke type. This is saying a great deal, for everyone knows there is only a negligible amount of vibration with four-cylinder engines. This even impulse of the two-stroke Scott motor accounts in a great measure for the longevity of the tyres and the success of the chain transmission. Never have we experienced such comfort from a positive method of transmission, and, what is more, the Renold chains have never given a moment's trouble, and have only required shortening once in 700 miles. In fact, the machine as a whole has proved wonderfully reliable, our one and only *contretemps* being the result of misfortune more than anything else. It was in connection with the carburetter. The high-speed driving chain is immediately under the float chamber, and the chain having developed a certain amount of slackness, gradually chafed a tiny hole in the carburetter casting, and caused a leakage before the trouble was found out and rectified by adjusting the chains.



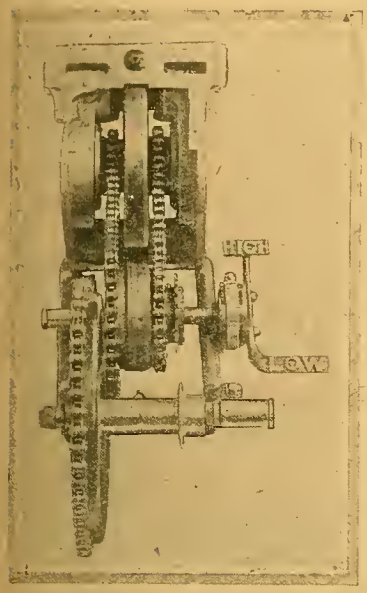
Plan view of the Scott. The lettered description shows the disposition of the various parts.

The Foot-starting Device.

The original method of starting the Scott engine is a great success. One has merely to inject a small quantity of petrol into the transfer ports, flood the carburetter, and with a smart rearward dig of the foot whilst seated in the saddle, the engine is humming merrily. The acceleration powers of the engine are truly wonderful considering its size—2⅝in. bore by 2½in. stroke. It takes up the drive from a standstill without the slightest hesitancy, and the high gear can be engaged after thirty or forty yards. Knocking is unknown with this engine, and, what is more, the unique system of constant thrust is obtained under all normal conditions, so that slackness in any of the bearings has no effect in causing clanking or noise. We have nothing but praise for the two-speed gear. It has received no attention whatever at our hands, but its utility is undoubted. All parts are made from mild steel pressings and stampings, and every wearing part is case-hardened and ground to limit gauge to obviate wear. As may be seen by the illustration of the gear, a system of central drive is adopted. On either side of the flywheel is mounted a sprocket, driving on to a counter-shaft in which the change-speed gear is incorporated. The gear consists of two metal-to-metal expanding ring clutches, and by the

An Extended Trial of a Scott.—

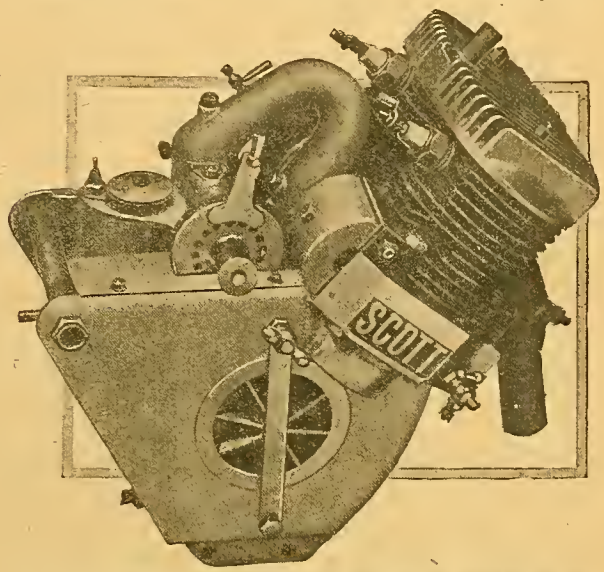
rocking motion of the gear pedal either gear may be engaged, the horizontal position giving a free engine. The final drive to the rear wheel is by a single chain.



The system of central drive. The simplicity of the counter-shaft gear may be gathered from the above.

The low gear enabled a clean ascent of Warmington, on the Edge Hills, with the roads exceptionally heavy, and there was plenty of power in hand. Hills such as Bunny, near Nottingham, it takes in its stride. The writer had made a non-stop run from Newark (twenty-five miles) well up to legal limit, but if the designer had seen the way the Scott roared over Bunny when the throttle was opened it would have done his heart good. For speed on the level, the Scott can easily hold its own with the best 3½ h.p. machines of orthodox type. There are many special features embodied in the design, some of which we may refer to briefly. The open frame, for instance, is very convenient, and enables the rider to wear a long thick motor coat enveloping the knees and legs. In the colder months we found this an untold blessing. The spring footboards are also good, and entirely do away with that stiffness one notices after riding a long distance with the legs in one position. The water-cooling apparatus has been well thought out, the spring forks are very effective—albeit they develop a certain amount of rattle when the rollers are worn—and the crank case inspection covers are useful to enable one to ascertain the amount of oil in the base and the condition of the big-end bearings.

The Bosch magneto is located above the counter-shaft gear, and driven by means of a chain. Some time ago a contributor to these columns pointed out that this indirect drive of the magneto may cause trouble by a variation of the timing owing to chain stretch. We find that the very slight variation which can take place from this cause is easily rectified by the position of the ignition lever on the handle-bar. By the way, the



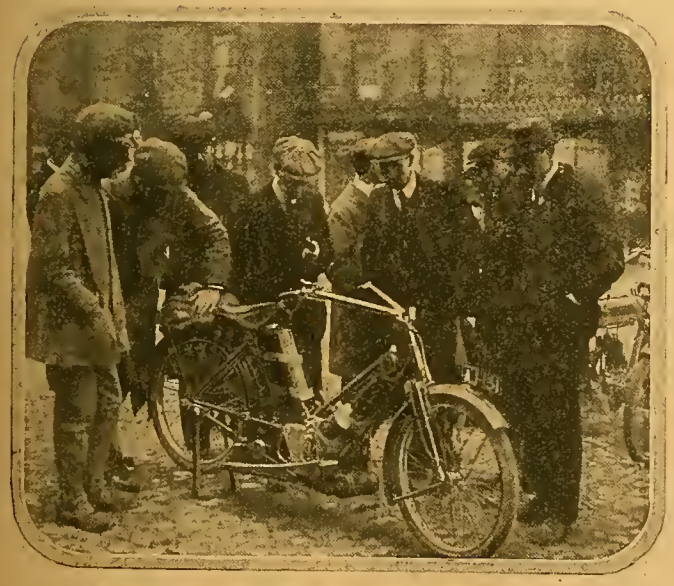
The twin-cylinder two-stroke Scott engine with water-cooled heads, showing carburetter and auxiliary air inlet, transfer port covers, and crankcase inspection covers. This unit forms the nucleus of the frame.

Scott engine has the ignition set much further advanced than the usual four-stroke engine, for the spark should take place (with ignition retarded) exactly at the top of the stroke.

One or two readers have at times queried us as to what would happen in case of a backfire into the crank case with a two-stroke engine. Speaking from experience with the Scott, we have noticed that the crank case covers tremor visibly—that is all. Backfiring is due to burnt-out gauzes in the transfer ports.

From our experience the following minor points might receive attention: The oil pump is somewhat inaccessible, as also the auxiliary air lever. It may, however, be mentioned in connection with the latter that, once set, it is right for the remainder of the run, unless exceptionally steep gradients are encountered. The spring stand fastener is hardly secure enough. We should also like the change-speed and brake pedals placed further forward.

To sum up, there are very few points open to criticism on the Scott motor bicycle; the engine certainly cannot be coaxed to run as slowly as the four-stroke type, and the petrol consumption is much higher—about fifty miles to the gallon—but against these disadvantages one has the simplicity of the two-stroke motor writ large on the memory, and a machine that can run as smoothly and do what the Scott can without valve gear, cams, and poppet valves is a competitor to be reckoned with.



At club meetings and competitions the two-speed Scott is invariably the centre of attraction by reason of its novel design.

B.M.C.R.C. SECOND MEMBERS' MEETING.

THE Second Members' Meeting of the British Motor Cycle Racing Club took place on Wednesday, 13th inst., in typical April weather. The day was mild, but throughout the afternoon several sharp showers fell, while a gusty wind blew from the south-east. In consequence of the wet the record time trials did not take place till after 3 p.m.

The B.M.C.R.C. must be congratulated on its programme, which gave not only the fullest particulars of each event, but a distance table, a speed table, and a list of previous best performances in Classes A, B, C, D, and E. There was a good entry, and a fair sprinkling of spectators, but not nearly enough of the latter, considering the interest and the excellent sport these meetings afford. There were many attractive machines on the track, which we refer to elsewhere, but the three Matchless motor bicycles which will actually compete in the Tourist Trophy Race attracted considerable attention.

The Record Time Trials, the first of the 1910 series, were started from the fork and run towards the aeroplane sheds, so that the men accomplished the trials with the wind in their favour. The times were taken over the kilometre and mile with flying starts.

According to the programme, a certificate will be issued for the best performance made in each class, and the club's gold medal will be awarded in each class for the best aggregate performance made during the 1910 season. In order to be eligible for the latter award, members must have ridden in all but two of the series of time trials held during the season.

In Class A, the best previous performance to Chitty's was by Fletcher on a Moto-Rêve, who covered the mile in 1m. 19.213s., speed 45.447 m.p.h., July 14th, 1909.

In Class B, Martin beat Dayrell, whose time for the mile was 1m. 16.038s., speed 47.345 m.p.h., August 18th, 1909.

In Class D, the best previous performance to Bowen's was by Lee-Evans, who covered the mile in 55.640s., speed 64.702 m.p.h.

The following are the results:

CLASS A.—Engines not exceeding 275 c.c.

	Bore and stroke.	c.c.	secs.	m.p.h.
W. Chitty (Givaudan)	70 × 70	270	71.23	*50.5

CLASS B.—Engines not exceeding 350 c.c.

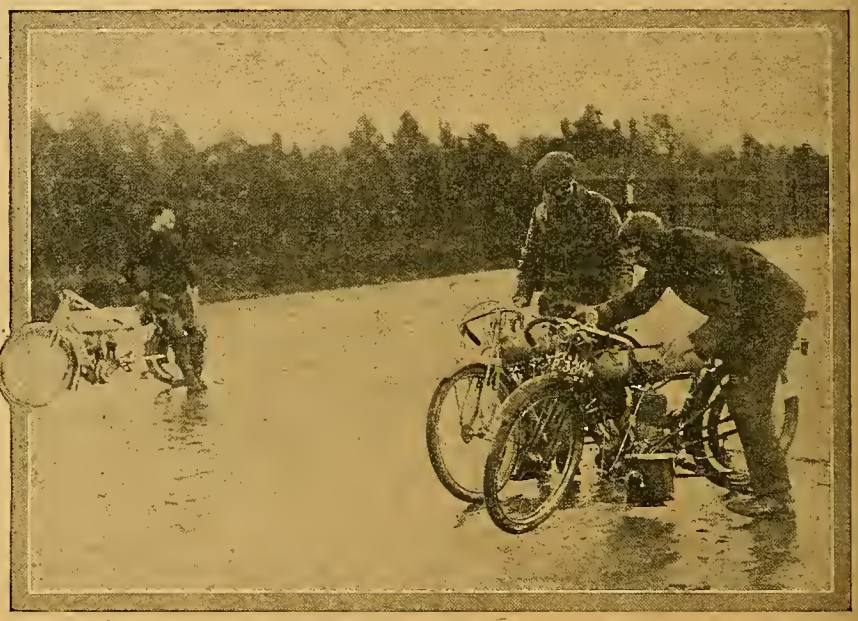
H. Martin (Martin)	85 × 60	340	61.46	*58.5
W. Chitty (Martin)	85 × 60	340	66.78	53.8
G. L. Fletcher (Douglas)	60 × 60	340	92.06	38.8

CLASS C.—Engines not exceeding 500 c.c.

	Bore and stroke.	c.c.	secs.	m.p.h.
S. A. M. Witham (Triumph)	85 × 88	499	59.32	60.7
F. A. McNab (Trump-J.A.P.)	85 × 85	482	60.79	59.2
A. G. Fenn (Triumph)	85 × 88	499	65.01	55.3
R. C. Griesbach (Triumph)	84 × 86	476	67.30	53.5
A. C. Maitland (Trump-J.A.P.)	85 × 85	482	69.46	51.8
F. A. Applebee (Rex)	83 × 89	482	68.37	50.7
J. T. Bashall (Triumph)	85 × 88	499	76.41	47.1

CLASS D.—Engines not exceeding 750 c.c.

H. H. Bowen (Bat-J.A.P.)	85 × 58	658	52.76	*68.20
G. Lee Evans (Indian)	70 × 80	616	55.27	65.1
W. O. Bentley (Indian)	70 × 83	639	56.60	63.60
D. R. Clarke (Indian)	70 × 83	639	65.63	54.8
C. E. Bennett (Indian)	70 × 83	639	83.47	43.10



A. G. Fenn (3½ h.p. Triumph) and H. A. Collier (6 h.p. Matchless) winners of the Relay Race. Fenn is receiving the bracelet for the last lap.

CLASS E.—Engines not exceeding 1,000 c.c.

	Bore and stroke.	c.c.	secs.	m.p.h.
G. Lee Evans (Indian)	82.5 × 93	994	50.57	71.1

*World's record.

The Relay Race.

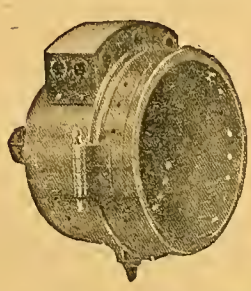
The next event to be run off was the Relay Race—a highly sporting and most interesting affair which greatly pleased the onlookers. The following competitors took part: McNab and Bowen, Maitland and C. R. Collier, Griesbach and Colver, Fenn and H. A. Collier, and Applebee and Geiger. The latter rode a V.S., the others the same machines as in the previous event.

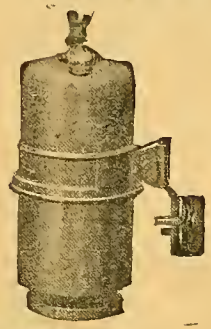
The men entered in pairs, of which one rode a single-cylinder and the other a twin, the combined capacity of which did not exceed 1,170 c.c. Either one of the pair, whoever decided, started and wore a "bracelet"—in reality a large elastic band—which he handed to his partner at the end of each lap. The race consisted of four laps in all, each partner riding

DUNHILL'S MOTORITIES

FOR MOTOR CYCLISTS.

TROUSER OVERALLS,
Made from Finest Double Texture Waterproof Materials, 16 6.





LENS-MIRROR LAMP, with Generator. Complete 20/6.

CARBIDE CARRIER.
Complete.....1 8.
Fitted with Carbide 2/-.

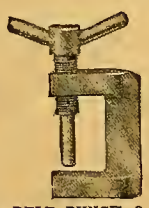
Exide 20 amps., 4 volts, Accumulator. Size — 6½ in. × 4⅜ in. × 2 5/16 in., £1 0 0.
2665. Exide 4 volts., 12 amps., Accumulator, 12 6.

TOOL BAGS, 4 9.

FOUR-GLASS GOGGLES, Hinged Detachable Glasses, Leather Half Mask, 3 6.

BELT REMOVER and TYRE LEVER, 1/-

"UKANTES" MOTOR CYCLE STAND. 9/6 per pair.



BELT PUNCH, 2/-

Branches—London, Nottingham, Manchester, Newcastle, Bristol, Leeds, Glasgow, Dublin, Belfast.
NOTE—Tyres from which the Dunlop Co.'s private marks have been removed are not guaranteed.

A20

B.M.C.R.C. Second Members' Meeting.—

two alternate laps. First prize, two gold medals; second prize, two silver medals. The start, the three changes, and finish all took place at the fork, and most exciting it was.

The Start.

At the word "go" Maitland broke his belt, and C. R. Collier made a poor start. At the end of the first lap H. A. Collier romped in first, stopped neatly,

During the progress of the Hour Race, H. H. Bowen stopped for petrol. Many were the willing hands who rushed to help him.

and quickly handed the bracelet to Fenn, who slipped it on and started, while the others managed fairly well. At the second lap Fenn stopped neatly and lost his partner no time, but Geiger and Bowen overshot the mark, while Griesbach was somewhat late. At the third lap Collier and Fenn again hit it off neatly, and so did McNab, but Applebee flew past the line. Result: 1, H. A. Collier and Fenn; 2, McNab and Bowen; 3, Applebee and Geiger. It had been raining just previous to the race, and as the spray from the numerous puddles flew up from the wheels, belts slipped badly, and the engines raced as if they were in free engine.

Up to the end of the second event the weather had been fairly fine, but during the Hour Tourist Trophy Race for machines complying with the 1910 T.T. regulations (except purely touring accessories such as mudguards and toolbags, which might be removed), there were several heavy showers, and the spray flew from the front wheels of the machines like the bow wave of a motor boat, soaking belts and magnetos in the most disastrous manner. For this race the first prize was a silver cup presented by Mr. H. A. Collier, the second prize the club's gold medal, the third prize the club's silver medal, and certificates to all who finished. The following competitors started:

	Bore and stroke.	c.c.
F. A. McNab (Trump-J.A.P.)	85 × 85	482
H. H. Bowen (Bat)	85 × 58	658
A. C. Maitland (Trump-J.A.P.)	85 × 85	482
C. R. Collier (Matchless-J.A.P.)	85 × 58	658
H. V. Colver (Matchless-J.A.P.)	85 × 58	658
Bert Yates (Humber)	85 × 88	499
W. O. Bentley (Indian)	70 × 83	639
G. Lee Evans (Indian)	70 × 83	639
J. Gibson (Indian)	70 × 83	639
D. R. Clarke (Indian)	70 × 83	639
H. A. Collier (Matchless-J.A.P.	85 × 58	658
A. G. Fenn (Triumph)	85 × 88	499
J. T. Bashall (M.A.B.)	85 × 60	340
S. A. M. Witham (Triumph)	85 × 88	499

At the word "go" almost all made a fine start except Bashall, who stopped within two hundred yards, and at the end of the first lap the men passed in the following order: Bowen, Bennett, and C. R. Collier in close order, Clarke, H. A. Collier, Lee Evans, Geiger, Bentley, Colver, Fenn, Yates, McNab, Gibson, and Witham. In the second lap Bowen kept the lead, C. R. Collier took second place, and Bennett third. In the third lap Bennett took second place, which he kept till the eighth lap, when he caught up Bowen. H. A. Collier had then assumed the third place. At the tenth lap Bowen stopped for petrol, and left the lead to Bennett till the thirteenth round, when he overtook Bennett, whose machine was not then running well. The brothers Collier crept into second and third positions, but, amid the hearty cheers of the spectators, Bowen maintained his lead to the end. Result:

1.	H. H. Bowen (Bat-J.A.P.)	56 miles	1038 yards	
2.	C. R. Collier (Matchless-J.A.P.)	53 ,,	326 ,,	
3.	H. A. Collier (Matchless-J.A.P.)	51 ,,	740 ,,	
4.	C. E. Bennett (Indian)	50 ,,	1035 ,,	
5.	M. Geiger (V.S.)	46 ,,	937 ,,	
6.	Bert Yates (Humber)	42 ,,	1113 ,,	

Lining up for the start of the Hour Tourist Trophy Race. There were nineteen entrants, British machines finishing first, second, and third.

B.M.C.R.C. Second Members' Meeting.—

There were many retirements through wet on the belts and magnetos, and Evans had trouble early in the race through losing his filler cap. It is interesting to note that the three winning machines were fitted with J.A.P. engines, and the Humber was the only single-cylinder machine to finish. Bowen used a Watawata belt, which seemed little affected by the wet. Those who officiated were: Judge, Major F. Lindsay Lloyd; starter, A. B. Ebblewhite; marshals, A. G. Reynolds and W. H. Wells; clerk of the lap scoring board, A. G. Reynolds.

Mechanical Details of the Racing Machines.

Auxiliary exhaust ports were very popular. On Bashall's M.A.B. the port was protected by a drilled box fastened by a clamp round the cylinder. Martin had two circular drilled boxes each side of his exhaust port proper and an extra exhaust port at the bottom of the stroke, protected by a drilled sheet metal sleeve. Chitty's Givaudan was fitted with a Model B Longuemare carburetter, auxiliary exhaust ports, and two old pattern push pump lubricators were fitted, one to introduce oil into the crank case and the other to the piston. Fletcher was riding a 1908 Douglas, which had run in countless competitions. As regards the Matchless racers, these were referred to in the last issue, but it is interesting to note that they are fitted with a foot-controlled belt rim brake, situated on the off side of the machine, close in against the frame. All the corners in the Isle of Man are on the near side, so that in the case of a spill the brake would not be damaged. H. A. Collier was riding with a belt guard in front of his engine pulley, a device sorely needed on the 13th, owing to the amount of wet on the track. An interesting point about the Matchless tanks was the size of the fillers. All were of a sufficient size to enable petrol to be poured in quickly. Fenn was riding what he called an "Imperial Triumph," which was rendered somewhat unrecognisable from the usual run of Triumph machines by a torpedo tank, a weird pattern Longuemare carburetter, and a cardboard belt guard.

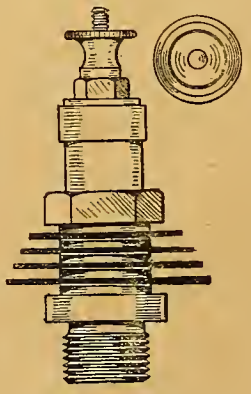
The success of the Bat machines was quite remarkable, and Wednesday, the 13th April, 1910, will be handed down to posterity as a day of victory for the J.A.P. engine.

H. H. Bowen and his victorious twin Bat-J.A.P. He scored a very popular win in two events. Bowen's appearance is accounted for by the wet state of the track, and the mud and dirt thrown up by the front wheel.

It is interesting to note that Martin on his record ride used A.S.L. air spring forks, which, we believe, was the first time these were used in an important racing event.

A NOVEL SPARKING PLUG.

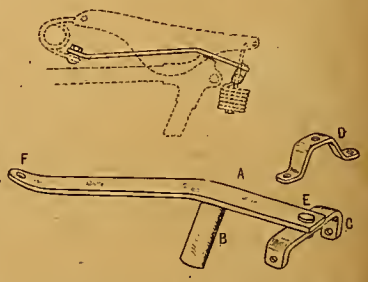
The J.B. sparking plug, primarily introduced for aeroplane engines, is a distinct novelty, and will doubtless be largely used for air-cooled motor cycle engines, particularly those with high compression which are prone to overheating, as this trouble after a time results in the failure of the plug. With a view to keeping the body of the sparking plug as cool as possible, it is made with thin radiators on the lines of an air-cooled cylinder. The new J.B. plug should solve the difficulty with the insulation breaking down, as the cooling flanges should keep it at a much lower temperature. We shall report on its behaviour in a motor cycle engine in due course. The agents for this original plug are G. H. Smith and W. H. Dorey, Ltd., 14a, Great Marlborough Street, W



A DEVICE FOR OBTAINING A LOWER SEAT.

The accompanying sketch shows a seat-pillar fitted by a reader to two different motor cycles, in order to lower the seating position as much as possible without moving the saddle backward. Both machines had the ordinary forward 7 seat-pillar and Brooks saddles. The resultant gain is about an inch and a quarter.

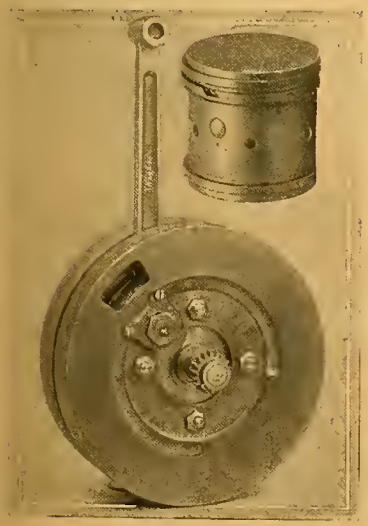
A is an iron bar $\frac{3}{16}$in. by 1$\frac{1}{4}$in., tapered towards F. B is a solid piece of round steel welded to A and fits the seat-pillar tube. C or D (according to the design of the saddle springs) is bolted to A by a $\frac{3}{8}$in. bolt E, and supports the rear saddle springs which are bolted to it. The front spring is bolted at F. Small adjustments to get the right clearance between the seat and the frame can be made by fitting C above or below A and inserting washers between them.



THE CENTAUR REDIVIVUS.

MANY of our readers, we opine, have pleasant recollections of the chain-driven Centaur motor bicycle, for six years ago it was one of the most substantially built machines on the market, and to this day a large number are running on the roads. Since the manufacture of chain-driven Centaur motor cycles was relinquished there has been greatly increased activity in motor cycling circles, and recently the Centaur Cycle Co., Ltd., resolved to place two new patterns on the market—a standard and a T.T. model. The very latest practice has been embodied in the design of these machines, and they are thoroughly well constructed. Thanks to the courtesy of Mr. W. G. Jenks, we have inspected the two latest models, and are enabled to give our readers a few advance particulars and illustrate one or two of the more important features. Dealing first with the standard tourist, in general appearance it is on orthodox lines, with the engine carried vertically low down in the frame. Spring forks with the springs enclosed in hollow tubes are used, and other usual details, such as pedalling gear, footrests, stand, and carrier, are included. The control of the B. and B. carburetter is on the right-hand grip. As regards the engine, which is rated at 3½ h.p., the bore and stroke are 85 by 87 mm. The mechanically operated valves are situated in front of the engine, where they receive the maximum cooling draught. The main shaft is carried in ball bearings, and the pulley is adjustable. The piston (which we illustrate) has three diagonally slotted rings, two being placed above the gudgeon pin and one at the bottom as a guide for the piston. Holes are drilled at equal distances around the circumference to assist lubrication. The flywheels are large and heavy on the periphery, ensuring steady running. On the standard model the chain-driven Bosch magneto is carried in front of the engine between a couple of tubes extending from the steering head to the front of the crank case, and protected by a leather cover.

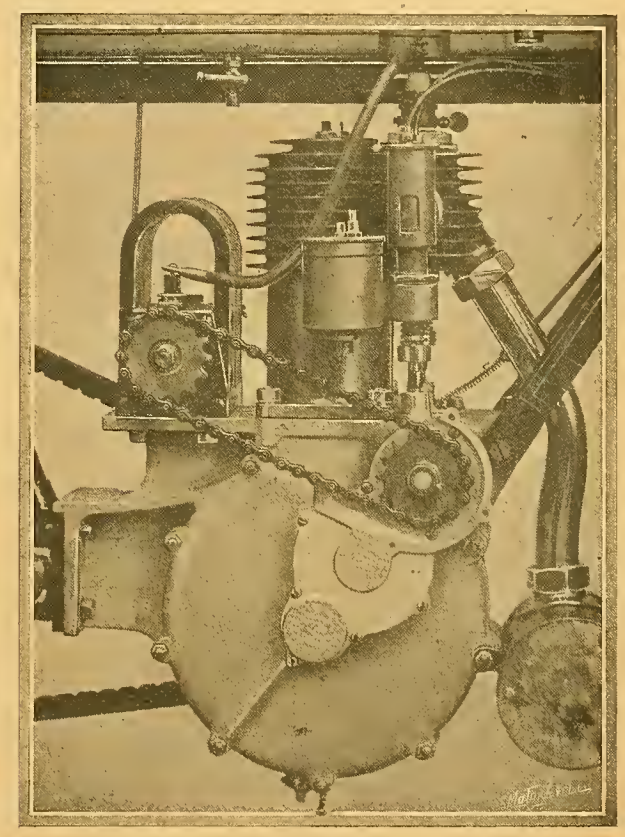
The spring fork of the new Centaur.



The piston, connecting rod, and heavy flywheels. The piston, which has three rings, is drilled to assist lubrication.

No. 2 model is a Tourist Trophy type, and, besides having rigid forks and one set of footrests in place of the pedalling gear, the magneto is located abaft the cylinder, and carried on a platform cast integral with the aluminium crank case. The carburetter is in this case on the right-hand side of the cylinder. One of these models is being entered for next month's Tourist Trophy Race, and very probably that veteran expert F. W. Chase will ride it.

In the case of either model the brakes are the usual belt rim foot applied and front rim hand applied. The transmission is by ⅞in. V rubber belt. The oil and petrol compartments are capacious. A petrol gauge is fitted, and the oil pump is enclosed in the fore part of the tank. Palmer tyres and Middlemore Rideasy saddles complete the equipment of a thoroughly sound machine, which is almost bound to spring into popular favour before very long, as the workmanship and finish are of the highest order.



The power unit of the Centaur T.T. model, showing disposition of magneto and carburetter. By removing the crankcase bolts, and undoing the petrol and oil unions, the engine, carburetter, and magneto may be removed bodily from the frame without disturbing any other adjustments

It is expected that deliveries will be commenced in about ten days' time, and meanwhile applications to the Centaur Cycle Co., Ltd., Coventry, for catalogues will be filed and receive attention immediately the lists are out of the printers' hands.

Cost of Competing in the London Edinburgh Run

BY THE M.C.C. TRIALS HON. SEC.

PREVIOUS to last year's London-Edinburgh run, and again this year, when interest in this popular event is aroused by the preliminary announcements and descriptions in the press, a number of potential participants have written me asking if I can tell them the approximate expense entailed in becoming a member of the Motor Cycling Club and riding throughout the twenty-four hours' run. A few words, therefore, on the subject may interest readers, and incidentally save me a considerable amount of correspondence at a busy time.

I may as well confess, however, that, although I have ridden in the event three consecutive years, I have never kept a close record of my expenses, for the simple reason that I have always looked upon this run as a Whitsuntide holiday, and when holiday-making one does not usually keep count of every odd shilling spent; and I would here urge that the run is a holiday, so interesting, albeit fascinating, does it become the further one travels towards Edinburgh.

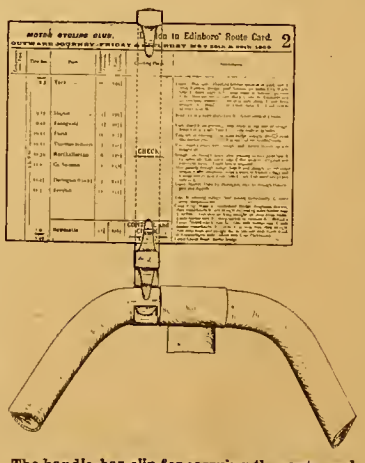
Expense to a Non-member.

Dealing first with a non-member of the club, he must first be elected to membership at a cost of twenty-six shillings—five shillings entrance fee and one guinea subscription. Applications should be directed to Mr. A. Candler, 1, Lime Grove, Shepherd's Bush, W.

Country members will have the expense of getting to the starting point; but as the majority ride up, this is after all an insignificant item; besides, those who live north of London save on the return home—unless, of course, they enter for the double journey. For instance, a member living at Newcastle (the second entry received for this year's event was from a Newcastle member) rides up to London, possibly in one day (I believe I am right in stating that entrants from Newcastle have ridden up the day previous to the start), and rides comfortably home from Edinburgh in another day. Taking an opposite case, the third entry received was from a member at Bristol, but as he is a car owner his pocket is doubtless a deep one. However, a day's run to the scene of the start does entail expense, the least of which is incurred on the run itself for two or three meals and petrol. A day's run means riding to London on the Thursday and staying there, so that there are hotel expenses. In some cases it would doubtless be cheaper to train up to London on the Friday (starting day), the fare for self and machine coming to no more than the expenses of riding up and hotel, etc., after.

I suppose if I ignore equipment expenses I shall be "dropped on"; but whilst I recognise that many new things in the way of inner tubes, cases for carrying same, belts, tyres (if the machine is an old one), lamps, matches, spare parts, etc., are necessary, I would point out that one only buys these things in a lump, so to speak, instead of by dribs and drabs during the year. Regarding lamps, it is no novelty to see some machines at the start fitted with no fewer than three, but I think this number, or even two, quite unnecessary. I have used one good lamp and one good generator on each occasion, and have never had trouble; in fact, my lamp has been burning long after sufficient daylight has appeared to do without it, except last year, when I turned it out at Norman's Cross after refreshment—yes, you can get refreshment at this place.

I, however, started late last year, and did not get so much riding in the dark as some; still, how long does it take to refill a generator or change a refractory burner? If some of those over-ambitious riders who exceeded the fifteen minutes' allowance last year had had lamp troubles they would have experienced a "blessing in disguise." Those who enter for the Challenge Cup may perhaps be excused for carrying a second lamp, since it is imperative that they do not get ahead of schedule time, and do not want to stop for anything.



The handle-bar clip for carrying the route card referred to in the accompanying article.

Expenses Incurred on the Run.

Now we come to the expenses incurred on the run. The first check is at Biggleswade, and here most of us are glad of a cup of hot coffee and a couple of sandwiches—a humble shilling, say, including cigarettes. Next come meals at Grantham, York, and Newcastle. A set of coupons for the single journey cost 8s. Tea at Jedburgh, 1s. Add to this 5s. or 6s. for petrol and 2s. 6d. for lubricating oil, and perhaps an odd shilling for refreshment at Biggleswade (where most riders take refreshment), and we have 18s. 6d. for the journey—say £1, allowing for sundry refreshment *en route*. London to Edinburgh for £1 is not an

Cost of Competing in the London-Edinburgh Run.—exorbitant sum for 400 miles, is it? Now add hotel expenses at Edinburgh. Dinner on the Saturday night, bed, and breakfast Sunday morning—10s. 6d. After this it depends on what one decides to do. The majority, of course, stay at Edinburgh until the Whit-Monday morning, and this involves an expense of about another 15s.; a few make a start home by road, and others return to London by the Sunday night train in order to race at Brooklands, or if they particularly wish to get back for any other reason. The ideal way for those living in London is to tour home in three days, though business has always prevented my doing so. The first year I rode to Penrith on the Monday; rode out and had a look at Lake Ambleside on the Tuesday morning, and caught the 2.35 express to London. The second year I also rode to Penrith on the Monday, and from there to Warrington (over Shap) on the Tuesday, staying at Warrington a few days, and subsequently making a one day's run home to London.

Last year I had to be back in London on the Wednesday, so rode to Carlisle on the Monday, and on to Doncaster the next day, catching a train at the latter place soon after six o'clock. There are many different ways of returning, each having special attractions, and a party of riders can have a real good time. Assuming that my last method is followed, *i.e.*, riding to Doncaster, the expense after leaving Edinburgh, including carriage of machine, would amount to about £2 10s., reckoning first-class hotels and dinner on the train.

Summarising the various items, we get a total expenditure made up as follows: Expenses on the journey, £1; Saturday to Monday hotel, £1 5s. 6d.; journey home, including train fare for rider and machine from Doncaster to London, £2 10s. Total, £4 15s. 6d.

The run then costs, roughly, a "fiver." Non-members will have to add another £1 6s.

If the return to London be made by road in two days—and many do this—an appreciable saving can be made, because 15s. railway fare is saved, also the fare for the machine and dinner on the train. One should be able to save £1 this way.

In conclusion, I will mention a tip in regard to the carrying and treatment of the linen route cards. These should be first coated with ordinary size and afterwards carefully coated with ordinary paper varnish (I believe this is a spirit varnish, since it dries quickly); this will protect it in case of wet. I have my last year's route cards now, and they are as good as new, the directions, schedule time, etc., thereon being quite legible, despite exposure to rain.

Regarding carrying the route cards, I have always used a pair of spring steel clips as used in paper shops, etc., for show purposes. I have improved on these clips, and Messrs. Terry and Sons, of Redditch, have been good enough to make me some of these improved clips, which I shall be pleased to sell to any readers at 1s. each. They clip on the handle-bar, and the sliding clips on the vertical piece serve to hold the route cards secure. I have, of course, seen much more elaborate holders, especially on machines entered for the Motor Cycling Club Challenge Cup, but for the ordinary medal hunter these clips are really good enough. S. G. Frost, I remember, has his route and time-table made out on a strip attached to a roller, these being enclosed in a box with a transparent top, an electric light completing the outfit. No doubt his ingenuity in making this elaborate accessory helped him to win the cup in 1908.

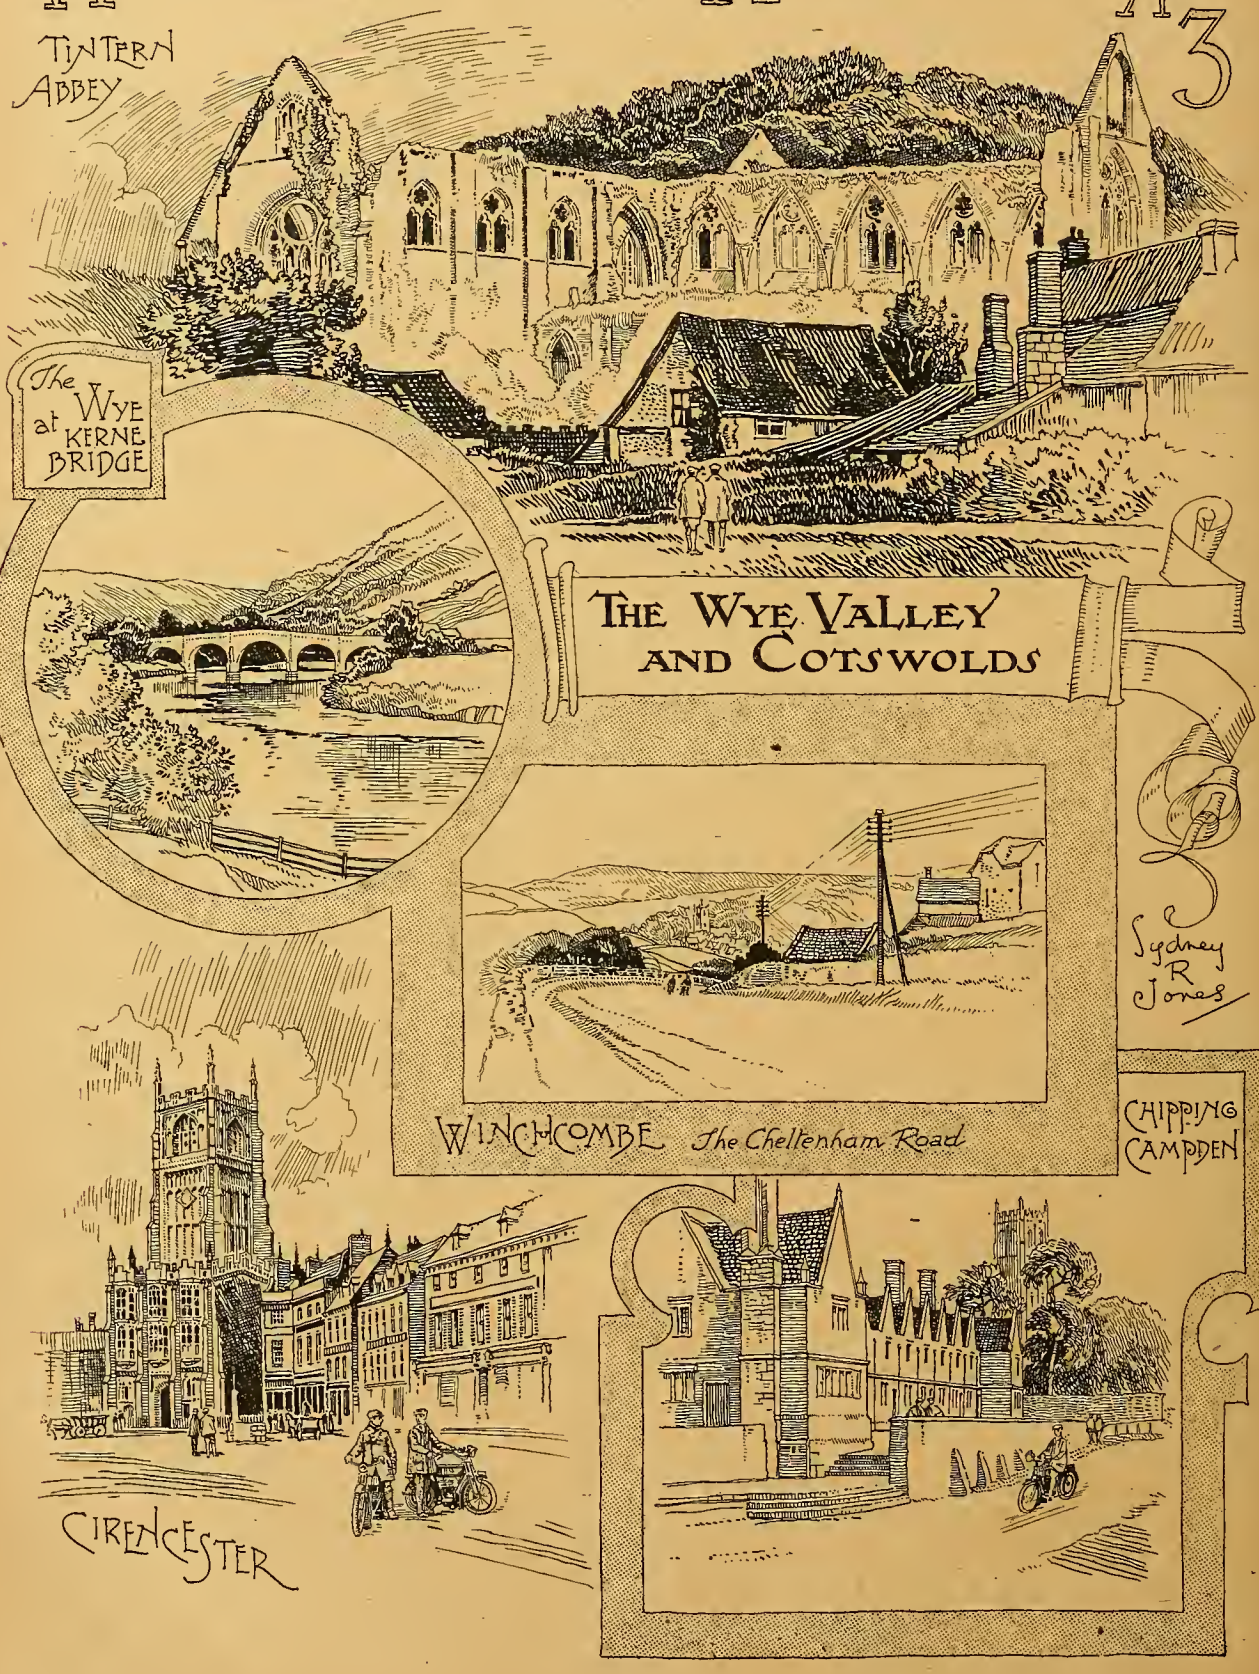
HARRY G. BELL.

Ye Olde Gate House, Highgate, the scene of the start at 10 p.m. on Friday, May 13th.

Speeding along the excellent surface of the Great North Road.

Not a street accident, merely competitors in a M.C.C. long distance trial being checked by a timekeeper.

WHERE TO GO AT WHITSUNTIDE. No. 3



THE SECOND QUARTERLY TRIAL OF 1910.

YESTERDAY (Wednesday) the second Quarterly Trial of 1910 was to take place over the usual course. Below will be found the list of competitors :

BICYCLE AND TRICYCLE CLASS.

Rider and machine.	No. of Cyls.	Bore	Stroke
Miss L. Berend (2 Moto-Rêve)	2	52	70
W. Cooper (3½ Bradbury)	1	87	87
W. Pratt (3½ P. and M.)	1	82	88
E. A. Colliver (2½ P. and M.)	1	66	76
H. Robert (3½ P. and M.)	1	82	88
F. Smith (5-7 Clyno)	2	76	82
E. D. Dickson (7 Indian)	2	82.5	93
E. H. Lees (5 Indian)	2	70	83
B. Allan Hill (3½ Kerry-Abingdon) ...	1	84	86
C. K. Wigram (5 Rex)	2	76	79
J. G. F. Firth (3½ P. and M.)	1	82	85
W. A. Lockwood (3½ P. and M.)	1	82	88
F. Philipp (3½ Scott)	2	66.66	63.5
Reg. Samson (3½ Reg. Samson)	1	85	88
G. L. Fletcher (2¾ Douglas)	2	60	60
P. M. Pridmore (3½ Triumph)	1	84	86
F. H. Stevenson (3½ Triumph)	1	84	86
P. Phillips (2¾ Douglas)	2	60	60
C. J. Fox (7-8 Bat)	2	85	85
G. T. Gray (3 N.S.U.)	1	80	80
C. J. Janssen (2¾ Moto-Rêve)	2	50	85
A. C. Robbins (3½ Humber, two-speed) ...	1	83	90
H. A. Cooper (2¾ h.p. Douglas)	2	60	60
A. V. Deacock (3 h.p. Wanderer)	2	60	70
F. A. James (1½ h.p. Omega)	1	65	65
H. S. James (1½ h.p. Omega)	1	65	65

MOTOR CYCLE RACES AT BROOKLANDS.

ENTRIES FOR NEXT WEDNESDAY'S MEETING.

THERE will only be racing on Wednesday at the B.A.R.C. meeting, and not on Thursday also, as was anticipated. The first event is the April Motor Cycle Handicap, for which thirty-six entries have been received. The Weybridge Handicap, timed to start at 3 p.m., has attracted twenty-two entries. Below we give the complete lists :

2-0 p.m.—The April Motor Cycle Handicap.

Limit capacity, 670 c.c. Distance, about eight miles.

SPECIAL FEATURES.

THREE NEW MODEL

COST OF COMPETING IN THE LONDON-EDINBURGH RUN.

TENTH ANNIVERSARY OF THE THOUSAND MILES TRIAL (Illustrated).

M.C.C. Inter-team Trial.

Mr. J. W. G. Brooker has been appointed judge to represent the A.C.U. at this competition.

Lighting a Dangerous Gate.

The A.C.U. has decided to share with the Sussex Centre of the N.C.U. the cost of placing and maintaining a lamp on a dangerous gate at Jacob's Post, Wiversfield.

A Paper before the A.C.U.

On the 27th April, at 8.30 p.m., Mr. I. B. Hart Davies will read a paper illustrated by lantern slides, before members of the Auto Cycle Union, at 112, Piccadilly, entitled "My Experiences from End to End." All motor cyclists interested will be welcome.

Chains for Power Transmission.

Mr. Alec S. Hill, a member of the Institution of Automobile Engineers, read a paper entitled "Chains for Power Transmission" before members of the I.A.E. on the 13th inst., at Storey's Gate, St. James's Park, S.W.

The paper dealt, as far as motors are concerned, with the transmission of power by chains on motor cars, but a shock-absorbing spring wheel similar to the one which was fitted to Singer chain-driven motor bicycles a few years ago was mentioned. Near the close of the lecture, Mr. Hill, suggested that "there is a future for a chain-driven motor bicycle by using a light form of inverted tooth type of chain in connection with a shock-absorbing or spring wheel, resulting in a more efficient transmission of power than could be obtained by the present method of belt transmission." The lecturer apparently overlooked the fact that there are three well-known makes of chain-driven motor bicycles on the market, and although the belt drive is the more popular form of transmission, the chain drive on the Indian, Phelon and Moore, and Scott motor cycles gives every satisfaction.

With regard to the use of the inverted tooth type of chain, this was used with good results on the Century and Eagle tandem tricycles about seven or eight years ago, and doubtless a light form of silent pitchless chain could be used on motor bicycles with advantage.

Chester Historical Pageant.

At Eaton Drive, Chester, a historical pageant is to be held daily at 2.45 p.m. from Monday, July 18th, to Saturday, July 23rd. There will be 3,000 performers.

Affiliations to the Governing Body.

The Keighley and District A.C.C. and the motor cycle section of the Bath Cycling Club have decided to affiliate to the A.C.U. Application has also been received from the Aspatria College M.C.C. (Cumberland), which will be accepted subject to the club's rules being in order.

James R. Kelly, a well-known leader in northern motor cycle circles. His new mount is a long-stroke 2½ h.p. Moto-Reve, 50×85 mm. Last year Mr. Kelly had a 2 h.p. of the same make and a 7-9 h.p. Minerva, but has now forsaken the latter for a car which he employs chiefly for business purposes, using the Moto-Reve for pleasure.

LAMP LIGHTING TIMES.
(GREENWICH.)

April	21	..	..	8.5 p.m.
,,	23	..	..	8.8 ,,
,,	25	..	..	8.11 ,,
,,	27	..	..	8.14 ,,

Police Traps.

We have received information of a police trap a furlong in extent in Foxley Lane, Purley, on the down grade from Woodmansterne to the Brighton Road. The measured distance is just before the junction formed by Plough Lane and Foxley Lane is reached.

There is a police trap working in Hyde Street, Winchester, a continuation of the main road to Basingstoke.

Tar Spraying Operations.

The Preston - Liverpool - Southport Road is being tar sprayed between Penwortham Bridge and Longton. Half of the road is at present in this condition, and a number of small loose stones are scattered about, but one can easily ride through with a little care.

Checking Road Dangers at Night.

A Stockton contractor was fined 15s. at Middlesbrough Police Court on Friday for not having a light at night to warn passengers that the road in Cumberland Road, Middlesbrough, was being excavated. It was stated the excavation was two feet deep, but defendant said it was only six inches, and he did not think a light was necessary.

The Team Trial on June 18th.

The trials hon. sec. of the M.C.C. Competition advises us that further promises of entries have been received from the undermentioned clubs:

Southern Motor Club.
Harrogate and District M.C.C.
Great Yarmouth and District M.C.C.
Hertfordshire County A.C.C (Motor Cycle Section).
North West London M.C.C.
Essex M.C.

The above, together with the Motor Cycling Club (holders), Coventry and Warwickshire M.C., Bristol Bicycle and Motor Club, Streatham and District M.C., Sutton Coldfield A.C., and Edinburgh M.C.C., brings the total number of teams to twelve.

Racing at Tunbridge Wells.

A permit has been granted to the Tunbridge Wells Whit-Monday Sports Committee to hold the following motor cycle races: Three miles handicap, five miles handicap, and three miles scratch.

A Novel Defence.

A motor cyclist who was recently summoned for exceeding the speed limit put forward the novel defence that the inch-long ash of his cigar was unbroken at the moment at which he was stopped. This circumstantial evidence secured his acquittal.

Pacing Motor Cycles Not in Favour.

The pacing motor cycles recently furnished by the management of the Winter Track in Paris for the respective pacemakers of the various riders engaged have not proved a success. The idea was that all the competitors should be equally served as regards pace, but neither the public, pacemakers, nor riders relished the idea, so the paced events fell flat.

A Grumble.

W. Douglas Hawkes writes: "I, like many others at the last Brooklands meeting, was very much annoyed at not being able to get a programme, because I turned up after the first race. If this sort of thing continues, it is likely to keep many people away, as those who do not know the riders well by sight have no chance of following the races." No doubt the matter will have attention after this.

New Patterns with Old Names.

This issue contains the first illustrated description of two new model motor cycles to be built by the Centaur Cycle Co., Ltd. It is refreshing to us to see so many firms returning to the manufacture of motor cycles. Within the last year or two Humbers, Ltd., recommenced the manufacture of power-propelled bicycles, next followed the Excelsior, Singer, and Bradbury, then the Royal Enfield, and now the Centaur Co.

Entries for the T.T. Race.

The following additional entries have been received for the International T.T. Race on May 26th: The Rex Motor Manufacturing Co., Ltd., one machine, bringing this firm's number up to four; Humber, Ltd., three machines; J. Baxter, Rex; C. E. Murphy, one machine; H. H. Bowen, Bat-J.A.P.; F. Mackay, Rex; W. E. Grange, 3½ h.p. Rex; and F. Geddes, one machine. The total number of entries has now reached fifty; last year's total was fifty-eight. Entries close Saturday week, April 30th.

Reduce Speed in Towns and Villages.

Motor cyclists should be careful as to the speed at which they pass through Water Orton and Coleshill, Warwickshire, particularly on Coleshill Hill. It is said that a plain clothes officer at Stonebridge overheard a party of motor cyclists wagering as to the speed at which they could ascend the hill at Coleshill. The result is that a constable has been stationed at the points named, and registration numbers of passing motors are being noted.

Brooklands Meeting Next Wednesday.

The next Brooklands meeting is on Wednesday, the 27th inst. Originally this was intended by the B.A.R.C. to be a two days' affair, but, owing to the insufficiency of entries (apparently not in the motor cycle classes, judging by the long list), there will only be racing on one day.

FUTURE EVENTS.

April 27—Brooklands A.R.C. Meeting.
" 30—M.C.C. Members' Hill-climb.
May 4—B M.C.R.C. Meeting at Brooklands.
" 4—Herts. County A.C. (motor cycle section) Open Hill-climb.
" 13, 14, and 16 (Whitsun)—M.C.C. London-Edinburgh and London-Edinburgh and Back Runs.
" 26 (Thurs.)—INTERNATIONAL MOTOR CYCLE T.T. RACE
" 27—Open Hill-climb in the Isle of Man.
June 4—Motor Cycling Club second private race meeting & gymkhana at Brooklands.
" 6-11—Scottish Six Days' Open Reliability Trial, organised by Edinburgh M.C.C.
" 18—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CHALLENGE CUP. Competing Teams: Motor Cycling Club (holders), Coventry and Warwickshire M.C., Bristol B. and M.C., Streatham and District M.C., Sutton Coldfield A.C., Edinburgh M.C.C., Southern M.C., Harrogate and District M.C.C., Great Yarmouth and District M.C.C., Herts. County A.C., Essex M.C., and N.W. London M.C.C.

Sunday Competitions Again.

Owing to the action of a certain motor cycle club in holding a hill-climbing test on Rectory Hill, Amersham, during church service hours, the police are taking an unpleasant active interest in motor cyclists who make trial runs up the hill on the one day of the week set aside as a day of rest. The Amersham police have always taken a most kindly view of the Quarterly Trials, which are carefully carried out by the A.C.U. in a proper and orderly manner. It would be a pity if the inconsiderate action of a few were to bring discredit on this useful and popular competition.

Addresses Wanted.

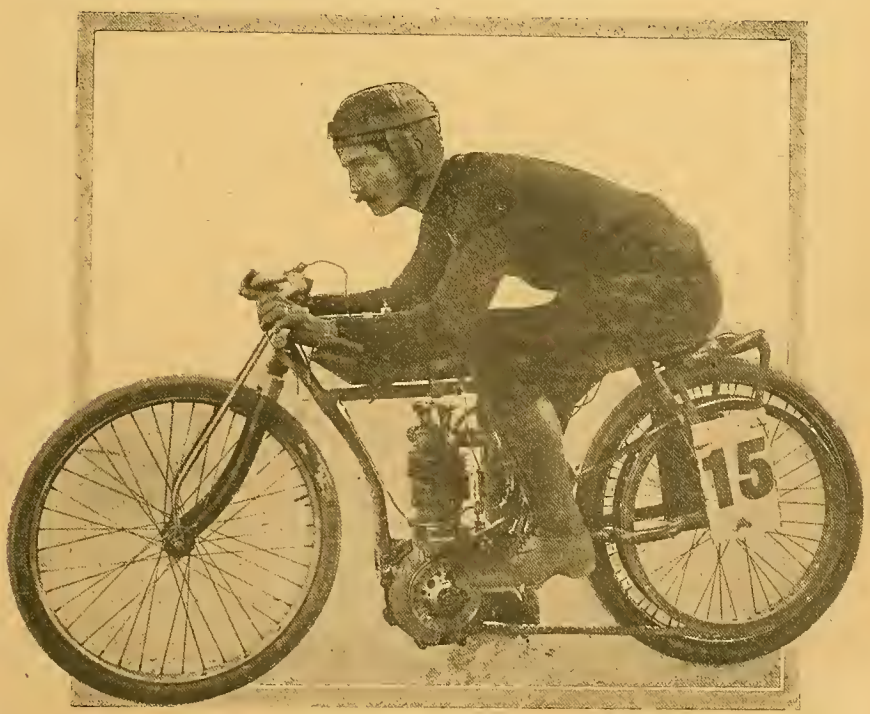
The Wolf Engineering Co., Wolverhampton, have recently received enquiries from E. W. Clegg, R. S. Goodwin, T. P. Smith, and R. McDonald, which they are unable to reply to, as the addresses in each case were omitted.

The B.M.C.R.C. Programme.

Apart from containing a list of the entries for last week's race meeting, the B.M.C.R.C. programme, to which we refer in our report of the event, contains such useful information as a distance table, a speed table giving the lap times in seconds and the equivalent miles an hour, and a table of best previous motor cycle performances on Brooklands track. Copies may be had on sending three penny stamps to the secretary of the B.M.C.R.C., Ashleigh House, Erith, Kent.

The Bournemouth Centenary Fetes

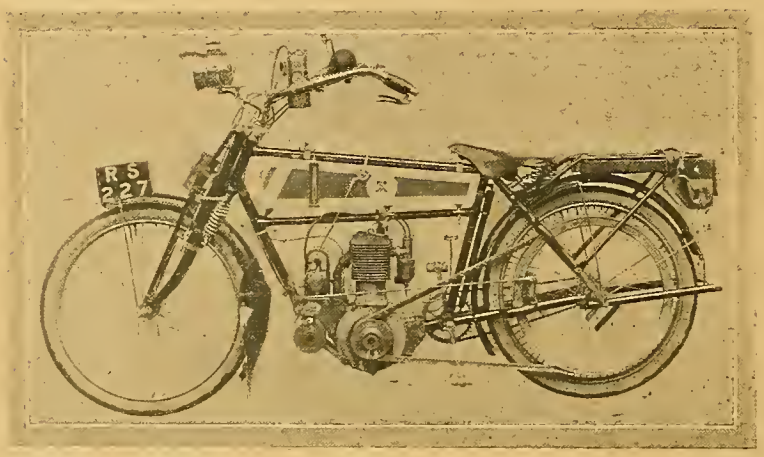
In view of the large number who intend to visit Bournemouth during July next for the aviation meeting and the Centenary fêtes, the Motor Union is making special arrangements on behalf of its members. Hotel accommodation has been secured at the Hotel Metropole, and this will form the Motor Union's headquarters throughout the entire fortnight. A special enclosure has also been reserved for Motor Unionists, with reduced charges for admission to the meeting.



Harry Martin, who established a world's record at Brooklands on Wednesday last week, by covering a mile in 61·46 secs. = 58·5 m.p.h. He used the 85×60 mm. overhead valve J.A.P. engine shown. An A.S.L. air spring fork was fitted in place of the rigid one in the photograph.

NEW MACHINES IN THE QUARTERLY TRIALS.

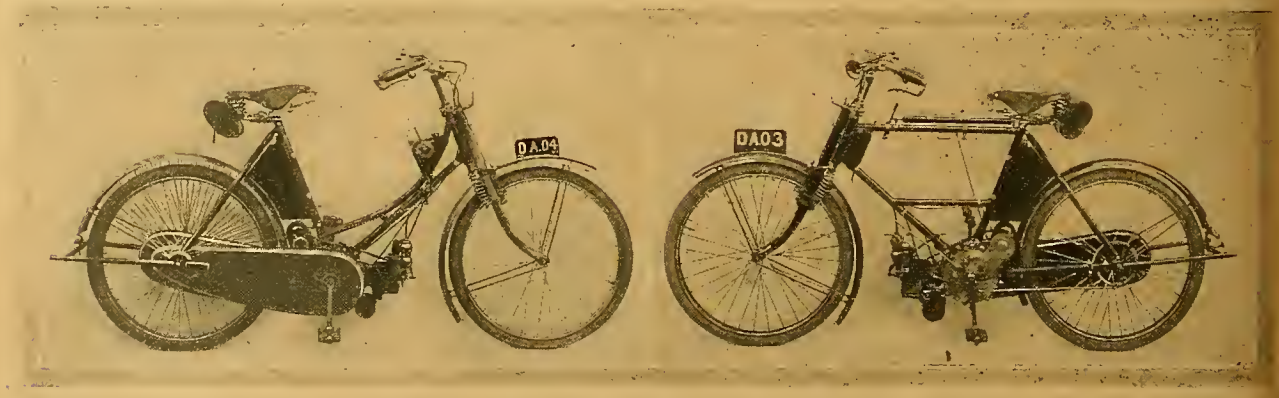
A NEW model which was entered for the Quarterly Trials is the 3½ h.p. Reg. Samson motor bicycle. This has a specially designed frame with sloping top rail to give a low position, the distance from the ground to top of saddle being 32in. The engine is a 3½ h.p. Precision, 85 mm. bore by 88 mm. stroke, with ball bearing crankshaft. The magneto is a Simms, and the carburetter either a B. and B. or Amac to order. The whole of the power unit —engine, carburetter, magneto, etc.—can be entirely removed from the frame by detaching three bolts. Mr. Samson has introduced several registered features of his own design on this machine, among which is a box on the front mudguard combining a front number plate and carrier for a spare detachable tube. The magneto driving chain is adjusted by means of four bolts in the sides of the engine plates. These bolts pass through a sliding magneto platform, and obviate any necessity to insert a spanner underneath the magneto. The pedal for the rear brake is carried on a separate stud, and not on the footrest. The filler cap of the petrol tank is exceptionally large, and is provided with a large gauze filter. All the lugs on the frame, to which are attached the stand, carrier, and foot brake, are brazed, not bolted. The cables for the front brake and valve lifter are concealed in the handle-bar, and issue from the centre of the handle-bar clip. The machines can be supplied exactly as illustrated, with full kit of tools, belt carrier, tool bag carrying tail numbers, etc. It will be noticed that the Druid spring fork is fitted, also the Lyso belt and 2¼in. Clincher rubber studded tyres. Mr. Reginald Samson, Ladywood Road, Birmingham, who is responsible for the design of this machine, also makes a speciality of several motor cycle accessories, which we hope to deal with at a later date. Most of the improvements which have been embodied in the machine are the result of practical riding experience.



A new model which was entered for the Quarterly Trials. It is named by its maker the Reg. Samson, and its principal features are described in the accompanying letterpress.

The Omega Lightweight.

A few days ago one of the partners of the Omega Motor Cycle Co., Wolverhampton, Mr. H. Summerhill James, kindly lent us an Omega motor bicycle for a short ride. Two of these machines were entered for the Quarterly Trials on Wednesday. For the benefit of those of our readers who did not see this machine at the last Stanley Show or the illustration and description of it which appeared in our show report, we would point out that the machine closely resembles a pedal bicycle, the crank case of the engine occupying the usual position of the bottom bracket. Through the centre of the hollow engine crankshaft is fitted an axle on which are cranks and pedals for starting and assisting the machine up steep hills. The reduction in gear is effected by means of an epicyclic train, the drive from the motor to the rear wheel being by chain, which is enclosed in a metal case. There is also a friction clutch contained in the crank case, which is operated by means of a lever on the handle-bar. The cylinder is horizontal, the carburetter is in front of the cylinder, and the magneto, which is gear driven, is mounted on the crank case casting. The petrol tank is behind the seat tube, and the oil tank and pump behind the steering socket tube. Two brakes are fitted, one a front rim brake, the other a back-pedalling band brake.



Omega lady's and Gentleman's model lightweights. The engine is horizontal, and the transmission is by gear and chain.

New Machines in the Quarterly Trials.—

When we took the machine over we were instructed to disengage the clutch, mount, and pedal the machine, which was quite easy, owing to its light weight. Once under way, the exhaust valve was lifted, the clutch engaged by means of the lever on the handle-bar, and on dropping the valve the engine fired immediately. The trial embraced about twenty miles of undulating roads, on which the machine behaved very well indeed, considering the power of the engine, which is only 1½ h.p., the bore being 65 mm. and the stroke 65 mm. For free-wheeling down long slopes the clutch is a great advantage, also for starting and wheeling the machine about. For riders weighing ten to eleven stones this machine should prove very serviceable. With a weight of over thirteen stones in the saddle we found it jibbed at one rather severe hill with a gradient of 1 in 9, but this was with the standard gear of 6 to 1. The makers are now trying a slightly lower gear for heavy-weight riders, which will doubtless enable the Omega to climb practically any main road hill in the kingdom unaided in the case of lightweight riders and with slight pedal assistance from others. The machine we tried was excellently finished, and reflects credit on those who are responsible for its production.

INTER-TEAM RELIABILITY TRIAL.

We have received the following communication respecting the inter-team reliability trial from London to Harrogate and back for the Service Cup at Easter. The results as published on page 326a of *The Motor Cycle* last week were supplied by C. C. Cooke, the hon. sec. of the Herts County A.C. (motor cycle section). "In your issue of Thursday, 14th, you published the 'official' result of the competition between this club and the Herts County M.C.C. I beg to inform you that the committee of this club does not agree with the results as published, because it claims that as the contest was arranged by a joint sub-committee of the two clubs, no result ought to have been issued until passed by this joint committee. Further, this club does not admit that the figures, as published, show the correct result. I shall feel obliged if you will kindly insert this notice in your valuable paper.—(Signed) CLIFFORD A. STERN, hon. sec. North West London M.C.C."

The following awards have been made by the North-west London M.C.C. in connection with the above run: Silver cups—R. G. Goslett, A. J. Brown, Glyn Rowden, H. C. Bean, George E. Purchase, G. Hollis, W. C. Davenport, C. Simpson, and E. G. Westacott.

GREAT YARMOUTH AND DISTRICT M.C.C. HILL-CLIMB.

The above club held a most successful hill-climb test at Ringland, near Norwich, last Thursday. The president, Dr. H. R. Mayo, superintended the proceedings, and Mr. R. H. Williams acted as starter, and was in charge of the electrical timing apparatus, which he designed and carried out. The club is greatly indebted to him, as upon this apparatus depended the success of the event. It is intended to use the same timing arrangement at Gunton Park later in the year, when Colonel the Hon. A. C. Harbord has kindly consented to the club holding a race meeting there.

The length of the hill is one-fifth of a mile, the total rise 105.6 feet, the steepest part being 1 in 6.9 feet. A standing start had to be made on a gradient of 1 in 13½. Notwithstanding this, everyone got away well, and only two failed to finish. The fastest time of the day was made by F. C. North on a 3½ h.p. Ariel, R. O. Clark making second fastest time on his 1909 C.F.N. Tourist Trophy mount.

Halfway up the hill the scene was a very busy and animated one, as each machine and rider had to be weighed for the purpose of working out the formula as laid down by Professor Callender, as the events were run on a handicap.

RESULT OF CLASS A HANDICAP (single-geared machines).

Place.	Rider and machine.	Remarks.
1.	R. O. Clark (1¾ F.N.)	Pedalled.
2.	H. Boswell (1¾ F.N.)	Pedalled.
3.	A. Adcock (4½ F.N.)	
4.	H. Adcock (5-6 F.N.)	
5.	C. F. North (3½ Ariel)	Fastest time.
6.	G. H. Cross (2¾ Anglian)	
7.	R. O. Clark (4 C.F.N.)	
8.	C. B. Duberly (3½ Ariel)	
9.	L. Wilford (3½ Premier)	
10.	H. Lock (3½ Triumph)	
	T. W. Hancock (4½ F.N.) ...	Failed.
	R. A. Milligan (4½ F.N.) ...	Failed.

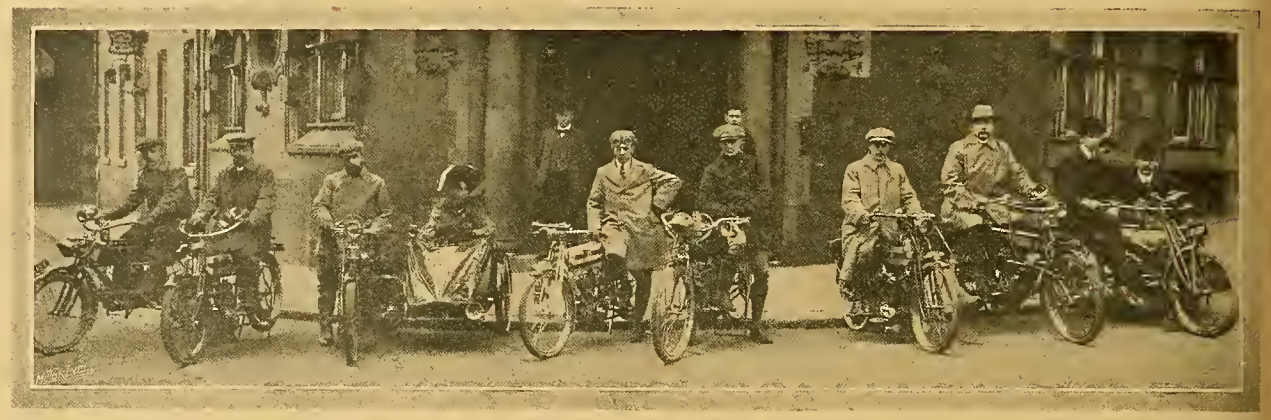
CLASS B (two-speed gear and clutch)

1.	R. O. Clark (2¼ F.N.)	Pedalled.
2.	H. Master (2¼ F.N.)	Pedalled.
3.	C. B. Duberly (3½ Ariel) ...	Fastest time.
4.	F. C. North (3½ Ariel)	
5.	V. H. Blake (2¾ Anglian)	
6.	H. Collins (5 Roc)	

The electrical timing apparatus at the start. C. B. Duberly (3½ h.p. Ariel), who made fastest time in Class B, is seen on the starting line.

The finishing point, showing R. O. Clark (1¾ h.p. F.N.), winner of the handicap in Class A, crossing the tape.

CLUB NEWS.



Riders who attended the opening run of the Stockport and District Motor Cycle Club. Multi-cylinders are very popular with members of this club.

Essex M.C.

There is a club run to Southend on the 24th inst., luncheon at the Marlborough Hotel at 1.30 p.m.

North-west London M.C.C.

Any members who are not competing, but who would act as marshals or checkers, at the Petrol Consumption Trial next Saturday, are requested to communicate with the trial hon. sec., G. H. Hollis.

Hertfordshire County A.C.

A splendid list of entries has been secured for the members' hill-climb on Saturday next at Aston Hill, near Tring. The entries in five classes total forty-five, viz., four in Class I., nine in Class II., nine in Class III., eight in Class IV., and fifteen in Class V. The classes are detailed on the next page. The open hill-climb is on May 7th.

Walthamstow M.C.

The above club held its first competition of 1910 on the 10th inst. It was the first of a series of four trials for W. S. Low cup. Result of first trial :

	Marks lost.
A. G. Peppercorn (3½ h.p. Triumph	0
A. T. Stanton (3½ h.p. Bradbury)	0
J. W. Percival (6-7 h.p. Fafnir Royal Tricar) ...	0
A. A. Blunks (3½ h.p. Rex)	1
J. H. Kerr (5 h.p. Rex)	5
H. J. Beal (3½ h.p. Rex)	45

Next Saturday a members' hill-climb will be held.

Newcastle and District M.C.

A slow hill-climb was held on the Benton Bank, Newcastle, last Saturday afternoon. The event, unfortunately, took place in a heavy downpour of rain, which considerably marred the success of the competition. The results were :

Single-cylinders.—R. S. Ellis (3½ h.p. Rex), 1m. 8⅘s., winner ; D. Mallett (3½ h.p. Bradbury), 59s. ; C. Spencer (3½ h.p. Bercley), 43⅕s. ; S. Hudson (3½ h.p. Premier), 30s. ; F. Keir (3 h.p. Dene) pedalled and was disqualified ; E. L. Bates (3¾ h.p. N.S.U.) did not finish.

Twin-cylinders.—F. Holzaphel (5 h.p. Rex), 49⅗s., winner ; F. Mallett (6 h.p. N.S.U.), 43⅘s. ; R. S. Ellis (5 h.p. two-stroke Rex) did not finish.

Birmingham M.C.C.

The Trials Committee met on the 15th inst. to make final arrangements for the hill-climb on Saturday next. Full particulars will be issued to all members to-day (Thursday). The reason for not disclosing the name of the hill until the day of the climb is, in the first place, to avoid trouble with the police, and, secondly, to give all members an equal chance. There will be three classes, for light-weights, singles, and twins respectively.

The run to Warmington on Saturday, the 30th, will not count for the attendance prize, as several of the members have expressed their desire to join in the Coventry and Warwickshire M.C. Military Reconnaissance. The meeting place is the Barrack Square, Coventry, at 11.30 a.m.

The A.C.U. (Midland Centre).

The annual meeting of the above Centre was held at headquarters on Thursday evening last, when the following officers were elected : Chairman, R. Vernon C. Brook ; hon. secretary and treasurer, H. C. Pickering ; hon. auditors, E. W. Winckle and Howard Smith. The accounts for the past year were examined and the balance, amounting to 17s. 7½d., was carried forward.

Worcestershire M.C.C.

At a general meeting held at the Hop Market, Worcester, on Saturday evening, the 16th inst., G. R. A. Deacon, "Bronsil," Hill Avenue, Worcester, was elected as joint hon. secretary of the above club. An assistant secretary will be appointed later.

Twelve new members were enrolled and a committee formed, which will meet shortly to arrange fixtures.

Streatham and District M.C.C.

A members' hill-climb was held on Tilburstow Hill, Godstone, Surrey, on Saturday last. The weather was showery, but the road surface was good. Machines were weighed at Caterham railway station. The results on A.C.U. formula are as follows :

CLASS I. (Engines under 500 c.c.)

Place	Competitor and machine.	Figure of merit.
1.	A. R. Hunter (3½ h.p. Triumph) ...	.01141
2.	H. Hunter (3½ h.p. Triumph)	.01139
3.	G. F. Hunter (3½ h.p. Triumph)... ...	.01120
4.	R. G. Mundy (3½ h.p. Triumph) ...	.01056
5.	S. H. Pattison (3½ h.p. Triumph) ...	.01054
6.	G. D. Nelson (3½ h.p. Chater-J.A.P.) ...	.01031
7.	J. H. Jeffrey (3½ h.p. Zenith Tricycle)	.00921
8.	C. J. Feeny (3½ h.p. Triumph)	.00903
9.	J. W. Ayres (3½ h.p. Zenith)	.00703
10.	R. G. Nye (3½ h.p. Rex)	.00677
11.	L. G. Callingham (3 h.p. Ariel)... ...	.00640

CLASS II. (Engines over 500 c.c.)

1.	W. Cooper (3½ h.p. Bradbury)	.01098
2.	H. A. Johnson (5 h.p. Vindec)	.01038
3.	C. E. Davies (5 h.p. Rex)	.00851
4.	D. R. Greig (3½ h.p. Bradbury)... ...	.00846
5.	D. Pattison (5 h.p. Patna)	.00749
6.	F. Harvey (5½ h.p. N.S.U.)	.00679

CLASS III. (Passenger machines.)

1.	H. P. White (3½ h.p. P. and M. and sidecar)	.01182

The fastest time of the day was made by H. Hunter, the next fastest being A. R. Hunter and G. F. Hunter.

RESULTS OF SEALED HANDICAP.

1. H. A. Johnson (V.S.), rec. 24 secs.
2. A. R. Hunter (Triumph), rec. 18 secs.
3. D. R. Greig (Bradbury), rec. 29 secs.

Club News.—

Wansbeck M.C.

The above club opened the competition season with two hill-climbs, fast and slow, held at Welden Bridge Hill. The attendance was good. The gears of competitors' machines were limited between 4 and 6 to 1, each rider to enter both trials and to use the same gear in both. The fast climb results were: T. W. Hall (3½ h.p. Bradbury), 1m. 14s.; H. Howitt (Rex twin Speed King), 1m. 14½s.; J. Arkle (3½ h.p. L.M.C.), 1m. 35½s. The slow speed was won by J. Arkle (3½ h.p. L.M.C.), the only competitor to complete the climb. The members were afterwards entertained to tea by their president, Mr. J. J. Hall.

Southport M.C.C.

The above newly-formed club held its opening run to Ribchester. A somewhat longer run had been arranged, but owing to the limited time before darkness the original route was slightly curtailed. Although the roads were very dusty, a most enjoyable afternoon was spent.

Competitors in the slow and fast hill-climb organised by the Wansbeck M.C. at Weldon Bridge Hill.

Doncaster and District M.C.C.

The first run of the newly-formed Doncaster and District M.C.C. was to Swinderby (Lincs.), when nineteen members turned out. The membership is now twenty-seven. The home journey was *vid* Lincoln and Gainsborough. Mr. G. F. Stafford having resigned the secretaryship, Mr. R. Ebdell, of Rowenroyd, Queen's Road, Doncaster, has been elected in his stead.

North West London M.C.C.

The first club competition, a petrol consumption trial, will be held on Saturday next, over the usual course near Stanmore. May 7th is the date fixed for the Coventry and back twelve hours' ride. This run is usually the best supported competition of the year. As members are started in order of entry, it is advisable to enter as early as possible. The marks will be awarded on a slightly different basis from last year.

Hertfordshire County A.C.

A members' hill-climbing competition will be held on Aston Hill, near Tring, on Saturday next, at 3 p.m. There will be five classes open to motor cyclists, which will be as follows: Class I.—For bicycles manufactured in 1907 or previous years. Open only to members who have not previously won a prize in a hill-climbing competition; pedalling allowed. Class II.—For single-cylinder machines with fixed gears. Class III.—For multi-cylinder machines with fixed gears. Class IV.—For machines fitted with variable gears. Class V.—For any make of motor bicycle. Fastest time to win. Classes I. to IV. will be decided on A.C.U. formula. The machines must be presented for weighing at Boxmoor L. and N.W.R. Station between noon and 2 p.m. on Saturday. Number cards will be supplied at the weighbridge, and will be allotted in order of entry. Competitors will take up their proper positions at the bottom and top of the hill, and must remain in their places. No vehicle which has finished the ascent of the hill may return to the starting point without special permission.

The newly-formed Doncaster and District Motor Cycle Club's opening run was well attended.

Coventry and Warwickshire M.C.

The general idea of the military reconnaissance which will be held by the above club on April 30th is that Southland (red), having declared war on Midland (blue), crosses the latter's frontier, and on April 30th reaches a line with its divisions based on Oxford. Three Midland divisions mobilised at Coventry are facing the Southland army when information is received that a second red army is occupying Bedford and is advancing on Northampton. The duty of the defending force will be to reconnoitre all roads leading between the two armies, to forward the information gained to the army headquarters at Coventry. Despatch riders on motor cycles will be attached to the defending forces as well as motor cyclist scouts, who will ride in advance of the cars. Several motor cyclists will be wanted for each car, and members of clubs within a twenty-five mile radius of Coventry are invited to join in the run. Communications should be sent to E. W. Walford, hon. secretary, 19, Hertford Street, Coventry.

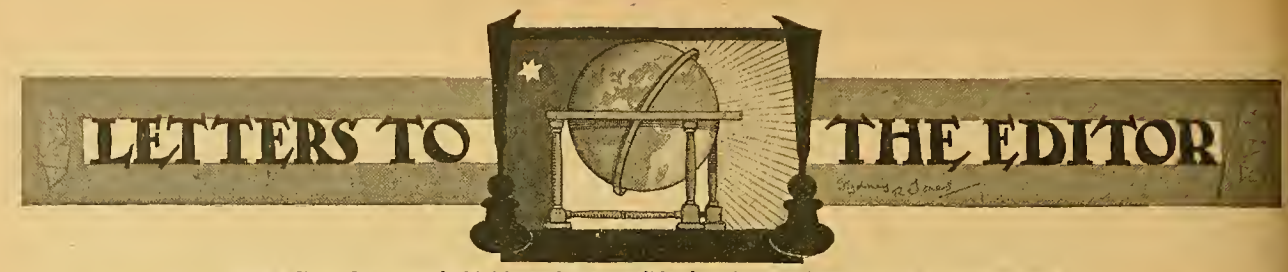
York County M.C.C.

At a recent meeting the arrangements for the Leeds-Edinburgh and back reliability trial, which is arranged for July 16th and 17th, were discussed.

There was a proposition put forward that this should be made into a 36 hours instead of 24 hours run, thus giving 12 hours at Edinburgh, during which time all machines would be locked up. This would do away with all-night riding. A vote on the subject was found to be even, the chairman giving the casting vote in favour of 24 hours.

Middlesbrough and District M.C.C.

The committee has decided to postpone the hill-climb until the 30th inst. There will be three classes—(1) open to novices who have not won a prize in any hill-climb. Entry fee to club members 1s., non-members 2s. A.C.U. formula. (2.) Single-cylinders and twin-cylinders confined to members only. Entry fee 1s. If six competitors in each event three prizes each, if four two prizes, three competitors one prize. Several novelties are included in the summer programme, viz., paper-chase, scout race, and flexibility hill-climb. It was decided that the club should do all that lay in its power to further the interests of the Northern League of Motor Cycle Clubs, and to attend the conference in this connection which is to be held at York. The results of the recent team trial run to Richmond in connection with the Middlesbrough and District Motor Cycling Club has just been announced, and the winning team is declared as follows: E. Young (3½ h.p. Bradbury), R. W. Day (3½ h.p. Triumph), and J. H. Dale (3½ h.p. Triumph). The prize, according to the rules of the competition, was to have been awarded to the team which did the journey at a speed nearest to twenty miles an hour. The winners put up a good performance, being only one minute out. The second team, which was two minutes out, consisted of R. Richardson (Moto-Rêve), H. Fangrieve (3½ h.p. Triumph), and W. Turner (3½ h.p. Triumph).



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Tyre Gaiters.

[4711.]—With reference to "Ixion's" remarks in a recent issue I for one would like to know where a tyre gaiter, for, say, 2¼in. tyres, can be procured. I mean the variety which encircles the tyre completely and fixes by lacing, either through eyelets or by hooks. Such would no doubt be a great boon, but up to the present I have not been able to discover any firm supplying such an article, although they are sold for car tyres. I often think how useless it is recommending articles without knowing for certain that they can be procured. Many things advised are very good, but, if they cannot be procured, what is the use of suggesting them? Writers who make these kindly suggestions would greatly oblige by intimating where the articles can be procured, and then all would be well.

W. CLARIDGE.

Motor Cycle Tyres.

[4712.]—Mr. J. F. Briggs [No. 4680] airs his grievances on motor cycle tyres. As one who has had a little experience with such queer things, I should like to advise him to use the Dunlop security bolts, which are fitted with neat rubber seats and tops, and do not chafe the tube. If he adopts them he should have no trouble.

What kind of rim is he using? I suppose the same as fitted to his 1909 P. and M.—beaded edge. Then, surely, he must have a beaded edge cover on it. If he gets such spoke-head punctures as he says he does, I can only say that he does not know how to fit tyres. Does he, by the way, use chalk when fitting a tube? And why does he want to kink it? Then he says that the Michelin tube appears to be too long. No, it is not! It is made purposely longer than other tubes to prevent it stretching unduly, which would enable it more easily to puncture.

If Mr. Briggs is a rider of over twelve stone I strongly advise him to go in for a R.O.M. 2½in. cover, so long as he rides the 3½ P. and M., for it is a heavy machine. The cost of altering his rim would only cost about 6s. at any decent cycle maker's. He will then he able to ride in peace for miles, and miles, and miles.

I have no interest in either of the articles mentioned.

L. C. CUFFE.

The Motor Cycle in the United States.

[4713.]—I have only just seen the article by "Transatlantic" in the issue of January 3rd on the American motor cycle. "Transatlantic" is correct in some respects.

As regards the loop frame construction, I fail to agree with him on that point, as there can be nothing that can embody a stronger construction than a one-piece tubing in loop form.

Referring to the exhaust pipes being long and twisted, the reason for this is that we Americans attach a great deal of importance to general appearance, so that the silencer is placed out of sight, thus necessitating long exhaust pipes.

As regards enamel, I think that some machines are gaudy, but usually it is the purchaser who specifies a certain colour among optional colours. The manufacturers usually state that plain blue or black is best suited.

Now a word in regard to your foreign machines. I think they are pretty substantial looking and of good plain lines, notably the Triumph; the only fault I find is that there is much complication in the control in order to gain an end. There are too many levers and wires. Our system is simply twisting grips, which operate spark and throttle.

Boston, Mass. A READER.

Lightweights v. Heavyweights.

[4714.]—After reading "Twelve Stone's" letter in a recent issue, I feel I must give my own experiences from a lightweight point of view

About five weeks ago I purchased a twin 2 h.p. motor cycle, and since then have ridden it over 500 miles, my weight being twelve stones. My average pace works out at 20 m.p.h., and although this country (Wales) is not so hilly as the Lake District, we can boast of some excellent hills. In only one case have I had to assist with the pedals, and that on an exceptionally bad hill. During all the 500 miles the machine has not been touched with the spanner in any way, every run having been a non-stop. If reliability, portability, cheapness in running, and ease of handling in traffic count for anything, give me the lightweight. No more heavyweights for me (10 h.p. in particular). PORTABLE.

Automatic Carburetters.

[4715.]—I have followed the articles in *The Motor Cycle* on automatic *versus* two-lever carburetters with interest. My experience is that when one drives slowly round a dangerous corner and immediately faces a stiff hill, the setting of the extra-air lever becomes a matter of guesswork and luck. Sometimes one sails to the top at a good speed, and sometimes one gets off and pushes.

Now my ideal carburetter would automatically give a correct mixture at low speeds, and allow a quick opening of the throttle on hills without fear of misfiring. It would have an extra air lever to twiddle on the open roads where speed is permissible. Some car owners obtain something of this sort by fitting a Bowden air valve to the induction pipe of an engine with an automatic carburetter. N. S.

[We were shown recently a carburetter which should comply with our correspondent's suggestion. It will be described and illustrated very shortly.—ED.]

Wear of Canvas and Rubber Belts.

[4716.]—Your correspondent, the Rev. J. Gordon, says in his letter to you on the above subject, appearing on page 307, that "rubber belts, however efficient on a solo machine, are a perfect nuisance on a powerful twin with sidecar."

I have been using a 6 h.p. variable geared twin with sidecar attached for some considerable time, and I also do a large solo mileage each year, and until the commencement of the present one my views entirely coincided with those expressed by Mr. Gordon.

In February last, however, I fitted a 1in. Dunlop belt to the twin, and have since done some 700 to 800 miles with the sidecar, and the belt is absolutely as good as new. It has only been shortened twice, and runs fairly slack without ever slipping. Its strength must be enormous, for I never spare my machine, and often take 11 st. and even heavier passengers. The speed gear also puts an additional strain on the belt, as it is of the expanding pulley type, giving a variation from 3¾ to 1 to about 7 to 1.

Of course, I know that any well-made rubber and canvas belt ought to do well up to the first 1,000 miles, but my own experience is that belts often go to pieces in the first few hundred miles in sidecar use. The Dunlop looks none the worse yet for the heavy work it has done.

May I add to the host of others you have received my appreciation of the fact that you have done away with Monday publication.

CHAS. S. LAKE, A.M.I.Mech.E.

The Unrolled Stones Danger.

[4717.]—Whilst returning from Sheffield to Leeds late on the night of April 11th I had the misfortune to become acquainted with the above danger in a way which might have proved very serious for me. I have frequently read of it in your paper, but this was my first experience, and I hope will be my last.

The patch was about forty yards long, and covered the whole road with the exception of a narrow track at the side, and it was near Chapeltown. There was no warning light or anything to call the attention to the danger. I was riding very carefully and at a slow pace, as I am not well acquainted with this portion of the road, nor am I keen on night riding at any time, but the impact was sudden and startling. My light went out, and I was nearly thrown off as the machine bounded and swerved across the road and I pulled up at the foot of a hedge. I could hear one or two people about, but no one came near me to ask if I was hurt or required assistance, which I am thankful to say I did not. It is almost impossible to discern a patch of unrolled stones at night until one is on top of them, and it seems to me criminal that urban district councils should allow users of a public highway to be exposed to such a danger without making any attempt to warn them of it. A red light at each end of the patch would call attention to it and save disaster. I trust you will insert this letter in your widely circulating paper, as I am sure too much prominence cannot be given to a subject of such importance to all who have at times to use the road at night.

T. CARTER.

Dry Battery Ignition.

[4718.]—For several weeks past there have appeared letters from your readers dealing with dry battery ignition, some of which have been highly complimentary to my dry battery, particularly the "Flash" motor cycle size. The correspondent "D. S." in your issue of the 31st ult. raises a point I should like to make quite clear to users and prospective users of this system of ignition.

To obtain the best results from any dry battery a good plain coil with a make and break contact breaker which makes a reliable contact of the shortest possible duration should be employed; most make and break contact breakers are suitable if the blade is adjusted as lightly as possible.

When a trembler coil is employed it is important to make a careful test of the current consumption, which can be varied considerably by the adjustment of the trembler screw, but in any case a make and break contact breaker should be employed, the contacts being adjusted a little closer, so as to allow of a longer duraton of contact necessary for the satisfactory operation of the trembler.

The only satisfactory method of testing the actual current consumption of a coil is to connect a sensitive dead beat ampère meter having a very open scale, reading at one-fifth to two-fifths of an ampère in circuit with the battery, and then run the engine at its normal speed, when a steady reading will be obtained.

With the "H. H." non-trembler coil and a good make and break contact breaker, the current consumption should not exceed one-fifth of an ampère, whilst with the "H. H." trembler coil and a slightly closer adjustment of contact breaker the current should not exceed one-third of an ampère with the engine running at normal speed.

It will be at once apparent that by decreasing the current consumption by one-half, the mileage obtainable from the battery will be more than doubled, whilst burning of the platinum points is obviated and general reliability greatly increased.

I must apologise for the length of this letter, but from the letters recently appearing there is no doubt that the subject is one of great interest to motor cyclists.

A. H. HUNT.

Belts and Other Topics.

[4719.]—I should like to sympathise with H. S. Phillips [4690]. I have had a similar experience with a well-known firm of rubber belt manufacturers. My belt began to go very badly after 850 miles on a 2¾ h.p. lightweight twin! The core was not nearly central. I wrote to them and sent a piece of the belt; they said it was last year's type, and they would send me another if I sent the old belt and 6s. 6d. (original cost 11s.) I replied that a new belt would probably deteriorate before I had time to use it, as I had had at once to purchase another spare, which would last me a good time; as to it being last year's pattern I bought it on a new machine on January 24th, 1910. In ordering the machine I had asked for a Whittle instead of the standard, but the firm replied that it would slow the machine considerably, slip when new, and grip too well when worn in. I have met a friend since who has used one on the same machine for a very long distance, and he is perfectly satisfied, and would not change back in a hurry. I am sorry I gave way. The belt firm have not replied to my second letter asking for 5s. instead of a belt cheap.

I am surprised to find that B. H. Davies in a recent issue says he found "two copper washers under the lid of the float chamber made the level right," as my petrol level is

Opening meet of the Cambridgeshire Motor Cycle Club. This organisation consists of about fifty riders, and, as showing the keenness of the members, we may cite the fact that thirty-five took part in this run to Bedford.

rather low and I do not want to tamper with the jet. I tried his advice, but found that one washer made the spirit overflow all over the place. His needle valve must have been very worn to bear two.

[Obviously the washer used by Mr. Vine was much too heavy.—Ed.]

In contrast to the belt company's attitude I should like to mention how the R.O.M. people treated me. I returned my back tyre and tube which had had two punctures and a burst at the bead; after 1,500 miles the tread was still in good condition, rubber-studded. I sent tyre and tube by post, and said I should like them replaced by return as I was in a hurry. Two days afterwards I received a new tyre and good second-hand tube by rail at 9 a.m., and by post a letter saying the old tyre was unsatisfactory, and they hoped their replacements without charge would meet with my approval. It did, and I let them know it by post, as well as through the medium of your columns.

B. T. VINE.

An Appreciation of a Lightweight.

[4720.]—"Well, I must say, after reading *The Motor Cycle* for April 7th, I am content with my little Motosacoche. Just returned from calling at Lady W——, and it took me up the steep bit of tramway beautifully. I go to Elmstone Sunday by Sunday without a bit of trouble from start to finish, take my service, and come back again, and the country is lovely."

Dear Mr. Editor, the above is an extract from my journal, and I thought it hardly fair to my nice little machine to hide its praise, and so I send it to your useful paper to publish if you like. And let me add what I consider its praiseworthy points.

First: It climbs stiff hills, I wish I had known it earlier, in Bucks, when I was constantly getting involved between high hills on a motor of another make. On my Motosacoche I have not yet met the hill it will not go up with just a little help from me if the belt is not tight. I have now learnt how to take off a bit at the end without any trouble.

Secondly: The wings on both sides to catch the wind are a decided gain. The air mixture is automatic, and I never know what over-heating is.

Thirdly: I have the free-engine device, and this is a great comfort to me, as I can mount as I do with my ordinary bicycle, but with less hopping—in fact, a shove off. This to an old man—I am past 70—is a great advantage, especially as I can mount uphill. The weight of the machine is only 80 lbs.

I should say I am passionately fond of the country after some fifty years, less furloughs, in India, Mauritius, Ceylon, and other places. I can recommend the machine to any persons of my tastes, who love English scenery, but who have been longer away from home than at home, and now when they are getting too old for pedalling a bicycle still wish to enjoy God's scenery, his glory in the country, without undue fatigue.

"O, what a glory doth this world put on
To him who with a fervent heart goes forth!"
—Longfellow.

(Canon) V. W. HARCOURT.

Water-cooling on Motor Bicycle Engines.

[4721.]—We have read with much interest the articles and letters which have recently appeared in your valuable journal on the subject of water-cooling on motor bicycle engines, especially the several references made to Mr. Green as one of the early pioneers in this direction. But for this we should not have asked you to insert this letter.

We feel, however, to remain silent any longer might be misinterpreted, and, further, perhaps that some explanation is due to those of your readers who have been anxiously looking forward to the day when a water-cooled motor bicycle engine such as they have so long been waiting for would be *un fait accompli*.

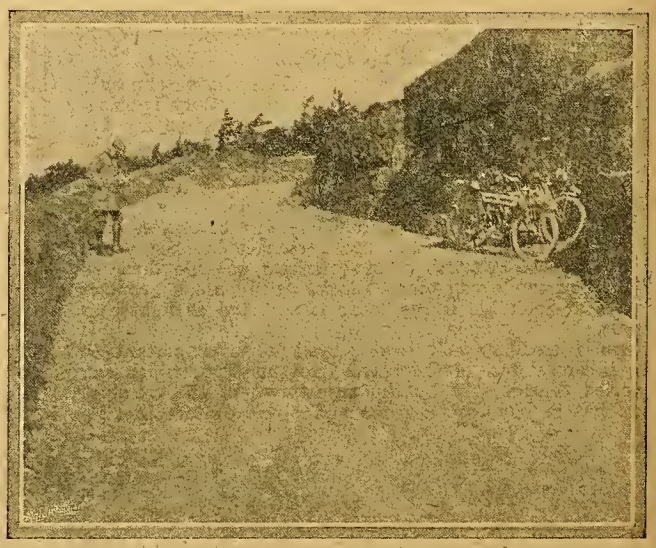
It is many years since Mr. Green attempted to solve the problem of making a water-cooled motor bicycle engine which should embody the essentials of extreme lightness with a compact and neat design. The result of his earliest efforts was first shown at the Agricultural Hall in March, 1906, when we exhibited a patent water-jacket and cylinder adapted to a machine of standard make. Subsequently a few new sample machines were made, which amply proved the value of the invention, but soon afterwards, the motor bicycle trade becoming affected by the general depression of the motor industry, we decided to await a more favourable opportunity before placing the invention on the market, leaving Mr. Green to take advantage of the interval to make still further improvements in his invention. We had just begun to make arrangements to put this improved engine on the market when the demand which suddenly arose for light engines for flying purposes absorbed the whole of our attention, compelling us to postpone carrying out our intentions with regard to motor bicycles yet a little longer.

We are glad to be in the position to inform your readers that steps are now being actively taken to place Mr. Green's invention on the market. We shall be happy to furnish further information on application.

GREEN'S MOTOR PATENTS SYNDICATE, LTD.,
J. Miller, Managing Director.

A Jaunt in the North Riding.

[4722.]—I was much interested in the above article in the issue of the 7th inst. I can vouch for the rough surface of the road over Wass Bank and the ruts, together with the stiff gradient. A friend of mine and I rode up it in the dark after the hill-climb on the Saturday at Sutton Bank at Easter. The surface was covered with loose stones, and I had a puncture from one of them, but my



Triumph climbed it well. My friend had a nasty spill on the top in one of the ruts and broke off his right pedal and bent his footrest. Helmsley was safely reached after a most enjoyable ride from Southport. The photograph herewith [reproduced.—Ed.] was taken on Easter Monday near the top of Sutton Bank. R. HOLFORD JONES.

EXPERIENCES WANTED.

"R. G." (Birkenhead) would like to have readers' experiences with the Lodge double pole and single pole plugs working in conjunction. Does an engine so fitted show any appreciable difference in power and economy?

"H. E." (Bungay) would be glad of the experiences of readers who have converted a 1903 or 1904 Rex from surface to spray carburetter; also the mode of conversion and its effects.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

A Reply by our Legal Adviser.

I was cycling along a country road and met a farmer with a young sheep dog. The dog jumped at me as I passed (I was going slowly) and ripped my waterproof overalls. Can you inform me whether the owner is liable for the cost of repairs? I have his name and address and that of a witness.—O 3569.

The owner of the dog would not be liable in the case mentioned, unless it could be shown that he knew the dog to be of a savage disposition. Strong evidence would be required of this.

Detachable Tubes. Benzol.

(1.) Do you recommend the use of (a) butt-ended tubes; (b) any tyre filling (Pfleumatic, Miraculum, etc.)? (2) Will an ordinary motor cycle run on benzol or must the carburetter be altered?—H. V.

(1.) We regret we have had no experience with any tyre filling, though we have heard good accounts of both of the fillings named. Detachable jointed tubes are quite a success, and are most convenient in use, provided a spare is carried, as punctures can then be repaired at home. (2.) Benzol is apparently quite satisfactory for motor cycle engines. You might have to weight the float slightly. You will find some useful hints on this subject in *The Motor Cycle* for Jan. 24th last.

The Uses of a Clutch.

Kindly inform me: Would a Mabon clutch fitted to a 1909 Triumph enable me (a) to start from a standstill on a fairly steep hill? (b) To climb steep hills after turning a sharp corner better than at present? (c.) Is engine started with handle?—P.A.F.

(a.) A clutch that does not embody a change-speed gear will not allow you to start from standstill on a very severe gradient. Starting from a standstill depends on the gear ratio and weight to be moved. (b.) If you slow down for a sharp corner and allow the clutch to slip it would enable you to pick up speed again. (c.) We cannot recommend handle starting on the engine-shaft in the case of small magneto-ignited engines. It is far better to jack up the rear wheel, start the engine by means of the pedals, and then put the lever in the neutral position.

Slow Running.

My machine is a 1908 twin N.S.U., and although it runs excellently at high speeds, and will take any hill round here, yet I cannot get it to run slowly. At any speed under about seventeen miles an hour one cylinder does not fire regularly. I have tried new plugs, with no effect. The gear is 4 to 1. Is this too high? I shall be very much obliged if you can suggest something to help me out of my difficulty.—M., Meriden.

You do not state the horse-power. If your machine is one of the 6 h.p. models the gear is about right. To enable the engine to run slowly you probably require to close one of the air inlets. If you examine the carburetter you will find that there are two discs, the air openings of which should be varied by turning the disc round and locking it by means of a screw in the centre. Try partially closing one of these openings until the engine will run slowly. Inlet valve springs should be exactly the same tension, and the amount of opening should be the same, say one-eighth of an inch. If you have any doubt about the inlet valves, change them over, and if the change causes the other cylinder to misfire, you will know which of the inlet valves is at fault.

A. G. Miller, of Mitcheldean, Glos., who speaks in high terms of praise of his twin Premier. He informs us he recently took a ten stone passenger on the carrier of this machine a distance of 11½ miles in 24 minutes, and that he finds his machine a perfect hill-climber, most reliable, and silent.

Life of Magnets. A Club in Hampshire.

(a.) I have been told that a magnet never needs re-magnetising, but sometimes becomes "depolarised." Is this so? (b.) Is there any club which organises motor cycle competitions in or near the county of Hampshire? If so, could you give me the address of the secretary?—S. R. C.

(a.) Magnets may in some instances need re-magnetising, say after three or four years' continuous use, and they do not become depolarised. This is a term used in conjunction with dry batteries which are kept in continuous work for which they are not intended. (b.) The most active club in the county of Hampshire is the Southampton and District M.C.C. Secretary, Mr. H. Percy Young, Dunelm, 87, Shirley Park Road, Shirley, Southampton.

A Difficult Diagnosis.

I have just assembled my 3 h.p. Fafnir motor cycle, and find there is no spark when the lever is retarded, and it will not run slower than ten miles per hour. Last year I could slow down to five miles per hour. I have examined all the parts, and everything seems in good order; timing not interfered with. Above ten miles per hour the engine runs well. What would you advise me to do? Should I alter the timing, or have the coil tested (plain). Rocker in good order, and no missing above ten miles per hour.—T. B.

It is difficult to answer your query without personally examining the machine, but if you have altered anything in the way of valve springs, or setting, or opening of valves, that may be the reason why the engine refuses to run slowly. For instance, if the inlet valve spring has been substituted for a stronger one, that would account for it. The adjustment of the carburetter is also important. You say there is no spark when the lever is retarded. This would point to the fact that the contact breaker is badly adjusted, or when the lever is retarded it brings one of the wires into such a position that it short circuits. Before doing anything else, try another sparking plug, and set the points very close together. It is unlikely that there is anything wrong with the coil.

Setting of Trembler. Carburetter Adjustment.

I have a 1906 2¾ h.p. Ariel fitted with Minerva engine and Minerva Longuemare carburetter. The coil is a trembler, and I have a make and break contact breaker. (1.) How ought I to set the trembler? (2.) How ought I to set contact breaker? At present the machine is very difficult to start, and misfires very badly at slow speeds. But when going fast (with no alteration of throttle) it does not miss at all, and seems to run quite properly. I think it is the trembler, as I have had it set (by means of an ampèremeter) to take a minimum of current, and it gives a very high note. I do not think it is the mixture, as the engine misses badly at slow speed with every setting of the extra air, though it is all right when going faster with air half open. I have fitted to my main air intake a shutter, such as there is on a Bray's incandescent lamp to regulate the air. (3.) Even if I have too large a choke tube, will regulating this main air come to the same thing as altering the choke tube? (I believe the choke tube is too big.) (4.) What effects have over-oiling besides causing sooting?—AK 612.

(1.) You ought to set the trembler with the points touching one another as lightly as possible, so that you get a good spark and do not use much current. The coil should give a fairly high note. (2.) Set the contact breaker to make a fairly firm contact. The best way to adjust the contact screw is with the engine running on the stand. The points should not bear too hard together, or pitting and misfiring will result. (3.) Yes, you will get much the same results as by altering the choke tube if more air is required. If, however, the difficult starting is caused by too great air supply a smaller choke tube will improve matters generally. Some useful hints on the adjustment of carburetters appeared in the issue of April 7th. (4.) Over-oiling, of course, leads to an excessive amount of carbon deposit (which in turn causes overheating and knocking), and a dirty engine, as the oil exudes from every joint.

A Motor Cycle for Ladies' Use.

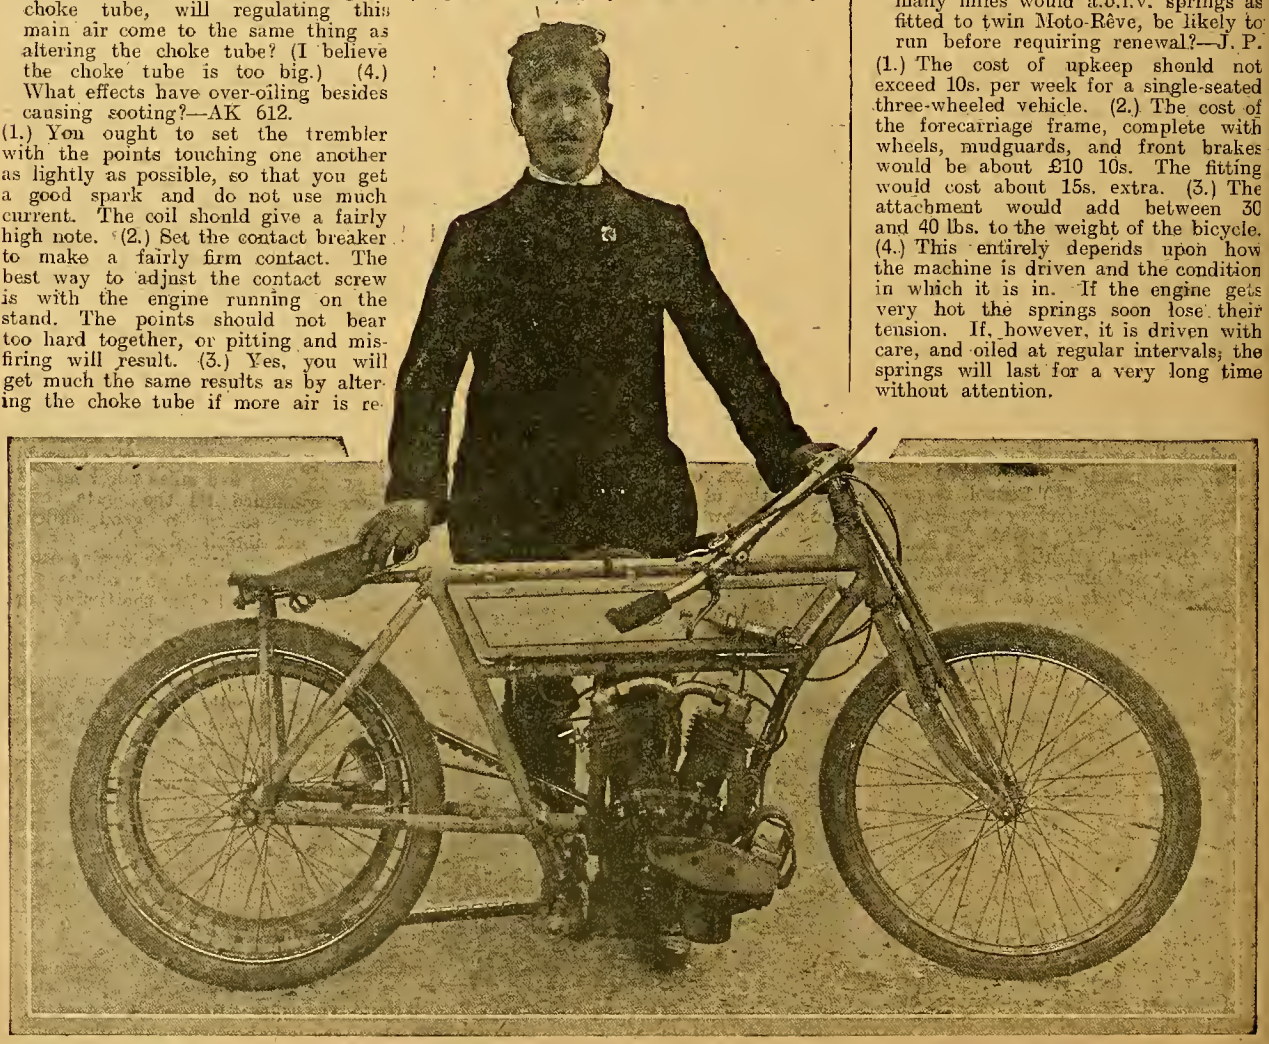
Kindly give me your opinion on the Motosacoche. Is it suitable for a lady? Is the machinery easy to learn and understand and the driving simple? Is it more difficult than on an ordinary cycle to keep one's balance? Is it really noiseless, and can you give me any idea of the expense of the upkeep? Also would it require a boy to clean and keep in order?—(Miss) C. A. F.

We should say that the machine in question is highly suitable for a lady. It is very light, and it is not difficult to control or to understand. There is really less difficulty in balancing a motor bicycle than an ordinary bicycle. You would find the machine to be practically noiseless. The expense of upkeep would be exceedingly small, say about 1s. 6d. per 100 miles for fuel. It would be best to get a boy to clean the machine, but, of course, this depends very much upon the inclination and wishes of the rider.

A Tricycle Attachment. A.O.I.V.

It is just possible I shall get a 3½ h.p. with two-speed gear, do away with the front wheel and substitute two, converting machine into a "two-wheels in front" tricycle (without forecarriage). Please tell me—(1.) The cost of upkeep for, say, 200 miles per week for a vehicle of this description. (2.) Could you tell me the cost of the two front wheel arrangement? (3.) What weight would this attachment add, taking into account weight of original front wheel removed? (4.) How many miles would a.o.i.v. springs as fitted to twin Moto-Rêve, be likely to run before requiring renewal?—J. P.

(1.) The cost of upkeep should not exceed 10s. per week for a single-seated three-wheeled vehicle. (2.) The cost of the forecarriage frame, complete with wheels, mudguards, and front brakes would be about £10 10s. The fitting would cost about 15s. extra. (3.) The attachment would add between 30 and 40 lbs. to the weight of the bicycle. (4.) This entirely depends upon how the machine is driven and the condition in which it is in. If the engine gets very hot the springs soon lose their tension. If, however, it is driven with care, and oiled at regular intervals, the springs will last for a very long time without attention.

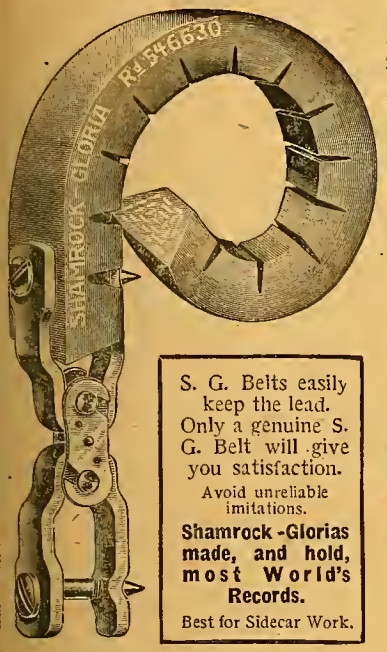


Martin Geiger, a consistent performer on a twin-cylinder V.S. at Brooklands and elsewhere. On Wednesday last week at the B.M.C.R.C. meeting he covered 46 miles 937 yards in an hour on the 5 h.p. V.S. shown. He will be remembered as the holder of the Land's End to John-o'-Groat's Sidecar Record on a 7 h.p. two-speed machine of the same make.

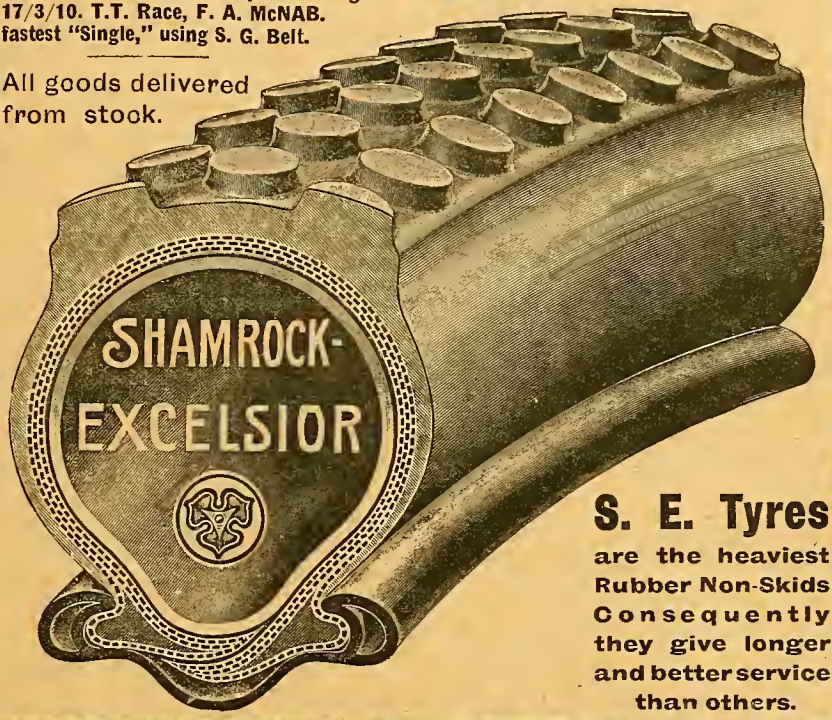
Best Results again at Brooklands.

28/3/10. H. A. COLLIER, 1st. Using a Shamrock-Gloria Belt.
17/3/10. T.T. Race, F. A. McNAB. fastest "Single," using S. G. Belt.

All goods delivered from stock.



S. G. Belts easily keep the lead. Only a genuine S. G. Belt will give you satisfaction.
Avoid unreliable imitations.
Shamrock-Glorias made, and hold, most World's Records.
Best for Sidecar Work.



S. E. Tyres
are the heaviest Rubber Non-Skids Consequently they give longer and better service than others.

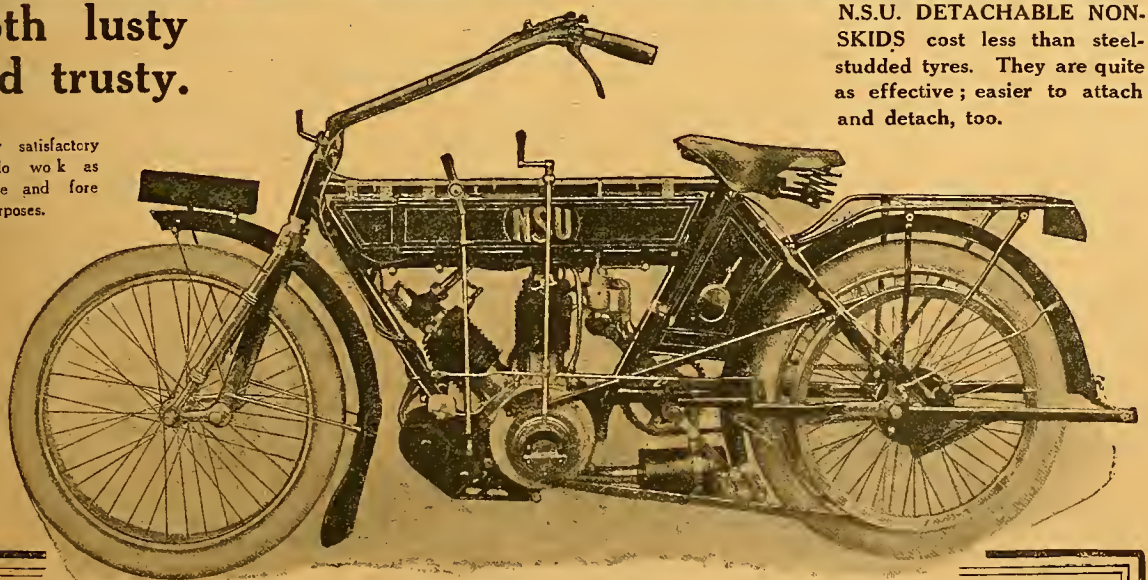
SOLE MANUFACTURERS—
The HANOVER RUBBER CO., 29-31, Old St., LONDON, E.C.

Both lusty and trusty.

Equally satisfactory for solo work as for side and fore car purposes.

N.S.U. DETACHABLE NON-SKIDS cost less than steel-studded tyres. They are quite as effective; easier to attach and detach, too.



This excellent machine has 75 x 90 mm. cylinders, M.O.I.V., gear driven Bosch magneto protected by leather case, handle-bar control, spring forks, long comfortably arranged handle-bars, internal expanding brake, belt rim foot brake,

6 h.p. Twin-cylinder

N. S. U.

1in. V belt, mud flap to front mudguard, divided rear mudguard, footrests, stand, carrier, etc. If desired, this machine can be delivered with two-speed gear and free engine apparatus on engine shaft or in rear hub at extra cost.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns — 1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

WAUCHOPE'S, 9, SHOE LANE, FLEET ST., LONDON, E.C.

'Phone, 5777 Holborn. Telegrams: "Opificer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office When this is desired, 2d. will be charged for registration and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No 000, c/o 'The Motor Cycle,' Coventry", or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20 Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days, and if no sale is effected, each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

CAMEL

Franco-British Exhibition 1908.

3 *Grand Prix.* 8 *Gold Medals.*

As a chain is only as strong as its weakest link, a belt is only as efficient as its least considered essential.

The essential links in motor belting construction—Maximum effective pulling surface; Elimination of stretch; Tensile strength; Flexibility; Centring of core; Prevention of twisting, ends breaking, and surface cracking—when evenly considered and supported by suitable materials and experience, ensure a perfect whole.

Camel Belting, owing to its uniform wear, due to scientific construction, is offered and sold as being the nearest possible to the ideal.

Obtainable through all Agents.

TO ENSURE A SWEET RUNNING ENGINE USE ALWAYS

'CHEMICO' MOTOR BIKE OIL.

You can't get the best results from the worst, or even from comparatively poor, oil—in no case where oil is employed is it safe to say "That will do" to the first article that comes along—in the case of engine oil the necessity for care in selection is greater. We've studied this matter in the laboratory as practical chemists, we've worked it out on the road as practical motor cyclists, and offer you of our very best.

1/8 per Quart Tin.

APOLOGY!

We feel bound to offer to many of our customers, both retail and trade, our sincere apology for any inconvenience we have put them to recently through our inability to execute their orders with the usual promptitude.

So extraordinary, however, has been the demand of late for

H. H. HELLESEN
DRY BATTERIES

that it has been impossible to cope with the business, and orders have had to be "held up."

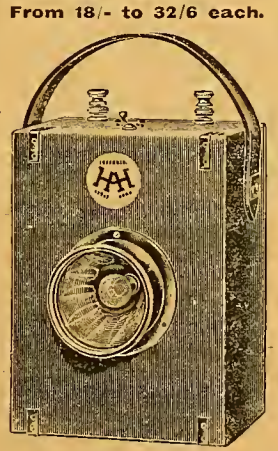
Necessary arrangements have already been made and we are now able to deliver by return.

May we also draw your attention to our new

PORTABLE ELECTRIC HAND LAMPS

employing the above Dry Batteries. Made in five sizes.

From 18/- to 32/6 each.



Write for Catalogues and Lists.

WANTED, Lightweight, in exchange for good 2¼h.p Minerva, new condition, cash adjustment necessary.—5, Station Rd., Edgware, Middlesex.

WANTED, handle-bars, saddle, low seat-pillar, tan with space for accumulator, coil, tyres wired, 2 by 2; lever for exhaust.—Kenworthy, Walpole, Wisbech

WANTED, good make lightweight second-hand moto cycle, engine J.A.P., free, two-speed; exchang new cycles or cash; approval.—Gittoes, Cycle Stores, Ne Radnor.

WANTED, Phœnix Epicyclic Gearbox, ont of quad car, complete with all fittings, reverse pedal change lever, and quadrant.—Harfield, Almorah, Swan wick, Hants.

FOR CASH!—If you wish to realise immediately o your machine go to Nye's. Any modern magneto machine bought.—69, Leather Lane, Holborn, London Phone 6299 Holborn.

WANTED, 9h.p. Riley or Singer Tricar, in good order; give cash or 4h.p. 2-cyl. motor cycle, cost £50 only six weeks ago, in part.—Box No. 4,493, *The Motor Cycle* Offices, Coventry.

MOTOR Cycles and Tricars bought, sold, exchanged; highest prices; clients waiting; quick sales; satisfaction guaranteed.—R. M. Pullman and Bros., motor engineers and salesmen, London Rd., Norbury, London.

WANTED, 1910 Douglas, also up-to-date high powered motor cycle not earlier than 1909 state lowest price for spot cash; no dealers.—204, Worple Rd., Wimbledon.

WANTED, magneto motor cycle; exchange Phœnix 5 to 6h.p. twin, coach-built, wheel steering, two-speed tricar; no rubbish; particulars and illustration each way.—Fisher, architect, Pontypool.

WANTED, Magneto Motor Cycle, high power, low built, with sidecar; exchange 1a.p. gas engine, electric ignition, also dynamo (50v. 10a.) and cash to value.—Edward, 528, Manchester Rd., Hollinwood, Oldham.

WANTED, motor cycle, forecar, or runabout, in exchange for brindle bull dog, Royal Stone strain, 16 months old, suitable for the show bench, stud yard, or companion; approval willingly. — Hindle, 19, St. Thomas Rd., Chorley.

EXCHANGE.

3½h.p. Rex Engine for higher power, cash adjustment. —Todd, Shirley Hall, Brailsford, Derby.

LONGUEMARE, 6h.p., exchange variable pulley, or sell £1.—Young, Buchan Hill, Crawley.

WANTED, Triumph Motor Cycle; exchange Wolseley 4-seated 2-cyl. car.—R. Griffin, Kendal.

3½h.p. Motor Cycle, perfect condition; cash, or exchange coh pony.—27, Elmsdale Rd., Walthamstow.

HAMMOND Typewriter, in perfect working order; exchange for motor cycle.—C., 130, Brixton Rd., S.W.

MOTOR CYCLES FOR COLONIAL USE.

IN recent numbers of *The Motor Cycle* (writes an Australasian correspondent) I have read with interest articles in reference to the building of motor cycles suitable for colonial use, and as a rider with a knowledge of South Africa, New Zealand, and Australia, I should like to give you an account of some of my experiences.

At present I will refer only to Australia, where I am now located, and where my business is continually keeping me on the road in town and country, over the tarred esplanades of fashionable resorts, and along the winding and lonely bush tracks, once the happy hunting grounds of notorious bushrangers.

On the whole, the roads in and around the great cities such as Sydney and Melbourne, are good, and the many fine views to be obtained and the glorious panorama of sea and sky which is the reward of the wheelman make motor cycling a real pleasure.

However, one naturally refuses to be kept within the boundaries of more or less energetic municipalities, and a lengthy tour is arranged.

We will suppose that a run from Melbourne to Sydney is decided upon, a distance of 575 miles. For the first sixty miles to Seymour the road is good, but after that—well, here the troubles of the rider of a machine built for British conditions only commence. The road is unmade for the most part, and in the summer very deep in dust and sand, an alternative being at one's disposal of running in and out of the gum tree bush through which the road was cut in the bad old days, but this is very risky, even with the best of brakes, the path being thickly strewn with fallen trees and branches.

However, nothing daunted, you struggle on your circuitous course, considerably lengthening the journey, until you arrive at a more formidable obstruction in the guise of a dry river bed, deep in sand.

Now, my brethren of the motor cycle, unless you are riders of powerful twins and have a free engine, whereby you may get a fresh start should you get bogged, I advise you first of all to dismount and reconnoitre the position. The most fordable portion of the watercourse must be found, unless there happen to be a plank bridge which is wide enough for you to scramble across.

The trying part, however, for the motor bicycle, and particularly the spring forks, frame, wheels and rims, is the frequent occurrence of subsidences across the road, caused by rushing narrow streams in the rainy season. Riding across these gutters severely strains the whole machine, and, in fact, it is an art to manipulate it at all without dismounting.

Resuming your journey, should you successfully accomplish the first 100 miles, you will find the conditions of riding just as strenuous for practically the whole distance, until you are rewarded for your perseverance by a sight of glorious Sydney Harbour.

Although the use of motor cycles on the bush roads of Australia calls for such exceptional care on the part of the rider, there is an ever-increasing number of motor cycles appearing year by year, and they are used by all classes, both for business and pleasure; therefore it behoves the home manufacturer who wishes to keep his machine to the fore to go thoroughly into the question of strength of general construction besides reliability of running power.

MILITARY MOTOR CYCLING NOTES.

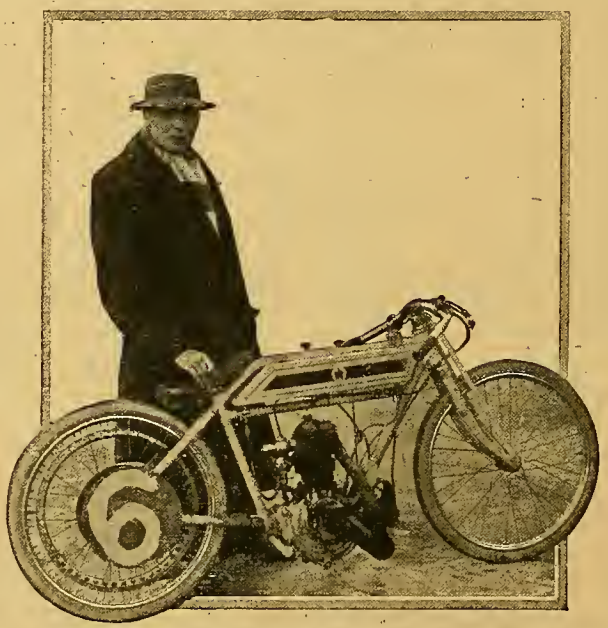
By "CELERITER."

THE ART OF DESPATCH RIDING.

I CAN hear some motor cyclists say, "The art! Why, it's as easy as skidding on greasy asphalt!" So much for ignorance; now to the facts. Of course, any motor cyclist who can read a map is able to take a message from one place to another. But that is not the sort of job a military despatch rider has to undertake. Let me take a very normal case as an example, and we will imagine we have two motor cyclists at our disposal. One, who is an old hand at the game, we will call Jones, the other Brown, a keen and enthusiastic motor cyclist, but a novice at military work. They are attached to General Snooks, commanding the 5th Cavalry Brigade, which is moving from Newbury on Wallingford, expecting to come in touch with the enemy somewhere near the Thames. Away to the right the 6th Cavalry Brigade, commanded by Col. Robinson, is moving from Basingstoke on Reading and Henley, whilst the headquarters of the Division, under the able leadership of General Smith, is moving from Basingstoke to Pangbourne.

How it should Not be Done.

The staff officer for the 5th Brigade tells our two despatch riders to keep near the general. Brown interprets this literally, and for five miles rides close at hand, overheating his engine, frightening the horses, and making himself generally unpopular. Jones, who has played this particularly unpleasant game before, does his riding in sections of half a mile at a time, waiting for the general to come up, and then going on again. By the end of five miles some officer on the staff, probably for the sake of a little peace, sends Brown back to Newbury with the laconic message, "Go back, find the 2nd Line Transport, and deliver this message, then rejoin." Off goes Brown right down the long line of squadrons, cordially cursed by everybody, instead of taking some side road. He meets lots of waggons, and in vain enquires for the 2nd Line Transport. After a good deal of wandering he eventually discovers them watering their horses in a secluded park, gives his message, and prepares to return. He has not the faintest idea where to return to save along the road to Wallingford. On his way to this town he passes all sorts of troops, but cannot find his general anywhere. He may be lucky and meet Jones, who will tell him that until noon the general has established his headquarters at the Post Office, Yattendon, in which case he will be all right; if not, he is not likely to find his general until well on in the afternoon after fruitless miles of riding and many questionings. When he arrives the staff officer says, "Where did you find the 2nd Line Transport?" The only answer he can give is, "In some park near Newbury."



O. C. Godfrey, with the actual 3½ h.p. single-cylinder Rex machine he will ride in the Tourist Trophy Race. The carburetter is an Amac with adjustable nozzle.

An Expert at Work.

Now let us turn with relief to motor cyclist Jones. All the while he has carefully noted the position of headquarters on the map. By an occasional question he has kept himself informed of the movement of the various detachments, so when he receives the order to go to the officer commanding the 23rd Hussars he knows where to look for him. He knows, for instance, that the latter reached East Ilsley at 10 a.m., he knows they were moving on Streatley, and so he can calculate exactly where he is likely to find them. He does not see the fun of riding along a narrow road, encumbered by waggons. A glance at his map shows him a better road, a mile or two further perhaps, but along which he travels at high speed without let or hindrance. Two miles short of Streatley he finds his quarry, delivers his message, and in reply to anxious questions vouchsafes the following information: "General established his headquarters at Yattendon at 9.30 a.m., sir, and will remain there until noon. The 24th Lancers are due to reach Steventon at 11 p.m. No signs of the enemy's patrols by the road I travelled." Before leaving for his return journey he enquires, "In case I have to come back to you, sir, in which direction are you moving from Streatley?"

That is the difference between the expert and the novice.

Always on the Alert.

The despatch bearer must remember that he has invariably to deal with busy men, who have no time to give him information, but are generally anxious to obtain information from him about the movement of other bodies. He must therefore, first and foremost, keep a continuous watch on the movement of all bodies of troops with whom he is likely to have to communicate. He must as far as possible familiarise himself with the names of officers commanding various units. He must keep his eyes and ears open, then he will find that his knowledge will save him very many useless miles of wandering and much valuable time.

Military Motor Cycling Notes.—

Gradually and with practice he will learn of whom to make enquiries as to the whereabouts of individuals or units. He will discover it is a waste of time to ask a cavalryman questions with regard to his own infantry and guns, that nobody except the senior officers ever has any idea where the general is to be found. There are a thousand and one hints I could give the novice on these points alone, but he would forget them at once. The only thing to impress these points on his memory is practice and experience. Then he will find them out for himself.

Intercepting Cavalry Across Country.

I recollect some four years ago at army manœuvres being sent off to try and find the Cavalry Brigade. The only address given was that they were last heard of fifty minutes ago at a spot some ten miles distant. Instead of immediately starting off to this spot and endeavouring to trace them, I asked where they had been heard of previous to that. The reply showed me that they were obviously moving east at the rate of about seven miles an hour. I accordingly rode in a direction and at a speed which I thought would intercept their course, and within forty minutes had delivered my message. Five minutes after my departure another motor cyclist was given the same errand. He rode straight away to the place where the brigade had been last heard of, and it was only owing to the fact that he happened to meet me on my return journey that he managed to deliver his message under two hours.

The motto for a despatch rider is that a pennyworth of brains will save at least a shillingsworth of petrol, not to speak of lives, temper, and time, which would be of the utmost importance in war.

A. G. Fenn, the faddist, and his Imperial Triumph which he has altered in various ways to conform to his ideals.

Captain C. Battine's Paper.

On Thursday, the 7th inst., at the A.C.U., Captain C. Battine delivered a most interesting lecture upon the uses of the motor cycle in warfare. The lecture was followed by a discussion, in which several well-known men both in the military world and in motor cycling circles took part. The result of the discussion tended to emphasise the point that to be of any use in war time the motorist must have been educated during periods of peace to the duties he would have to perform. Another point which was also made clear was the folly of forming motor cyclists into fighting units and of arming them with rifles in the fond hope of using them in the firing line.

The motor cyclist will have to make use of many things on service, but a rifle is not one of them. Pluck, endurance, intelligence, speed, and military knowledge will be his stock in trade. When these qualities fail him the possession of a rifle will not help him out of the difficulty, and at all other times he will find that weapon a useless encumbrance.

The Motor Cycle Corps.

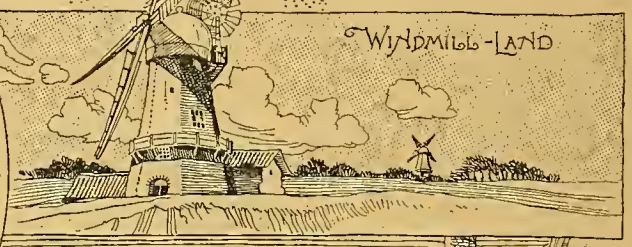
Since my appeal to the readers of *The Motor Cycle* was published quite a large number of readers have sent in their names expressing their willingness to join such a corps when formed. One and all, however, have laid stress upon the condition that the corps should be a properly authorised body conducted on military lines. I feel quite sure that all readers of this paper will sympathise with the spirit that dictates such a condition. The man who wants to pose in picturesque costume according to the fancy of his own ideas on military motor cycling has ample opportunities of doing so. There is no legal bar to his dressing himself up in any clothes he may happen to fancy and in playing at soldiers on the high roads to his heart's content, but I think most people with sense will be content to allow him to plough (?) a lonely furrow. Those of us, on the other hand, who are more seriously minded, and think more of making ourselves useful than ornamental, will refuse to join any organisation not officially sanctioned and supported by War Office funds.

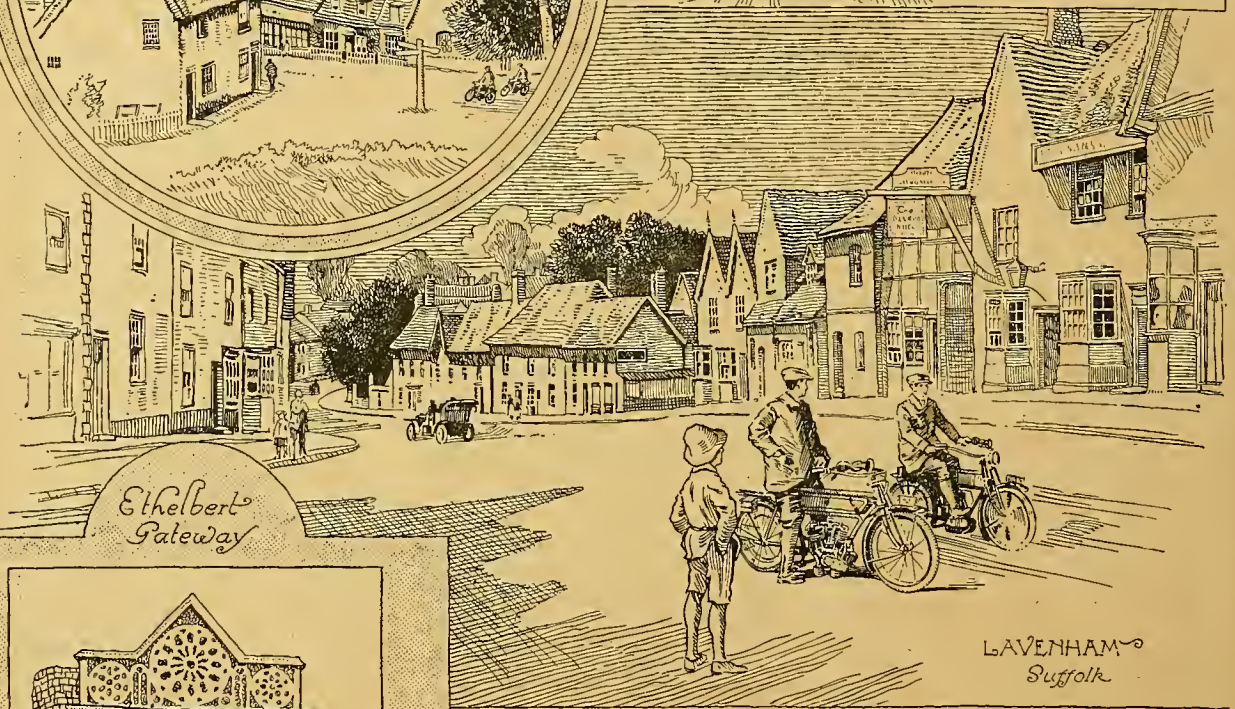
A Further Appeal to Keen Riders.

At the risk of obsessing the keen motor cyclists I would like to point out that, though the London District and the Western Command have produced quite a lot of enthusiastic volunteers for the proposed corps, Scotland, South, North, and Eastern England have not proved fruitful up to the present. I would appeal to the motor cyclists of Lincoln, Nottingham, Essex, Kent, Hampshire, Wales, and Yorkshire to send in their names as recruits for the new corps when formed, and I ask every individual man who is interested in the scheme to carry on an active recruiting propaganda amongst his motor cyclist friends and his clubmates. The only way we can get what we want from the War Office is to come forward with the scheme and the men. The scheme has already been put forward; it remains for you, readers of *The Motor Cycle*, to provide the men. We want 250 in all, and unless we can get at least this number of volunteers there is very little chance of the corps ever being started. Surely it is not very much to ask. To send a postcard to the Editor of this paper only costs a halfpenny and commits the writer to nothing. Roll up, all keen riders of the "petrol horse," and let us make a success of this corps of ours. Surely we motor cyclists can do as much to help our country as our cousins of the motor car.

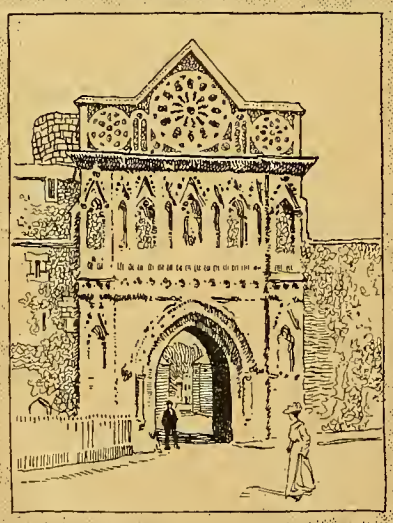
WHERE TO GO AT WHITSUNTIDE

East Anglia No. 4



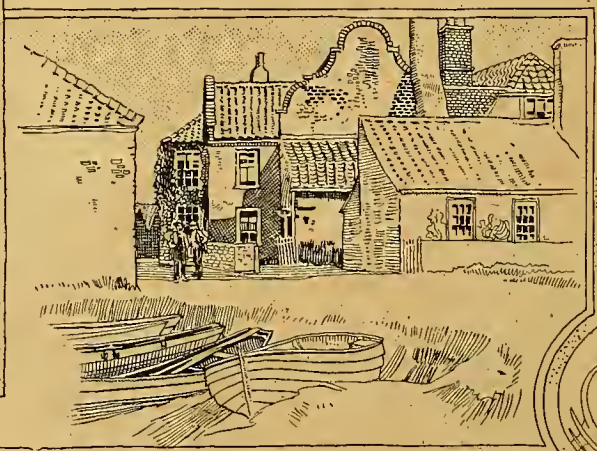


ETHELBERT GATEWAY



NORWICH

LAVENHAM
Suffolk



YARMOUTH

Sydney R. Jones

A Complete Stud.

Visiting an old acquaintance the other day, I found him in possession of a quite ideal stud. For dry roads and speed work he owns a nippy little T.T. racer, scaling no more than 140 lbs., and capable of a mile a minute bat on Brooklands. For ordinary comfortable long-distance work he rides a much heavier machine —a single-cylinder two-speeder, weighing 200 lbs. all on, game to climb any hill in any weather with a big kit on its carrier, finely sprung fore and aft, reliable as they make 'em. But he says he is getting too stiff and fat and old for the T.T. type of jigger. It cramps his spine, it bucks and curvets overmuch, and keeps his wrists too low. So for speed work in 1911 he looks forward to a heavy, well-sprung, high-geared 8 h.p. twin. The roadster mount sometimes tugs a sidecar, when solitude irks him. This is the sort of stud for a two-machine enthusiast, and the man who can run to a third mount should add a little 80 lbs. lightweight for completeness' sake.

A Non-stop Trial Tip.

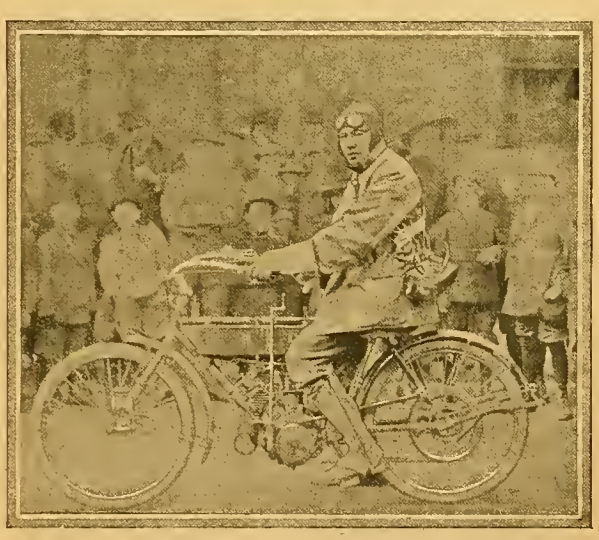
Examining the reports of sundry 1909 non-stop trials, I was interested to notice how many men had been outed by broken belts or fractured belt fasteners. The rubber belts have yet to attain as sound a joint as some of the leather belts. I always carry a leather belt with me, for use if furious rain should give my rubber a bad fit of the slips, and several seasons have elapsed since I broke or pulled out the fastener of a leather belt; as readers are aware, the joint is quite the strongest portion of several patent leather belts, whereas it is invariably the most vulnerable detail of a rubber belt. The rubber belt scores heavily with its special merits of cleanliness and absence of stretch or glazing.

Automatic Carburetters.

I mean to keep dinging away at this point, because I know how many riders botch their driving on hills, as they are too clumsy to coax the best out of their engines with the modern two-lever device. I leave it to the trade to meet the coming demand, but just let me point out that a multiple-jet carburetter can easily be designed to supply a perfect mixture at all engine speeds. Your first jet is the only one uncovered with the throttle in the starting position; it can be adjusted to supply a rich mixture for starting and very slow running. Jet No. 2 will then supply a vapour consisting almost exclusively of air to dilute No. 1's mixture for faster running at speeds from twenty to thirty-five miles per hour, and No. 3 is set to work when the throttle is swept recklessly open, and adds a complement of well-balanced mixture for packing the cylinder cram-jam full in real hard work. Such a carburetter takes in all its air through the choke tubes, possesses only the one lever which actuates the throttle, and on cars has been proved to give maximum power, maximum economy, and real automaticity. There are other designs, of course, but here is a simple, inexpensive, and foolproof alternative to the patterns we are using now. All its three jets may be instantaneously accessible from the outside without touching any other portion, and all its air supply may be filtered by a simple spring bayonet-jointed gauze cap, slipped on and off in a second. It is, however, by no means impossible to design a truly automatic and efficient single jet device.

Exhaust Whistles.

I have been using an exhaust whistle for some time past, and, while I strongly deprecate recourse to such violent and piercing alarums in traffic and populous regions, there is nothing to touch them for shifting drivers of traction engines and hooded vans out on the open road. I do not at present know of a sample which I can unreservedly recommend for use on a single-cylinder, though almost any type will work well on either a single or a twin when the engine is running really fast. At slow speeds on single-cylinder engines all the samples I have tried produce but a feeble noise. I think, however, that I can



. Voel er, (3 h.p. twin N.S.U.) a successful competitor in the New York M.C.C. Quarterly Trials on April 3rd. He climbed both the test hills easily, and finished with a perfect score, gaining a gold medal.

tell designers how to make a whistle which will be efficient on even a single-cylinder at slow speeds—it must possess a sliding reed. I examined a whistle of this type on a car engine the other day. The reed portion had three flats on its sides, and this reed slid backwards and forwards in a tube under the influence of a lever and cord. The variable orifice thus produced responded admirably at all speeds, and made quite sufficient noise when the car was barely moving on top gear with the throttle shut right off, since the closing of the reed orifices enhanced the feeble pressure of the exhaust, and made the most of it.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

How to Overhaul a Motor Cycle.

[4723.]—In regard to letter 4696, April 14th, 1910, by Dr. T. S. Watson, I should like to mention that there is no need to fit a larger valve than was previously used, after truing up, as described in the article mentioned. The actual valve seat remains exactly as it was before, only the "pocket" being turned off to give a free passage to the gases. CON-ROD.

A Tyre Tip. The Motor Cycle Corps.

[4724.]—The following hint will perhaps prove useful. On returning from a tour at Easter I had a bad burst in the front tyre, and no repairing canvas. The difficulty was overcome by putting a cloth pad inside the cover and binding a broad strap round the outside several times. I did the remaining thirty miles comfortably and without trouble.

I shall be only too pleased for you to enrol my name amongst those willing to join a Motor Cycle Corps. My machine is a 1910 Minerva 3½ h.p. H. A. POWELL.

A Carburetter Experience.

[4725.]—I have a tip that may be of use to some users of Longuemare carburetters. I was for a long time troubled with petrol streaming out of the hole in cap on float chamber at high speed. When standing it would not flood, and everything seemed to be in order. At last I formed a theory that when the petrol lifted the float high enough the plunger used for flooding carburetter caused float to tilt to one side. This caused the needle instead of sliding freely to bind, so I removed the plunger, and have had a well-behaved carburetter ever since with no other alteration. A. M. G.

Increase of Speed on Partially Raising the Exhaust Valve.

[4726.]—If Mr. Nettleship thinks he has solved the problem by stopping his lifter from doing a "jig," I am afraid he is greatly mistaken, as I find that engines with the valve lifted by the tappet are the worse offenders.

Perhaps Mr. Nettleship did not see my last letter; if not I think he will find the solution "if" he will experiment with his engine by varying the timing to suit his engine. This should stop its peculiarity for good. PONY.

[4727.]—We observe the reappearance from time to time in your columns of this hoary-headed "phenomenon" with an ingenious but generally illogical explanation proffered in each case.

May we venture with all due diffidence to point out that modern academic investigation of the above and suchlike problems has placed the solution rather beyond the realms of mere surface surmise, and for the benefit of those enthusiasts who are interested in this particular phenomenon we would append the accepted explanation as arrived at by scientific investigators. By the aid of a contrivance known as the revolving mirror the exact action of a rapidly-moving body such as an exhaust valve may be watched and ultimately studied. Its application in this case discloses a tendency of the valve to bounce on its seating, which bounce gradually increases with the cam speed until at high rates of revolution it is extended well into the induction stroke very much to the detriment of the incoming mixture.

The judiciously applied support of a Bowden operated exhaust lift acts upon this bounce like a dash pot, there being a certain degree of non-elastic "give" in the Bowden wire which to a great extent checks the bounce without actually preventing the valve closing, hence the increase of power which is evident on its application at high speeds. THE COLVILLE MOTOR WORKS.

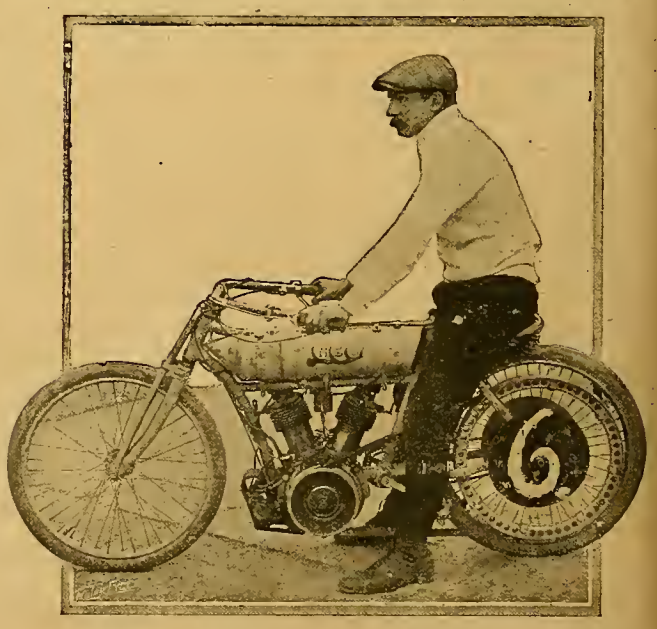
Tyre Gaiters.

[4728.]—Regarding Mr. Claridge's letter [No. 4711] in last week's issue, I personally bought two gaiters for a 2in. tyre about eighteen months ago at Gamage's, Holborn, but whether they stock them now I do not know. They were exactly what Mr. Claridge describes. They should be soaked first in water to soften. J. WILSON BUSHNELL, D.B.O.A.

[4729.]—In a comment by "Ixion" in the issue of the 7th I see he relates the sad experience of two motor cyclists who had not provided themselves with tyre gaiters. A few months back I had a somewhat similar experience. I have not means enough to carry tyre gaiters, as they run into money, and may not be used for months, and so have to lay my money out on other spares that may be required at any moment. Finding that I had a burst cover which allowed the tube when cover was repaired to blow out to size of a small football, I made my way to an ironmonger's shop and bought a few yards of chair webbing for a few pence. This I bound round the gash, starting winding at the end where the gash was farthest away from the road surface, so that the laps prevented grit from entering the gash. This wore so well that I had it on for very nearly a month, when I fitted new tyres. I may say that now I carry with me a few yards of chair webbing, being inexpensive and handy for parcels. I advise all motor cyclists to carry a yard or two of webbing; it costs 4½d., and can be bought anywhere; also a small ball of string for binding the final end. AN IRONMONGER.

Delay in Execution of Orders.

[4730.]—May I encroach upon your space to direct attention to a grievance experienced by motor cyclists, and probably car-owners also, in the matter of supplies and



A. Oberlander, a competitor in yesterday's Weybridge Handicap at Brooklands. The machine is a two-cylinder m.o.i.v. N.S.U., with bore and stroke of 80×99 mm.

A.C.U. QUARTERLY RELIABILITY TRIAL. SCENES ON THE TEST HILLS, DASHWOOD AND RECTORY (AMERSHAM).

S. R. Cooke and J. V. Robinson (2¾ h.p. Douglas motor cycles), climbing Dashwood on the outward journey to Banbury.

W. Cooper (3½ h.p. Bradbury) ascends Dashwood in a contented mood.

replacements. For example, seven weeks ago I ordered a plate-clutch in back-wheel, delivery being *guaranteed* within a fortnight from receipt of order, cash was asked for and sent, but I am still without the machine. On mentioning the matter to our club members I find that the complaint is general among us—one member, in fact, ordered a replacement as far back as November last, sent cash, but is still without the goods, notwithstanding his repeated applications. The practice appears to be, for some manufacturer to solicit orders by advertisement through your valued medium, or otherwise, then on receipt of order to send *pro forma* invoice, receive cash, and the customer may wait until sick and weary for the goods, and in the meantime be debarred from his pastime. This method of doing business is not restricted to small firms, but is practised by some firms whose reputation leads one to expect different treatment.

The motor cycling authorities assist their members to some extent in meeting the legal persecution to which they are subjected, and I think it would be an advantage if some association were found whereby, on the payment of a nominal sum, members could invoke assistance in these cases.

Individually, we cannot do much but suffer in patience, though collectively such pressure could be brought to bear as would put an end to a state of affairs peculiar, I hope, to the motor business. DISGUSTED.

A Suggested Motor Cycle Museum.

[4371.]—I am writing to ask if some attempt cannot be made to collect some of the ancient motor cycles, which are now so much scrap iron, but which in a few years' time will probably be of great interest. For instance, I bought the other day a 2 h.p. gear-driven Singer motor cycle in perfect working order for £1. A friend of mine has just bought for 30s. an 8 h.p. (R.A.C. rating) four-cylinder water-cooled Holden motor cycle. I saw advertised in the miscellaneous columns a few weeks ago a front-driven Werner for £4 15s., and a four-cylinder Binks is periodically advertised for sale in *The Motor Cycle*. No doubt there are various other interesting machines lying about rusty and disused in different garages. With reference to the Singer a few words may be of interest. When I received it a week ago the engine and magneto (low tension) were covered in rust, but it started up at practically the first turn, and it easily does 20 m.p.h. on the level and climbs well for its power. So far it has done about thirty miles, repairs having cost 9d. I think this speaks volumes for the workmanship put into the machine, as I believe it dates from 1903, and probably had not been used for two or three years until I tried it. The four-cylinder Holden hops along well on the level, but weeks of patient labour have so far failed to make more than three cylinders work together. H. E. RENDALL.

The second bend on Rectory Hill, Amersham.

A. C. Robbins (3½ h.p. two-speed Humber) commencing the ascent of Rectory, the second test hill.

A Puzzle or a Poser?

[4732.]—With reference to the recent correspondence in *The Motor Cycle re* petrol spraying from the extra air inlet of the carburetter, I do not think the design of either the ordinary motor cycle engine or carburetter can be blamed, or why should some riders have so much more to complain of than others?

On my own machine (a 3½ h.p. Bradbury), although the consumption is fairly high (eighty miles per gallon with a No. 30 jet), I can detect no trace of blow-back of petrol. I have the valves set in a normal manner, viz., exhaust opens threequarters of an inch from bottom of firing stroke, closes at top of exhaust stroke, and inlet opens as exhaust closes. The extra air inlet has been increased in area about fifty per cent.

On a friend's machine, twin a.o.v., a similar carburetter (1909 B. and B.) is fitted, and engine wastes apparently about fifty per cent. of the fuel through blow-back. Personally, I should be inclined to blame the valves for the trouble on any standard machine.

J. C. BENNETT MITCHELL.

The M.C.C. Inter-Team Trial.

[4733.]—I am afraid that in reviewing the rules of the 1910 competition you did not give those rules the same amount of consideration to which they were subjected when being reviewed by my committee, for I feel sure that you would not then have suggested the improvements mentioned in last week's issue of *The Motor Cycle*. In the first place, although it may be, and probably is, desirable that pedalling should be prohibited, the fact is that it is impossible unless the whole of the twenty-five mile circuit were lined with officials in view of each other to see that this rule should be enforced.

I have a recollection of quite a recent competition where the judges had to refrain from awarding marks under a certain heading for the only reason that the awarding of such marks was not practical. It is not the right thing to have to worry out definitions of rules after a competition is finished and the competitors look for results, and for this reason, if for no other, it was decided to leave the rules as regards pedalling just as they have served for the previous successful competitions. The fact that so far only one team has succeeded in obtaining a full score justifies the opinion that even with pedalling it is not child's play to get a team of six riders to make a clean one hundred miles non-stop.

With regard to the wearing of a distinctive coloured armlet by the members of each team, last year we had eighteen teams, and to me it appears somewhat difficult to select eighteen different colours, each sufficiently distinct to be easily recognised.

Our method of giving each team a different set of numbers, so that one team shall be all 20's, one all 30's, another all 40's, and so on appears to have worked well so far.

My committee has now had a good deal of experience in running competitions. I believe that I am not going too far in saying that the organisation of M.C.C. events bears a good name, and we are all great believers in leaving well alone.

I do not wish you to think that we hold ourselves above criticism; nothing is so good that it will not bear looking into; what should, however, be first considered when suggesting new rules is the possibility of carrying them out.

J. VAN HOOYDONK, Trials Hon. Sec.

[We should like to point out that, when we suggested that pedalling should be barred, we anticipated that pedalling chains would be removed. By ringing the changes on colour and design we think it would be possible to select eighteen or more suitable combinations.—ED.]

Lightweights v. Heavyweights.

[4734.]—*Re* letter No. 4710 in your issue of April 14th, in which Dr. Patterson relates his experiences with a 1909 Douglas lightweight, I think that if the Doctor would give slightly fuller details of the running expenses it would very materially enhance the already high value of the letter.

I may say that though not the fortunate possessor of one of these splendid machines, I have nothing but unbounded admiration and enthusiasm for their capabilities. They appear to me to stand quite in a class by themselves, combining as they do all the really desirable features of the standard heavyweight, together with certain unique features only found in lightweights.

I would suggest that such particulars should be under the following headings: (1.) Belts used (make and distance travelled). (2.) Tyres used (make and distance travelled). (3.) Replacements, such as plugs, valves, bushes, etc. (4.) Days out of commission through breakdowns of any kind. (5.) Whether a complete overhaul is included in the year's running. I submit that if these be given they would form a really solid basis for comparison, and would be the means of gathering into the motor cycling fold many would-be enthusiasts who now remain outside. LB 2727.

A. R. Abbott (8 h.p. Matchless and sidecar) leaving the Red Lion, Banbury.

LAST WEEK'S QUARTERLY TRIALS.

F. Greaves (2¼ h.p. Royal Enfield) making a good ascent of Rectory Hill, Amersham.

Homeward Bound. Competitors nearing Uxbridge.

Motor Cycle Tyres.

[4735.]—In reference to the letter of J. F. Briggs in the issue of March 31st, I am afraid he is one of very many who have been suffering with tyre troubles of the same nature he has so aptly described, and, as he observes, most frequently found when starting for a spin. There is no doubt that security bolts are a prolific source of puncture trouble, and I am also of J. F. B.'s opinion that the butt-ended tubes supplied with the machines mentioned (P. and M.) are too long, causing kinks. These kinks chafe and eventually puncture.

EXPERIENCES WANTED.

"H. J. K." (Salisbury) would be glad of readers' experiences with the N.S.U. engine shaft gear on a Triumph.

"F. A." (Kettering) would be glad to have readers' experiences of the Lowen sidecar.

"B. R. B." (Hants). The Roc gear, particularly with regard to tracking of front and rear wheels and braking power.

A.C.U. Quarterly Trial.

Uxbridge to Banbury & Back.

Wm. Bennison near the top of Dashwood on his A.C. sociable. The motor bicycles lining the roadside belong to interested spectators.

ON Wednesday, the 20th inst., the Auto Cycle Union Spring Quarterly Trial took place, starting from Uxbridge at 9 a.m., and extending over the usual course. Despite the recent suggestions to curtail trials and competitions, the entries numbered seventy-three, and of these the majority came from the trade. The fact of the matter is that the motor cycle trade is highly appreciative of the Quarterly Trials, as they serve effectually to bring new machines before the public notice, while the regulations imposed which enable marks to be awarded for brakes, hill-climbing, general convenience, etc., all tend to improve the modern motor bicycle and bring it still nearer perfection.

There was barely room to move in the Chequers Hotel yard just before the start, as it was full of machines and competitors rushing to find Straight and Beasley, and from them to get programmes and route cards, while the judges, Messrs. Brooker, Cove, and Sharp, dodged hither and thither among the forest of motor bicycles, examining each one with scrutinous care. Several of the mounts possessed interesting and novel features. H. Roberts's P. and M. was provided with an alarm bell worked by the right-hand inverted lever on the handle-bar. Two ladies' machines took part—one Miss Berend's Moto-Rêve and the other an Omega ridden by F. A. James. The neat appearance of the new Humbers (ridden by the company's experts of long experience, Crundall and Yates), the Brough, and the Arno, rendered these machines especially conspicuous. The latest Brown Midget Bicar was also there, with an expanding pulley gear worked by a side lever; with this gear the slack in the belt is taken up by pressing down on the footboard, which pushes back the rear wheel, and when the correct tension is found it is locked by turning a screw on the top tube. Other interesting machines were the 3 h.p. Wanderer, with under-geared pulley and horizontally-cast radiating fins on the front cylinder; the 3½ h.p. Premier, fitted with auxiliary exhaust release; the three James models; and the two new Enfield lightweights.

Immediately before the start. Competitors lined up in pairs outside the Chequers Hotel, Uxbridge.

Just after 9 a.m. Miss Berend, the dainty lady competitor, led the throng, the others following in quick succession. Miss Hind was present at the start, and regretted she could not compete, as her new machine had not been delivered. Only three of the entrants failed to put in an appearance. The weather was dull, but as the glass was high there was every

A.C.U. Quarterly Trial.—

prospect of it being fine, and as it had rained early in the morning the road surface was just of that consistency to be firm and dustless. Greasy patches—fortunately few and far between—were encountered on the long hill descending into Loudwater, at Stokenchurch and Aston Rowant.

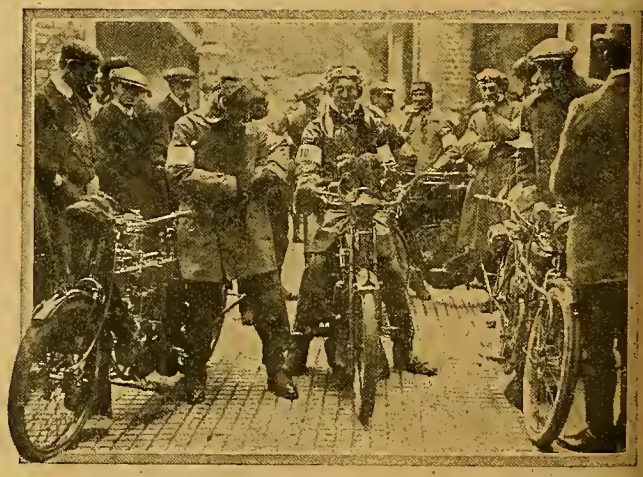
On Dashwood.

On Dashwood Hill, where the usual crowd of spectators had congregated, the surface, especially on the near side, was good; there was no wind, and next to no traffic, so that the hill-climbing conditions were ideal. Though things would have looked more cheerful had the sun come out, the roads would have dried too quickly and would have become dusty. All those who reached the foot of Dashwood Hill made satisfactory ascents, and the following are a few remarks made from careful observations on the hill.

The first competitor to come in sight was Miss Berend, whose little machine brought her up at a smart pace, though she used the pedals pretty vigorously. What appeared to be especially good ascents were made by W. Cooper (3½ h.p. Bradbury), F. Smith (5-7 h.p. Clyno), E. D. Dickson (7 h.p. Indian), A. V. Deacock (3 h.p. Wanderer, which came up in splendid form), G. E. Stanley (3½ h.p. Premier), C. J. Fox (7-8 h.p. Bat), F. W. Applebee (5 h.p. Rex), A. T. Stanton (3½ h.p. Bradbury), F. Savory (3¾ h.p. Premier), and Marshall and Newsome on Triumphs, while Islip on an Enfield made a particularly fine ascent for a lightweight. The remainder, except where otherwise stated, appeared to climb the hill in excellent form: E. A. Colliver (3½ h.p. P. and M., low gear), W. Pratt (3½ h.p. P. and M., top gear), H. Robert (3½ h.p. P. and M., low gear), B. A. Hill (3½ h.p. Kerry, first time a 1910 model has appeared in public competition—quite a good ascent), W. A. Lockwood (3½ h.p. P. and M.), G. L. Fletcher (2¾ h.p. Douglas), P. Phillips (2¾ h.p. Douglas), A. R. Abbott (8 h.p. Matchless and sidecar, Nala gear), E. H. Lees (5 h.p. Indian), C. K. Wigram (5 h.p. Rex, came up steadily), F. Philipp (3½ h.p. Scott), R. Samson (3½ h.p. Reg. Samson), M. Geiger (7-9 h.p. V.S. and sidecar), G. T. Gray (3 h.p. N.S.U., low gear), P. M. Pridmore (3½ h.p. Triumph), F. H. Stevenson (3½ h.p. Triumph), C. J. Janssen (2¾ h.p. Moto-Rêve, pedalled, but came up well), A. Forbes (5-6 h.p. A.C.), V. Underhill (3½ h.p. L.M.C.), H. A. Cooper (2¾ h.p. Douglas), A. C. Robbins (3½ h.p. Humber, came up on top gear, but had to change down actually on the crest), F. A. James (1½ h.p. Omega, pedalled, but came up well), E. Leighton (3½ h.p. Triumph), J. S. Holroyd (1½ h.p. Motosacoche, pedalled lightly), H. Lord (3½ h.p. Excelsior), A. L. Barker (3½ h.p. Clyde), W. Hewitt, jun. (3½ h.p. Excelsior), A. E. Wills (3½ h.p. Arno), J. F. Slaughter (3½ h.p. Ariel), G. N. Higgs (5-6 h.p. A.C.), W. Keep (4½ h.p. Midget Bicar), W. G. Ayling (3½ h.p. Midget Bicar), S. R. Cooke (2¾ h.p. Douglas), J. V. Robinson (2¾ h.p. Douglas), R. Measures (3½ h.p. Triumph), F. Savory (3½ h.p. Premier), C. Patteson (1½ h.p. Moto-Rêve, pedalled), W. Bennison (5-6 h.p. A.C. Sociable), J. F. Crundall (3½ h.p. Humber), B. Yates (3½ h.p.

Afternoon tea at Amersham, provided by "The Motor Cycle," was very popular. The competitors were anxious to be snapped drinking continued success to this journal.

Leaving Banbury on the return journey, F. Philipp (two-stroke Scott) leading. The famous Banbury Cross may be seen in the background.



Preparing to leave Banbury after the luncheon stop. H. Robert (P. & M.), C. K. Wigram (5 h.p. Rex), and E. D. Dickson (7 h.p. Indian).

A.C.U. Quarterly Trial.—

Humber), F. E. Edmonds (3½ h.p. Humber), G. Allan (3½ h.p. James), A. D. Arter (3½ h.p. James), G. Brough (3½ h.p. Brough), C. Hill (5-6 h.p. A.C. Sociable), F. J. Ellis (3½ h.p. Matchless), S. C. Perryman (3½ h.p. Ariel), A. L. Lamb (3½ h.p. Humber), F. A. Applebee (5 h.p. Rex), S. A. M. Witham (3½ h.p. Triumph), J. Portwine (5-6 h.p. A.C.), J. Greaves (2½ h.p. Enfield), H. Cox (2¾ h.p. Douglas), and H. C. Griffen (3½ h.p. Griffen-Simplex Premier).

Clear of Aston Rowant the going was excellent, though the early part of the Wheatly-Islip loop road was somewhat bumpy. All through Oxfordshire the police behaved magnificently; all cross-roads were watched by constables or sergeants, and here and there an inspector was seen on his bicycle inspecting his men at their posts. Only one man — a non-competitor — was stopped by the police, and that was for driving too fast in Stokenchurch. Following in the tail of the procession, very few machines were seen in trouble. A. D. Arter (3½ h.p. James) was seen suffering from a burst tyre; Miss Berend had one stop, apparently through overheating; and Yates had one stop for plug trouble.

Miss L. Berend (2 h.p. Moto-Reve) and G. E. Brough (3½ h.p. Brough) at Uxbridge.

The Banbury Control.

When we arrived in Banbury, the first person we met was the Mayor of that town, who made full enquiries about the day's trials, particularly with regard to the way in which the marks were allotted, etc. It is worthy of note that, although the trials' luncheon stop has been at Banbury ever since the inauguration of the Quarterlies, no untoward incident has ever occurred, and the police have, as far as we know, been thoroughly satisfied with the conduct of the whole of the competitors. The garage at the Red Lion presented its usual animated scene, and the number of spectators and interested riders was larger than usual.

At 12.13 p.m. the competitors began to arrive. W. Pratt (3½ h.p. P. and M.) led the way, followed by W. Cooper (3½ h.p. Bradbury) and Miss L. Berend (Moto-Rêvé). Miss Berend did not appear in the slightest degree distressed with her long ride. Between 12.13 and 12.30 nearly all the competitors had arrived, and very soon a telegram was received from Mr. Straight, advising the officials that sixty-nine competitors had left Dashwood Hill. We hardly expected, despite the reliability of the modern motor cycle, that everyone would turn up at Banbury within the schedule time, but by 12.53 the whole of the sixty-nine had reported themselves, and a quarter of an hour later the officials began dispatching the early arrivals on their return journey to Uxbridge, *viâ* Bicester and Amersham. One unfortunate competitor, V. Underhill (3½ h.p. L.M.C.), broke his belt fastener within a few yards of the garage doors and returned to report and repair. This was the only incident of any note that took place during the luncheon control, and before 2 p.m. the party of willing checkers were seated at luncheon.

On the return journey, Stanton was seen at the foot of the hill out of Banbury with plug troubles, while Applebee, sen., had a stop from a similar reason. The road to Aynho was pretty good, but a fair quantity of mud was met with under the trees. The course was well marked—in fact, better than usual—and P. W. Bischoff rendered valuable assistance in this direction. Messrs. A. H. Hunter, — Maybury, F. A. Hardy, and A. E. Woodman rendered the organisers great assistance by following the men on motor bicycles. On Rectory Hill the surface was in very good order, and what wind there was favoured the competitors. As on Dashwood, Mr. A. V. Ebblewhite took the times at the start and Mr. Straight took the times at the finish. Tea was provided for the men by *The Motor Cycle* at the foot of the hill, which was much appreciated.

Excellent ascents were made by W. Cooper (3½ h.p. Bradbury), E. D. Dickson (7 h.p. Indian), G. E. Stanley (3½ h.p. Premier), G. L. Fletcher (2¾ h.p. Douglas), F. Philipp (3½ h.p. Scott), C. J. Fox (7-8 h.p. Bat), A. V. Deacock (3 h.p. Wanderer), W. Hewitt (3½ h.p. Excelsior), J. Marshall (3½ h.p. Triumph), F. A. Applebee (5 h.p. Rex), J. F. Slaughter (3½ h.p. Ariel), W. Newsome (3½ h.p. Triumph), — Islip (2½ h.p. Enfield), and G. N. Higgs (5-6 h.p. A.C. Sociable). Satisfactory ascents were made by F. W. Applebee (5 h.p. Rex), W. Pratt (3½ h.p. P. and M.), H. Robert (3½ h.p. P. and M.), E. H. Lees (5 h.p. Indian), B. A. Hill (3½ h.p. Kerry), E. A. Colliver (2½ h.p. P. and M.), A. R. Abbott (8 h.p. Matchless and sidecar), F. Smith (5-7 h.p. Clyno), C. K. Wigram (5 h.p. Rex), P. Phillips (2¾ h.p. Douglas, pedalled, but came up well), W. A. Lockwood (3½ h.p. P. and M.), M. Geiger (7-9 h.p. V.S. and sidecar—engine missing, but came up well), R. Samson (3½ h.p. Reg-Samson), G. T. Gray (3 h.p. N.S.U.), E. Leighton (3½ h.p. Triumph), F. A. James (1½ h.p. Omega, pedalled), A. C. Robbins (3½ h.p. Humber), H. A. Cooper (2¾ h.p. Douglas), F. W. Phillips (1½ h.p. Omega, clutch slipping), A. Forbes (5-6 h.p. A.C.), G. E. Brough (3½ h.p. Brough), P. M. Pridmore (3½ h.p.

A.C.U. Quarterly Trial.—

Triumph), F. H. Stevenson (3½ h.p. Triumph), C. Cross (3½ h.p. L.M.C.), J. V. Robinson (2¾ h.p. Douglas, pedalled), J. S. Holroyd (1½ h.p. Moto-sacoche), S. R. Cooke (2¾ h.p. Douglas, pedalled), H. Lord (3½ h.p. Excelsior), J. F. Crundall (3½ h.p. Humber, top speed), F. E. Edmonds (3½ h.p. Humber), R. Measures (3½ h.p. Triumph), C. Patteson (1½ h.p. Moto-Rêve), W. Keep (4½ h.p. Midget Bicar), B. Yates (3½ h.p. Humber), A. L. Barker (3½ h.p. Clyde), J. Portwine (5-6 h.p. A.C.), F. J. Ellis (3½ h.p. Matchless, pedalled), V. Underhill (3½ h.p. L.M.C.), B. Jones (3¾ h.p. twin Premier), F. Savory (3½ h.p. Premier), G. Allen (3½ h.p. James), S. C. Perryman (3½ h.p. Ariel), S. A. M. Witham (3½ h.p. Triumph), A. T. Stanton (3½ h.p. Bradbury), C. Hill (5-6 h.p. A.C.), — Greaves (2½ h.p. Enfield, pedalled), A. L. Lamb (3½ h.p. Humber, impeded), C. J. Janssen (2¾ h.p. Moto-Rêve, misfiring), A. E. Wills (3½ h.p. Arno), W. G. Ayling (3½ h.p. Midget Bicar, dismounted), W. Bennison (5-6 h.p. A.C., shed his passenger), H. C. Griffen (3½ h.p. Griffen-Simplex-Premier and sidecar), and H. Cox (2¾ h.p. Douglas, plug trouble, arrived too late to be timed). C. Patteson (1½ h.p. Moto-Rêve) had trouble close to Uxbridge; he dismantled nearly everything on his engine, including the timing gear, reassembled the parts, and finished the journey without finding the cause of the trouble.

Of the seventy-three entries, those who did not start were J. G. T. Frith, H. S. Selves, and R. G. Mundy; while of the seventy starters only one failed to complete the course—D. R. Clarke (3½ h.p. James), who gave up before reaching Dashwood. All the passenger machines which started finished. The above information is unofficial.

Preliminary List of Non-stop Runs.

The following competitors report finishing the journey without trouble, but this result must not be regarded as official. The official awards will only be made public after the A.C.U. Committee has met to-morrow evening and passed the judges' report.

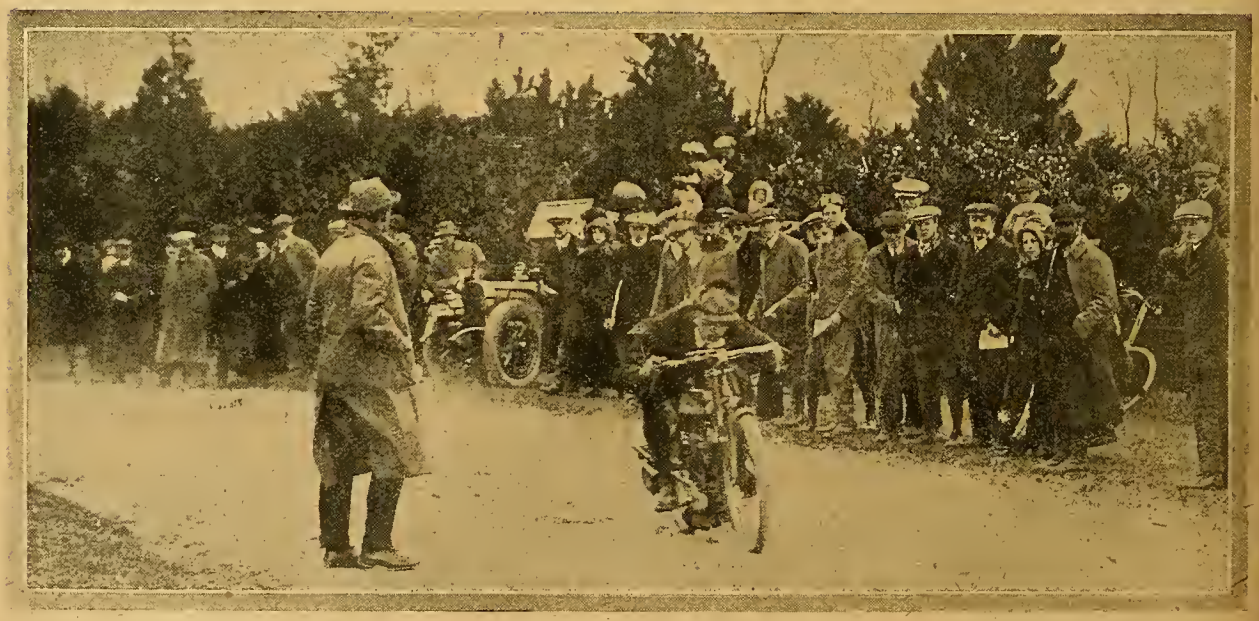
W. Cooper (3½ Bradbury).
W. Pratt (3½ P. and M.).
E. A. Colliver (2½ P. and M.).
H. Robert (3½ P. and M.).
F. Smith (5-7 Clyno).
B. A. Hill (3½ Kerry-Abingdon).
W. A. Lockwood (3½ P. and M.).
F. Philipp (3½ Scott).
R. Samson (3½ Reg. Samson).
G. L. Fletcher (2¾ Douglas).
P. M. Pridmore (3½ Triumph).
F. H. Stevenson (3½ Triumph).
C. J. Fox (7-8 Bat).
G. T. Gray (3 N.S.U.).
A. C. Robbins (3½ two-speed Humber).
H. A. Cooper (2¾ Douglas).
A. V. Deacock (3 Wanderer).
F. A. James (1½ Omega).
F. W. Phillips (1½ Omega).
A. L. Barker (3½ Clyde).
B. Jones (3¾ Premier).
F. Savory (3½ Premier).
J. S. Holroyd (1¼ Moto-sacoche).
H. Lord (3½ Excelsior).
J. F. Slaughter (3½ Ariel).—
S. R. Cooke (2¾ Douglas).
R. Measures (3½ Triumph).
J. V. Robinson (2¾ Douglas).
E. Leighton (3½ Triumph).
C. Cross (3½ L.M.C.).
J. F. Crundall (3½ Humber).
F. E. Edmonds (3½ Humber).
G. Allen (3½ James).
J. Marshall (3½ Triumph).
G. E. Brough (3½ Brough).
F. J. Ellis (3½ Matchless).
S. C. Perryman (3½ Ariel).
A. L. Lamb (3½ Humber).
F. A. Applebee (5 Rex).
S. A. M. Witham (3½ Trinmph).
—. Islip (2½ Enfield).
A. Forbes (5-6 A.C. tricar).

PASSENGER CLASS.

G. N. Higgs (5-6 A.C. tricar).
A. Forbes (5-6 A.C. tricar).
C. Hill (5-6 A.C. tricar).

Mr. A. G. Reynolds, who was unable to follow the whole trial, did excellent work in marshalling the machines on their arrival at the end of the day. Each competitor as he came in had to place his machine in its proper numerical position, so that the judges were enabled to check the arrivals and to carry out their work of inspection with ease.

HERTS. COUNTY A.C. HILL-CLIMB AT ASTON (see opposite page).



J. P. Le Grand (5 h.p. Rex) at speed in the All-comers' Class. Crowds of spectators lined the roadside almost the whole length of the hill.

HERTS. COUNTY A.C. MEMBERS' HILL-CLIMB.

At the start—W. S. Stafford riding a 5 h.p. Kerry in the class for machines manufactured during or prior to 1907.

ON Saturday last the Herts County Automobile Club carried out its members' hill-climbing competition on Aston Hill, near Tring, a venue which is closely identified with the promoting club, as it has for some years past held, in addition to its members' events, open competitions for both motor cycles and cars. The hill, which has more than an average gradient, is nearly a mile in length, and the steepest portion is encountered soon after the start. The surface on Saturday was in excellent condition. The weather was dull and cold, and although at times it looked very threatening only a slight shower fell while the event was in progress. A very good entry had been received, and this would probably have been larger, but the committee of the club refused to elect a number of candidates who had applied for membership apparently for the special purpose of taking part in the competition. Unfortunately, just before the conclusion of the motor cycle events, W. A. Jacobs, one of the competitors in Class 5, had the misfortune to fall when travelling at a great speed, the cause of the accident being due to his goggles dropping from his cap across his face, and in removing them he lost control of his steering. Fortunately he did not sustain any serious injuries, although he was rather badly cut about the face by the glass from the goggles.

In order to encourage the owners of old machines who are apt to think they do not get a fair chance when competing in the same classes with riders of more up-to-date machines, the committee provided a class for motor cycles manufactured during or prior to 1907, but apparently there are not many old machines in the club, for it only attracted three entrants.

The weighing of the machines having been carried out expeditiously at Boxmoor Station, a start was made with commendable promptitude at the advertised time, the competitors being despatched at intervals by Mr. T. H. Woollen.

The following are the results of the various classes:

CLASS 1.—For bicycles manufactured in 1907 or previous years. Open only to members who have not previously won a prize in a hill-climbing competition. Pedalling allowed.

	Rider and machine.	Fig. of merit.	Difference in time.
1.	H. Karslake (3½ Dreadnought)	126	0
2.	W. S. Stafford (5 Kerry)	172	4s.

The "old crocks," as they were called by the spectators, made a very creditable show, but the riders naturally came in for a great deal of chaffing from their friends.

CLASS 2.—For single-cylinder bicycles with fixed gears.

1.	W. Cooper (3½ Bradbury)	88	0
2.	C. C. Cooke (3½ Triumph)	100	11⅘s.
3.	Miles Brunton (3½ Triumph)	101	12⅖s.
4.	W. A. Jacobs (3½ Rex)	102	5⅖s.
5.	F. White (3½ Rex)	121	19⅕s.
6.	E. Gwynne (3½ Triumph)	124	24⅘s.
7.	A. H. Colliver (3½ Triumph)	127	28⅘s.

Cooper climbed the hill in splendid style, as also did Jacobs, and special mention should be made of Hon. Sec. Cooke, who made an excellent ascent.

CLASS 3.—For multi-cylinder bicycles with fixed gears.

1.	A. V. Deacock (3 Wanderer)	107	28½s.
2.	C. M. Down (5 Indian)	114	6s.
3.	J. P. Le Grand (5 Rex)	123	0
4.	F. A. Hardy (5 V.S.)	124	21s.
5.	W. H. Wells (5 Indian)	140	28⅗s.
6.	E. Gwynne (7 V.S.)	147	12s.
7.	G. Rowden (7-8 Bat)	161	7⅖s.
8.	W. S. Stafford (5 Kerry)	172	38⅘s.

It was quite apparent when Le Grand hove in sight that his was a good performance; in fact, it was the fastest of the day so far.

CLASS 4.—For bicycles with variable gears.

1.	E. A. Colliver (2½ P. and M.)	93	25⅘s.
2.	H. Karslake (3½ Dreadnought)	126	23⅘s.
3.	F. A. Hardy (5 V.S.)	127	0
4.	B. Marians (3½ P. and M.)	133	20⅕s.
5.	W. Pratt (3½ P. and M.)	156	33⅗s.
6.	R. G. Goslett (3½ P. and M.)	167	52⅖s.
7.	F. J. Beard (3½ Scott)	272	87s.

Beard's machine could not have been going at all well, for he made a very poor show, and nearly stopped. The low-powered P. and M. took the hill in fine style.

Classes 1 to 4 were only open to standard touring machines, and the results were decided on the A.C.U. formula.

CLASS 5.—For any motor bicycle, fastest time to win.

The results of Class 5 are not yet available.

The following are the officials, who worked hard to make this event the success it undoubtedly was, and they are to be congratulated upon the excellence of the general arrangements: Judge, Lord Herbert Scott, D.S.O.; clerks of the course, Messrs. S. Saker, F. J. Jenkins, F. G. Carter, and R. G. Booth; marshals, Messrs. F. M. Carson and J. Jaggard; clerk of the scales, Mr. A. F. Petch; timekeepers, Messrs. T. H. Woollen and C. Wheeler; hon. secretary, Mr. C. C. Cooke.

In our last issue in the description of the B.M.C.R.C. second members' meeting, we gave F. A. Applebee's time and speed in the Record Time Trials incorrectly. Applebee rode a standard Rex 3½ h.p. single-cylinder 83 by 89 mm. 482 cc., and covered the flying mile at a speed of 60.7 miles per hour. Applebee's position in Class C should therefore have been first instead of seventh, as he tied with another competitor who accomplished the same speed but on a machine with slightly greater cylinder capacity. We much regret the error, which was of a purely clerical character.

A.C.U. SPRING QUARTERLY TRIALS (FULLY DESCRIBED AND ILLUSTRATED).
MILITARY MOTOR CYCLING NOTES: THE ART OF DESPATCH RIDING.
HERTS COUNTY A.C. HILL-CLIMB AND OTHER CLUB EVENTS.

The T.T. Fund.

Further contributions to this deserving fund are: Price's Patent Candle Co., Ltd., £5 5s.; A. J. Sproston, 10s.; W. Heaton, 2s. 6d.; Triumph Cycle Co., Ltd., £10 10s.; Jebron (J. E. Brown per *The Motor Cycle*), £1.

Tourist Trophy Entries.

Entries for the Tourist Trophy Race received since our last issue went to press are: J. Gibson (3½ h.p. Trump-J.A.P.), D. E. Rea (3½ h.p. Mors), Premier Cycle Co., Ltd. (two 3½ h.p. Premiers and one 5 h.p. twin Premier, riders G. E. Stanley, F. Savory, and B. Vickers Jones respectively), Zenith Motors, Ltd. (two Zenith Graduas), J. R. Woodward (5 h.p. Rex), Components, Ltd. (two 3½ h.p. Ariels), W. G. McMinnies (3½ h.p. Triumph), F. W. Dayrell (5 h.p. Bat-J.A.P.) The entry of F. Geddes has been withdrawn. The complete list now totals sixty-one, and the A.C.U. reminds competitors that it reserves the right of refusing or limiting further entries.

An Object Lesson.

Mr. P. W. Bischoff, who was recently stopped on the Embankment for exceeding the speed limit, speaks in warm terms of the courteous treatment he received from Sergt. Thomas, who was in charge of the control. The measured distance of 220 yards was actually 225 yards. Further to eliminate any possibility of error, any discrepancy between the watches is added to the time, and no prosecution follows unless the speed then works out at over twenty-three miles an hour. Mr. Curtiss Bennett, at Bow Street, recognised that the offence was purely technical, and imposed a fine of 22s., including costs. Such impartiality is a notable object lesson to the procedure of certain other benches.

F. J. Beard on a 3½ h.p. Two-stroke Scott in the Herts County A.C. Members' Hill-climb at Aston last Saturday. (See previous page.)

Open Hill-climb in Scotland.

An open hill-climbing contest is being arranged by the Glasgow Motor Cycle Club for Saturday, the 7th prox. The venue will only be made known to competitors.

B.M.C.R.C. Meeting at Brooklands.

On Wednesday next, at Brooklands, the B.M.C.R.C. will hold its third members' meeting of 1910. Three events are on the programme, commencing at 2.30 p.m., details of which will be found on another page of this issue.

Special Issue of "The Motor Cycle."

The seventh spring issue and T.T. special number will appear on Thursday, May 26th, the day of the Tourist Trophy Race in the Isle of Man. Besides special articles and illustrations, it will contain an illustrated historical article descriptive of the International Cup Race (the forerunner of the present T.T. Race), and the Tourist Trophy Race to date, photographs of competitors in this year's event with specifications of their machines; touring centres, illustrated with maps of the best roads in the vicinity, etc.

The New Licence Fee of £1.

Under the guillotine motion the Budget of this year was to have passed through its last stage in the House of Commons yesterday (Wednesday), and the new uniform rate of £1 for motor cycles will be enforced for the second six months of 1910. Licences taken out this year are to cease to have effect after June 30th, and fresh licences will have to be taken out on July 1st, but allowance will be made for any duty paid for any period of 1910 previous to July 1st.

New Regulation at Brooklands.

The B.A.R.C. has issued a new regulation which will appear in future upon the instructions that are always sent to competitors before a meeting. This refers to passing at the fork, and is intended to prevent the recurrence of any accident such as the one which occurred near the fork at the Easter meeting. The regulation reads as follows: "A line has been painted on the track, near the outer edge, opposite the entrance to the 'straight.' Competitors must keep this line on their right hand unless in the act of passing a car." The same regulation applies to motor cycles.

First Open Event of 1910.

The first open hill-climb of 1910 takes place at Aston Hill, near Tring, on the 7th prox. The event is being organised by the motor cycle section of the Herts County A.C. Entries close to-morrow (Friday) at 6 p.m.

London-Land's End-London Awards.

In connection with the above competition for the Jarrott Cup, the M.C.C. has now decided to award silver medals to O. L. Summers (7 h.p. twin Peugeot) and J. V. Robinson (2¾ h.p. twin Douglas). These two names were held over for further consideration when the first list of awards was published.

A Meeting of Northern Club Officials.

An important meeting is to be held at York on Saturday, when officials representing all the important clubs in the North will meet to decide whether the clubs composing the Northern League will affiliate with the Auto Cycle Union or fight that body. The decision of the latter course would be most unfortunate. A copy of the agenda is given on another page. Some enlightened individual said the other day that there were only four important unaffiliated clubs. If he knew anything of the conditions of the North, he would find that there are more than four important unaffiliated clubs even in Yorkshire.

M.C.C. London-Edinburgh Run.

Those who rode in last year's event will be interested to hear that the bridge that was under construction at Doncaster and was so awkward to negotiate is now practically finished, and no trouble will be experienced at this spot this year.

New System of Timing.

Another important alteration so far as entrants for the Motor Cycling Club challenge cup for motor bicycles and Rover cup for cars are concerned is the entirely new system of timing to be adopted—a system which should certainly prove advantageous, especially with so many entrants. There will be a minimum of five "surprise checks" each way, at each of which will be stationed a timekeeper with a green flag corresponding with the green ribbons carried by the riders in these two events. Should any "surprise checks be arranged in the dark the timekeeper will show a green light. Riders competing for these two trophies only will be required to stop and be timed (riders for club medals will not be required to stop). The object of these "surprise checks" is to avoid the timekeeper being harassed by a crowd of more than one rider stopping at one time so that accuracy can be assured.

Another interesting feature is the special signposting of the Great North Road, which is being carried out by the Royal Automobile Club. This, in conjunction with the numerous direction arrows which are posted up all along the route by willing helpers and members of different clubs, should still further prevent any man going astray.

Entries (which closed at ordinary fees yesterday) have been flowing in for the run. Up to May 2nd entries will be accepted at double fees

Speed Trials at Whitsuntide on Filey Sands.

Permission having been obtained for the use of Filey sands for a speed contest, the Scarborough and District M.C. will hold a "flying kilometre" speed contest on these famous sands on Whit-Monday, open only to members and visiting members. Any motor cyclist who desires to become a "visiting member" may do so on payment of the fee of 2s. 6d. to the honorary secretary, Mr. H. Frain. A special electrical timing apparatus (probably wireless) will be used. Entries will be divided into classes according to cubical capacity, and the winner will be judged entirely on speed.

FUTURE EVENTS.

April 30—M.C.C. Members' Hill-climb.
May 4—B M.C.R.C. Meeting at Brooklands.
" 7—Herts. County A.C. (motor cycle section) Open Hill-climb.
" 13, 14, and 16 (Whitsun)—M.C.C. London-Edinburgh and London-Edinburgh and Back Runs.
" 26 (Thurs.)—INTERNATIONAL MOTOR CYCLE T.T. RACE
" 27—Open Hill-climb in the Isle of Man.
June 4—Motor Cycling Club second private race meeting & gymkhana at Brooklands.
" 6-11—Scottish Six Days' Open Reliability Trial, organised by Edinburgh M.C.C.
" 18—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CHALLENGE CUP. Competing Teams: Motor Cycling Club (holders), Coventry and Warwickshire M.C., Bristol B. and M.C., Streatham and District M.C., Sutton Coldfield A.C., Edinburgh M.C.C., Southern M.C., Harrogate and District M.C.C., Great Yarmouth and District M.C.C., Herts. County A.C., Essex M.C., and N.W. London M.C.C.

Somewhat Ancient.

Evidently the promoters of the Tunbridge Wells Whit-Monday Sports are unacquainted with modern motor cycle matters. The names and addresses given on the list of events we have received are so hopelessly out of date that we cannot refrain from referring to them. Here are one or two examples: Under the regulations of the *A.C.G.B.I.* Competitors must be licensed by the *Automobile Club, 18, Down Street*, W. Handicapper, Mr. F. Straight, *Auto Club.*

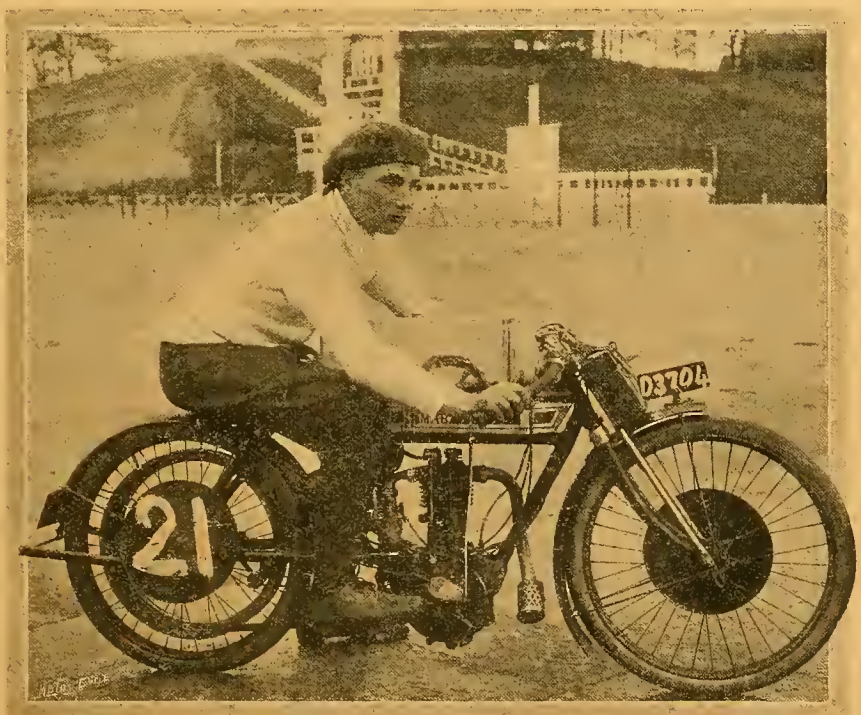
Police Traps.

We have received information that the police are very active at Ombersley, on the Kidderminster-Worcester Road. If they fail to prove excess of the legal limit the conviction is generally for driving to the common danger.

We have received rumours of a police trap between St. Albans and London Colney. The exact extent of the measured distance is not to hand, but between St. Albans and the village, a distance of three miles, caution is advised.

Motor Cycles in Denmark and Germany.

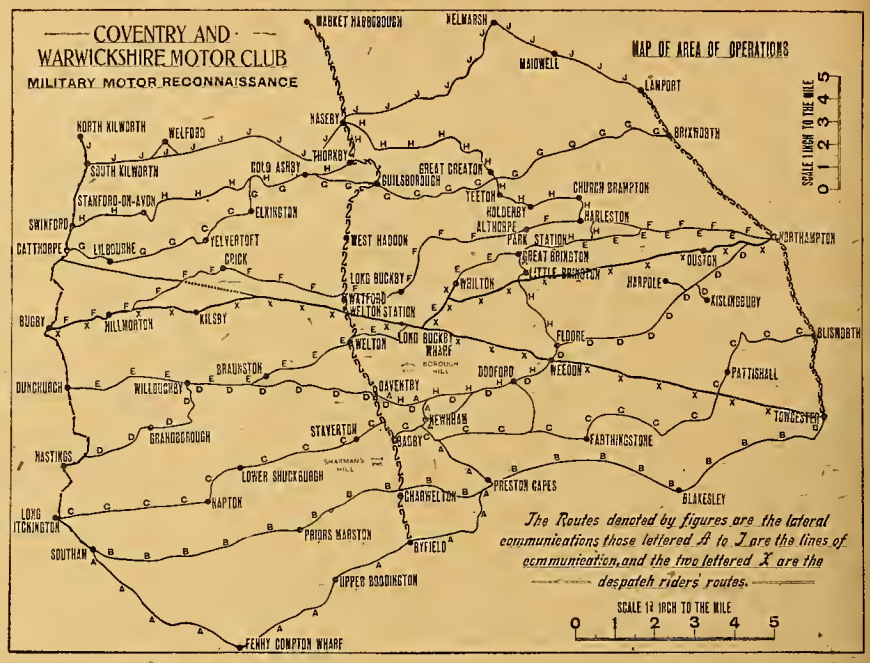
On September 1st, 1909, there were in Denmark 699 cars and 3,418 motor cycles—a comparatively high number of motor cycles, figuring out at thirteen motor cycles per each 10,000 inhabitants. In Germany with 22,479 motor cycles (January 1st, 1910) there are only 3 to 4 motor cycles per each 10,000 inhabitants. On the other hand, Germany, with her 27,462 motor cars, boasts five motor cars for each 10,000 inhabitants, whilst the figure, as far as Denmark is concerned, is only between two and three per each 10,000 inhabitants.



J. T. Bashall—a brother of W. H. Bashall—has had the above sporting little racer built for speed work, and entered it for yesterday's April Handicap at Brooklands. The machine is a M.A.B. and the engine a J.A.P., measuring 85 × 60 mm. J. T. and W. H. Bashall will ride Twin Bats in the T.T. Race.

COVENTRY AND WARWICKSHIRE M.C. MILITARY MOTOR RECONNAISSANCE.

The map which accompanies this paragraph shows the area which will be covered in the Military Motor Reconnaissance on Saturday next. Each car will be in command of a territorial officer in uniform, who will also have charge of the motor cyclists attached to the car. One or more cars will be allotted to each of the roads marked A to J. The motor cyclist scouts will be sent ahead and down each by-road at right angles to the advance, the car awaiting their report. All important information will be sent by motor cyclist despatch riders to the routes marked X. On these routes there will be despatch riders who will take the information to the General Officer in command of the Midland forces. The routes marked 1, 2, 3, are the lateral communication routes, 1 being the first reached from Coventry. Here lateral communication will be established; each car, by means of the motor cyclist scouts, will get in touch with cars on its right and left. When this has been done a move forward will take place to routes 2 and 3. The meet will be at the Barrack Square, Coventry, at 11.30 a.m., and tea at the Wheatsheaf, Daventry, about 5.30 p.m.



B.M.C.R.C. THIRD 1910 MEMBERS' MEETING.

The events down for decision at the meeting at Brooklands on Wednesday next, the 4th prox., are:

2.30 p.m. ALL COMERS' HANDICAP, for all classes of motor cycles, the cubic capacity of whose engines does not exceed 1,000 cc. Distance about 8½ miles.

3 p.m. ONE MILE SPRINT RACE, for all classes of motor cycles up to 1,000 cc. engine capacity.

4 p.m. THE THIRD AND FINAL ONE HOUR TOURIST TROPHY RACE, for motor cycles complying with the 1910 Tourist Trophy conditions in full, except that the regulation as to the weight of tools carried will not be insisted upon.

Entries close mid-day, April 30th. Admission to members is free; to the general public, 1s.

NORTHERN LEAGUE OF MOTOR CYCLE CLUBS.

A notice respecting the inaugural meeting of the above has been issued to over thirty clubs north of the Witham and Dee, and it is expected that all will be represented. The hon. secs. and chairmen will in most cases represent their respective clubs. Should any have been overlooked they are requested to regard the notice reprinted below as an invitation to attend.

"I beg to inform you that a meeting of motor cycle club officials has been arranged to be held at the Royal Station Hotel, York, on Saturday, April 30th, at 6.30 p.m., to discuss and transact the following business:

"To consider a scheme for the Union of the Motor Cycle Clubs in the North of England, and to officially form a league of such clubs as proposed at the meetings held at Scarborough, 1909-10

"To elect officers and council of the league, and discuss the rules and constitution of the association.

"To discuss the relations of the league with other motor cycle organisations.

"To make arrangements for a later meeting to be held, and suggest the business to be brought before the assembly on that date.

"To make arrangements for a meeting and combined competition to be held at Whitsuntide, and also to propose any other social gatherings to be held this season.

"As it will doubtless be apparent to you after reading the above agenda, this meeting will be of great importance to all those interested in the club movement in the North. I would therefore ask your club to kindly send two or three representatives, including yourself and the chairman of the club if possible.—(Signed) T. H. STRAKER, hon. sec."

North-West London M.C.C. Consumption Trial. Competitors lined up outside Stanmore Station after the weighing operations.

CLUB NEWS.

Edinburgh M.C.C.

The first event of 1910 takes place on Saturday next, in the form of a hill-climbing competition at Peebles.

Motor Cycle Union of Ireland (Ulster Centre).

The first hill-climb of 1910 was held at Bangor on Saturday last, the entries being divided into two classes, "A" for novices and "B" open. A handicap was arranged, entrants competing in pairs. There were twelve entrants in Class A and twenty in Class B.

Motor Cycle Union of Ireland (Ulster Centre) Hill-climb at Bangor. The winner, B. J. McManus (3½ h.p. Premier), leading in the final.

In Class A the final was won by B. J. McManus (3½ h.p. Premier with auxiliary exhaust) from C. R. Martin (3½ h.p. Triumph).

In Class B the finalists were B. J. McManus (3½ h.p. Premier) and C. Rea (3½ h.p. Triumph), the former again proving successful.

Reading and District M.C.C.

A meeting will shortly be held to reorganise the club. Will readers interested and willing to join please send names and addresses to Hon. Sec. Frank Deacon, 4, Fatherson Road, Reading. An old member is offering a prize for an opening hill-climb.

Abertillery and District M.C.C.

At a well attended first meeting of the above club, R. Wessendorff, Pleasant View, Llanhilleth, was elected president, H. Campion treasurer, and W. D. Lewis-Evans, M.A., hon. secretary. Arrangements were also made for reliability trials and hill-climbing and speed-judging competitions.

York County M.C.C.

A petrol consumption trial was held on Saturday last. The course selected was Wetherby to Boroughbridge and back, 12½ miles each way. Result:

		Miles to gallon.	Fig. of merit.
1.	C. Benn (3½ h.p. Triumph) ...	173 ...	36.08
2.	W. Bougill (3½ h.p. Bradbury)...	160 ...	34.4
3.	—. Fenton (3½ h.p. Triumph) ...	135 ...	28.8
4.	H. Wilkinson (3½ h.p. Triumph)	129 ...	27.9
5.	F. Scott (3½ h.p. Triumph) ...	131 ...	27.37
6.	H. Whitfield (3½ h.p. Triumph)	125 ...	24.6
7.	—. Boyd (3½ h.p. Humber) ...	111 ...	23.9
8.	Dr. Deane (5 h.p. Rex)	77 ...	23.2

There was a strong head wind and rain on return journey.

Lewes M.C.C.

On Tuesday next, at the White Hart Hotel, at 8 p.m., a general meeting is to be held for the purpose of drawing up rules and enrolling members of the above club. Local readers are invited.

Glasgow M.C.C.

This club has arranged to hold an open hill-climbing contest on Saturday, 7th May. The committee, looking out for a fresh hill, have discovered one within easy reach of Glasgow which is ideal as regards steepness, straightness, quality of surface, and absolute freedom from interrupting traffic. It makes a real test of the hill-climbing capacity of the modern 3½ h.p. machine. To avoid possibility of interference it is not considered advisable to publish the venue, but this is stated on the entry forms, which can be obtained from the hon. secretary, A. Gordon Bostock, Students Union, University, Glasgow.

Walthamstow M.C.

On Saturday last a members' hill-climb was held near Nazing, being well supported. After the successful events thirty members and friends sat down to tea at the Sun, Nazing Common. Messrs. A. G. Reynolds and J. W. Percival were timekeepers. Result as follows:

Class A.—Sealed handicap for passenger machines.

Rider and machine.	Nett time. M. S.	Handicap time. M. S.
1. J. H. Kerr (5 h.p. Rex)	0 52 1/5 ...	0 49 1/5
2. F. W. Applebee (5 h.p. Rex) ...	0 57 1/5 ...	0 55 1/5
3. F. A. Applebee (5 h.p. Rex)	1 2 ...	1 2
4. S. McMinn (6 h.p. Phänomen) ...	1 10 4/5 ...	1 9 4/5

Class B.—Sealed handicap for single-cylinder bicycles.

1. A. A. Blanks (3½ h.p. Rex)	0 43 2/5 ...	0 39 2/5
2. A. T. Stanton (3½ h.p. Bradbury) ...	0 42 2/5 ...	0 40 4/5
3. T. J. Sidney (3½ h.p. Brown) ...	0 43 3/5 ...	0 41 3/5

Eight competitors.

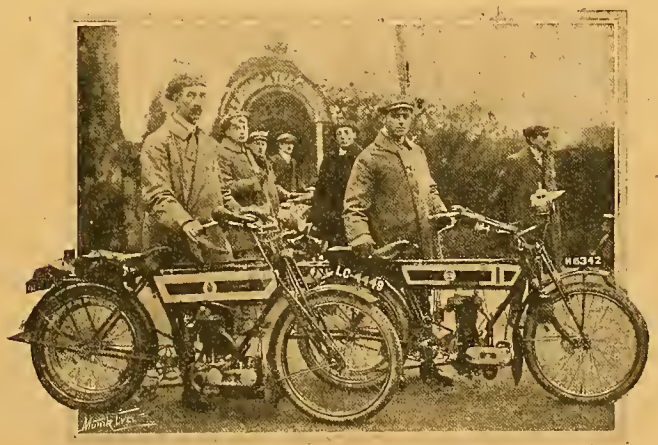
Class C.—Sealed handicap multi-cylinder motor cycles.

1. J. H. Kerr (5 h.p. Rex)	0 36 ...	0 33
2. F. W. Applebee (5 h.p. Rex) ...	0 38 3/5 ...	0 35 3/5
3. F. A. Applebee (5 h.p. Rex) ...	0 36 2/5 ...	0 36 2/5
4. G. McMinn (6 h.p. Phänomen) ...	0 42 3/5 ...	0 39 3/5

Class D.—Scratch event for single-cylinder motor cycles, run up in pairs, winner in each heat to compete again until winner was found. Winner, T. J. Sidney (3½ h.p. Brown).

Class E.—Scratch multi-cylinder motor cycles under same condition as D. Winner, J. H. Kerr (5 h.p. Rex).

Class F.—Winner of Classes D and E, J. H. Kerr (5 h.p. Rex).



North-west London M.C.C. Consumption Trial at Stanmore last Saturday. H. J. Pooley (3½ h.p. Premier) the winner, G. H. Hollis (3½ h.p. Triumph) second (see next page).

Club News.—

North-west London M.C.C.

A petrol consumption trial was held on Saturday last on a difficult course near Stanmore. The result was: 1st, H. Pooley (3½ h.p. Premier), 148.5 miles per gallon; 2nd, G. Hollis (3½ h.p. Triumph), 144 miles per gallon. Carburine spirit was kindly supplied by Mr. Brock, of Stanmore, who also lent a car for the use of officials. Mr. H. G. Cove, riding his new Matchless, acted as judge. Entries for the Coventry and return trial close next Monday, May 2nd.

Nottingham and District M.C.C.

On the occasion of the day run to Warwick and Kenilworth on May 1st, all members are asked to please be at the place of assembly punctually at 9.30, because the members of the Leicester and District M.C.C. are joining at Leicester at 10.30 prompt.

The Forest Sports Obstacle Race for motor cyclists is on May 7th. Will members who intend to compete in this event please send in entries to Mr. Spring by to-morrow (Friday)? The obstacles are to be arranged so that all classes of motor cycles can easily accomplish the race.

Harrogate and District M.C.C.

The speed-judging competition, although held in wet and boisterous weather, attracted a fair number of riders, who, in spite of the muddy roads and showers, enjoyed themselves. One competitor who was driving a sidecar experienced a puncture, and finished the run seated in the sidecar with his passenger. The results are as follow:

Rider and machine.	Speed in m.p.h.	Figure of merit.	Remarks.
F. Strafford (3½ h.p. Triumph)	17	X	Fast
W. Fawcett (3½ h.p. Scott)	16	51.4	Slow
J. A. Tindall (3½ h.p. Triumph)	20	112.3	Slow
F. Mackay (5 h.p. Rex)	18	117.1	Fast
R. Spencer (3½ h.p. Scott)	17	145.1	Slow
G. S. Sayner (3 h.p. Triumph)	20	151.4	Slow
W. F. Broadbank (3½ h.p. Triumph)	20	170.4	Fast
T. C. Atkinson (3½ h.p. Triumph)	20	270.1	Slow
W. Parker (3¾ h.p. Premier)	18	452.1	Fast
J. Mackay (2¼ h.p. Moto-Rêve)	17	561.1	Slow
J. Bramley (3½ h.p. Triumph and sidecar)	16	657.0	Fast
W. E. Grange (3½ h.p. Rex and sidecar)	19	981.4	Slow

Birmingham M.C.C.

The above club held a most successful hill-climb on Saturday last at Cox's Hill, Dunham.

Each competitor was allowed one attempt only. The hill is not a particularly steep one, but is a long grind of about three-quarters of a mile, with two rather stiff portions and two awkward corners.

The results on time were announced shortly after the competition, and are given herewith together with the results on formula. Owing to a slight error in working out the times Newey was announced as being third, whereas he should be bracketed with Slaughter for first place, Halberd then taking third place instead of second. The question of first prize will have to be gone into by the Trials Committee.

The officials were: Chief judge and timekeeper, Mr. E. R Lycett, assisted by Messrs. A. H. Haden and E. W. Winckle; starter, Mr. R. V. C. Brook. Synchronised watches were used for timing in this instance. Results:

Birmingham M.C.C. Hill-climb on the 23rd inst. Competitors comparing watches at top of the hill.

SINGLE CYLINDERS.

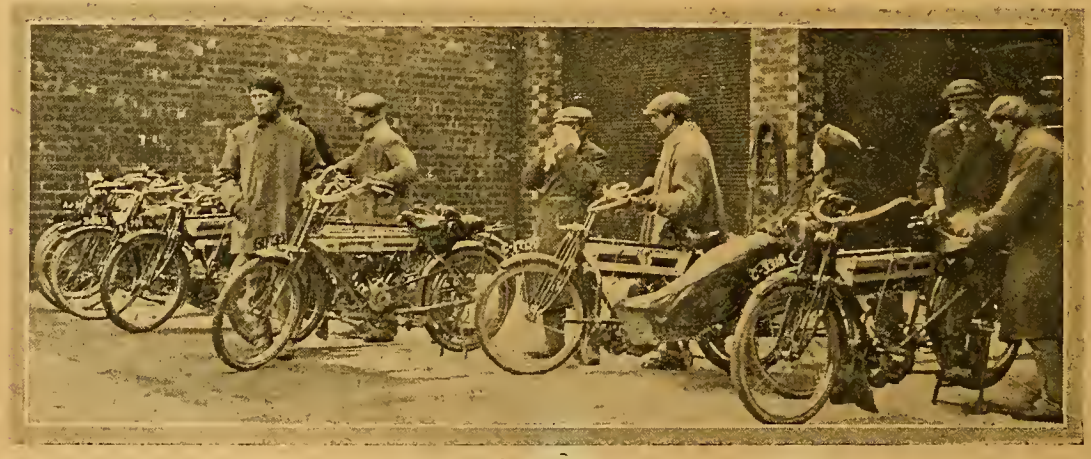
Name and machine.	Position on time.	Difference in time.	Fig. of merit.
J. H. Slaughter (3½ Ariel)	1	X	12.5
R. W. Duke (3½ Triumph)	4	6⅕	9.85
H. Newey (3½ Norton)	1	X	8.8
J. Troman (3½ Triumph)	6	8⅖	8.42
R. H. Halberd (3½ Bradbury)	3	⅕	8.4
H. J. Cox (1¾ Singer)	12	1 49⅕	8.0
R. H. Edwards (3½ Triumph)	8	9⅗	7.97
T. B. Clayton (3½ Bradbury)	4	6⅕	7.9
S. K. Jones (3½ L.M.C.)	10	29⅘	7.6
H. D. Jones (3½ New Comet)	6	8⅖	7.6
R. Samson (3½ Reg. Samson)	9	17⅘	7.3
F P. Mayell (3½ Triumph)	11	30⅖	6.66

TWIN CYLINDERS.

H. R. Fowler (5 Rex, twin)	1	X	7.7
S. C. Perryman (5 Norton, twin)	2	9⅗	7.43
S. Smith (5 Norton, twin)	3	14⅘	6.47

A. D. Arter (3½ James) failed through flooding carburetter.

Note.—Time is given in seconds slower than fastest. X = fastest. Formula used is $\frac{W}{C \times T}$.



Some competitors in the Harrogate M.C. Speed Judging Competition last Saturday assembled for the start in the garage of the Clarendon Hotel, Harrogate.

Club News.—

Bristol Bicycle and Motor Club.

The first of three reliability trials arranged by the above club took place on Saturday, the 16th inst., over a twenty-six and a half miles course, which had to be covered three times. There were checks at the completion of each circuit and a secret check on each. Competitors were penalised 1 mark for each half-minute outside schedule time at each check, and 20 marks for each stop, the one losing the least number of marks to be declared the winner. The course was a somewhat trying one, and the result was:

	Lost
W. W. Douglas (2¾ h.p. Douglas), non-stop ...	5 marks
P. Phillips (2¾ h.p. Douglas), non-stop	7 ,,
F. C. Wasley (2¾ h.p. Douglas), non-stop ...	7 ,,
Eli Clark (2¾ h.p. Douglas), non-stop	10 ,,
P. Grout (2¾ h.p. Douglas), non-stop	10 ,,
G. B. Fry (3½ h.p. Rex), non-stop	17 ,,
B. Adams (4 h.p. Roc and sidecar), 2 stops ...	64 ,,
F. Bevan (5½ h.p. Rex and sidecar), 1 stop ...	106 ,,
E. Kickham (2¾ h.p. Douglas), 1 stop	116 ,,
A. Fisher (6 h.p. N.S.U. and sidecar), 1 stop ...	206 ,,

Manchester M.C.

A few members of the above club took part in a week-end tour in Wales, making Llangollen their centre. A most enjoyable run was made round the surrounding district, and a scratch hill-climb for a three guinea sweepstake was the event of the day. The events were divided into three classes, and the winners doing fastest time of the day were as follows: Twin-cylinder class, A. J. Moorhouse (5 h.p. Indian); single-cylinder class, J. Scott (3½ h.p. Rex); passenger class, Jack Tytler (5 h.p. Dot and sidecar). The return home was made *viâ* Ruabon, Wrexham, Chester, making a stop at Cranage Farm for tea, where about twenty-four members sat down after a very successful week-end. On Saturday next the inter-team motor cycle hill-climbing competition with the Liverpool contingent takes place, head-quarters Llangollen. The annual 400 miles reliability trials for cars and cycles commences May 18th-20th.

Essex M.C.

The speed judgment test on the 17th inst. over a distance of twelve miles resulted in a win for Stanley Webb (3½ h.p. Triumph), 6⅘s. error; 2, A. Brassington (twin Rex and sidecar), 1m. 57s. error; 3, A. G. Peppercorn (3½ h.p. Triumph).

Competitors in the Bristol B. & M.C. Reliability Trial, the results of which are given on this page.

Winchester and District M.C.C.

The opening run of this club was to Basingstoke, *viâ* Alton. The weather was favourable, and an enjoyable time was spent. Tea was provided at Tyrrell's Café, Basingstoke.

Western District M.C.

Members are reminded that the closing date for names of intending competitors in the Bath and Back Reliability Trial for the "Smart Cup" is to-morrow (Friday). Names should be forwarded to the Trials Hon. Sec., Hubert J. M. Hughes, 223, Acton Lane, Chiswick, W. Competitors in this run must be at headquarters at 7.30 a.m. sharp.

Scarborough and District M.C.

The following letter has been sent to all Northern motor cycle clubs, the secretary's addresses of which are known to the secretary of the Scarborough Club:

"I should esteem it a favour if you will kindly let the members of your club know that the Scarborough and District M.C. has decided to accept as members any of the motor cycling members of your club who may be visiting Scarborough, at a reduced fee of 2s. 6d. Such 'visiting members' will have the right to enter into special competitions which will be arranged from time to time, and also be entitled to the use of the clubroom and garage during their stay in Scarborough. It is felt that Scarborough being the only watering-place on the north coast with a motor cycling club such an offer as outlined above may be appreciated by motor cyclists of other clubs. If any of the motor cycling members of your club care to join on these terms I shall be very glad if they will communicate with me.—Yours faithfully, HAROLD FRAIN, Hon. Sec.

"N.B.—A special competition—a flying kilometre—will be held near Scarborough on Whit-Monday."

Edinburgh Waverley M.C. competitors at the start of the first reliability run of 1910. From left to right the riders are: W. Gerard (Twin N.S.U.), J. R. Alexander (Twin Indian), A. H. Alexander (3½ h.p. Rex), and A. A. Hay (Matchless). The hon. sec., P. E. Tolfree, is at the extreme right astride his Matchless.

Club News.—

Swansea and District M.C.C.

A general meeting was held on the 20th inst., when officers were elected. Afterwards, Mr. Alfred Webb read a very interesting paper on "The Benefits of Clubs and Unionism," which was very much appreciated.

It is probable that the club will affiliate this year to the A.C.U., M.U., and Welsh Automobile Club. The subscription will remain 10s. per annum.

Essex M.C.

Forthcoming events are as under-noted:

May 7th.—Petrol Consumption Competition.
June 12th.—Non-stop Competition.
,, 30th.—Cripples Outing.
July 16th.—Members hill-climb.
August 19-20th.—Twenty-four Hours' Ride to York and back.
September 3rd.—Gymkhana (provisional).

The committee has decided to enter teams for the M.C.C. Inter-team Trial and the A.C.U. inter-club contest.

Burnley Victoria C. and M.C.

The newly-formed section of the above club intend to hold a hill-climb on Saturday, May 14th, for members only. There will be two classes—(1) For machines under 500 c.c. (2.) For any machine. There will also be a prize for the fastest time of the day. The entry fee is 2s. per class, and entries must be forwarded to the hon. sec., E. Brown, Myrtle Cottage, Burnley, on or before May 7th. Full particulars of membership may be obtained from the secretary. The club starts from the Yorkshire Hotel every Tuesday and Saturday at 2 p.m., Sunday 9 and 2 o'clock. The subscription for motor cyclists is 5s. 6d. per annum.

Shropshire M.C.C.

On the 17th inst. there was a run to Farlow Hill. C. Rice Oxley, the secretary, made a splendid climb on his new 1910 standard Triumph, from which the pedals had been removed the previous week. His machine was fitted with standard jet and full touring equipment, and, in spite of this and the rider's weight (12 stones), the engine picked up well round the bend, and carried the rider to the top at a comfortable speed. H. G. Potts, on a 1910 5-6 h.p. Bat-J.A.P., made three clean ascents, the machine needing no skill whatever in its manipulation round the bends, but simply going round at a walking pace and picking up with ease each time.

Surrey M.C.C.

A speed-judging trial was held on the 20th inst. The competitors were required to ride over a measured distance of one mile at a speed which was fixed by the drawing of a lot before the start at 18½ miles per hour. The results were as follows:

		Error.
1.	L. Kennard (5 h.p. Vindec)	9⅕s.
2.	H. Mitchell (3½ h.p. Triumph)	12⅖s.
3.	J. A. Manners-Smith (3½ h.p. Triumph)...	16⅗s.

J. H. Sparks (——), error 20⅘s.; G. Pine (3½ h.p. Triumph), error 22⅖s.; A. C. Maitland (3½ h.p. Trump-J.A.P.), error 22⅗s.; P. Mitchell (2¼ h.p. F.N.), error 30⅖s.; H. R. Owtram (3½ h.p. Triumph), error 44⅘s.; C. Gammon (3¼ h.p. Rex), error 54⅖s.; C. J. Feeny (3½ h.p. Triumph), error 69⅖s.; F. A. McNab (3½ h.p. Trump-J.A.P.), error 98⅖s.

The next run will be held on Wednesday, May 4th. Destination, Leith Hill. Start at 2.30 p.m.

Sutton Coldfield A.C.

As four members of the above club will be competing in the Tourist Trophy Race in the Isle of Man next month it is hoped that a good number of well-wishers and supporters will make the journey across to the island to witness what is the most popular motor cycle event of the year.

Members with T.T. machines will be catered for on the occasion of the club's annual hill-climb on May 7th, when there will be three separate classes and also a "slow" climb if time will permit after the ordinary events of the day.

There will be gold and silver medals for best on formula in each class and a special gold medal for fastest time of the day.

Full particulars may be had from the hon. secretary, Howard Smith, The Dingle, Four Oaks.

Birmingham M.C.C.

On Whit-Monday the club will join in the third annual meet of Midland motor cyclists at Stratford-on-Avon, whilst on Whit-Tuesday a 200 Miles' Reliability Trial will take place to Lincoln and back, this latter will in all probability become an annual event. On June 4th the club will meet the Oxford M.C.C. in a hill-climbing competition.

An efficiency trial is being arranged, and this will make an entirely novel competition. Particulars will be announced later.

Southampton and District M.C.

The first competition of 1910 was held on the 20th inst., this taking the form of a speed-judging test. The route selected was to Lyndhurst, *viâ* the Cump, Romsey, Pauncefoot Hill, Ower, and Cadnam (eighteen miles). The result was a tie between G. Bunting (3½ h.p. Phelon and Moore), who had drawn 16 miles per hour, and arrived 15s. slow only, and H. P. Young (4½ h.p. Humber tricar), who had drawn the 15½ miles per hour slip, and was 15s. too fast; third, E. Prince (3 h.p. Raleigh), who had drawn 19 miles per hour, but was 1m. too fast. Other competitors were various amounts in error, 8¾m. too fast being the greatest divergence scored.

Streatham and District M.C.C.

A most interesting and instructive lecture was given by Mr. A. E. Bennett, A.M.I.E.E., A.M.I.A.E., the late official examiner to the R.A.C., the subject taken being "Carburation."

Mr. Bennett carefully went into the elementary chemistry of the elements, viz., carbon, oxygen and hydrogen, laying some stress upon the danger of allowing exhaust gases to be emitted in a closed room. He showed a most interesting experiment of the properties of carbonic gas and hydride. This was ingeniously obtained by the use of an ordinary soda water syphon. He then proceeded to the main subject, "Carburation." At the bottom end of a glass tube some thirty inches long, a plug of waste, saturated with petrol, was placed. A light was then applied at the top, and by use of foot bellows air was forced through the bottom end. This clearly demonstrated how an excess of carbon produced a smoky flame, and as the proportion of petrol became less, the flame became absolutely non-luminous, and almost immediately afterwards a light blue flame was seen to travel down the tube, showing the slow burning of a weak mixture. He concluded with some valuable hints as to the methods of tuning up carburetters.

QUARTERLY TRIAL.—Scene on the road, three miles from Aylesbury. Miss Berend (Moto Reve) and W. Pratt (P. and M.) in the foreground.

The Humber Single and Two-speed Geared Models.

THERE are few machines over which the experienced and critical motor cyclist can run his eye without being able to suggest some improvement, even if only one of detail, but a very close scrutiny and examination of the latest Humber motor cycles has left no doubt in our minds that these fine machines may safely be included in that small and select category. Messrs. Humber, Ltd., have, we think, done wisely in confining their 1910 models to what really amounts to one machine built in two distinct styles. Whilst all the requirements of the "single" man are satisfied in the single-geared model, those who want a handy machine with a two-speed gear for sidecar or heavy touring work are well catered for. At the same time these two machines are practically the same model, the two-speed machine differing only from the single-geared in being fitted with a gear and being provided with footboards instead of pedals.

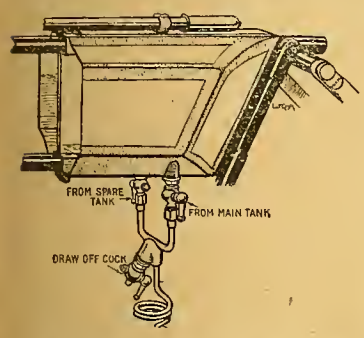


Fig. 1.—The double petrol tank, showing method of fitting tanks to top and bottom frame tubes.

Starting with the engine, this is a neat single-cylinder with a bore and stroke of 83 mm. by 90 mm. respectively. Both valves are mechanically operated, and are situated at the side of the engine in an extremely accessible position. The timing gear is enclosed in an oil-tight aluminium casing, which also covers the intermediate and magneto pinions, whereby the Bosch magneto is driven off the exhaust timing wheel. The magneto itself is carried on a platform forming a forward extension of the crank chamber. A means for lifting the exhaust valve is incorporated

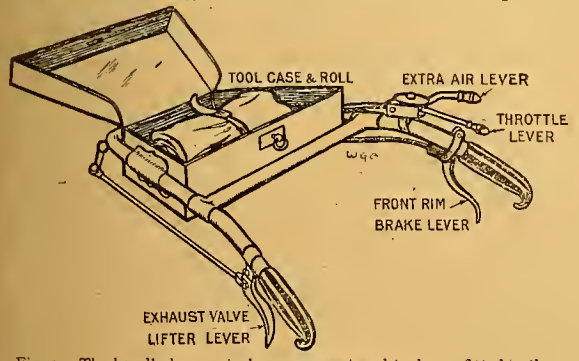

Fig. 2.—The handle-bar control arrangement and tool case fitted to the 3½ h.p. Humber.

in the timing gear, and the crank for this purpose passes through the timing gear case and is connected up to the lever on the left handle-bar through a system of rods with ball joints. Being enclosed the exhaust valve lifting mechanism is kept constantly lubricated, and does not form a harbour of refuge for dirt and grit. The exhaust pipe deserves a special note; it is of most sensible diameter, and contains no sudden bends. The silencer is underneath and forward of the crank chamber, and is fitted with a neat cut-out operated by the right foot. The crankshaft runs in ball bearings.

The crank case of the engine forms an integral part of the frame. The front down tube is attached to the extension of the case which carries the magneto, whilst the saddle tube and rear forks unite in a short bracket to which the crank case is also bolted. This arrangement is shown in fig. 6.

The B. and B. carburetter is placed behind and close up to the cylinder, where it is within easy reach from the saddle.

A very notable feature of the Humber machines is the arrangement of the petrol and oil tanks, which is illustrated in fig. 1. The tank is made in two complete halves, each quite independent of the other, and fitted with its own filler and outlet tap. The sectional shape of these tanks is such that when placed together two square spaces are left for the top and bottom tubes of the frame to pass through, the double tank being secured in position at the top by a long sliding clip which also carries the tyre inflator, and at the bottom by a couple of small lugs and bolts. The right-hand tank is divided into two compartments, the forward one of which forms a receptacle for lubricating oil which is drawn therefrom and supplied to the engine crank case by an inclined hand pump. As its petrol capacity is therefore considerably less than that of the right-hand tank, the latter is used for ordinary running and the former in case of emergency. The two outlet pipes from the tanks unite in a neat little fitment, which allows petrol for injection and other purposes to be drawn out of either or both tanks. As shown in fig. 1, the combined tank is neatly bevelled, and is decidedly pleasing in appearance. On its left-hand side a cavity is formed to afford easy access to the sparking plug and valves.

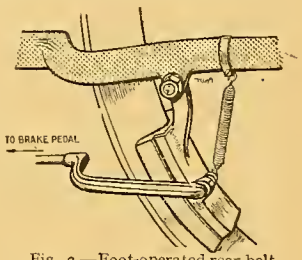

Fig. 3.—Foot-operated rear belt rim brake worked by a pedal shown in fig. 4.

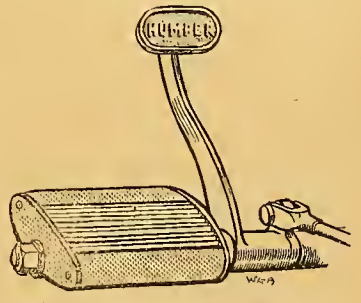

Fig. 4.—Rubber-covered footrest and rear brake pedal.

With the exception of the ignition advance lever, which is on the left-hand side of the tank, the engine is completely controlled from the handle-bars. As can be seen in fig. 2, the right hand has charge of the throttle and extra air lever, whilst the left controls the exhaust valve. The right hand also actuates the front rim brake through a Bowden wire. The extremely neat and original way in which the tool case is mounted in the forward portion of the handle-bar is shown in fig. 2, and is such an excellent idea that it needs no further recommendation at our hands. The extra strut on the handle-bar for carrying a watch or hooter will be noted.

The Humber Single and Two-speed Geared Models.—

The braking arrangements on both the single-geared and two-speed machines alike leave nothing to be desired. The front wheel rim brake is common to both types, and in the single-geared model it is supplemented by a neat and strong belt rim brake operated by the right foot. This fitting and its mode of actuation are shown respectively in figs. 3 and 4, the latter illustration showing also the comfortable rubber-covered footrest which is fitted in addition to the

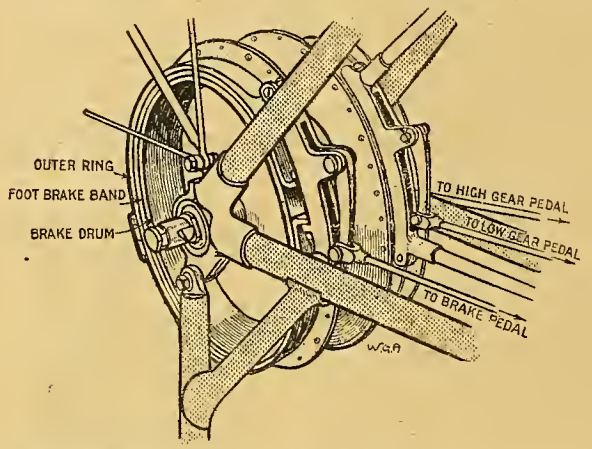

Fig. 5.—Humber two-speed geared hub (made under Roc licence). The braking surfaces of the pedal brakes are steel to cast iron. The wheel spokes have been omitted for the sake of clearness.

usual pedals. The rests are carried on a bar extending across the front of the crank chamber, and are capable of being swivelled on this bar into the most comfortable position.

In the case of the two-speed model, the rear wheel brake is fitted on the right-hand side of the back hub. This brake is exactly similar to the two others on the opposite side of the hub which serve to engage the clutch or lock the epicyclic train enclosed within it. Fig. 5 shows the brake side of the two-speed gear and its general arrangement. The drum upon which the brake acts is of large diameter, and is of cast-iron; the contracting ring which forms the brake shoe is of steel and is surrounded with a guard ring, or "keep,"

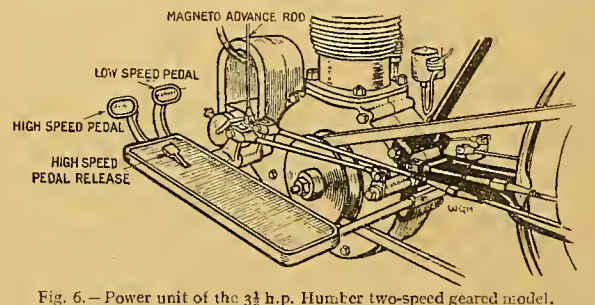

Fig. 6.—Power unit of the 3½ h.p. Humber two-speed geared model. The foot brake pedal of this pattern is on the right footboard.

which ensures it expanding, when out of action, evenly all round and just clear of the drum. The clearance being small prevents grit finding its way in between the surfaces. The bell crank through which the brake is applied is pivoted on a crescent-shaped bracket supporting the guard ring and secured to a branch of the back forks by a short tube. The crescent for the bell crank of the low gear, the drum for which is between that of the high gear and the brake, is supported by two separate tubes as shown. The high gear brake, which causes the whole gear box and hub to run solid, is actuated through a shaft which slides in the tubular axle, and is pushed in and out by an external bell crank.

Fig. 6 exhibits the pedal control of the two-speed gear, the position of the pedals being the same as when the high gear is in, the high speed pedal being secured in its fully-on position by a neat catch passing through the rubber-covered footboard. When both pedals are released the epicyclic gear is in neutral. A slight pressure with the foot on the low speed pedal causes the gear to take up the drive, the brake—which acts as the clutch—being slipped to any desired extent. To get into high gear the toe is moved from the low and finally locked "home" by the trip-catch. Pressure on the latter makes the engine "free."

It will be realised that with this gear a third and powerful brake is provided, as when the high gear is in operation gentle pressure on the low gear pedal puts on a brake. The brake actuating rods are provided with right and left-hand turnbuckles, so that the clutches can be adjusted to a great nicety.

Both the single-geared and two-speed models are fitted with an adjustable engine pulley, which allows the gear ratio between engine and road-wheel to be altered through a fairly wide extent.

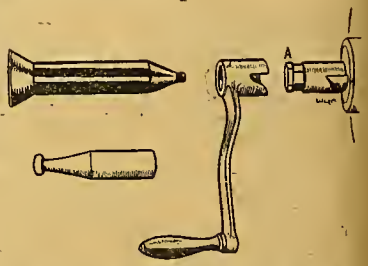

Fig. 7.—The hand-starting device fitted to the rear hub axle. On the left the grease squirt with wooden plunger for injecting grease into the hub through the axle which is hollow.

Among the advantages of the Roc type of gear is the hand starting, the arrangement for which is shown in fig. 7. A handle, which when out of use is carried in the handle-bar tool bag, is fitted to an extension of the back axle on the right-hand side, the engine being started without jacking up or running along. A neat little fitting supplied with the machine is the grease squirt with which the gear box is supplied with lubricant. The body of the squirt screws into the back axle extension in the place of a small plug, and grease is pumped in with the aid of a wooden piston.

Beaded-edge Dunlop tyres 26in. by 2¼in. are fitted to both wheels, and the standard machines embrace stand, carrier, number plates, ⅞in. rubber belt, and all requisite tools.

As regards comfort and appearance, the 3½ h.p. Humber machines reach a very high standard, the black-edged chamfered tank, long handle-bars, sensible mudguards, and general *tout ensemble* being very taking.

We have received a communication from the Assistant Comptroller of the G.P.O., calling attention to the embarrassment of the sorting staff caused by the number of letters reaching *The Motor Cycle* bearing the word "London" only. The address of the editorial offices of *The Motor Cycle* (20, Tudor Street, London, E.C.) is clearly given at the foot of the "Contents" on the first page. Correspondents should make a note of this for future reference.

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

A Motor Cycle for Canadian Roads.

(1.) What make of motor cycle would be best for use in Manitoba, Canada? (2.) What good English or American firms have a depot in Canada?—B. V. R.

(1.) Naturally, we cannot recommend any one specific make, but if you will look through our advertisement columns and select a machine which you think will suit your requirements we will let you know if it will suit you. You will require a machine with the crank case fairly high off the ground, and one that is not too heavy, but yet strongly built. (2.) Brown Bros., Ltd., is the only English firm we know of having a depot in Canada. The address of the depot is Tangent Cycle Co., 418, College Street, Toronto.

Ground Clearance. Magneto Switch.

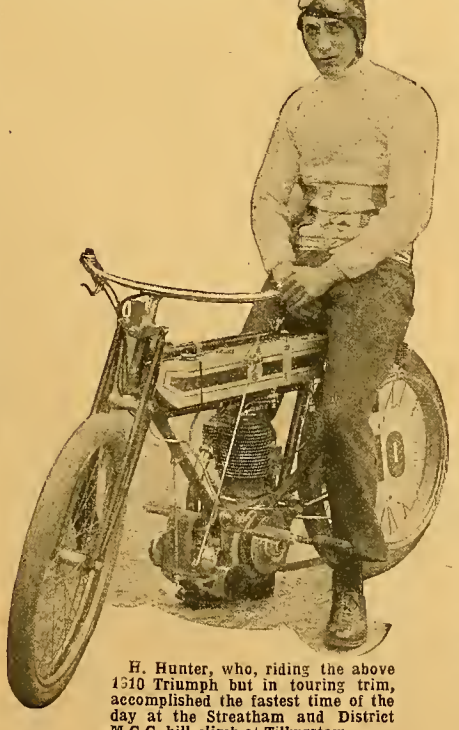
(1.) Do you consider 2½in. to be enough clearance between the bottom of the crank case and the ground, as I have had a new 6 h.p. J.A.P. engine fitted to a No. 5T Chater-Lea frame, and could not get the engine any higher up on account of the silencer fouling the bottom bracket. I think that 2½in. will clear any road. (2.) I also want to fix a switch so as to cut the magneto out. Would you inform me as to how to do it? (3.) Is it possible to make the engine so that I could cut out the back cylinder at times? The magneto is Bosch type, D.A.V., and the engine is one of the latest 6 h.p. J.A.P., with gear-driven magneto and m.o.i.v.—C. V.

(1.) We think that 2½in. is barely sufficient clearance; hardly enough to clear the average brick, should you unfortunately encounter one in the road. It would also be risky for you to wheel the machine off a pathway on to the road. It is, we think, cutting it rather too fine. Four inches is the minimum safe clearance. (2.) It is quite easy to fit a switch. You merely connect a wire from the earth terminal of the magneto (immediately over the contact breaker) to the switch. The switching off is done by earthing the current; that is to say, hen the switch is "on" and the wire connected to earth through the handle-bar, the magneto is put out of action. (3.) Yes, you can easily arrange to cut out the back cylinder by fitting an exhaust lifter, which will raise one valve before the other.

Exemptions from the Local Taxation Licence.

The writer has a motor cycle which he uses for business purposes only. The machine has a bag carrier at the back on which is a handbag of catalogues. It has been registered, and has the plates properly fixed at back and front. Will you kindly say if I require an Inland Revenue licence provided I have my firm's or my own name and address painted on in not less than 1in. letteres?—S. R. G.

It seems that the Local Taxation Licence Authorities only recognise a machine to be exempt from licence duty provided it is specially constructed for the transport of merchandise. If you can persuade your local authorities that they have no right to tax your machine and have your name painted on the tank in 1in. letters, you will be entitled to exemption. You will not, however, be able to use the machine *at any time* for pleasure purposes.



H. Hunter, who, riding the above 1910 Triumph but in touring trim, accomplished the fastest time of the day at the Streatham and District M.C.C. hill-climb at Tilburstow.

Fitting an Exhaust Cut-out.

I am informed that by fitting a cut-out to the exhaust pipe or silencer of my 2¾ h.p. F.N. I shall obtain more power on hills and keep my engine cooler. Please inform me—(1.) Is this correct? (2.) If a cut-out is an advantage, why is it not fitted by the makers? (3.) Is it sufficient to drill a hole in the exhaust pipe and fit a slide? If so, should the position of the cut-out be about half-way between the cylinder and the exhaust box? (4.) What size ought the hole to be?—W. E. E.

(1.) In certain cases, where an inefficient silencer is fitted, a cut-out will improve matters. (2.) However, it is a barbarous fitting, which renders motor cycles unpopular, as it causes much inconvenience to other users of the road. (3 and 4.) You might drill out the holes slightly in the exhaust pipe without greatly increasing the sound; but, if you like, you can fit a cut-out just short of the silencer by cutting a proper-sized hole in the pipe and fitting over it a cut-out which can be bought ready made.

Selecting a Machine for Sidecar Work.

(1.) Would you prefer m.o.i.v. or a.o.i.v. on a 6 h.p. twin light J.A.P. engine? (2.) Do you think that the J.A.P. automatic lubricating system is superior to the ordinary method of pumping oil into the engine? (3.) Is a 6 h.p. light twin J.A.P. engine powerful enough to fit into a No. 5T Chater-Lea frame and sidecar, weight to carry about 22 st., without having to assist on steep gradients with the pedals? (4.) Do you consider the J.A.P. automatic carburetter is an improvement on the ordinary carburetter?—C. V.

(1.) In a twin-cylinder engine we should emphatically recommend mechanically operated inlet valves. (2.) The lubricator in question is a good one and undoubtedly a saving of trouble and worry during the warm months, but in cold weather requires careful manipulation, as cold often causes the oil to flow very slowly. (3.) The engine should be quite powerful enough for a sidecar, especially if a two-speed gear is fitted. (4.) We have a high opinion of the carburetter mentioned. Leave your decision as regards this accessory in the engine maker's hands.

An Old Trouble. Pitting of Valves.

I am troubled with the exhaust valve of my 3½ h.p. 1907 machine pitting badly, which soon makes the compression very poor. I have found cast-iron head valves very good, but the heads break so soon, and at present am running on a steel valve. Is the trouble likely to be the carburetter, do you think? It is a Longuemare with a five-slot jet.—B. A.

Of course, if the mixture is very strong it will tend to pit the valves more than if you were running on a correct or cool mixture. Verify the adjustments of the carburetter by previous hints in these columns. On the other hand, you may find some improvement from a valve of nickel or nickel-steel, or other special heat-resisting material.

5 or 9 h.p. for Sidecar Work.

(1.) Is a 7-9 h.p. Peugeot a suitable mount for solo and sidecar work, or is it too powerful? Would it be capable of climbing 1 in 9 with two up, total weight 21 st., or would a 5-6 h.p. Peugeot answer the purpose just as well? What gradient might I expect the latter to climb with a suitable gear; also what gear would you recommend?—H. P.

The 7 h.p. machine would be better for sidecar work than as a solo machine. If hill is short, it should climb 1 in 9 with two up on top speed if you get a good run at it. The 5-6 h.p. would take about 1 in 12 on top speed. Of course, for sidecar work a two-speed gear is desirable, and practically indispensable for touring in moderately hilly districts or driving through traffic with comfort. For passenger work you should gear the 7-9 h.p. 4¼ to 1 and the 5-6 h.p. 5 to 1. An adjustable pulley would enable you to experiment with slightly higher or lower gears, depending on the weight of machine and passenger.

Engine Stiffness.

Would it do any harm in the way of overheating to my two-speed motor bicycle to use Vacuum A water-cooled oil instead of an air-cooled oil? It is most difficult to start the engine with handle on the back axle, and I invariably have to pour two oil cans of petrol in at least before I can get the piston free, which must be bad for the engine, as I get such a head of gas on in the engine that it always backfires first. What I want to know is whether it would be better to stick to air-cooled oil and keep on pouring in petrol in quantities stated, or use a water-cooled oil and only a few drops of petrol.—H. J. E.

You may well use the thinner oil, as if the stiffness you complain of is entirely in the engine you are using much too thick oil. Do not free the piston with petrol, but use paraffin if you have to free your rings. So much petrol will be likely to cause a seizure, or a crank case explosion is not even unlikely. In the summer time probably you will be able to use the slightly thicker oil with good results. By the way, are you sure that the stiffness is entirely due to the engine? We should be inclined to think that something is binding in the gear, or the brake bands are too tight. Try revolving wheel and engine with the belt removed. Another point is to see that the exhaust valve is lifted well off its seating when the lifter lever is raised. If not, there is a partial compression in the engine. You may cure this by taking up the slackness in the wire.

Throttling Down a Four-cylinder.

I have a 5-6 h.p. F.N. which goes very well except when one wants to reduce speed below, say, fourteen or fifteen miles per hour. If the throttle is further closed the engine immediately stops firing, and the only way to drive in traffic is to set the throttle about a third open and use the exhaust lifter. The ignition is, apparently, in perfect order, and the compression good the valves also are timed correctly. I have a standard F.N. carburetter with separate throttles over each cylinder. I have also an inlet pipe the same shape as the 1910 model, *i.e.*, the gas enters between the second and third cylinders. If the engine is run light when on the stand it is practically impossible to control it at less than 600 or 700 revolutions per minute. If the throttle is further closed the engine immediately stops. If this is a peculiarity of this type of machine and cannot be altered, of course I must put up with it.—B. B.

We should recommend you to see that there are no air leaks in the inlet pipe and carburetter unions, and to exclude as much extra air as possible. For running slowly you want a strong mixture and little of it. You should also examine the throttles, and see that each one has the same opening. If you find that this is not the case, you must file the openings until they are absolutely equal in every case. The new carburetter fitted to the latest type of F.N. would greatly improve the machine, but unfortunately, the makers are at present unable to deliver it. As a last resource, you should try restricting the main air intake, and then, if no improvement, slightly weaker inlet valve springs. The difficulty you mention is not common to four-cylinder F.N.'s. We have personally witnessed one of these machines run slower than ten miles an hour, with the engine firing regularly.

A Silencer at Rear of Machine. Economy in Petrol.

(1.) I am thinking of fitting a 3½ h.p. Rex with a silencer somewhere towards the rear of the machine, and leading a copper exhaust pipe back to it. Will you let me know whether this would be advantageous in the way of cooling the exhaust gases, and also the minimum thickness (in the walls) of copper tubing which one may use for the purpose, from the point of view of economy? (2.) What is the principle of so-called "petrol economisers"? Would it be simple to make some such fitting to attach to a 1910 Brown and Barlow carburetter?—G.B.

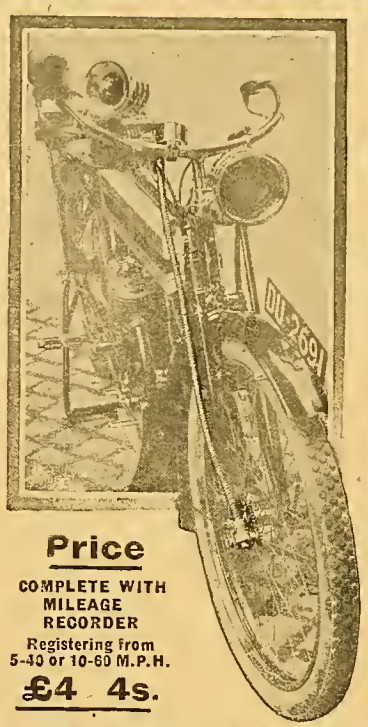
(1.) Yes, it is quite good practice to have a good long exhaust pipe, as this cools the gases and so reduces the sound. You must not, however, use a copper pipe; the joint would always be giving trouble, as it does not stand the heat. The pipe would have to be a steel one of the thickness of the existing exhaust pipe. (2.) The petrol economiser referred to (we presume you mean White's) is really a device for controlling the fixed air supply to the carburetter, and is very useful for starting in cold weather. It is not really an economiser except that in some cases it allows a smaller jet to be fitted than previously if the air at the bottom of the carburetter is partially closed. In the case of a B. and B. 1910 model you can fit the "economiser," or a suitable adapter can be supplied which will ensure easier starting if you have any trouble in that direction.

Gordon L. Fletcher and a 1908 pattern 2¾ h.p. twin-cylinder Douglas on which he has set up some notable performances, particularly in long-distance reliability trials. His most recent successes were in the M.C.C. Jarrott Cup Competition (when he won Mr. Trotman's prize for best performance on a lightweight), and a no-trouble run in the last Quarterly Trial.

THE ALL-FAMOUS

COWEY SPEED INDICATOR

BRITISH-MADE AND GUARANTEED AGAINST REPAIR CHARGES FOR 12 MONTHS.
Can be fitted to any make of Spring Fork on the Market.



The Speed Indicator with the finest reputation in the world—**The COWEY**—built on a principle which has been specially designed for use on motor bicycles. **Instruments built on centrifugal or magnetic principles cannot possibly give satisfaction on a motor bicycle, and only end in disappointment and failure.** There are thousands of COWEYS in use all over the country, and we are not misrepresenting fact when we state that they are giving unqualified satisfaction.

MOTOR BICYCLES FOR SALE

1909 Triumphs, in first-rate condition, complete accessories; £34.—Below.

1907 Triumph, handle-bar control, an excellent chine; £23.—Below

1906 Triumph, magneto ignition, guaranteed per order; £19.—Below.

1909 Rex, 3½h.p., Tourist, cantilever seat, only rid few times, equal to new; £50.—Below.

1909 Rex, 3½h.p., Tourist, standard machine, with accessories, splendid order; £28.—Below.

1909 Minerva, 3½h.p., magneto ignition, spring fo Amac carburetter, handle-bar control, sev refinements; £25.—Below.

1909 Peugeot-Chater, 5h.p., 2¼in. Palmer cord t F.R.S. lamp, etc.; ideal machine for side work; £20.—Below.

THE Eastern Garage Co. have, in addition to above, a number of good machines at prices ra ing from £7. Please favour us with a visit at 4 Romford Rd., Forest Gate, or telephone, Stratford Telegrams, Egaraco, London.

2½h.p. Douglas, 1910, slightly soiled, highest grad £35.—128, High Rd., S. Tottenham.

4½h.p. 4-cyl. F.N., magneto, hums like a top; £23 128, High Rd., Tottenham.

BRADBURYS. 1910, in stock, £46; Bradbury, 19 model, £36; liberal exchanges.—128, High R Tottenham.

BROWN, 2¾h.p., vertical, perfect condition; £8 1 —128, High Rd., Tottenham. 'Phone, 1982 T tenham.

HUMBERS, 3½h.p., 1910, tourist model, £45; tw speed, £50, in stock; liberal exchanges. — 12 High Rd., Tottenham.

PHŒNIX, 2¾h.p., magneto, two speeds, suit doctor £14 10s.—128, High Rd., Tottenham.

TRIUMPHS, 1910, in stock, £48 15s. and £55; liber exchanges.—128, High Rd., Tottenham. 1982 T tenham.

3½h.p. Rex, magneto, spring forks, fine machine; £2 —128, High Rd., Tottenham.

HAMPSTEAD for Bargains.—Heath Street Mot Works, 5, Heath St. Tel.: 2678, P.O.

HAMPSTEAD.—3½h.p. Quadrant, magneto, handl bar control, splendid order; £18; all accessorie

HAMPSTEAD.—2¾h.p. vertical 1908 Minerva, splen did condition, with all accessories; £11.

HAMPSTEAD.—3½h.p. Triumph, 1909, splendid cond tion, with all accessories; bargain, £35.

HAMPSTEAD.—1910 2¼h.p. two-speed F.N.'s; £40 no extra for easy payments.

HAMPSTEAD.—1910 Rexes, all models in stock; n extra for easy payments.—Below.

HAMPSTEAD.—Kerry-Abingdon from stock; ex change or gradual payments taken; no extra.

HAMPSTEAD.—5h.p. twin Peugeot, magneto, an spring forks, Osborne four-speed pulley; £16

HAMPSTEAD.—Triumph, 1910, from stock; no wait ing.

HAMPSTEAD.—Douglas, 1910, latest model, from stock; 5 per cent. extra for easy payments.

HAMPSTEAD.—F.N., 4¼h.p., late model, splendid con dition, all accessories; £20, special bargain.

HAMPSTEAD.—F.N., 4¼h.p., latest model, handle bar control, condition splendid, with accessories; £24.

HAMPSTEAD.—Sidecar, best make, brand new, ad justable to any machine; £3 15s.

HAMPSTEAD.—Sole London Agents for Lincoln Elks, all models in stock; no waiting.

HAMPSTEAD.—2¾h.p. 1910 F.N., almost new, with accessories; £33, special bargain.

HAMPSTEAD.—3½h.p. 1909 Minerva, magneto, and spring forks, all accessories; £25.

HAMPSTEAD for Moto-Reve Model A.; in stock; no waiting; no extra for easy payments.

HAMPSTEAD.—F.N., late model, magneto, and spring forks, splendid condition, all accessories; £22.

HAMPSTEAD.—3h.p. Triumph, good order, with ac cessories; £16 special bargain.

HAMPSTEAD.—5h.p. twin Peugeot, magneto, and spring forks, good order; bargain, £16.

HAMPSTEAD.—1909 twin Douglas, splendid condition, with all accessories; £26, a bargain.

HAMPSTEAD.—1¾h.p. F.N., good condition, all accessories; £13; magneto, and spring forks.

HAMPSTEAD for latest 1910 models, in stock (Triumphs, Indian), Premier, Douglas, Rexs, Humber, etc.; exchanges or gradual payments.—Rey, 5, Heath St. Tel.: 2678 P.O., Hampstead.

WHITTLES.—Triumph, 3½h.p., 1907, magneto, spring forks, like new; great bargain, £24.

WHITTLES.—Rex de Luxe, 5-6h.p., twin, magneto, Roc clutch, nearly new, unscratched; £26.

WHITTLES. — Minerva, 4½h.p., twin, spring forks; sacrifice £16 16s.—Whittles Motor Exchange, Earlsfield.

3½h.p. Excelsior, Amac, h.b.c., re-enamelled, good condition, £11.—Hill House, North Dulwich.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

The Northern League.

As reported in our last issue, an important meeting of Northern club officials was held in York on Saturday, April 30th, the outcome of which was the formation of a League of Northern Motor Cycle Clubs to conduct Northern competitions and form rules and regulations for those clubs which decide to throw in their lot with the League. Northern club officials consider that their organisations have been left too much in the cold by the governing body—the A.C.U.—except in the matter of the licence and permit fees.

In connection with practically all sports and pastimes there have always been differences of opinion between North and South as to how matters should be regulated. Exactly why this should be it is impossible to say, but the fact remains that it is so. The A.C.U. has certainly done a good deal to conciliate Northern clubs and to draw them into the fold if possible, but so far without any very great measure of success, or the meetings referred to would not have been held, nor would the decision to form a Northern League have been so unanimous. A large number of riders, particularly in the North, seem to think that they ought to be able to work independently of any other body, the bone of contention with the A.C.U. being the right to hold inter-club contests without paying a permit fee to the A.C.U. and without the riders being compelled to take out a riding licence for one open event during the year.

The A.C.U. has announced that in future the licence for one event will be 1s., increasing to 5s. if the rider compete in more than one event during the year, but this concession was too late to help to stem the tide of events. The A.C.U. had made this and one or two other concessions purposely to prevent the League assuming shape, but it could not be expected to pass over the infringement of its regulations with regard to the proclaimed hill-climb at Staxton without loss of dignity and diminution of power. It will be very regrettable if the Northern League does not own allegiance to the Auto Cycle Union in some form or another. We nevertheless trust that the two organisations will work amicably, and that, even if the Northerners cannot see their way to apply to the Southerners for permits and licences, they will at least endeavour to formulate some scheme to enable both bodies to work under the same rules as far as the conduct of competitions is concerned. Their highest aims and objects are identical, and there is no reason why each in its own geographical sphere of influence should not carry on its operations, not only without causing offence to, but in harmony with, the other.

A Car Licence covers a Motor Cycle.

On a recent occasion we received a query from a correspondent to the effect that he had disposed of his car and asking if he could keep one or two motor cycles without taking out a fresh local taxation licence, presuming that the two-guinea licence he had paid would cover the cost of two motor bicycle licences. This query is one we have seen raised before, and we therefore decided to obtain an official view of the position. On making application to the Comptroller of the Local Taxation Licences Branch of the L.C.C. we received the following reply: "I beg to acquaint you that, in the circumstances you mention, the licence would cover one vehicle only, the rate of duty in respect of which does not exceed two guineas."

Occasional Comments

"By Ixion"

1910 Improvements—Stamina and Efficiency.

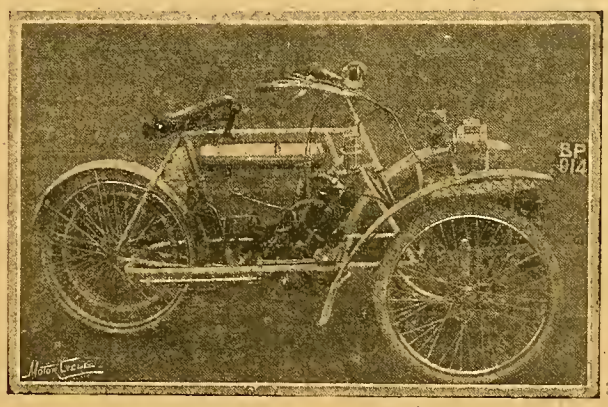
At the last Stanley Show I heard several really clever critics complaining that the exhibition contained "nothing new"—just a range of furbished up 1909 models, with a few new talking points of no very special importance. I was half inclined to agree with these carpers, but since then I have sampled quite a little fleet of the despised 1910 models, and my opinions are now revised. From a superficial standpoint the 1910 model may in many cases very closely resemble its predecessor of last year, but when we come to *ride* them we instantly discover a marked difference. For example, many 1909 3½ h.p. tourist mounts had an evil and incurable habit of knocking. When they slowed up on a bad hill, "clank-clank-clank" hammered the engine, and not infrequently such metallic clangour was aroused under far less arduous circumstances. But the alleged duplicate of 1910 is usually guiltless on this count. The same applies to the "dying away" habits of 1909. Some cheery souls are wont to open the throttle rather liberally along deserted stretches of straight road. In 1909 the machine would exact its own penalty for such illegal driving by refusing to ascend quite an insignificant incline after a few miles of this bucketing. The 1910 patterns, as I am credibly informed by the miscreants who so handle them, will romp up Birdlip after a ten-mile scrap. Again, the 1910 engine has a better hill-climbing compass than its sister of 1909; it goes farther and faster up the few forbidding precipices that still make a motor cyclist feel nervous. Altogether, we must admit that last year has produced some very real and vital improvements in engine design. Let us hope 1910 will push the motor bicycle a step further towards the heights of ideality, even if no startling novelties come to light.

Congratulations to the A.C.U.

The A.C.U. got rather a rough handling both from the trade and amateurs over the conduct of the first Quarterly Trial this year, and now that it has run off the second event more efficiently, it must receive our congratulations. At the same time, this trial has ceased to be of any real value as a criterion of reliability. Even if we credit it with perfect management, it is too short to hall-mark the machines of 1910. Our standards have outgrown such petty little distances, and the hill-climbs are infantile; who considers Dashwood or Rectory a real climb nowadays on summer surfaces? The trial may continue to serve a certain purpose of moderate value. It is a good school for novices in trial riding, and it encourages faint hopes of unknown machines, which make their first bow to the public therein. If the trade demand a reduction in the number of trials, there are few open trials we could spare with less regret. But so long as fifty or sixty amateurs are willing to use it for practising purposes, there is no radical objection to its survival. I think these amateurs who are now the backbone of this trial have a right to expect that the turns shall be properly marked; it is hard lines when a non-stop certificate is sacrificed because the organisers have neglected to place a huge arrow in a sensible position at an awkward or crucial turning.

Automatic Carburation.

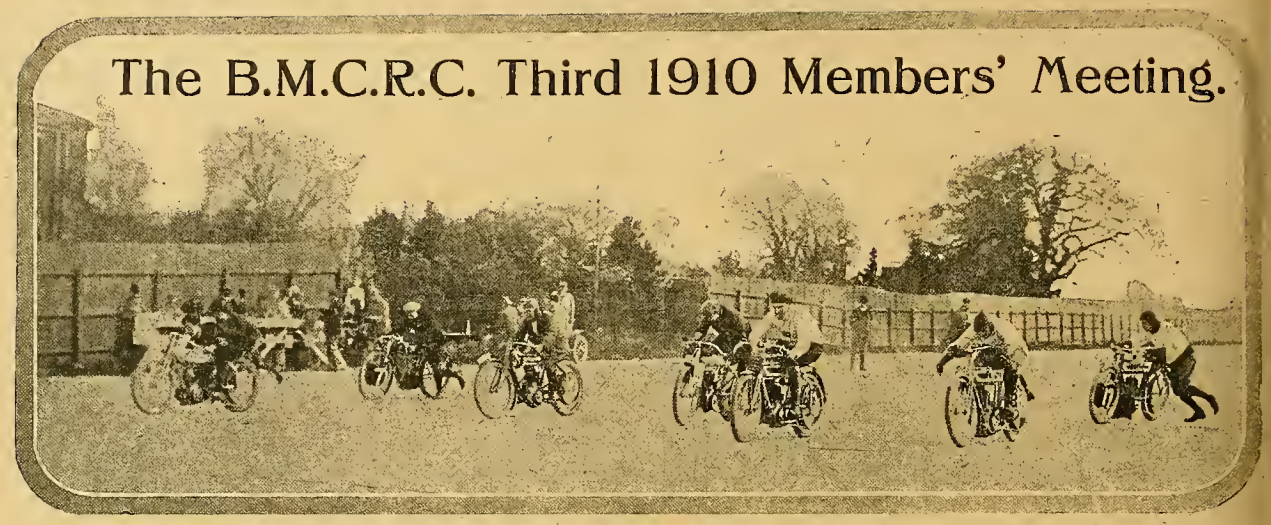
A firm of carburetter patentees write taking objection to my eulogy of the triple-jet carburetter as employed on cars. They assert with much truth that the automatic single jet is enjoying a greater vogue than the automatic triple jet. This is true. It happens to be true because a triple-jet carburetter requires very skilled adjustment. This adjustment is too laborious for most busy manufacturers of carburetters to attempt, varying as it does with each of the hundreds of different engines which in a year pass through their hands, and it is too delicate a task for the average owner. I



Another rejuvenated motor cycle belonging to F. H. Paine, of Walberton, near Arundel. The tricycle is a combination of a two pattern 4½ h.p. Excelsior with forecar attachment minus front seat. A Ruthardt magneto and B. and B. hand-bar controlled carburetter have been added besides other up-to-date adjuncts.

have been experimenting with automatic carburetters for some time past, though I am not financially interested in any of them, and after "two years' hard" at the game I regard the automatic triple jet as slightly more efficient than the automatic single jet for car work, though less simple, and therefore less practicable. But I do not press the claims of the triple jet for motor cycles. Even greater success is being achieved by single-jet automatics on cars, such as the Zenith, White and Poppe, and Claudel-Hobson. There is a great future for motor cycle carburetters in the same field. Yet a large firm can easily employ a triple jet on motor cycles, if they wish to. These patent carburetters are sold as separate accessories in the car market; hence the bother about adjustments. A large motor cycle factory, turning out fifty or one hundred machines a week, would have no such trouble. The same series of jets and choke tubes would suit practically every engine in the output without any finicking about.

The B.M.C.R.C. Third 1910 Members' Meeting.



Competitors starting for the One Hour Tourist Trophy Race.

WHEN the meeting started, at 2.30 on Wednesday, the 4th inst., the weather was fine, but a strong breeze blew down from the members' hill and black rain-laden clouds loomed in the distance to windward. The first race was the all-comers' handicap for all classes of motor bicycles, the cubic capacity of the cylinders of which does not exceed 1,000 c.c. First prize, the club's gold medal; second prize, the club's silver medal; third prize, the club's bronze medal. Distance, 8 miles 269 yards. Starters allowed. The following competitors took part:

Rider and machine.	Cyls.	Bore and stroke.	S-stripped T-touring.	Start M. S.
C. R. Collier (Matchless) ...	2	85.5 × 85	T	Scr.
H. V. Colver (Matchless) ...	2	85.5 × 85	T	Scr.
G. Lee Evans (Indian) ...	2	82.5 × 93	S	Scr.
H. H. Bowen (Bat)	2	85.5 × 58	T	0 33
H. A. Collier (Matchless) ...	2	85.5 × 58	T	0 33
C. E. Bennett (Indian) ...	2	71.5 × 82.5	T	0 33
W. O. Bentley (Indian) ...	2	70 × 82.5	S	0 39
M. Geiger (V.S.)	2	75 × 75	S	1 3
F. A. McNab (Trump-J.A.P.)	1	85.5 × 85	T	1 33
J. Gibson (Trump-J.A.P.) ...	1	85.5 × 85	T	1 33
R. C. Griesbach (Triumph) ...	1	84 × 86	S	1 36
W. Chitty (Martin-J.A.P.)...	1	85 × 60	S	1 48
A. Maitland (Trump-J.A.P.)	1	85.5 × 85	S	2 42
E. Gwynne (Triumph ...	1	84 × 86	T	2 42
G. L. Fletcher (Douglas ...	2	60 × 60	T	4 30

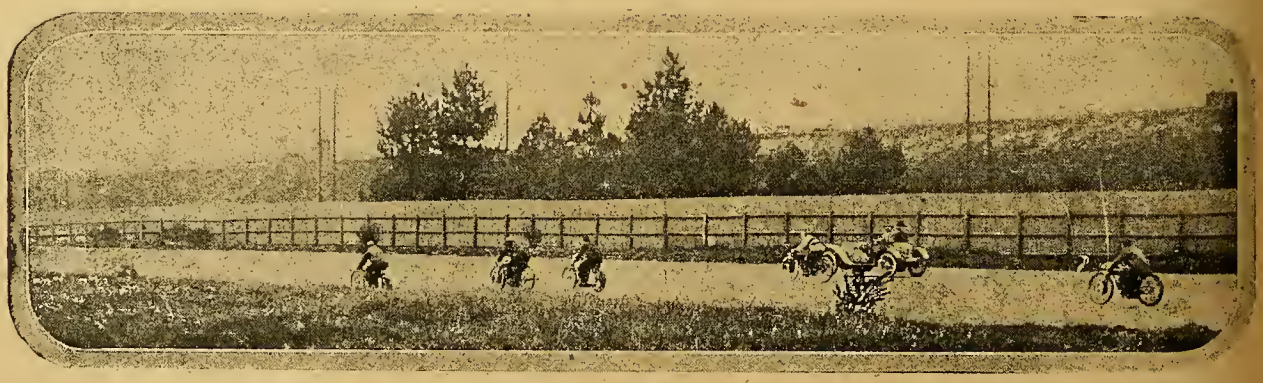
This race, as was the case with all others which were run on Wednesday, started and finished at the fork—quite the best arrangement. At the end of the first lap the men passed in the following order: Fletcher, Gwynne, Maitland, Gibson, Griesbach, Chitty, McNab, Geiger, Bowen, Bennett, H. A. Collier, Lee Evans, C. R. Collier, and Colver. In the second lap Gibson led, and was followed by McNab, Griesbach, Gwynne, Fletcher, Bowen, Chitty, C. R. Collier, Geiger, Lee Evans, Bennett, Maitland, and Colver. At the finish Bowen was leading, but his rear cover blew off and bent the mudguard double. Then Collier led the throng, and, for some reason best known to himself, went careering down the straight. Result:

1. J. Gibson (3½ h.p. Trump-J.A.P.)
2. F. A. McNab (3½ h.p. Trump-J.A.P.)
3. G. Lee Evans (7 h.p. Indian).

and the rest as follows: Griesbach, Bennett, Geiger, Colver, Gwynne, Chitty, and Maitland. Time, 8 min. 29⅘ sec. net. McNab's machine was fitted with the Hellesen-Hunt dry battery ignition and plain coil.

A Novel Event—The Sprint Race.

The next event, which took place at 3 p.m., was a sprint race over a distance of about a mile, in which the competitors were classified as follows: Classes A and B, engines not exceeding 350 and 500 c.c.; Class C, engines not exceeding 500 c.c.; Class D, 750 c.c.; Class E, 1,000 c.c. The men were allowed a flying start, and rode for some distance till they caught up the official car, dressed in line in close formation, and at the sound of Ebblewhite's syren, started. Divided as they were into classes, the members in consequence were almost equally matched in each class, but contrary to anticipation the finishes were disappointing. The winners were: Classes A and B, H. Martin (one-cylinder A.S.L., 85 × 60, 340 c.c.); Class C, 1 Gibson, 2 McNab (Trump-J.A.P.'s, same machines as before); Class D, C. E. Bennett (two-cylinder Indian); Class E, G. Lee Evans (two-cylinder Indian). The first prize in each class was the club's silver medal.



The Sprint Race. Competitors jockeying their machines to get in line with the timekeeper's car.

The B.M.C.R.C. Third 1910 Members' Meeting.—

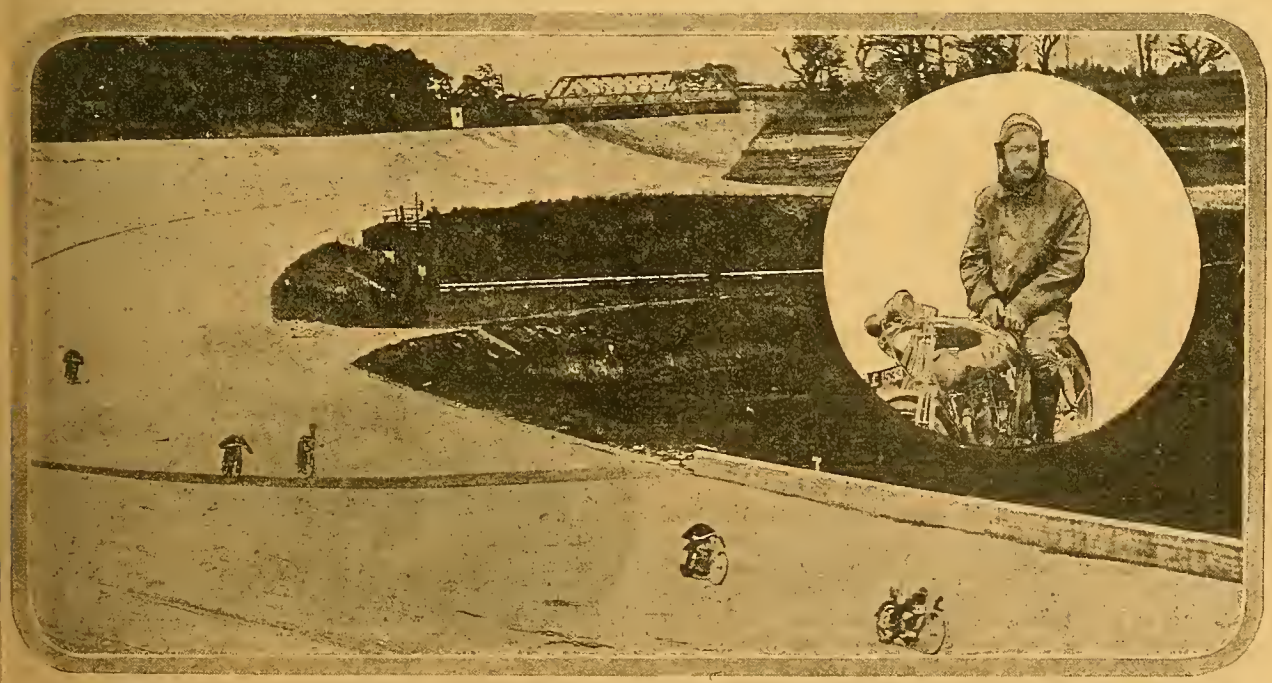
The *pièce de résistance* of the meeting was the hour T.T. race at 4 p.m., in which the full T.T. conditions, except as regards the weight of tools carried, were enforced. First prize, silver cup, presented by the club; second prize, the club's gold medal; third prize, the club's silver medal; and certificates to all who finished. Unfortunately, several well-known riders failed to start. Seven in all took part in the race, these being:

	Cyl.	Bore Stroke	c.c.
H. V. Colver (Matchless) ...	2	85.5 × 58 ...	666
C. E. Bennett (Indian)	2	71.5 × 82.5 ...	662.5
M. Geiger (V.S.)	2	75 × 75 ...	663
J. F. Crundall (Humber) ...	1	85 × 88 ...	499
A. Oberländer (N.S.U.)	1	85 × 88 ...	499
F. A. McNab (Trump-J.A.P.) ...	1	85.5 × 85 ...	488
J. Gibson (Trump-J.A.P.) ...	1	85.5 × 85 ...	488
E. Gwynne (Triumph)	1	84 × 86 ...	476

It was not announced till the actual start that Lee Evans was to be a non-starter, so several of the very fair number of spectators were anxious to back him. Tom Tyler, the bookmaker, who is quite a feature at these meetings, would only give 2 to 1, a price which was not at all attractive, and as an excuse continued to shout, much to everyone's amusement, "2 to 1 Evans! 2 to 1 Evans. Certain to win. Beat a motor car once, he did!" Colver's starting price was 4 to 1, and McNab's 6 to 1. After several showers of rain the weather cleared for the start, which took place at 4.15. At the end of the first lap Colver led by a long distance, while Bennett, Gibson, McNab, and Geiger followed in close order, then came a gap, and Crundall and Oberländer brought up the rear. In the second lap Oberländer lapped Crundall. In the third lap Colver passed with his stand trailing on the ground, to which he pathetically pointed. In this lap Gwynne retired with a broken valve. In the fourth lap Gibson had valve trouble and did not restart till the seventh lap, retiring in the fifteenth. In the fifth lap the order was Colver, Gibson, McNab, Geiger, Oberländer, Crundall, and in the next round Colver stopped, fastened up his stand, and was in hot pursuit of Bennett in next to no time. Only for one lap did Bennett hold first place. In the ninth lap Bennett stopped. For the next few rounds the following order: Colver, McNab, Geiger, Oberländer, was maintained, till in the fourteenth lap Colver stopped for oil and gave McNab the lead. Rain poured down in torrents, and Colver rode with his hand before his face. In the fifteenth lap Geiger retired owing to a broken petrol pipe. McNab was now leading by a long way, while Colver going well now was in hot pursuit,

J. Gibson (3½ h.p. Trump-J.A.P.), winner of the handicap event. This is the machine he will ride in the T.T. Race.

and Geiger, Oberländer, and Crundall followed. The excitement was intense as McNab was soon hard pressed. At the twentieth lap Colver was on his rival who led by 1s., and on the next lap passed him in a deluge of rain. Distances covered: (1) H. V. Colver, 55 miles 720 yards; (2) F. A. McNab (who put up a splendid race), 55 miles 550 yards; (3) A. Oberländer, 50 miles 45 yards; (4) J. F. Crundall, 47 miles 252 yards.



The One Hour Tourist Trophy Race in progress. J. Gibson leading, closely followed by Geiger, McNab, Bennett, and Colver. H. V. Colver (5 h.p. Twin Matchless) beat F. A. McNab (3½ h.p. Trump-J.A.P.) by 170 yards only. Inset, the winner, with his T.T. mount.

A FORECAST OF THE T.T. RACE.

THERE is obviously going to be what the north-country soccer enthusiast would call a "grate fite" for the Marquis St. Mars trophy on May 26th. Fancy the A.C.U. having to limit the entries—and ninety machines being the limit—when we can remember what a job the A.C.C. had a few years ago to rake up *three* motor cyclists with racing machines to fight for old England in the International Cup. Now the cream of the dare-devil amateurs are mustering and tuning for the Isle of Man, and, as for good professional riders, one or two firms would give a great deal to find one unemployed; there is a great dearth of ten stone men with iron nerves, steel wrists, and the gifts of an expert mechanic.

A Review of the Teams.

Then look at the teams! One's eye runs down the list, and pauses at many an item. What do you think of three twin Matchless machines, with the two Colliers and Colver up—invincible trio. The father of the firm never worries if one of them breaks a piston and another bursts a tyre, for he knows that the survivor will nobly carry the credit of Plumstead. Here is a winner, for sure. But, wait a bit; here are *twelve* Rexes, with a big factory behind them, and amongst their jockeys Godfrey, the most daring midget of the entire bunch, with urbane Applebee, Sproston the apostle of pluck, the two Yorkshire cracks Scriven and Mackay, and seven other staunch henchmen, if mischance befalls the first string.

Or, again, Triumphs—the machine that was always good, and gets a little bit better every day—three times three of them, with cute Jack Marshall at the helm. Beaten he was last year; 750 c.c. was too tough a proposition for 500 c.c.; yet if his engine could have stood the racket for an extra thirty miles he would have shaken the big twins up to the very finish, and might even have snatched a narrow victory. This year he is certain to be a few miles faster in every hour. Can the twins say as much with a drop of 80 c.c. in their capacity? If accident overtakes them, Newsome and Creyton are richer in experience than they were, and their 1910 engines will stand more driving than the 1909; behind them are a small fleet of first class amateurs—Witham, who does sixty an hour on Brooklands; Adamson, who can climb Amulree till the clouds roll by, with a hot engine all the time; McMinnies the Dark Blue; and several more.

Wants to Win a Dry Race.

Then come the vermilion Indian crew from the land of the Stars and Stripes. If the roads are wet and dirty, this crowd should have things all their own way, for few of the belt-drivers will get round ten times non-stop as the chains are expected to do. Let's hope for a fine day, or the race may peter out disappointingly, and Wells wants to win a dry race if at all.

Scarcely a man in this team but has shown his power to tune by doing sixty-five or so in a sprint, and several of them have come very near the complete sixty in the hour. It will be a good combination that finishes ahead of the leading Indian when the course is closed, and the tailed out unfortunates are flagged off the road. Nor are we through all the threatening contingents yet.

Who can afford to ignore four twin Bats, with Dayrell, Bowen, and the two Bashalls up? A *leetle* spice too much daring here, if anything; it might be a case of "let the engine have its head, and chance getting round the corner"; but this quartette are a year or two older, and have a tumble or two in their memories. There are bigger impossibilities than that they should top the list.

Dark Horses.

Lots of them. Stanley, on the Premier, was only fractionally less dangerous than Jack Marshall last year, when he was a new man on a new machine. B. V. Jones is a finisher every time, and has put on a lot of speed—eighth last year, wasn't he? McNab, the ponderous Mercury; two Scotts, quit their mark like greased lightning, and the easiest jiggers in the race to sit, if they can keep going fast all through their jocks will be fresh as paint after ten laps.

Rumour says the new Humbers—chain-driven, by the way—are presently going to teach all the old hands something new in design; Crundall and Yates to sit them, men who were racing, aye and invincible, too, when some of the entrants were in their cradles; Reed, who won the twin-cylinder class once, and thinks his turn is about due again; Norton, technical expert, and

E. B. Ware on his 8 h.p. twin-cylinder King's Own-J.A.P. The machine is chain-driven and fitted with a F. and M. two-speed gear—unusual fittings for such a powerful racer. Ware rode at Brooklands on April 2nd.

A Forecast of the T.T. Race.—

most indefatigable of sportsmen; Harry Martin, cushioned by air springs from the cruel potholes, and many another. Pick the winner? Well, I think not. "If 'ifs' and 'ands' were pots and pans," I might. If it is wet, keep your eye on the Indians and two-stroke Scotts; they will come away in a bunch on sloppy roads, I fancy; if so, they should be hunted home by a few survivors of the belt-driven brigade, who dodge transmission stops until the seventh or eighth lap, and possibly one or two belt-drivers might even then press them right through.

Single v. Twin Cylinders.

In no case do I regard a single-cylinder win as really probable. The entries of singles and twins are so large that luck ought to be levelled up between them. Good men on both types ought to come through without accident or trouble. Quite apart from personal fads, we have two facts to support the expectation of a twin-cylinder win. The Matchless firm have chosen to enter three twins, instead of a mixed team—that alone is tolerably eloquent. Secondly, in all T.T. events at Brooklands the single cylinder has been outdistanced when the race has been prolonged. A single-cylinder T.T. with a track gear of, say, 3½ to 1 can undoubtedly cover a single flying mile on the flat almost as fast as the T.T. twins; but it cannot live with them for an hour.

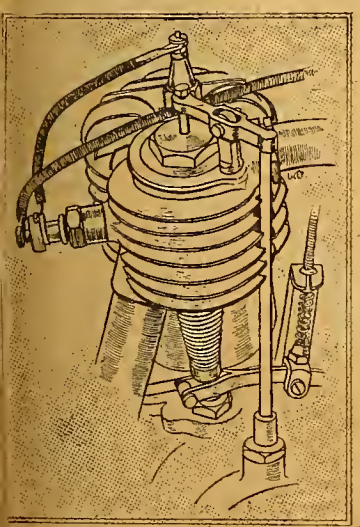
Comparisons of Speed.

In the B.M.C.R.C. hour T.T. race in March several Indians covered upwards of fifty-five miles, but the single-cylinder Bats only managed fifty-four miles, and the Triumphs forty-eight. Multiplying by three, to get near the Manx distance, the twins would win by ten miles or so. Actually they will not, because only short patches of the Manx course are suited for them to utilise their undoubtedly higher speed capacity. But I am convinced that only a perfect holocaust of bad luck can prevent a twin-cylinder win, and I prefer to regard the singles as fighting out a separate battle among themselves. Given dryish roads, there should be a battle royal between five or six twin-cylinder machines for the leading places, and behind them a rather smaller band of singles, tolerably close up, may be expected to wage an equally exciting struggle of even greater general interest. KIRK MICHAEL.

TOURIST TROPHY MODELS.

THE REX SINGLE AND TWIN-CYLINDER MACHINES.

TWO models—a single-cylinder and a twin—have been entered for the Tourist Trophy Race by the Rex Motor Mfg. Co., Coventry, and several of each will take part in the race. The single-cylinder engine with a bore and stroke of 84½ by 89 mm. is practically the ordinary standard model, but the twin-cylinder embodies a number of new features. The most prominent amongst these is the arrangement of the valves in the engine; the inlets, instead of being side by side with the exhausts, are inverted over the exhausts, and are worked by an overhead rocker and tappet, as shown in the annexed sketch. The inlet cam is mounted upon an extension of the shaft which carries the exhaust cam, the timing gear box having been widened for this purpose. This illustration shows how large are the radiating fins with which the valve chamber has been provided, and the neat arrangement of the exhaust and inlet pipes leading hereto. The cylinder casting with which the valve box is integral deserves special mention, not only on account of its neatness, but also for the fact that there seems to be no surplus metal anywhere

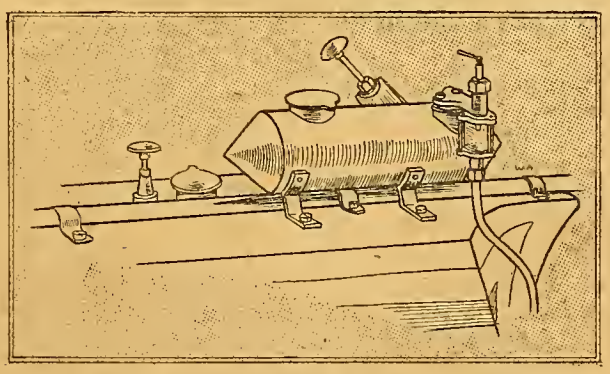


One cylinder of a T.T. Twin Rex, showing the exhaust and inlet motion and Lodge double-pole sparking plug.

It will be noticed that Lodge double-pole ignition is employed, a two-pole plug being placed in the side of the valve box, and an ordinary plug in the cylinder head.

The engine has undergone considerable modification in point of cylinder dimensions from the standard twin model, and to comply with the regulations the bore and stroke of this T.T. machine are 77½ by 71 mm. respectively. The behaviour of this engine will, no doubt, be watched with interest, especially in conjunction with the double pole ignition.

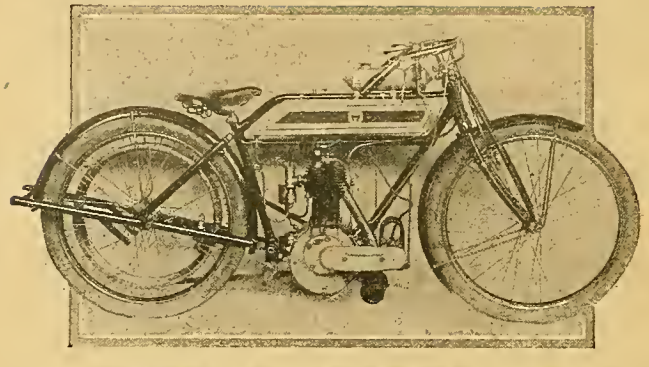
As might have been expected, the reciprocating parts have been made extremely light so as to permit the



The torpedo lubricating oil tank on the Rex T.T. models.

engine to run up to a high rate of speed. The pistons are of cast-iron, and are a fine piece of work. Two wide rings only are used, and above and below these oil grooves are formed. The piston head is considerably domed, thus allowing the maximum amount of metal to be machined away without impairing its strength. The gudgeon pin is tubular, and is made

Tourist Trophy Models.—



3½ h.p. single-cylinder T.T. Rex. The cylindrical tank on the top tube is for lubricating oil, and permits of increased petrol capacity.

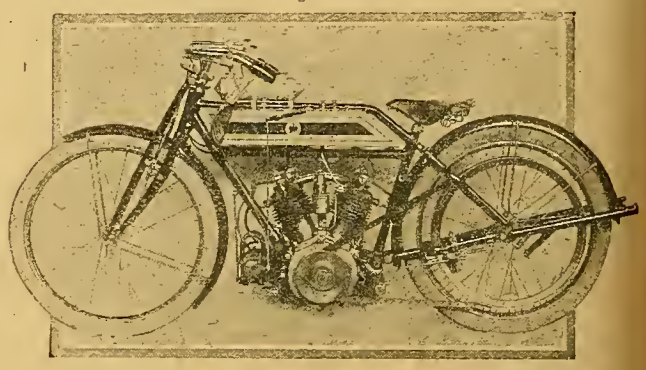
slightly taper, so that it fits securely in position without the aid of any other locking device.

The connecting rods have also been considerably lightened. A notable feature is the length and diameter of the big and little end bearings and the manner in which they are assured of lubrication. The big end has grooves cut right through the connecting rod boss and its brass, so that the crank pin receives a supply of lubricant not only at its ends but also at two intermediate places. At the little end a single groove is cut and serves the same purpose, but in this case an auxiliary hole is bored through to the bearing at each side of the connecting rod, so that it receives oil from below as well as from above.

No pains have been spared to make the lubrication arrangements as perfect as possible, and very thoroughly they have been carried out. First of all, the piston gets a certain amount of lubrication through the inlet pipes in the usual Rex manner. For this purpose a pipe from the crank chamber is led up to the mixing chamber of the carburetter, so that the suction of the engine draws in a certain amount of oil together with the mixture. As it has been found necessary to enlarge the petrol tank in order to carry a sufficient supply of fuel, the lubricating oil is carried in a separate torpedo-shaped tank placed above the petrol tank, and at its forward end. From this oil is supplied to the engine mainly by means of the drip feed arrangement on the right-hand side, or, in case of emergency, by the ordinary plunger pump, which is on the left.

The question of transmission has not yet been settled, but we understand the Rex Co. have been, or are still, carrying out extensive tests with regard to the relative merits of chain and belt drive, and will not decide which to use until trials have been made on the course and they have proved to their satisfaction which is the faster.

The machine is on standard Rex lines, with the exception of the points dealt with above, and has the appearance of a fast and at the same time a light and handy mount.



Twin-cylinder T.T. Rex. The engine has mechanically-operated overhead inlet valves and Lodge double-pole ignition.

WHIT-MONDAY EVENTS AT BROOKLANDS.

Following are the entries for the two motor cycle handicaps at Brooklands on Whit-Monday:

2.20 p.m.—THE MAY HANDICAP.

Cylinder capacity between 500 and 1,000 c.c. Distance about 8 miles.

	Bore and stroke.	Cyls.	c.c.
H. H. Bowen (Bat)	85½ × 58	2	666
B. Yates (Humber)			
A. J. Moorhouse (Indian)	82½ × 93	2	994
H. G. Partridge (N.S.U.)	75 × 90	2	808
J. P. Le Grand (Rex)	77½ × 70	2	670
W. E. Cook (N.L.G.)	80 × 99	2	995
H. Parker (N.L.G.)	80 × 94	2	945
A. Oberländer (N.S.U.)	80 × 99	2	995
R. T. Exshaw and W. H. Bashall (N.L.G.)	84 × 90	2	998
F. H. Arnott (V.S.)	75 × 75	2	663

THE MOTOR CYCLE SPRING ISSUE and T.T. SPECIAL NUMBER

On sale everywhere, Thursday, May 26th. 1d. as usual.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

A Good Liver Stirrer.

[4751.]—In reply to letter No. 4737, I have had sufficient acquaintance with horsemanship and motor cycling to assure "India" that he will find the latter little, if any, inferior to the former as a "liver stirrer." On a good machine the vibration is negligible. I have ridden a 5 h.p. twin P. and M., two-speed gear, Druid spring forks, for three years, and have done about 150 miles in the day without undue fatigue. I am 55, weigh about 14 stones, am a literary man, and find that nothing "stirs my liver" better than a good run on the motor cycle.

AB 668.

The Auto-wheel.

[4752.]—What has become of the Auto-wheel, which, at the time of the Stanley Show, numerous journals thought had solved all sorts of motor cycle difficulties? It reminds me of some daily newspaper articles a few years ago advocating shaving by means of a piece of paper after applying some sort of mixture. We were told that it would soon be universally used, and leave the face as smooth as alabaster. I have patiently waited for it, but it still seems a long way off.

C. BRIGGS.

Scouting on Motor Cycles.

[4753.]—I have done a little bit of this. My greatest practical difficulty occurred when riding along a narrow road—I met an enemy's scout practically face to face. It needs a smart rider to turn round and get away without being captured. On the other hand, to leave one's motor cycle and walk some distance away is also open to objection.

Can any of your military readers tell us what to do?

SCOUT.

[In case of real warfare both parties would be armed with revolvers and the one who got away without being captured would be the better marksman.—ED.]

Increase of Speed on Partially Raising the Exhaust Valve.

[4754.]—With all due respect to the one who signs himself "The Colville Motor Works," I thank him for the exact copy of an article which appeared some time back in *The Autocar*. I won't try to contradict the explanation arrived at by scientific investigators, viz., that the valve has a tendency to bounce off its seating and so upset the incoming gas; but why not allow for the tendency to bounce (by setting timing), so that inlet valve commences to open when piston has travelled an eighth of an inch down on the induction stroke? By that time the exhaust valve will be firmly on its seating and allow incoming gas to be sucked in without being upset by the bounce of exhaust valve.

PONY.

[4755.]—In the issue of April 28th "Pony" says, "If I will experiment with my engine by varying the timing to suit the engine," the exhaust lifter peculiarity "should" stop for good. I hope "Pony" won't be cross, but either by accident or design the makers managed to time my engine correctly; at any rate it is now two years and eleven months since I fixed the spring which prevents the lifter doing a jig, and the peculiarity "has" stopped absolutely. "The Colville Motor Works" mention the valve bouncing theory, but if "modern academic investigation" is as simple and infallible as they suggest, I shall expect to hear that the man who coaxes his engine round Brooklands at the fastest rate will be found to have a Bowden lifter or a dashpot fitted to the inlet valve, as well as to the exhaust valve, as undoubtedly a partially opened valve would affect the engine more on the compression stroke than on the induction stroke, and incidentally the valve bouncing theory becomes one of the possible explanations of the blow-back peculiarity mentioned in "Ixion's" A Puzzle or a Poser? but, of course, this is merely "surface surmise" on my part.

Your correspondents assume that their respective explanation of the valve raising phenomenon is conclusive in all cases. I should not care to go quite so far, as I think that in different engines entirely different causes may show precisely similar symptoms, but I can vouch for cause, effect, and cure in the case I quote.

WHITTLESHIP.

Delay in Execution of Orders.

[4756.]—"Disgusted" in his letter [4730] deserves the thanks of all motor cyclists for drawing attention to a state of affairs which is notorious; one might almost say scandalous.

Last season I returned my machine to the makers for overhauling, and received it back—after much correspondence and many promises—in seven weeks. Three weeks ago I ordered a new mudguard, and am still waiting for it. But by far the most annoying thing is the neglect of one's letters; one would think that a man who had bought a £50 machine and would probably buy again was worth a little attention. The manufacturers' idea seems to be to sell a bicycle and then the purchaser may go to the dence. Let us hope, with your assistance, makers will mend their ways, and realise that these small orders are often of vital importance to the sender.

CHARLES LYALL.

Hill-climbs and Other Matters.

[4757.]—As one who lives in the neighbourhood of Sutton Bank, and who witnessed the contests there on Easter Saturday, I could not help feeling the futility of it all. This is a grand district for making one think out the best methods of getting the best use out of a motor cycle; there are much worse gradients than Sutton Bank within five miles of it *which cannot be rushed;* they are not so long, it is true, but far more twisty and lumpy, inviting bad spills in cart-ruts and gutters running across the road.

Wherever the best scenery is to be found there also one generally finds the stiffest and often roughest hills such as described in the issue of April 7th, "A Jaunt in the North Riding." Now, it strikes me as a pity that when one starts out on a pleasure jaunt to have to do a turn of "hard labour," such as the riders in the above article had to do up Wass Bank. The object of this letter is, out of gratitude for the many tips I have got from reading *The Motor Cycle* regularly, to pass them on to a few more readers who may not have read this interesting weekly so long as I have.

Practically, the whole thing is to fit a two-speed gear and Whittle belt (⅞in. or 1in.) to a 3½ h.p. of one of the best known makes of machines. There are so many choices nowadays of machines that are equally good, but they won't climb stiff, twisty, lumpy banks, *slowly*, so as to be both comfortable and safe.

Personally, I ride a 3¾ h.p. N.S.U. fitted with two-speed gear and free engine (both bought second-hand), and tackle these hills daily as a matter of course with the very greatest ease and comfort. Rubber belts and ordinary leather belts are of no use here, as it means shortening every few days, and slipping, and short life. The only improvement on the Whittle (for this district) would be a chain drive. My motor cycling now is practically all pleasure, where it used to be marred before by some very hard work.

EXPERIENTIA DOCET.

Automatic Carburetters.

[4758.]—I have read the letters in *The Motor Cycle* regarding automatic carburetters, and have been much interested in them. I purchased a 3½ h.p. new Rover tricar in July, 1906, and this machine is fitted with a carburetter which is entirely automatic. It is the simplest carburetter possible, has only one lever to operate throttle, and no extra air device whatever, no flap or sliding tubes, and it will give a correct mixture at all speeds. The engine will run dead slowly and will run fast. Weather is no object, and as proof of perfect mixture during the time I have had the machine (I have worn out three back tyre covers) the exhaust valve is as clean as most inlet valves, and shows no signs of burning.

I am never troubled with overheating, and my longest non-stop run was from Thornton Abbey to Peterborough, about eighty-nine miles. If a carburetter as simple as this could be fitted nearly four years ago, I cannot understand why more are not on the market. I do not know the maker of the carburetter; it was fitted by the Rover Co., but it is not the Rover automatic. AT 394.

The Motor Cycle in the United States.

[4759.]—I have read with great interest the correspondence which appeared in *The Motor Cycle* on the above subject and certainly feel very sorry for "Disgusted Belt User." I am at a loss to understand how he uses his belt if he can only average about 300 miles with an English belt.

In this hot country I have never found my belt run less than 2,000 miles, and often average more than this figure. It is a fact that if the pulley is not true and the belt not in a straight line, the life of it will be short, but even in this case I find the belt is good for nearly 1,000 miles.

My friend owned a 3½ h.p. motor cycle, fitted with an automatic pulley; the flanges of it are not true and yet he has covered more than 1,000 miles with the belt and it is still in use.

I received my new motor cycle fitted with Roc free engine and two-speed gear last month, and have since travelled about 300 miles on it. I have never shortened the belt yet, and it still looks like new.

I write this letter to let you know how your rubber and canvas belts behave in this part of the world, and certainly disagree with "Disgusted Belt User" about the short life of an English belt. SATISFIED BELT USER.

Perak, Malay States.

Storing Accumulators.

[4760.]—We have noticed at various times enquiries in the press on the above subject, and in many cases the advice given is such that, if followed, damage to the accumulator might result. We, therefore, give a few hints as to the methods to be followed, which an experience of twenty years in the manufacture of small portable accumulators for ignition and lighting purposes suggests are the best.

(1.) If an accumulator has never been charged, wrap it up or store it in a dark dry place.

(2.) If it is desired to put away an accumulator that has been charged for an indefinite period, run it down on a lamp till each 2-volt cell registers 1.9 volts, then empty out the acid and let it dry off, and store as No. 1. The slight sulphate formed in drying (if any) will disappear at the first charge.

(3.) If a charged accumulator is to be put by for any period up to six months, charge fully, wipe perfectly dry, and grease the terminals. Store in a dry dark place free from dust. At the end of the time very little of the charge will have been lost.

Water should never be put into an accumulator, whether charged or not, under any circumstances.

C. A. VANDERVELL AND CO.

The London-Edinburgh Run.

[4761.]—My object in writing this letter is simply because I think there must be other readers of your journal who have had the same treatment meted out to them at the hands of the committee of the M.C.C.

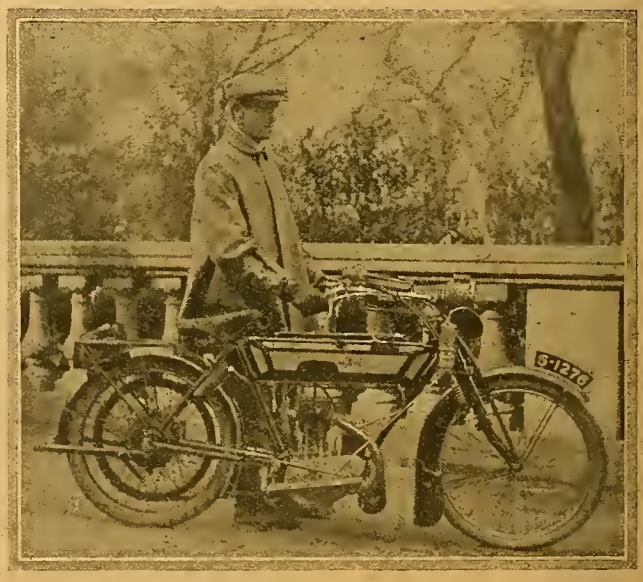
On April 24th I offered myself as a candidate for the London to Edinburgh run, and I therefore complied with the necessary conditions set forth in H. G. Bell's article in *The Motor Cycle*, viz., one guinea subscription, five shillings for membership, ten shillings and sixpence for entrance fee for run from London to Edinburgh, and eight shillings for food. This, I conclude, was all that was necessary, but to make sure I enclosed three trade references. Now comes the worst of all, and you may guess what a surprise I had when I had my money returned with a note that I had failed to get the necessary votes from the committee. I might add that the same thing occurred last year, and was a great surprise to many of my motoring friends, who will no doubt read this letter.

Can any reader offer me an explanation, as this action on the part of the M.C.C. Committee appears to me to be somewhat arbitrary.

JACK MORRIS.

An Appreciation of a Two-speed Humber.

[4762.]—In the early part of this year the Humber Company were good enough to let me have a trial run on one of the two-speed models, and I was so pleased with its running that I placed an order for one. The machine arrived just in time for Easter, and I lost no time in putting it through its paces. I thought my experience of its capabilities might interest some of your readers. Pleased as I was with the 1909 model, it cannot be compared with the present one.



A. C. Robbins and the 1910 2¾ h.p. Humber, which he eulogises in the accompanying letter.

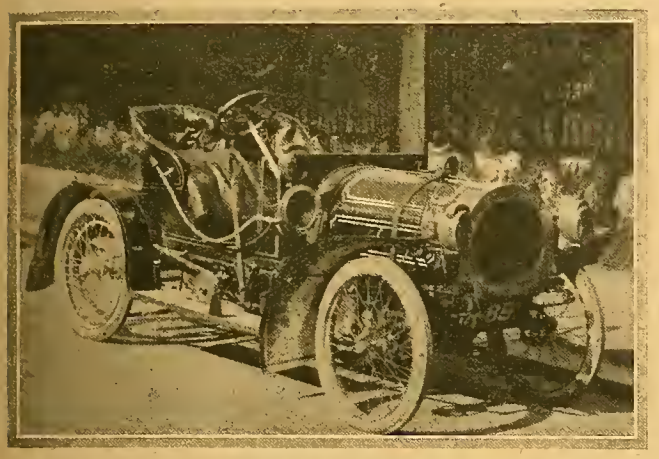
Its remarkable freedom from engine vibration, its soft gliding motion even when travelling slowly, its ease of control and handiness in dodging ruts, etc., all combine in making it one of the ideal mounts of the season. The operation of working the gears is much easier, with their neat adjustable rods, also the smooth handle-bar free from any sharp edges, and the rounded handle grips make it a comfort to ride.

It is a fair hill-eater; I find it will climb Swain's Lane hill without any hesitation on top gear of four and three-quarters to one without any rushing. I find it also capable of travelling at a very fast pace over long stretches without overheating; on the Great North Road (early in the morning), between Barnet and Biggleswade, it will go at speeds bordering on double the speed limit.

On the whole I consider it an exceptionally good tourist mount, and one which should be seen on the road a lot this year. The specification may be of interest: 3½ h.p. Humber, two-speed gear, Bosch magneto, B. and B. carburetter, Liversidge rubber and steel-studded back tyre, Dunlop front, Dunlop butt-ended tubes, Whittle belt, and Brooks's saddle. I can speak very highly of the Liversidge tyre, and also the Whittle belt—one free from punctures, the other free from breakages. A. C. ROBBINS.

A Light Four-wheeled Runabout.

[4763.]—I was very interested to read in *The Motor Cycle* the account of a belt-driven four-wheeled runabout with four-cylinder F.N. engine. I have had one built almost exactly like it. It was finished last August, and has been very successful. Mine has a 9 h.p. Advance twin, water-cooled engine, Bosch magneto, C.M.F. radiator, Kent three-speed gear, no reverse, Hans Renold chain from engine



A belt-driven runabout, propelled by a twin-cylinder V type Advance engine. (See letter No. 4763.)

to three-speed gear, 1in. Whittle belts, geared 6.8 and 10 to 1, but I am going to raise the gear, as it takes absolutely everything on top with two up. The wheelbase is 6ft., track 3ft. 6in. All four wheels are fitted with 26 × 2½in. Palmer cord tyres. I have run about 2,000 miles and had no trouble with the belts and not a single puncture. The body is painted dark green, with black and white lines. I got a local coachbuilder to make the body and paint same, and he finished it very nicely. It has quite a smart, up-to-date appearance. I hope the enclosed photograph will be of interest.

W. A. McKEGGIE.

An Extended Trial of a Scott.

[4764.]—I read the article under the above heading in the issue of the 21st ult. with great interest, the more so as I am an enthusiastic rider of a Scott, but have done over double the distance you mentioned. I have nothing to find fault with the major portion of the article, but find myself in disagreement with you on one or two items, notably, "petrol consumption." I may say that I ride one of the new 1910 4 h.p. models, which, while having the same stroke as the standard 3½ h.p. machine, has ⅛in. bigger bore, namely, 2¾in., against 2⅝in.

I completed 1,007 miles on fifteen gallons of Shell petrol, and had probably enough in tank to carry me ten miles more, but, having a twenty-five mile journey, was reluctantly compelled to fill up again. A simple calculation shows that this is slightly better than sixty-seven miles to the gallon, and I am hoping in my second 1,000 miles to improve on this and do over seventy.

Slow running: I find that I can throttle down comfortably to 10 m.p.h. on high gear, which is 4.3 to 1, but on the low 7.3 to 1, I can crawl at a speed, firing regularly, too slow to be shown on my Jones's speedometer, which is not very sensitive below 8 m.p.h., so that I don't think there is anything to complain of on that score. On the high gear, given a good level road, I have not the slightest difficulty in touching 50 m.p.h., while on a slight down gradient I have increased this to sixty out of curiosity to see what one could push it to. Needless to say, one does not often indulge in such bursts of speed, but on open roads I usually settle down to a comfortable 30 m.p.h., which is the Scott's most comfortable speed.

I have never myself found any trouble with the spring stand, and it has never come adrift, nor did I find it necessary to adjust the chains until I had completed 1,100 miles, and then but a trifle.

Like you, I, too, found the extra air lever somewhat inaccessible, but as it only wants once adjusting, it seemed to be a pity to complicate matters and put handle-bar control on it. One dark night, however, after starting, in putting my hand down to open it, I got hold of the sparking plug instead! Needless to say, my opinions underwent a violent change.

There is one point that you have not touched upon, which is one of the features of a Scott motor, namely, the water cooling. I have been asked numberless times if this causes any trouble, and if the water boils away. I have never yet had the water boiling at all, and in the first 1,000 miles only twice added about a teacupful to the tank.

Wishing, after the first 1,000 miles, to take the engine down and see what was the condition of same, I telephoned the Scott people for some exhaust packings, telling them that I was proposing to take it down. They told me it would be a much better plan to run up and have it taken down at their place, which I did. Showing the wonderful accessibility of the Scott, I may say that the whole engine was taken down and laid ready for my inspection in less than a quarter of an hour. When we proceeded to try the various parts on the limit ganges, there was not a shadow of wear or a shake in any part, and bar the fact that I had, through over lubricating, slightly choked up the exhaust ports, nothing wanted doing.

In conclusion, should anybody wish to use a speedometer with Scott machine, which is practically necessary on a first-class machine, I should strongly recommend him to have it coupled up, as mine is, to the back wheel, and clamped by a neat fitting, which the makers of the machine supply, to the down oil tube. It is extremely neat and out of the way, and is of great use for "tuning up purposes," as one has but to start it on the stand, slip in the high gear, and if it will touch sixty on the dial, with the throttle about half open, you may depend upon it it will give a good account of itself on the road. I need hardly say that the only connection I have with the Scott Engineering Co. is that of a satisfied user of one of their machines.

R. B. CAFFERATA.

Exhaust Whistles.

[4765.]—*Re* exhaust whistles on single-cylinder machines, I have such a whistle on my machine, but did not get good results till I fitted a shutter that worked along with pedal of whistle, so that the whole of the exhaust gases must go through whistle. Again, if you are running through a town, throttle shut, and need to give a warning, it is an easy matter to open throttle just for a second and give two or three sharp toots.

I used to have a lot of bother with a trinote horn being choked up; in fact, if there was any dust on the roads it was put out of business in less than five miles. I now have fitted a baffle in front of each horn about ½in. in front. This has stopped the dust getting in, and horn is always in order, but I prefer the exhaust whistle, as the hands are left free.

F. Exhaust.

EXPERIENCES WANTED.

"Beginner" (Ventnor) would be glad of readers' experiences of the Royal Mail tricycles used for the carriage of letters and postal parcels in the London streets.

"J. P. H." (Galway) would be glad of readers' opinions of Morganol lubricating oil for motor cycles.

"H.A.H." (Pontypridd) would be glad of readers' experiences with the Millennium Fit-all two-speed gear on a 5 h.p. twin-cylinder engine with sidecar.

A reply to an enquiry addressed Mr. Percy Pelt, Grantham, has been returned as "not known."

A FORECAST OF THE T.T. RACE.
SATURDAY'S OPEN HILL-CLIMB.
THE NORTHERN LEAGUE.

Whit-Monday Racing at Brooklands.

For the Whit-Monday meeting at Brooklands, there are sixteen entries in the May Motor Cycle Handicap, and twenty-nine in the Whitsun handicap.

Tourist Trophy Race.

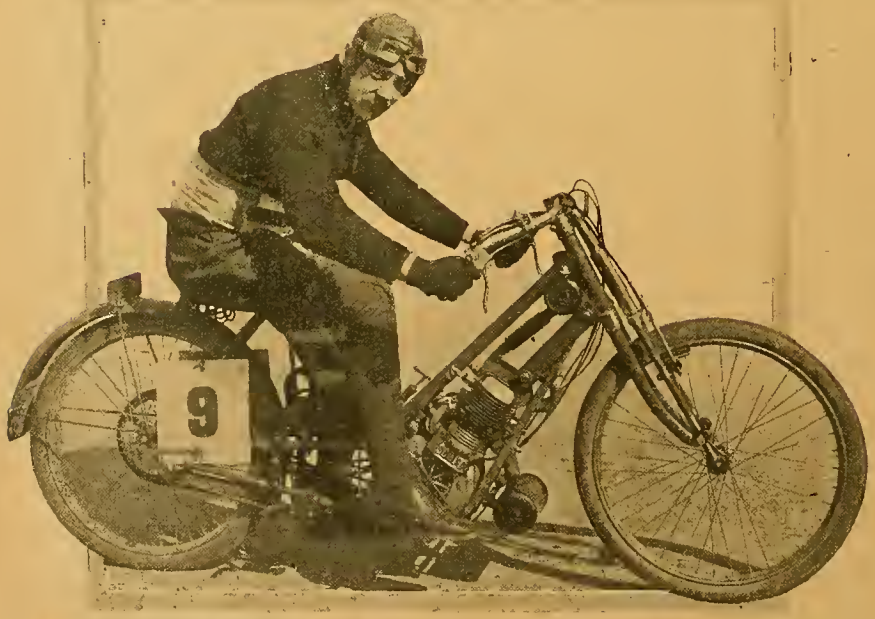
The machine entered by D. E. Rea is a 3½ h.p. Moveo, which will be ridden by Hugh Storey. There will be three Moveo motor cycles in the T.T.—a design hailing from Preston.

I.O.M. News.

The entry for the Tourist Trophy has eclipsed all previous figures; the latest received appear elsewhere in this issue. The race will be followed by a hill-climb on the mountain road, which will be held at 2.30 p.m. on Friday, 27th inst.

The Scott T.T. Racers.

The two two-stroke Scotts entered for the Tourist Trophy are now running on the road and promise very well. Eric S. Myers and F. Philipp will ride the machines in the race. They are more powerful than the standard model, and of amended and lighter design, as may be gathered by the illustration below. The bore is 2⅞in. and stroke 3in. The effective stroke is only 2¼in., so that the engine really is a short stroke engine viewed from the thermal aspect. The capacity is 39 cubic inches, compared with 27 cubic inches of the standard engine. At 2,000 revolutions per minute the new engine is calculated to give 6.3 b.h.p., whereas at the same speed the standard Scott gives 4.35. The T.T. model is geared 2½ to 1 on the high, and 3.78 on the low gear, so that at sixty miles per hour the engine makes 2,017 revolutions on the high and 3,041 on the low gear. A mechanical oil feed has been adopted in addition to the ordinary hand pump. The machines are exceptionally silent in running. The Scotts are the only two-stroke engined machines entered for the Tourist Trophy Race.



Eric S. Myers mounted on the 5 h.p. two-stroke Scott he has entered for the T.T. in the Isle of Man on the 26th inst. Some details of the machine are given in a paragraph above.

Official Repairers.

A number of motor cycle repairers have now been officially appointed by the Auto Cycle Union.

A Fine Performance.

The only private owner to obtain full marks in the recent Quarterly Trial was H. Robert, who rode a two-speed P. and M. Only one trade rider—to wit, J. F. Crundall (3½ h.p. Humber)—was equally successful.

International Licences.

With regard to a paragraph published last week which referred to the new international licences for motor cycles, it is advisable to point out to readers that for the present the usual triptych issued by the A.C.U., M.U., A.A., etc., holds good, but in the very near future the new licences will be compulsory, and although they will be obtainable from the above organisations, they will be also issued to all motorists whether members or not.

Police Traps.

We have received the following information from a correspondent. There are a large number of traps in the Edgware Road (Hendon district), a road which is much frequented by motor cyclists at week-ends. A trap has recently been working on the Silkstream Bridge, between West Hendon Broadway and the brewery, where there is a dip in the road. There is one working near Edgware, either in the middle of the village or nearer London, by the Hendon Workhouse at Burnt Oak. It is also advisable to drive carefully from Hendon to Brockley Hill.

Racing at Sydney, N.S.W.

The Sydney Cycle and Motor Club held a combined night carnival on the Sydney Sports Ground on March 23rd. A two miles race for machines 3 h.p. and over was won by S. L. Bailey (5 h.p. Massey-J.A.P.) from J. E. Yee (3½ h.p. Triumph) in 2m. 22⅕s. A mile, for machines under 3 h.p., was won by C. Crouch from A. Levi in 1m. 34s. Both rode Moto-Rêves. In the final, F. Crouch, brother of the winner, through his footrest striking the grass, swung wide up the track and sustained a bad fall. The five miles championship of New South Wales was won by S. L. Bailey (5 h.p. Massey-J.A.P.) from J. E. Yee (3½ h.p. Triumph) by threequarters of a lap, with L. W. Firth (3½ h.p. Triumph) third. Time, 6m. 14s.

THE MOTOR CYCLE

KING EDWARD VII.

THE great and glorious King whose death was announced to a startled world on Saturday last reigned during the nine years through which automobilism emerged from its embryo stage, and developed in that period into the universal means of locomotion it now is. His late Majesty, the first sportsman in the land, was largely responsible for the rapid rise to popularity which motoring enjoyed. Taking to the method of travel we all so dearly love in its earliest days, our deeply lamented Sovereign never forsook it, and almost to within a few days of his demise he enjoyed the use of his car. Not only did he help to popularise motoring by setting the example to the highest in the land, but he took a keen and active interest in its doings, and three years ago became patron of the governing body, then the Automobile Club of Great Britain and Ireland, granting it permission by Royal Warrant to assume the title of the Royal Automobile Club. Through his influence the present Queen's brother, Prince Francis of Teck, became chairman of the R.A.C., and *ipso facto* President of the Auto Cycle Union. It is not for us to enlarge upon the great loss sustained by Great Britain, Europe, nay the whole world; but it would be unfitting not to dwell upon the great blow which has fallen upon automobilism, including, of course, motor cycling, through the death of its great and noble patron. The whole nation is plunged in sadness, and the small yet ever increasing motor cycling community bewail the loss of the greatest motorist in the land. To the Queen Dowager, King George, his Consort, and the Royal Family, we offer on behalf of our readers our heartfelt sympathy in this great sorrow. The fact that the new King is an ardent supporter of motoring is indeed welcome.

The King is dead! Long live the King!

Latest Donations to the T.T. Fund.

A. N. Wood, £1 1s.; the Motor Cycling Club, £2 2s.

Entry for the Six Days' Trial.

C. Patteson (2 h.p. Moto-Rêve) is the latest entrant for the End-to-end trial next July.

Motor Cycles Increased in Price.

An advance in the price of motor cycles varying from 20s. to 30s. has been made by most of the prominent manufacturers, in consequence of the high prices of tyres.

London to Coventry and Back.

The North-West London M.C.C. twelve hours run to Coventry and back was postponed from Saturday at the last minute, and May 28th has been announced as the probable date. A large crowd collected at the finishing point on Saturday evening on the supposition that the competitors had started.

A Champion Tennis Player and Motor Cyclist.

A. F. Wilding, the old Cambridge lawn tennis captain, and well-known to our readers as an enthusiastic motor cyclist and rider of a Bat, has returned to England, and is looking very fit and well. Since his return home to New Zealand in 1908 Wilding has gained many honours. He is now anxious to follow in the footsteps of Brookes and secure the English championship. This week he will take part in the tennis tournament at Wiesbaden.

The Herts County A.C. (Motor Cycle Section) Hill-climb.

When the sad news of the death of King Edward was announced no one expected the hill-climb at Aston would take place, but as no one of those intimately concerned received news to the contrary a number of competitors made their way to Tring. On the way down, in Hemel Hempstead, Mr. Salmon, the secretary of the Herts County A.C., was met, and he first gave the official intimation of the postponement; then, when clear of the village, Geiger rounded a bend, and sadly shook his head, while a little further on came Wells, Hedstrom, Bentley, and others on Indians, all homeward bound. At the Rose and Crown in Tring, Jenkins, Booth, Straight, and a few others were to be seen, all very quiet and sad looking. On the hill itself a number of cars and motor cycles were gathered, and one or two were trying their machines up its gradient.

FUTURE EVENTS.

May 13, 14, and 16 (Whitsun)—M.C.C. London-Edinburgh and London-Edinburgh and Back Runs.

" 26 (Thurs.)—INTERNATIONAL MOTOR CYCLE T.T. RACE.

" 27—Open Hill-climb in the Isle of Man.

June 4—Motor Cycling Club second private race meeting and gymkhana at Brooklands.

" 6-11—Scottish Six Days' Open Reliability Trial, organised by Edinburgh M.C.C.

" 18—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CHALLENGE CUP. Competing Teams: Motor Cycling Club (holders), Coventry and Warwickshire M.C., Bristol B. and M.C., Streatham and District M.C., Sutton Coldfield A.C., Edinburgh M.C.C., Southern M.C., Harrogate and District M.C.C., Great Yarmouth and District M.C.C., Herts County A.C., Essex M.C., N.W. London M.C.C., Oxford M.C.C., Nottingham and District M.C.C., and Sheffield and Hallamshire M.C.

Annual Spring Number.

We have a number of special features in preparation for our special Spring Issue and Tourist Trophy Number on May 26th—a fortnight hence. Illustrations and sketches by well-known artists will be a feature, while, in addition to our usual features, special articles already arranged for include the following:

Through Great Britain and the Continent—an interesting narrative of a 4,000 miles tour, by Dr. A. M. Webster.

An historical article descriptive of the International Cup Race (the forerunner of the present T.T. Race), and the Tourist Trophy Race to date.

Suggested Holiday Tours in England, showing routes for an enjoyable tour on a motor cycle in Northern, Central, and Southern England.

Photographs of competitors for the Tourist Trophy, with specifications of their machines.

Latest news from the T.T. course, with illustrations and special reference to the practising.

Brooklands Whitsun Meeting.

The Whitsun race meeting, which was to have been held at Brooklands on Whit-Monday, has been postponed.

The London-Edinburgh Run.

We hear on going to press that the annual M.C.C. London-Edinburgh and back run will be held this week-end as originally arranged.

T.T. Items.

S. A. M. Witham will ride a 5. h.p. J.A.P. and not a 3½ h.p. Triumph as has been announced. The Moveo machines entered by Messrs. Loxham and Co. are a 5 h.p., rider R. Loxham. and a 3½ h.p., rider H. Holding. Both these machines are fitted with J.A.P. engines.

Worth Trying For.

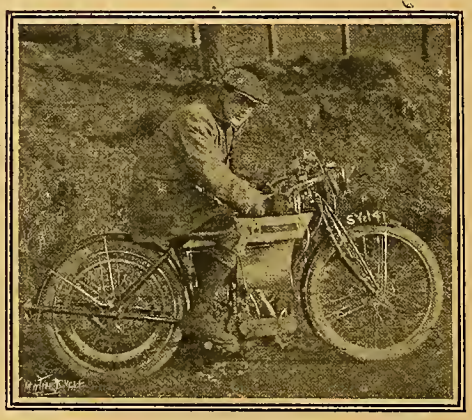
The Vacuum Oil Co. offer a prize of £25 to the winner of the T.T. should he use Vacuum oil in the race, or £10 to the first home of the first three who use this well-known lubricant.

The Filey Speed Trials.

As regards the speed trials at Filey on Whit-Monday, we understand that the organisers will follow the example of other clubs as regards the holding or postponement of the event.

M.C.C. Race Meeting and Gymkhana.

We have been favoured with an advance proof of the events to be held at the above meeting at Brooklands on June 4th. From it we notice that there are six racing events for motor cyclists, a hill-climb, and a special invitation race for a silver cup, besides three gymkhana events. We have already briefly referred to the invitation race. It is to be a contest between selected and representative riders of the most popular makes of motor bicycles as offered to the public, and the M.C.C. invite applications from members who desire to take part in such a contest. Every application will be considered, and the committee will select one suitable machine of each recognised make submitted to them, and will put up as fair a sporting competition for a silver cup as lies within their power.



A. H. Alexander (single cylinder T.T. Rex), fastest in the single cylinder class of the Edinburgh Waverley M.C. speed test. He will ride this machine in the T.T. Race fitted with wind scoops as shown.

The Board of Trade Returns.

Imports of motor cycles and parts show a considerable increase during April. The month's figures were £11,020, as compared with £6,374 in April, 1909, and £6,093 in 1908. The returns for the four months ended April 30th were:

	1908. £	1909. £	1910. £
Imports of motor cycles ...	17,360	12,263	15,669
Parts thereof...	5,923	7,470	20,148
	£23,283	£19,733	£35,817

The British Exports.

Exports of British-made motor cycles and parts still show an upward tendency. The April figures for 1908-9-10, were £4,558, £6,188, and £11,196 respectively. The export figures for the four months ended April 30th were:

	1908. £	1909. £	1910. £
Exports of motor cycles ...	9,014	13,467	29,022
Parts thereof...	8,773	11,317	13,080
	£17,787	£25,784	£42,102

Re-exports.

Foreign motor cycles and parts re-exported from this country during the four complete months of 1910 reached a value of £1,622. During the corresponding period of 1909 the figures were £6,673.

TOURIST TROPHY RACE. LATEST DETAILS. THE OLD COURSE TO BE USED.

Although eighty-three entries have been received for the T.T., it has been decided to reduce the number to seventy, in accordance with the regulations and to meet the wishes of the Isle of Man authorities. The prizes will be as last year, viz.: 1st, £40; 2nd, £20; 3rd, £10; 4th, £5. A cup will be awarded to the first private owner not finishing among the first three and a silver medal to all who complete the course. The old course will be used, viz.: St. John's-Ballacraine-Creg Willeys Hill-Kirkmichael-Peel-St. John's. During practice competitors must not leave Ballacraine corner after 7.15 a.m., and after 7.30 a.m. the legal limit must not be exceeded. Machines must bear numbers carried on round discs, as at Brooklands, on both sides of the front forks, and on a wooden board facing forward, and armlets in addition. Competitors will be expected to deposit 5s. with the A.C.U. for the loan of the boards. Machines will not be weighed this year, but the inspection by the judges will take place at St. John's at 10.30 a.m. on the 25th inst., and the brake and silencer tests will follow.

The judges nominated are: J. W. Orde, Robt. Todd, V. Hart, and J. W. G. Brooker.

The Isle of Man Steam Packet Co. announces that from May 23rd to June 30th (Sundays excepted) there will be a double day express service. The sailings will be as follows:

From Liverpool: Daily, 10.30 a.m. and 2.45 p.m. Extras, Wednesday, May 25th, 12.50 night.

From Douglas: Daily, 9 a.m. and 4 p.m. Extras, Monday, 12.30 a.m. (Sunday night); Thursday, May 26th, 6 p.m.

Thursday, 26th May, the day of the race, there will be a one-day excursion. Sailing as under: Liverpool to Douglas, Wednesday, 12.50 night; returning from Douglas Thursday, at 6 p.m. Day fare: Steerage, 4s.; saloon, 6s.

Four days' excursion tickets will be issued on Wednesday, May 25th, by steamers leaving Liverpool at 10.30 a.m., 2.45 p.m., and 12.50 night, available until the following Saturday. Four days' excursion tickets, issued also on Monday, 23rd May, available until the following Thursday. Fares: Steerage, 5s. 6d.; saloon, 8s. 6d.

The charges for machines when accompanied by passengers are: Motor bicycle, 2s. 6d.; with trailer, 5s.; motor tricycle, 5s. If more than one seat, 2s. per seat extra.

Petrol must be emptied from tanks before going on board.

THE SCOTTISH SIX DAYS' RELIABILITY TRIALS.

It has now been decided to alter the route slightly. On the second day the circuit from Aberfeldy to Amulree Hotel and Kenmore is left over till the last day. Thus, on the second day the competitors will go straight to Pitlochry, Braemar (lunch and control), Grantown (timed check), and Inverness—about 136 miles. On Saturday they will leave Aberfeldy and go straight over to Amulree Hotel, and then over the Amulree Hill to Kenmore, down the north side of Loch Tay to Killin (timed check), then on to Lochearnhead and home by Callander (lunch and control), Stirling, and Murrayfield car terminus (Edinburgh)—about 109 miles. This considerably reduces the second day's task.

MEET OF MIDLAND MOTOR CYCLISTS.

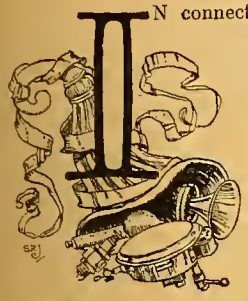
The third annual meet of Midland motor cyclists will be held at Stratford-on-Avon on Whit-Monday.

Ten clubs are expected to be represented, and programmes have been sent to the hon. secretaries of all clubs interested for distribution to their members. The programme is. Lunch at the "Swan's Nest" at 1.15; group photograph at 2.15; tug-of-war between teams of six members of each club represented at 3.0; prizes, road maps of England and Wales.

All motor cyclists in the Midlands are cordially invited, whether attached or unattached.

The meet in the two previous years was a great success.

MILITARY MOTOR RECONNAISSANCE IN THE MIDLANDS: OFFICIAL REPORT.



IN connection with the military motor reconnaissance of the Coventry and Warwickshire M.C., on April 30th, and reported in our last issue, Col. J. E. Caunter has now gone carefully into the matter, and issued his report, an extract from which we give below. The despatch riders, it will be observed, come in for especial praise by the military authorities:

General Remarks.

"The G.O.C. wishes to thank all who took part in the motor reconnaissance on April 30th, and to record his appreciation of the keenness and intelligence shown in carrying out the work.

"In spite of the inclement weather, which made efficient reconnaissance a matter of great difficulty, the many excellent reports received at the headquarters, Coventry, conclusively prove the value of a motor reconnaissance carried out under such circumstances as mentioned in the general and special idea.

Motor Cyclists.

"The motor cyclist despatch riders performed their duties in a most efficient manner. Only one case came to notice of reports having gone astray or of despatch riders losing their way. In one or two instances the distances were traversed at the rate of upwards of thirty miles an hour, the average pace working out at twenty-four to twenty-five miles an hour. In all, some thirty-six messages and reports were delivered.

Observing Officers.

"Although much good work was done, there are one or two points to which the attention of observing officers must be drawn if we are to get full value in future from a reconnaissance of the nature under consideration. The principal mistakes noticed were that reports did not always contain the information especially called for in the instructions issued to all observing officers, *e.g.*: Car No. 33 reported the interception of a Blue message, but no place or time was given. On D route a message (No. and place of despatch omitted) stated that Southland troops had been sighted, but gave no further details. The message was not signed. Several others omitted either the place of despatch or the hour at which the information was obtained, both points absolutely necessary for the G.O.C. to know, and without which a report is practically of no value."

THE NEW INTERNATIONAL PASS.

IN the past the path of the motor cyclist visiting France has been beset with difficulties, the principal of which was the question of licences. Most motor cyclists grudged the outlay of 50 francs, or £2, on landing, and some of them in blissful ignorance of the law's requirements, and others, perhaps, knowing the law but trusting to luck, have ridden in France without licences. When no accident happened the chances were in favour of getting through with success, but the consciousness that one might be stopped by any *agent de police* and asked some awkward questions tended to detract somewhat from the completeness of one's mental comfort.

These difficulties are now, fortunately, a thing of the past. The new international arrangements which have just come into force enable the motor cyclist to provide himself with all the papers required at an inclusive cost of half a guinea. The Motor Union, in conjunction with other bodies, has been appointed to issue, after examination, certificates of fitness of machine and competence of driver, and to supply the holder of these two passes with an International Pass which will take him, without further difficulties on account of licences, from one end of Europe to the other. Motor cyclists should write for further particulars to the Secretary of the Motor Union, Caxton House, Westminster.

INTER-CLUB TEAM TRIAL.

Promises of entries for the M.C.C. team trial, on June 18th, have now been received from fifteen clubs, the three latest being the Oxford M.C.C., the Nottingham and District M.C.C., and the Sheffield and Hallamshire M.C.C., all of which clubs were represented in the last event, the Oxford team occupying third place at the finish.

Aberdeen and District M.C.C.

The club held its first competition of the year—a flexibility trial—on the Slug Road on Saturday, 30th April. The winners, with their respective ratios, were: 1, J. Hay, 9.00; 2, J. Bruce, 7.72; 3, J. E. Wilks, 7.13.

Lewes M.C.C.

A general meeting of the above club was held at the White Hart Hotel, Lewes, on Tuesday last week, when officers were elected. The secretary was asked to obtain particulars from the A.C.U. and M.U. with reference to affiliation. It was resolved that the subscription should be 5s. per annum with an entry fee of 1s. Sixteen new members were elected.

Surrey M.C.C.

A club run took place on the 4th inst., to Leith Hill. The journey to and long climb up the hill were accomplished without incident, and tea was taken at the Leith Hill Hotel. The return was made by way of Dorking in heavy rain. A two-day tour through Kent to Hastings has been arranged for Whitsun; members who propose to attend are requested to notify the hon. sec. at once. Start on Sunday at 10 a.m.

Western District M.C.

The reliability trial to Bath and back for the "Smart Cup" held on the 1st inst. proved very popular, and the running of the leaders was remarkably close. Sixteen started, and following are the results subject to the confirmation of the committee:

	Entrant and machine.	Difference in seconds from schedule time.	Remarks.
1.	Stanley Woods (3½ Triumph)	0	Non-stop
2.	H. J. M. Hughes (5 V.S. and sidecar)	10	Non-stop
3.	H. Candwell (3½ Triumph)	30	Non-stop
4.	C. H. Dobson (5 Rex)	120	

Nottingham and District M.C.C.

At the Notts Forest F.C. Sports there was an obstacle race confined to members of the above club, no free engines or starters allowed. Competitors had to thread two sets of four flags each.

The result of the first heat was: 1, W. Welford (3½ Scott); 2, J. Fairburn (3½ C.C.R.-Smith). Welford, riding with excellent judgment, won easily. He had to use the low gear entirely owing to the regulations.

Heat 2.—1, G. C. Holmes (5-6 Roc); 2, A. E. Lole (5-6 F.N.) Geo. Brough (3½ Brough) skidded when taking the last obstacle and came down, Holmes winning easily.

Heat 3.—1, J. D. Mitchell (3½ T.T. Triumph); 2, C. H. Sewell (3½ Triumph); 3, J. King (5-6 F.N.) Mitchell won fairly easily, Sewell skidding slightly. King was handicapped by a bad start.

Final.—1, Holmes; 2, Welford; 3, Mitchell. Gold medals were awarded to each rider.

The competition was voted a thoroughly sporting event by participants and spectators alike.

Westmoreland M.C.C.

A reliability trial was held on Saturday, May 7th, the route taken was from Kendal to Keswick and Penrith *via* Grasmere, and returning over Shap Fells to Kendal. The day was bitterly cold and frequent hailstorms prevailed. There were four controls, all speedometers barred. A maximum of 100 marks was allowed each man, five marks were deducted for tyre troubles, ten marks off for any other stop whatever, one mark deducted for each minute soon or late at each control, average speed not to exceed 18 m.p.h. The results were as follows: 1, W. Westwood, Triumph, 100; 2, Dr. Dick, P. and M., 99; 3, R. Hutchinson, Bradbury, 97; 4, T. Armstrong, Triumph, 95; 5, H. Harrison, Bradbury, 94. The secretary would like members to note the next two hill-climbs are—May 21st, Dr. Dick's, Tug's Vicarage; June 9th, Mr. V. G. Blackburn's, Greyhound.

Some of the despatch riders in the Coventry and Warwickshire M.C. military reconnaissance, handing reports to the Commanding Officer. The official report says that the despatch riders "performed their duties in a most efficient manner." It may be mentioned that the machines were chiefly Triumph and Rex, in charge of F. Hulbert and H. Williamson respectively. (See previous page.)

Club News.—

Sutton Coldfield A.C.

The annual hill-climb took place on Saturday at Coalport, near Ironbridge, on a private road which can be closed to other traffic when desired. The event proved a great success.

Mr. R. H. Duke officiated as judge, whilst Mr. F. W. Finnemore, C.A., rendered assistance as accountant, thereby enabling results on formula, etc., to be posted up and be made known within two minutes of a competitor ascending the hill. The results were as follows:

CLASS I.—FOR SINGLE-CYLINDER TOURING CYCLES.

Position on formula.		Time. m.	s.
1.	H. J. Heaven (3½ Bradbury)	1	24⅘
2.	James St. John (3½ Triumph)	1	47⅕
3.	Howard Smith (3½ Triumph)	1	38⅕
4.	F. P. Mayell (3½ Triumph)	1	48⅖

5, T. Blyth Clayton (3½ Bradbury); 6, H. C. Newman (3½ Ivy); 7, R. N. Corah (3½ Corah), did not finish.

CLASS III.—FOR TOURIST TROPHY MACHINES.

Position on formula.		Time. m.	s.
1.	Howard Smith (3½ T.T. Triumph) ...	1	12⅕
2.	J. L. Norton (3½ Norton)	1	17⅗
3.	W. D. South (5 Indian)	1	22⅖
4.	James St. John (3½ Triumph)	1	30
5.	Rem Fowler (5 Rex Speed King) ...	1	48

Newcastle and District M.C.C.

A very successful trial was held on Saturday last. The competition took the form of a non-stop run for eight miles, then climbing Eglingham Bank. After lunch a second hill, known as Lemington Bank, was climbed. T. Smith (3½ Triumph) made fastest time. Dr. Goodall (3½ Triumph) winning on formula. In the twin class, J. F. Mallett (6 N.S.U.) was fastest and also first on formula. I. Baty (3½ Dene) won the gold medal for best time aggregate, and also for best formula aggregate.

Edinburgh Waverley M.C.

A speed competition was held at Dolphinton, near West Linton, on Saturday last, when some good speeds were recorded. The results of the competition are:

SPEED TRIAL.

	m.	s.
T. B. Hunter (5 twin Indian)	1	12
J. Baxter (5 T.T. Rex twin)	1	15
A. H. Alexander (3½ T.T. Rex)	1	17
W. Gerrard (4 Matchless)	1	18
F. Durie (3½ Triumph)	1	25
J. A. Brown (3½ Bradbury)	1	30

SLOW TRIAL.

J. A. Brown	2 35
A. H. Alexander	2 18
F. Durie	Failed.
W. Gerrard	Failed.
J. Baxter	Failed.
T. B. Hunter	Failed.

Redditch and District M.C.C.

A very successful hill-climbing competition was promoted and carried out by the members of the above club on Wednesday evening, May 4th. Eleven motor bicycles and one tricar entered. Mr. Frank Hyde kindly provided the first prize, and Mr. J. W. Davis the second prize. The competitors were started off by Mr. F. Smith, the captain, and checked at the finishing point by the Rev. G. Charke. The machines varied in power and weight from the 2¼ h.p. Enfield weighing 120 lbs., to the 4 h.p. N.S.U. weighing 220 lbs., and the times taken to ascend the hill varied from 79 seconds to 117 seconds, and 179 seconds for the tricar and passenger. The results on formula are:

Sutton Coldfield A.C. hill-climb. Scene at the foot of Coalport Hill, showing a competitor starting.

*1, J. Cocker (2¼ Enfield); 2, W. F. Skinner (3½ Tricar); *3, Stanley Smith (2¼ Enfield); 4, W. Spencer (3¾ N.S.U.); 5, H. Bryant (3½ Triumph); 6, F. Wright (3½ Triumph); 7, F. Woodfield (2¾ Douglas); 8, F. Hopkins (3½ Triumph); 9, G. H. Mansell (2¼ Enfield); 10, W. E. Brough (3½ Rex); 11, Wm. Ellis (4 N.S.U.); 12, H. W. Wynn (2¾ Wynn).

*As the first and third riders had not been elected members of the club, the committee have to decide as to whom to award the prizes. The fastest time was made by W. E. Brough, a lightweight rider of nine stones, on a 3½ Rex, whilst H. Bryant, a twelve stone rider, took two seconds longer on a 3½ Triumph.

A day run has been arranged for May 18th to Cheltenham. Start from headquarters at 10 a.m.

Competitors in the Edinburgh Waverley M.C. Speed Trials at Dolphinton.

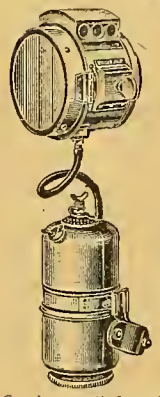
Carries enough Paraffin to last several weeks.
Price **4/-** Postage 2d.



THE HUNT ACETYLENE LENS MIRROR HEAD LAMP.

English manufacture.	Copper riveted.
Width of front, 4¾in.	Powerful lens mirror,
Mirror, 3⅜in.	will throw a beam of light 150
Weight, 30 ozs.	yards.
Solid Brass or Nickel-plated.	Fitted with Bray's burner.

Price, complete, with generator, **19/11.** Postage 6d.

Strong Tubular Carrier.
Size: 21 × 8in.

Can be supplied to fit D or oval stays, with or without dropped ends. Price complete with straps, **6/6.** Postage 6d.

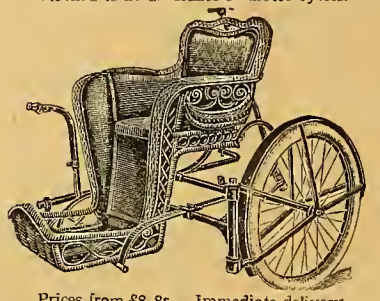
THE HUNT HELLESEN DRY CELL.

No corroding terminals. No acid. No charging. Always ready, clean, and dry. The **"Flash."** Height 6½ x 4½ x 2½in. Approx. mileage, with single-cylinder engine, 1500. Price **6/6.** The **"Flight"** ditto. Height 5⅝ × 5¼ × 2½in. Price **6/6.** The **"Midget"** emergency ditto. Height 5⅝×4⅜×1⅝in. Will run approx. 300 miles. Price **4/4.** Postage 6d. extra.

REPAIR BANDS.

The H.S. for bursts or gashes in the outer cover; goes completely over cover, and is tucked inside rim. Price **1/6,** postage 2d.

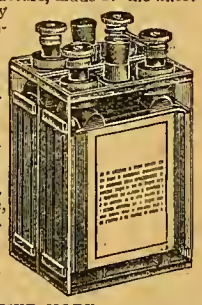
City Agents for **MILLS & FULFORD SIDECARS.**
Stocked to fit all makes of motor cycles.



Prices from £8 8s. Immediate delivery.
Catalogues post free.

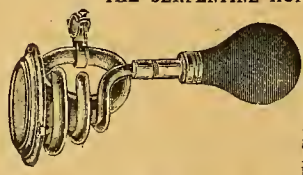
THE "HUNT" ACCUMULATORS

These are British manufacture, made of the finest quality materials. Specially constructed to stand vibration.



No. 0. 10 Amps.
Size 5 × 3 × 1⅞ins.
Price **9s. 6**
No. 1. 15 Amps.
Size 6 × 3½ × 1⅞ins.
Price **11s. 6d.**
No. 2. 20 Amps.
Size 6½ × 4⅛ × 2⅛ins.
Price **12s. 6d.**
No. 3. 40 Amps. Size, 6¾ × 4½ × 3⅜ins. Price **21s.**
No. 4. 60 Amps.
Size 6½ × 4¾ × 5¼ins.
Price **27s. 6d.**
Post free.

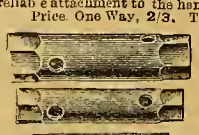
THE SERPENTINE HORN



An entirel new model, loud and penetrating. Gives off a deep, loud, lasting note, and can be heard from a great distance. Fitted with best rubber bulb and plated dust cover.
Length, 11in. Price **11/6** Postage 4d.

FULLER COILS.
Non-trembler 2¾ × 3 × 4½.
Price **10/6**
Twin ditto, 5½ × 3 × 4½.
Price **21/-**
Fuller trembler ditto, 2¾ × 3 × 4½in., **17/6**
Twin ditto, 5½ × 3 × 4½in., **21/.**

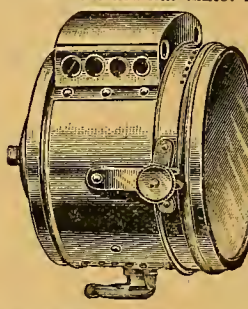
The "Hunt" ALL Metal Switch.
The design of this Switch is so extremely simple that there is nothing in it to get out of order; the contact is quick and definite for both make and break. The whole of the switch is made out of heavy sheet brass well finished and nickel-plated, the terminal is insulated with extra large ebonite washers and the fixing clip is attached by a bolt and a nut passing through the sides of the metal case, thus ensuring a reliable attachment to the handle-bar.
Price. One Way, **2/3.** Two Way, **2 9.** Postage 1d.

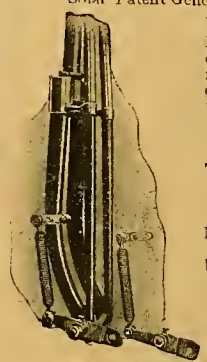


Motor Cycle Box Spanners.
Containing six sizes with tommy. English manufacture. Guaranteed.
Sizes $\frac{27}{32}$, $\frac{28}{32}$, $\frac{29}{32}$, $\frac{2}{3}$, $\frac{11}{32}$, $\frac{7}{16}$in.
Price **2/6** set. Postage 3d.

The Auxiliary Air Inlet.
Fits on inlet pipe. Gives a wider range of mixture. Useful on a hot day.
Price **3** - Postage 2d.

THE NEW SOLAR MANGIN LENS MIRROR LAMP.
This is our new lens mirror Head-light for motor cycles, of the same design and construction as our motor car lamps. Made of heavy brass reinforced and riveted in assembling, from the inside, which simplifies cleaning. Is 6in high and 4½in. long. Has removable powerful 4in. solar lens mirror reflector, front glass and ⅝ft. burner. Made for standard flat bracket, which fits in a casting concealed inside the back of lamp, the body of which is made in one piece. The bracket fastens to lamp with a set screw and to handle-bar stem with a clamp, so lamp turns. Intended to be supplied with gas from Solar Motor Cycle Generator or Tank and guaranteed to withstand motor cycle use, to be the most powerful 4in. lens mirror made, and projects the light a long distance ahead. Lamp only, **27/6.**
Solar Patent Generator, **22/6** extra.





"Matchless" Spring Forks.
Makes an old pattern machine up-to-date. Easily fitted, cheap, and highly effective. Hundreds of testimonials from delighted purchasers.
Price **15/6** per pair.

The "XI All" Spring Fork Attachment.
(For any power up to 5½.)
No side play. Increased safety. Riding made a luxury. Fitted by anyone in a few minutes.
No filing, drilling, or brazing.
Price, enamelled black, **15/-** per pair.

SPEED INDICATORS (THE COWEY).
Registers up to 60 miles per hour, with total mileage recorder, **84/-** The Jones ditto, **63/-** The Goodlad, registers up to 50 miles per hour, **42/-.** State year and make machine when ordering.

THE NEW MODEL MUD PROTECTOR.
With Side Wings.
Manufactured of best patent leather, strengthened with iron supports. It is attached by means of thumb screws to front mudguard, and can be fitted to any make of machine in one minute; protects both rider and motor from all dust and mud thrown up by the front wheel.
Price **5/-.**
Postage 4d. extra.

THE NORTH ROAD DUST AND RAINPROOF OVERALLS.
These meet a long-felt want; they can be instantly slipped on over the ordinary trousers, they fasten round waist with a leather strap and buckle. Being made in one piece they are a great protection to the stomach, also it is impossible for the rain to drive in as with the ordinary overalls. Made in three lengths—short, medium and long. Shaped to go over boot. Patent Side fasteners. Price, in fawn waterproof material, **16s. 6d.** Postage 6d.
Second quality ditto. **13/6** per pair. Double texture waterproof coat with collar and rain and windproof sleeves to match above, **21/-.**

1910 Illustrated Catalogue now ready, gratis and post free.

In answering this advertisement it is desirable to mention "The Motor Cycle."

Club News.—

The Harrogate and District M.C.C.

A hill-climbing competition was brought to a satisfactory conclusion on Saturday last in showery and boisterous weather. The hill is known as Kearly Cliff, and from start to finish is about 550 yards long. A flying start was allowed. The results are as follows:

Class II., single-cylinder touring mounts.—1st, J. A. Tindall; 2nd, A. B. Hughes; 3rd, Jim Mackay; 4th, H. W. Fortune; 5th, F. Strafford; 6th, J. E. Brooke; 7th, C. H. Bramley; 8th, W. F. Broadbank; 9th, C. F. Smith. All the above rode 3½ Triumphs. W. E. Grange, riding a 3½ T.T. Rex, was placed in Class VI. by the judges. Class IV., variable-geared touring machines.—1st, W. Fawcett (3½ Scott); 2nd, F. F. Topham (5 V.S.) Class V., passenger machines.—1st, H. W. Fortune (3½ Triumph and sidecar); F. F. Topham (5 V.S. and sidecar) failed. Class VI., for single-cylinder special machines.—1st, T. C. Atkinson (3½ Triumph); 2nd, W. E. Grange (3½ Rex); 3rd, E. R. Davies (2¾ Japumber). Final class, for the handsome trophy kindly presented to the club by Messrs. Pilchers, Ltd.—1st, H. W. Fortune (3½ Triumph and sidecar); 2nd, W. Fawcett (3½ Scott); 3rd, T. C. Atkinson (3½ T.T. Triumph); 4th, J. A. Tindall (3½ Triumph). T. C. Atkinson made fastest time of the day. H. W. Fortune's success in climbing the hill with sidecar and passenger creates a record, as it is the first time it has been accomplished on a single-geared motor bicycle.

Ayr and District M.C. opening hill-climb. The competitors at the starting point. The winner is third from the right. The upper photograph depicts a competitor crossing the starting line at full speed.

Ayr and District M.C.

The Asylum Brae, near Ayr, was the venue of another successful hill-climb organised by the A.D.M.C., and held on Monday afternoon last week. The ideal weather prevailing at the time attracted a goodly number of spectators and competitors alike, and with the surface of the course in excellent order and a strong wind blowing uphill, fast times were the order of the day. Twenty competitors took part, and the prize for fastest time was won by George Cocker in 32s., riding a specially-reconstructed 5 h.p. twin Rex. The awards were based on the following formula:

$$\frac{\text{Time in secs.} \times (\text{diameter of cyl.}^2 \times \text{No. of cyls.}) \times \sqrt{\text{stroke}}}{\text{Total weight in lbs.}}$$

		Time.	F.M.
1.	Chas. Carver (3. N.S.U.)	44.4 ..	6197
2.	J. Meredith (3½ Triumph)	34 ..	6227
3.	J. Johnstone (3½ Triumph)	33 ...	6274

TWIN CYLINDER CLASS.

1.	P. Armstrong (5 twin Rex)	34.2 ..	9811
2.	G. Cocker (5 twin Rex)	32 ...	10231
3.	A. Sommerville (5 twin Rex de Luxe)	39 ...	10599

The Lancashire M.C.C.

The above club held a petrol consumption trial on the 5th inst. Unfortunately, the weather was very tempestuous and only two members, out of a numerous entry list, turned out The course was thirty miles in length, and Dr. Ryan and Mr. Welden, the two competitors, riding 1910 Triumphs, were supplied with two and a half pints of petrol each. Mr. Welden finished with just over half a pint left and Dr. Ryan with a little less. The result will be announced later. Considering the fearful weather and the shocking state of the roads, the result was regarded as satisfactory.

The club is holding its annual hill-climb on June 16th. A sub-committee has been appointed to find a suitable hill, and it is proposed to handicap all previous winners and riders of special machines, so that all the members will, as far as possible, have an equal chance of winning.

Leicester and District M.C.C.

On the 1st inst. there was an enjoyable inter-club meeting with the Nottingham and District M.C.C. at Kenilworth.

The date fixed for the hill-climb is May 19th (Thursday). There will be four classes, *e.g.*, Class I., lightweight machines under 340 c.c.; Class II., over 340 c.c. but not exceeding 500 c.c.; Class III., exceeding 500 c.c.; Class IV., open class (Tourist Trophy models will be allowed to compete in this event). The entries close on the 14th inst. Competitors are urged to be at the headquarters not later than 2.15 p.m. to be weighed in.

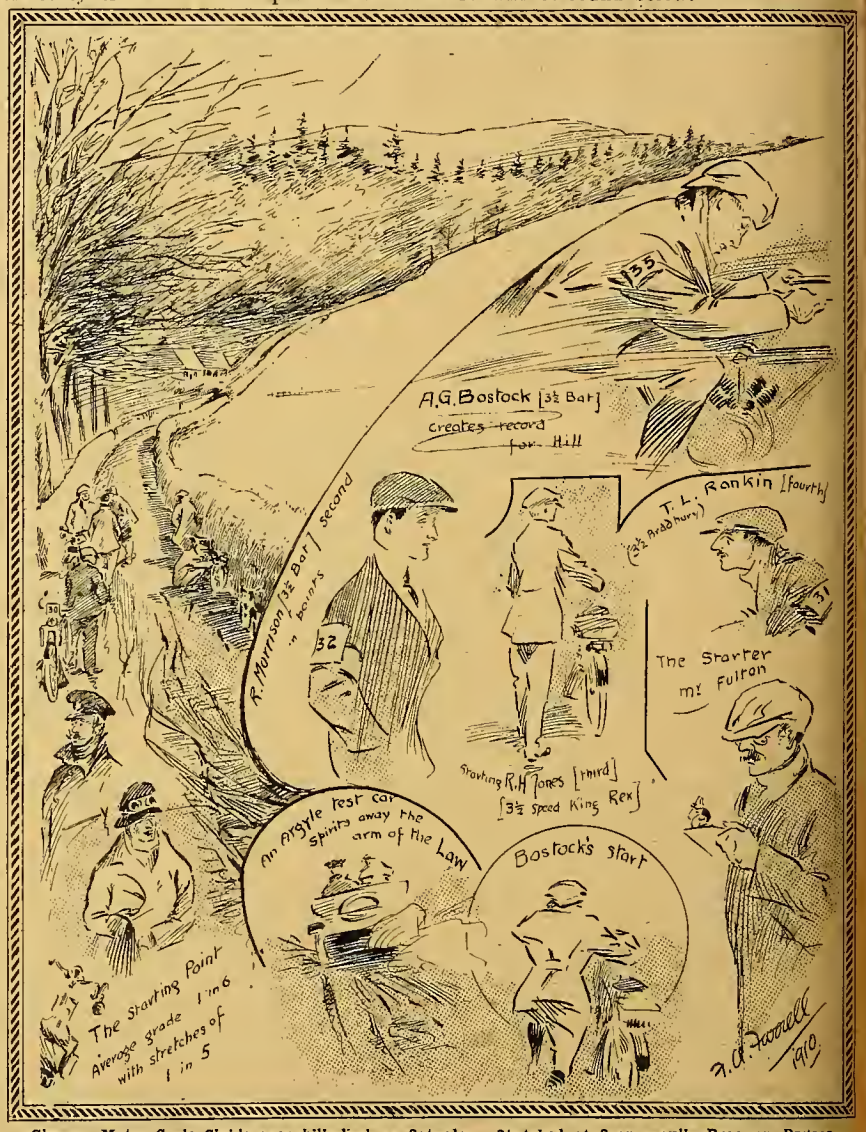
Club News.—

Birmingham M.C.C.

The club will attend the Stratford-on-Avon Meet on Whit-Monday. On Whit-Tuesday the annual reliability trial for the Sangster Cup will be run off. The run is to Lincoln and back. Start Perry Barr 8 a.m., finish Imperial Hotel, Birmingham, 6 p.m. Time of arrival at Lincoln, 12.15 p.m. First prize, Sangster Challenge Cup; second prize, gold medal; silver medals to all accomplishing meritorious performances; bronze medals to all who do the journey within nine and a quarter hours, if they have not won any other prize. A big muster is anticipated.

Glasgow M.C.C. Open Hill-climb.

The above club held a hill-climb last Saturday on Stonymoulin Brae, near Balloch. The contest was open to motor cyclists in Scotland. Owing to the wet state of the hill there were not many starters. The twin class was most disappointing. Out of an entry of eight only one succeeded in reaching the top. The hill was a real test for any machine, being 1,230 yards long and having gradients of one in five in several places, but no severe bends to call for any great skill on the part of the rider. The first performance of merit was that of R. Morrison on a 4 h.p. Bat, which he had ridden over from Edinburgh in the morning. He was followed by R. H. Jones, who travelled up well on his 3½ h.p. Speed King Rex. Each competitor was allowed two runs up. R. Morrison had a nasty skid some hundred yards from the top on his second ascent and finished practically broadside across the road. This spoilt his time by several seconds, A. G. Bostock, whose petrol had been shutting off on his first ascent owing to the excessive vibration from the bad road surface, tied down his petrol tap, and came roaring up the hill, making fastest time of the day. T. L. Rankin was only three-fifths of a second slower on his Bradbury, but his large capacity brought him down on formula. Many enthusiastic motor cyclists turned out to see the climb in spite of the bad weather. Results:



A.G. Bostock [3½ Bat] creates record for Hill
R. Morrison [3½ Bat] second
T. L. Rankin [fourth]
The Starter
Starting R.H. Jones [third] [3½ Speed King Rex]
An Argyle test car
Bostock's start
The Starting Point
Average grade 1 in 6 with stretches of 1 in 5

York County M.C.C.

The first quarterly trial of the above club arranged for last Saturday was postponed owing to the death of His late Majesty the King. It has been arranged to hold the run on the 22nd, starting from the Wellington Inn at 10 a.m.

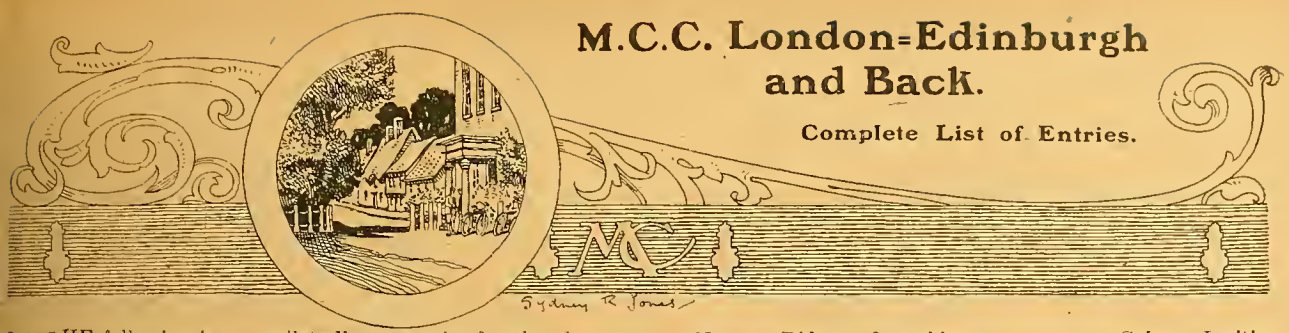
M.C.U.I. (Ulster Centre).

The hill-climb in connection with the reliability run to Ballycastle, reported in our last issue, was decided on a special formula which will be found below.

Time in secs. + cub. capacity

Weight of rider and machine

Results: 1, M. J. Lindsay; 2, Cecil Rea; 3, D. H. O'Flaherty; 4, J. J. Kennedy; 5, J. Stewart; 6, Jas. Martin (all on 3½ h.p. Triumphs); 7, B. J. McManus (3½ h.p. Premier); 8, B. D. Capper (3½ h.p. Triumph); 9, S. P. Corry (5 h.p. Indian); 10, L. MacLaine (3½ h.p. Triumph); 11, G. Simpson (4 h.p. Indian); 12, C. R. Martin (3½ h.p. Triumph); 13, Dunville Coates (3½ h.p. Triumph). J. Lavery (3½ h.p. Triumph) had a stop on the way owing to a burst tube, and Foster Coates and J. Kane, both on Triumphs, had trouble on the hill. The riders were started by E. B. Waring, secretary of the centre, and T. Moles acted as timekeeper at the top of the hill, being assisted by the president (Mr. R. G. Lindsay) who is taking a very practical interest in the various competitions. On the 14th inst. a hill-climbing competition will take place at Magheramorne, Co. Antrim. The centre is at present in a very flourishing condition, new members being enrolled at every committee meeting.



M.C.C. London-Edinburgh and Back.

Complete List of Entries.

THE following is a complete list of entries for the above run, kindly supplied by the energetic trials hon. secretary, Mr. Harry G. Bell. The Motor Cycling Club members will assemble at the Old Gatehouse, Highgate, to-morrow (Friday) evening, at eight o'clock, and the first motor cyclist (the captain, E. B. Dickson) will be despatched at 9 p.m., the remainder following at half-minute intervals until the last competitor to enter (A. R. Abbott) will be sent away at 9.57 p.m. It will be noted that 97 motor bicyclists and 16 passenger motor cyclists are taking part, a total of 113. Last year the total reached 112, made up of 91 motor bicyclists and 21 passenger motor cyclists.

TINKERING WITH A TWIN.

LAST Saturday week I met Jackson humming along the main road towards home. He pulled up when he saw me, and I noticed he was looking rather glum.

"Hullo!" I said, "Where been?"

"Oh, a spin round with Huntly; Westerham way and round through Tonbridge."

"Decent ride?"

"Not bad."

I looked at his clothes. "Been cutting out the pace, haven't you?"

He nodded. "Huntly's hot stuff, you know; fact is I've got the hump. He's tied me up badly all along. We tried Westerham, and I stuck at the bend, and at River Hill he simply walked past me. Makes me sick! Same engine, too, and his a year older and the heavier man."

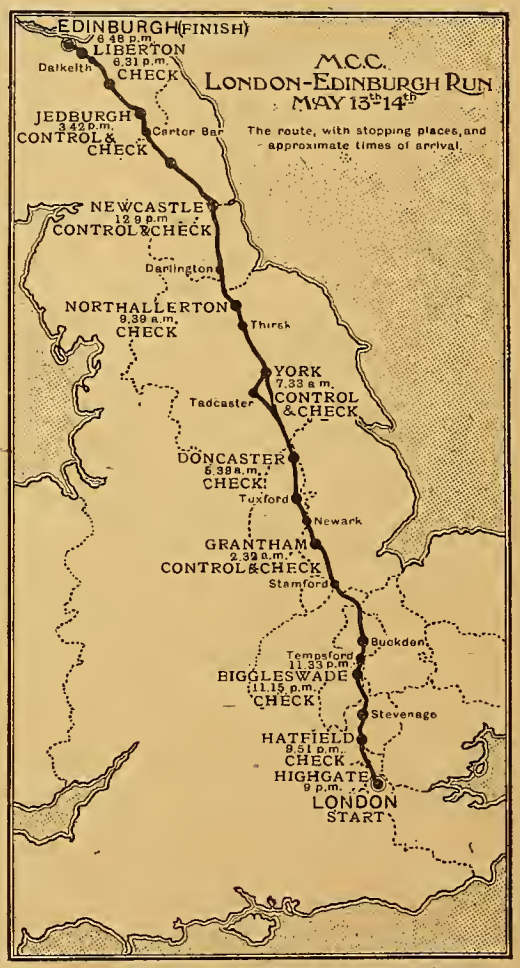
I smiled. I know Huntly. I fancied myself a bit in the "engine efficiency" line, but Huntly—I could quite understand poor Jackson had not had much of a show.

I looked down at his engine. "Been pretty hot, hasn't it," I said, tapping the exhaust pipe with my toe.

"Hot! Hot isn't the word for it. Had the carburetter on fire twice. Got the fair hump to-day," he repeated. "Look here, old chap! Candidly do you think I'm getting the best out of this crock?"

Dear Jackson! he looked so serious I hadn't the heart to smile. The best out of it, indeed! There are lots of things Jackson knows quite a lot about; and there are no flies, so to speak, on Jackson as a business man, but mechanics—well!

However, I like Jackson, he is a nice chap, so I simply said: "Well I don't know; wouldn't be any harm in having a look over it, would there; doing anything to-morrow? No! Bring it round to my place, and we'll have a look over it together." Agreed, and off goes Jackson as fast as he can. The engine has cooled, and J. is evidently going to do his best to make it piping hot again.



The route of the 1910 London-Edinburgh Run. This year's starting time from Highgate is 9 p.m.

Some Causes of the Sluggish Running.

Two nights later we look over the machine together.

"Turns rather stiff. How often do you run your old oil out of the crank case, Jackson?"

"Oh, goodness knows; haven't touched it for ever so long."

About half a pint of filth is run out of the crank case, a swill out with paraffin, and three new charges of oil given.

"Cylinders off lately?" "No." "Better look, don't you think?" Cylinders come off, and about an eighth of an inch of deposit on piston heads and cylinder domes cleaned off. Rings renewed lately? One a little discoloured; any spare rings? Yes, a new one while we're about it. Right. Now for the valves. Jackson is enthusiastic about the "grinding in." I don't attach a very great deal of importance to it, but we give them a turn while we are at it, but very carefully, with frequent lifts and a most scrupulous clean with paraffin afterwards. Now the springs. Exhausts are weak, and, what is more particular, the front is stronger than the back; new ones on here, and new cotters while we are about it—they are getting rather thin in the middle. There is too much clearance over these tappets. We must see to that presently. Either heat the stem of the valve and hammer it out a little, or, better still, braze a very thin steel plate on the tappet itself. Oh, those inlet valves! The springs are far too weak, the cotters and shoulders are worn, and consequently the valves open far too much ("No wonder your carburetter caught fire, Jackson"), and when the heads are pressed together one pushes the other nearly full open before it starts to open itself. This will never do. New springs first; seem about the right tension and both alike, but we will make sure of that after. First, about this opening, the slot in the valve is fairly long, so we will see if we can find some deeper cotters. That is better, but still too much; a little steel washer on the shoulder of the seating small enough to clear the spring. Ah! that is more the thing—about 3-32nds now.

Jackson thinks this amount of opening too little.

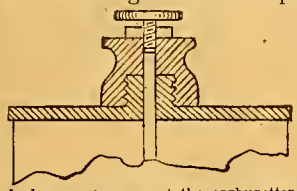
"Why, man, it will never get any gas," he says.

"It will get quite enough, old chap, and it will set down to a bare eighth before you have ridden far. Your poor engine has had indigestion all along as a matter of fact." Now the heads together again. One a little bit stronger than the other; very slight, if it were more we would cut a bit off the spring, but as it is we will just try pulling the weaker one out a bit. Now they're right. New copper washers, but first let us scrape that seating nice and clean. Good.

What about this carburetter. Longuemare, eh! with side air slots. We will just have that all down and

Tinkering with a Twin.—

clean out each slot. I doubt whether you get enough air for that twin at anything like speed. Adapter and jet? 22 and 10 ought to be about right. Ah! cap missing from the top of the needle valve (they always are); a loose fit in the guide too. We must make a damper to prevent the carburetter flooding through the needle jumping about.



A damper to prevent the carburetter flooding owing to the needle jumping about. A lock-nut enables the screw to be fixed in any desired position.

This can be adjusted to allow any lift desired, and I explain to Jackson that he will soon find out the adjustment that gives him the best all round results. Well, we start the engine up, and it runs like a bird, but when I short the plugs alternately one cylinder is decidedly faster than the other. Face up the contacts and try again, adjusting each screw with the cylinder running until we get it doing the highest r.p.m. we can. Both going like smoke now, but when run separately still a slightly higher speed on the front one. Not much, still enough to worry me. We try everything to bring the back cylinder up to it; no difference. Very well, if we can't get the back cylinder up to the front, we must get the front down to the back. Jackson demurs—"the front cylinder is a daisy, why not let it alone?" I explain to him the golden rule of synchronisation, and a half-turn of the front contact screw does the trick.

Now, Jackson, I think with luck you ought to get the benefit of that extra two or three stone of Huntly's.

. . . . . .

The other evening as I reached the top of Poll Hill, outward bound, somebody was coming up like a streak of greased lightning—Jackson sure enough. His face was all smiles when we both pulled up.

"Well, what luck?"

"Grand! River Hill all out, cool at the top, too! Any speed you like on the level. Huntly's behind somewhere. Old man, you're a brick."

I looked across at the little Poll Hill Arms.

"On an occasion like this, Jackson," I began——

He smiled and took my arm, "Come on," he said. "This is up to me!"

T. E. HENINGHEM.

A FRENCH ROTARY VALVE ENGINE.

WE are indebted to *La Vie Automobile* for the following interesting description and diagrams of a rotary valve engine, which is the invention of a Frenchman, Monsieur H. Boissier. The patent drawings are those of a four-cylinder water-cooled engine, but the valve system would be just as easily applied to a single or twin-cylinder motor cycle engine. It will be noticed that the cylinder and valve ports are water jacketed. We are aware that rotary valve engines on similar lines have been designed and tried in England, but the diagrams so clearly illustrate the cycle of operations that they are well worth reproduction.

Situate on the top of the cylinder, and cast with it, is a cylindrical valve chest A, in which rotates a valve or tap B mounted in ball bearings, which are held in adjustable cages in such a manner that the rotating part of the valve can be adjusted in every direction by means of set screws until it is absolutely concentric with the sleeve in which it rotates. The engine being of the four-cycle type, the sleeve or valve is geared to turn at half the speed of the main crankshaft, and is driven either by a chain or bevel gearing. The inlet D is on the left and exhaust E on the right.

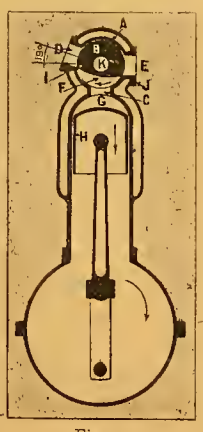


Fig. 1.

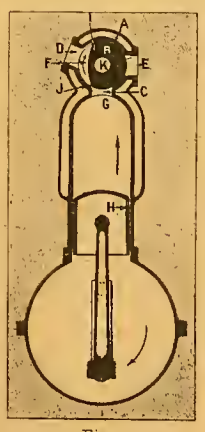

Fig. 2.

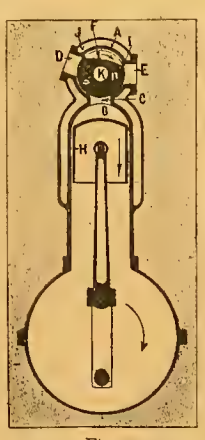

Fig. 3.

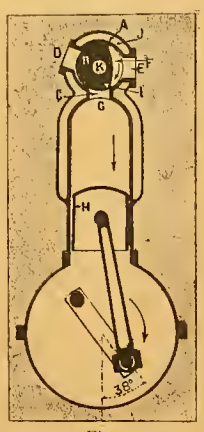

Fig. 4.

A. Valve chest. B. Distributing valve. C. Passage between distributing valve and cylinder.
D. Inlet. E. Exhaust. F. Slot in distributing valve. G. Cylinder. H Piston.
I. Front cut-off on slot F. J. Back cut-off on slot F. K. Distributing valveshaft.

Fig. 1 shows the position of valve and piston at dead centre of exhaust and inlet strokes. The edge of the slot I, in the distributing valve B, is just about to uncover the port D, through which the mixture is admitted to the engine.

Fig. 2 shows the piston H at the end of the induction stroke. The edge J of the slot in B has now arrived in such a position that the communication port G from valve chamber to cylinder is closed, preventing the escape of gas which has entered the cylinder.

Fig. 3 shows the compression stroke. B has continued to turn in the direction of the arrow, but no slot or opening having uncovered the orifices G D E, the gas is compressed in the cylinder.

In fig. 4 B still continuing to turn, the edge of the slot I has now arrived in the position indicated, and further movement of the crankshaft and valve B in the direction of the arrow uncovers the orifice G and the port E by which means the exhaust gases are expelled from the cylinder by the rising piston.

The great question in connection with a design of this description for motor cycles is whether the rotating sleeve could be kept cool enough without water-cooling, and the difficulty of providing the necessary lubrication.

The Vibrationless A.S.L.

Forks were used by Mr. HARRY MARTIN in his recent

WORLD'S RECORD

which conclusively proves the SPEED of the Air Spring device. We shall be pleased for you to test the comfort for yourself.

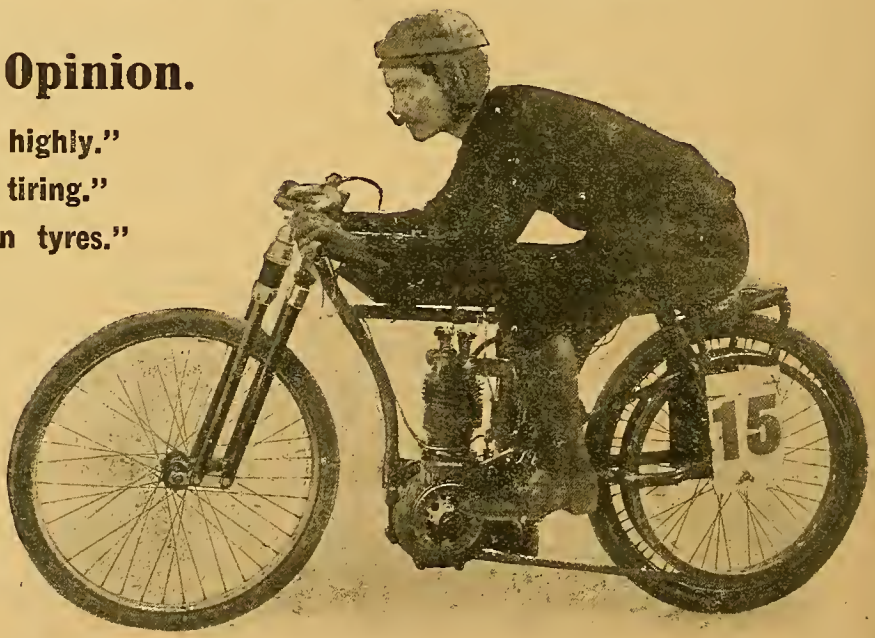
Mr. Martin's Opinion.

"Cannot speak too highly."

"Riding is far less tiring."

"Extremely light on tyres."

"I intend to have Air Springs fitted for both racing and touring."



Air Springs add 100% to pleasure of motor cycling.
ALL Vibration and Road Shock absorbed.
May we send you particulars?

AIR SPRINGS, LIMITED,
STAFFORD.

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

Pitting of Trembler Points.

Q. The contacts on my trembler coil soot up every few miles, thereby causing misfiring. The contacts are pure platinum. Can you tell me the reason for the above, and how can I cure it? The accumulators are always kept well charged.—G.V.L.

A. The trouble is probably due to the fact that the coil is fitted with an inefficient condenser. Either you set the adjusting screw bearing too hard on, or the points are not pure platinum but of some imitation metal. Before having the coil overhauled, it would be cheaper to try genuine iridium points such as the Jebron.

Excessive Petrol Consumption.

Q. I have a 2¾ h.p. motor cycle with Longuemare carburetter, seven spray, warm air pipe to exhaust, which seems to use up a lot of petrol. On a recent run I used half a gallon in nineteen miles. Is that not excessive? Can you tell me the cause and how to alter it? There is no leakage anywhere.—A. C.

A. We cannot believe that the engine is using such a lot of petrol. There must be a leakage from the joint or the carburetter itself is flooding badly owing to bad fit of the needle valve, or too high a level. The consumption is certainly most excessive. After attending to the matters named, you might try stopping up one of the slots in the jet and see if this will improve matters.

A Test of Silencers.

Q. Could you tell me a practicable method of testing with approximate accuracy the efficiency of various types of silencers and obtaining rough ratios of comparative efficiency, and that without an excessively large and expensive plant?—F. H. R.

A. The testing of a silencer requires a somewhat extensive plant. In the first place, you would have to give the engine a brake test to prove the efficiency of the silencer as regards power and absence of back pressure, and secondly, you would have to test it for sound, and the simplest way of doing this is to use a device which was made by Col. Holden, R.A., F.R.S., called an "Audiometer," consisting of a microphone, in the circuit of which resistance was put. The resistance was first of all cut out, and the sliding block moved along a coil of wires until the exhaust was inaudible. The amount of resistance employed to render the exhaust inaudible was then measured and compared with other silencers tested. This method was employed in the A.C.U. Silencer Trials held a few years ago. A practical test on the road would be to run the engine "all out" for a mile to the foot of a steep hill, and note how far the machine ascends with the different silencers fitted, every other adjustment to remain unaltered.

Level of the Petrol Too Low.

Q. I am in trouble with my Fafnir engined machine with spray carburetter. I have had all the engine down since about November and just put it together. I tried it on the stand and it fired after about three turns of the pedals, but would only go for short periods at a time after flooding the carburetter. If I kept pushing the plunger of the float chamber down to keep it flooded it went as right as could be, but as soon as I released the plunger it stopped after about ten or fifteen seconds. I have since had the carburetter to pieces, and everything works all right, such as the float and the needle, but when I filled the float chamber with petrol I could see the spirit oozing out of the jet in the spray chamber. I took the feed pipe off from the tank, thinking perhaps it was not quite clear, and cleaned it with a piece of wire, then put all together again. I tried it on the stand again, and it seemed slightly better, so took it on the road. The first time it ran for about fifty yards and stopped, flooded carburetter again, and this time it went about 200 yards, but on slowing down to round a corner it stopped again. Kindly locate the difficulty.—F.J.J.

The Indian trophy, measuring 1 in. deep and 16in. wide, to be presented to the first private owner riding an Indian motor cycle to finish in the Tourist Trophy Race.

A. The trouble seems to be due to the fact that the level in the float chamber is wrong. Get an old jet, cut it down, and fit a piece of brass or copper pipe over it, exactly the length of the standard jet, so that you will be able to see how far up this pipe the petrol comes. You will probably find that it is far short of the top, and you should adjust the weight on the needle until the petrol comes within ⅛in. of the edge of the pipe. If the carburetter is a Longuemare merely remove the jet. Then put back the standard jet, and you will probably find the trouble cured. The matter is gone into fully in the latest edition of "Motor Cycles and How to Manage Them."

An Absence of Power.

Q. I have a 3 h.p. motor cycle which, although it has gone well in the past, now has a peculiar way of sometimes starting well with full power, but after two or three minutes diminishes in the power of its explosions so that they sound weak and muffled. I have gone over everything that I can think of, and I find that the spark is all right, also the carburetter and the timing. After standing a few minutes I sometimes have a difficulty in starting, and when started have to keep pedalling until speed and power are developed. What is the probable explanation?—H.J.P.

A. The trouble is one which is difficult for us to diagnose without seeing the machine. Carefully examine your valves, and see that there is a slight clearance between the stem and the tappet. Probably owing to the heat the valve stem becomes elongated, so preventing the valve from closing. The remedy is to file ⅛in. off the ends. Also make sure that the valves are working properly and moving freely in their guides. Also try new valve springs. If the compression of the engine will not bear your weight on the pedals for half a minute, that would account for the absence of life in an engine.

A Single-cylinder Magneto on a Twin.

Can a single-cylinder magneto be fitted to a twin engine, say, on the principle of the Clément-Garrard type, whose cylinders, as you are doubtless aware, are placed very close to each other in the V? Now, this question, let me tell you, is merely the outcome of a suggestion to a friend of mine, who happens to be the owner of a twin Clement, built in the form of a lightweight, and which also is very fast for a 3 h.p. machine. Only quite recently he had trouble with the sparking coil, and it took some considerable time before he really found out the cause of the very slight misfiring. During the time of this trouble in ignition, several suggestions were put to the owner of the Clément-Garrard to fit a twin-cylinder magneto, but he does not think by spending £6 on this particular item that he will get any more value for his machine when the time comes to sell it. He is under the impression that it is possible to fit a single-cylinder magneto by making alterations to the make and break contact, and using in conjunction a K. and C. high-tension distributer. Please oblige with your views.—M. E. M.

We do not think that your friend would find that a single-cylinder magneto would work well with a twin-cylinder Clément-Garrard, although as the angle of the twin-cylinder is very small, it is quite possible that he would be able to get a spark in each cylinder, but we fancy that the effective range of advance and retard of the ignition would be so much reduced that the whole arrangement would not prove satisfactory. We have given this matter very careful consideration, and have come to the conclusion that to get really good results with any V type engine a specially designed magneto would certainly be essential. Should your friend try the experiment and be successful in obtaining satisfactory results we should be most interested to hear further from you, but, as suggested above, it seems improbable that the system would work well. Early V-type engines gave trouble through not having a specially made magneto.

Overheating and Knocking on Hills.

My 1910 3½ h.p. motor cycle will not climb hills such as Dashwood after a non-stop run of five miles, and will not keep up thirty miles per hour on the level for more than half a mile, but slows down and knocks, and no alteration of the levers will induce it to pick up. I can go up Dashwood fast with a cold engine. The engine used to get excessively hot, so I put a smaller jet in, but now I cannot get any speed at all over about 25 m.p.h. Formerly it used to require full air with one-third gas, and now it requires scarcely any air at all. Do you consider that I should improve matters by replacing the original jet and filing out the extra air holes? I oil every twelve or fourteen miles with Price's Huile de Luxe. The gear is 4¾ to 1. Is this too low?—D.G.R.

Possibly the trouble is due to an excessive amount of carbon deposit on the cylinder head and piston, and we should advise you to clean this off as soon as possible. It may be that the spark should be timed earlier. Yes, certainly put back the original jet and file out the air holes. We presume you understand that with a smaller jet a less quantity of air is required. Are you sure you manipulate the levers properly in climbing hills? The procedure is to open the throttle wide if the gradient demands it, and, should the engine show signs of slowing down or knocking, close the extra air lever gradually. The spark may be very slightly retarded for the last few yards of a very steep knuckle. The gear is slightly too low for an 11 st. rider. If you weigh between 11 and 14 st. the gear is about right.

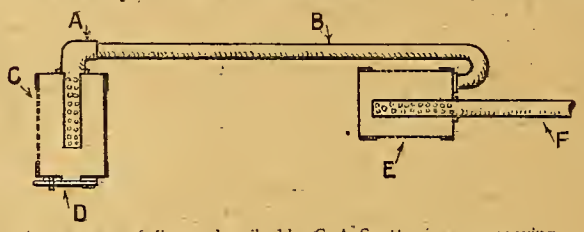
READERS' REPLIES.

Throttling Down a Four-cylinder.

B.B.'s trouble in slowing down with a 5-6 h.p. F.N. is, I feel sure, due to excessive amount of opening of the inlet valves. As a rider of one of these fine mounts I find $\frac{1}{16}$in. opening is ample.—H.A.U.

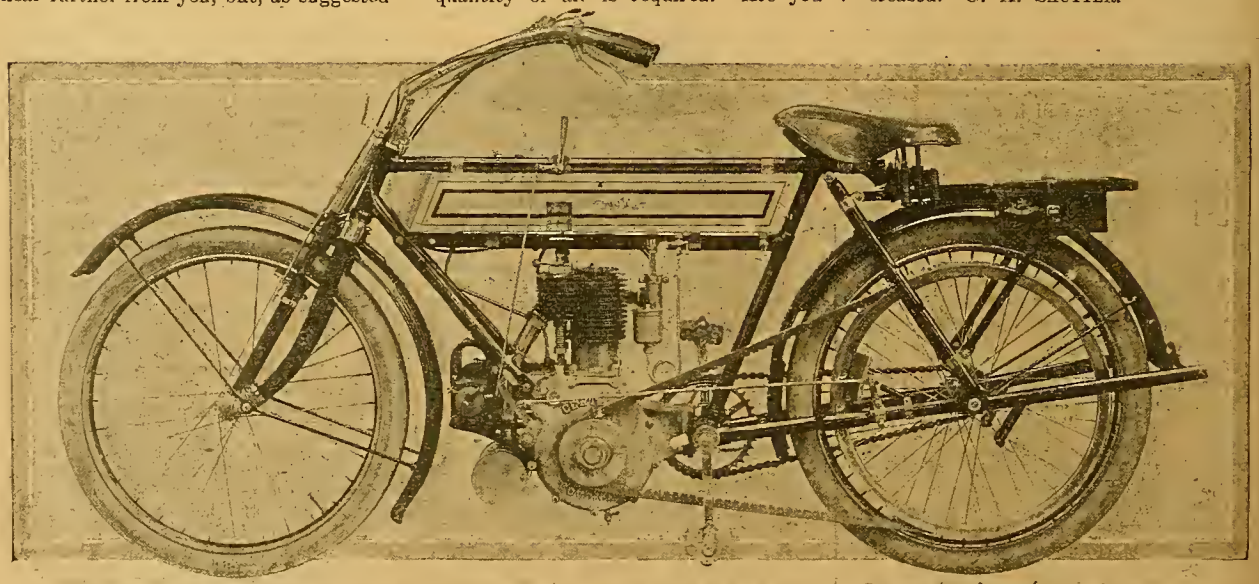
A Silencer at Rear of Machine.

With reference to "G. B.'s" enquiry about fitting a silencer at the rear of a motor cycle, I may be able to give some information of interest. I have had a double silencer fitted to my 4 h.p. twin N.S.U. for over a year, and find it a great boon, especially when passing frisky horses. I enclose a rough sketch of mine to show what I mean. With the cut-out open it is much more silent than most machines I have seen, or, rather, heard. With the cut-out shut it is absolutely noiseless, save for the clicking of the valves. I only use maximum silence when the speed does not exceed fifteen miles per hour, as it has a tendency to overheat the engine, but with the cut-out open it is silent enough for anything, except a horse that performs a cake walk when it sees anybody in goggles. The pleasure obtained by using a silent silencer is greatly increased.—G. A. SAUTTER.



Arrangement of silencer described by G. A. Sautter in accompanying letter.

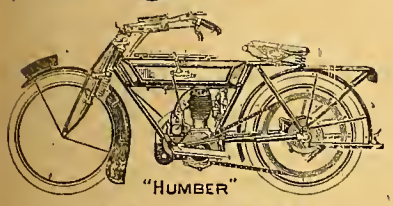
A. Elbow. B. Copper piping ¾in. inside diameter. C. Row of $\frac{1}{16}$in. holes. D. Cut out worked by Bowden lever on the handle-bar. E. Original silencer. F. Exhaust from engine.



The new pattern 2¾ h.p. Centaur roadster model. It will be remembered that we described and illustrated the main features of the T.T. and roadster model Centaurs in our issue of April 21st. The engine of both types measures 85 × 87 mm., the mechanically-operated valves being situated in front.

FOUR LEFT ONLY!

£55 0 0 for £44 0 0.

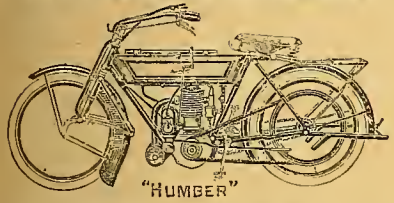


1909½ HUMBERS

brand new. These you can hardly tell from 1910 models, being fitted with improved pattern silencers, spring forks larger pulleys Roc licensed two-speed gear, h.-b. control, registered tank, high tension magnetos, Dunlop tyres, oil pump operated by foot, stand and carrier, toolbag with all tools fitted to handle-bar. Fully guaranteed.

£44, with sidecar.
£40, less sidecar.

1909½ Single Speed Humbers.



SIX ONLY ..... £33 15s.

Druid spring forks, Bosch magnetos, h.-b. control, pedalling gear, stand and carrier, toolbags, tools, number-plates, etc. Usual price £45. A clear saving of £11 10s. Only Booth's can offer such value

MOTOR BICYCLES FOR SALE.

5 h.p. 1909 Special Twin Rex, 24in. wheels, R.O.M. back and front fast, and like new; £29.—Below.

REX, 3½h.p., late 1909, better than new, not done 400 miles; £24.—Below.

REX, 3½h.p., 1908, good condition, new Dunlop tyre, Whittle belt; £21, cheap.—Below.

BROWN, 3½h.p., Bosch magneto, Mahon free engine, spring forks, stand, carrier, etc.; £18, bargain.—Stanley Motor Garage, Westbrook St., Bolton.

HUMBER, 3½h.p., free engine, in good order; what offers?—O. W. Warriner, 57, Micklegate, York.

TRIUMPHS, 1910, for sale, old Triumphs taken in on new obes.—G. W. Warriner and Son, Micklegate, York.

HUMBER, 3h.p., splendid condition; £16.—Broadbent, 69, Woodgrove Rd., Burnley.

5 h.p. Twin Antoine, good condition; cheap; powerful; £13.—Martin, Anfield Rd., Liverpool.

F.N., 4½h.p., h.b. control, magneto, perfect order, including tyres; £21.—Briggs, Whitby.

1910 Triumph Motor, unpacked; immediate delivery; £48 15s.—Fred Lee, Pocklington.

1910 3½h.p. Humber, two speeds, as received in crate; £45.—R. Blezard, 26, Bank Hey St., Blackpool.

1903 4h.p. J.A.P.; will take lightweight in part exchange; £30.—K. Harvey, Chapeltown, Sheffield.

TRIUMPH, 1908, condition excellent; accept £28 15s., a real bargain.—Seal and Ball, Nevill St., Southport.

1909 Triumph, not done 500 miles, bought Easter, 1910, Dunlop studs; £41.—Lockwood Farmer, Rotherham.

3½h.p. White and Poppe, Amac, handle-bar control, long and low; £15, or offer.—F. Robinson, Bath St., Bolton.

PHELON and Moore, August, 1909, Kempshall, perfect condition; £40, or near offer.—Wyrill, 32, Rebecca St. Bradford.

3¾h.p. N.S.U., magneto, spring forks, studded tyres, good order; £15, offers.—Braithwaite, Parkside Meanwood, Leeds.

1909 Rex, 3½h.p., new at Easter, only used once; take £32, or nearest offer; bought tricar.—Motorist, 29, Victoria St., Goole.

5½h.p. Twin N.S.U., magneto, free engine, detachable non-skids, in splendid order; £24.—J. Earnshaw, decorator, Bingley.

DOUGLAS, Bradbury, Norton, Ariel, Lincoln Elk, P.M.C. two-stroke; sole agent for Manchester district, Gourlay, Fallowfield.

1¾h.p. Phœnix, spray, good order, trial given; nearest £5, or exchange cycle, part cash.—Stansfield, Smithwell, Heptonstall, Yorks.

3½h.p. Rex, good condition, accumulator, 26 by 2 wheels; £12 10s.; just been 600 miles tour.—Seal and Ball, Nevill St., Southport.

REX 6h.p. Twin, magneto, perfect, handle-bar control, Whittle's belt studded rear tyre; £19.—Harlow, 188, Middlewood Rd., Sheffield.

REX, 5h.p. twin, spring forks, 1907 model, in perfect order, scarcely been ridden; £20, bargain.—G. W. Warriner, 57, Micklegate, York.

5-6h.p. 4-cyl. F.N., 1909 model, with two-speed gear, fo tboards, tyres nearly new; 38 guineas cost over £64 new.—M., 5, Lawson St., Barrow-in-Furness.

5½h.p. Rex, magneto, Roc clutch, handle starting, spring forks and seat pillar, in first-class condition; £18 10s.—Atkinson, Thornthwaite Mill, Darley, Leeds.

LIVERPOOL.—Motosacoche, Moto-Reve, Wolf, the only veritable lightweights; Phelon and Moore heavy and light.—Sole official agents, British Cycle Co., 1, and 3, Berry St.

ROYAL Enfield Lightweight Motor Cycle, twin cyls., magneto, mechanical valves; 38 guineas; from stock.—District agents, Newton and Co., 50, Blackfriars St., Manchester.

NSU., 3½h.p., 1908 model, magneto, spring forks, two speeds, free engine, footboards, excellent condition, spares, lamp, etc.; £22 10s.—19, Dartmouth Rd., Chorlton-cum-Hardy.

4 h.p. Roc, 1908, magneto, clutch, free engine, handle starting, studded back tyre, in good order; £28, or reasonable offer; trial on application.—Captain Grounds Barracks, Warrington.

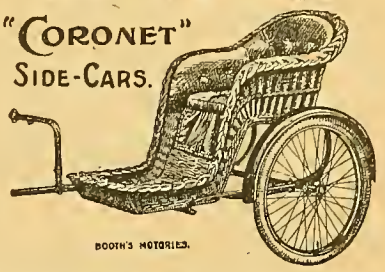
TRIUMPH, 2½h.p., handle-bar control, stand, carrier, horn, lamp, two belts, cut-out, Clincher tyres (one almost new), comfortable, perfect running order; £8.—22, Roe Lane, Southport.

P. and M., magneto, two speeds, h.b. control, just been thoroughly overhauled, cylinder bored and new piston fitted, tyres good, tubes detachable; any trial; £26.—Hattersley, Little Horton, Bradford.

CLYNO Motor Cycles, the finest touring mount for Yorkshire hills; send P.O. for list, or send address; will demonstrate sample machine.—Potter, Agent, Leicester Grove, Blackman Lane, Leeds.

1909 Motosacoche, 1¾h.p., not run 350 miles, complete, head lamp, watch, spring forks, stand, mirror, horn, numbers, tools, accumulator, spares; £28.—Box 4,678, *The Motor Cycle* Offices, Coventry.

£4 17s. 6d.



We maintain the "Coronet" is the BEST D SIGNED SIDECAR on the Market.

Free from Side-slip.—The "Coronet" Sidecar is attached in three places, the front down tube, bottom stay, and saddle bolt, and can be detached in three minutes. Every tube of attachment is telescopical and adjustable to suit any length wheelbase, any height or width. When attached the combination is as firm and rigid as a Tricar, and entirely free from side-slip, and can be driven safely without passenger if desired.

Delivery from stock to suit TRIUMPHS, REXES, P. & M.'s, N.S.U.'s.
Price £4 17s. 6d. Discount to trade.

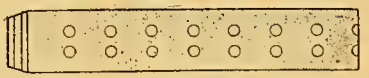
CORONET ADJUSTABLE PULLEY.

12/6

The best variable speed pulley on the market. Loose flange securely held in any position by a simple yet ingenious contrivance. Gear can be altered without the aid of spanners, lock ring easily operated by hand. Buy a "Coronet" pulley and gear your machine suitable for hill-climbing.

Standard makes, such as Rexes, Triumphs, Minervas, supplied without the necessity of sending old pulley for pattern. Discount to trade.

"GRIPSKIN" BELTING.



Made from selected parts of hides, correct angle, perfect drive; the best leather belt on the market. Longer life than rubber.

CAMEL

Franco-British Exhibition 1908.

3 *Grand Prix.* 8 *Gold Medals.*

As a chain is only as strong as its weakest link, a belt is only as efficient as its least considered essential.

The essential links in motor belting construction—Maximum effective pulling surface; Elimination of stretch; Tensile strength; Flexibility; Centring of core; Prevention of twisting, ends breaking, and surface cracking—when evenly considered and supported by suitable materials and experience, ensure a perfect whole.

Camel Belting, owing to its uniform wear, due to scientific construction, is offered and sold as being the nearest possible to the ideal.

Obtainable through all Agents.

CARS FOR SALE.

10h.p. Modern Oldsmobile, Cadillac type, 2 or seater, 760 by 90 Dunlops, screen, fast, quie £68, part tricar or bike.—61, Denmark Hill, Camberwe

ADAMS, 10h.p., 2-seater, two ignitions, foldi screen, new condition; sell £65, take good mot bike part payment.—Boscombe, Cholmeley Park, Hig gate, N.

O. T.A.V. 2-seater, in thorough order, including ext tyre, hood, and tools; only £35 to clear. Apply, Salway Motor Wks., Salway Hill, Woodfo Green.

5½h.p. Humberette, perfect condition throughout, t speeds and reverse; will sell cheap, or take part exchange modern motor cycle.—Garner, George Yar Barnsley.

16-20h.p. National, like new, hood, screen, two igr tions, Claudel-Hobson carburetter, for sale or e change 2-seater and cash.—McFayden, Blackhall S Paisley.

SIZAIRE, 9h.p., 120 by 110, Stepney, speedomete lamps, and spares, a smart 2-seater in capital orde £90 only.—Full particulars, Roland Rutter, Bury S Edmund's.

6h.p. Wolseley, three speeds and reverse, Bosch ma neto, 700 by 85 Dunlops, Stepney, lamps, flaish green, and guaranteed; trial; £45.—Nye's, 69, Leath Lane, Holborn, London.

A BARGAIN to immediate purchaser for £45.—10h 2-cyl. car, in excellent running order, four speed and reverse, Dunlop grooved tyres.—Address, H., 2, R chester Rd., Earlsdon, Coventry.

SMART Little Brougham, side entrance, 2-cyl., liv axle, 10-12h.p., extension over driver, lamps, etc £65.—Owen Cottage, Melbourne Lodge, Queen's Wall Ealing.

6h.p. Siddeley, 2-seater, steel frame, three-speed, r verse, lamps, new accumulator, Dunlop tyres, neat £34, or exchange for good bike.—Jameson, 16, Sout St., Sunderland.

10-12h.p., 2-cyl., 2-seater, cardan drive, three speed and reverse, complete, horn, lamps, etc.; £3 cash; twin motor cycle or Raleighette part.—Harris, 20 Midland Rd., Derby.

HUMBERETTE, 2-seater, smart little car, three speed and reverse, side change levers, lamps, etc.; sacri fice £22 10s.—Seen at Turner's Motor Garage, Pitts hanger Lane, Ealing.

6½h.p. 2 or 4-seated Gladiator, Aster engine, thre speeds and reverse, mechanically equal to new, very silent, and most reliable; £55; all lamps and tools motor cycle part; will give 50 miles trial.—Wm. Elce Leawood, Matlock.

STAR Car, 7h.p., 2-seater, with Cape hood, wind screen Stepney, lamps, and complete spares; the car is in excellent condition, tyres almost new; £100.—Apply H. W. Pulleyn, 8, Coppergate, York.

SPEEDWELL, 15h.p., 4-cyl., side entrance car, mag neto and electric ignitions, M.O.V., splendid con dition; £85; good motor cycle taken part payment.— Bedwell, Cherryhinton Rd., Cambridge.

12h.p. N.A.G., of Berlin, one of these famous makes may be had, price 142 guineas, mechanically perfect, elegant side entrance body, as new, leather hood and accessories, all complete, 2-cyl.; any examination trial given. Seen Surbiton.—Apply, 1, Belvedere Crescent, Waterloo, S.E.

ENGINES.

2¾h.p. Genuine De Dion engine, perfect; £2 15s.; seen any time.—268, Hornsey Rd., Holloway.

REX Engine Parts for 1906 to 1910 model.—Wauchope's, 9, Shoe Lane, Fleet St., London, E.C.

ENGINES.—Roc, 4h.p., single-cyl., new 1910 type; early deliveries.—A. W. Wall, Ltd., Birmingham.

HIRST Magnetos, for single-cyl. engines new, and guaranteed; £2 15s. each.—Wauchope's, 9, Shoe Lane, Fleet St., London, E.C.

7-9h.p. V.S., Peugeot twin, complete every way, including gear drive magneto, adjustable pulley, very fast; bargain, £10.—Olsson, East Hill, Oxted.

NEW 2¾h.p. F.N. Engine, carburetter, and silencer, complete; also 2¼h.p. genuine De Dion engine; what offers?—Sawer, 210, The Moor, Sheffield.

ENGINES, Engines, Engines, twin or single-cylinder, for car, cycle, boat, and aeroplane. Send for particulars to Advance Motor Mfg. Co., Ltd., Northampton.

COMPLETE Engine, 3h.p., 76 by 86, Amac, 1909, h.b.c., 30s.; also 7ft. 6in. 1in. Stanley, new, 5s.; two Longuemares, 2s. 6d. each.—Preston, 2, Foxbourne Rd., Balham.

ENGINES.—2¼h.p. J.A.P., brand new, £4 15s.; 3½h.p. M.M.C., £3 10s.; 3½h.p. Chater-Lea, M.G.V., £5; 2¼h.p. De Dion, £3; 3h.p. motor cycle engine, £2; 2½ h.p. ditto, 30s.—128, High Rd., Tottenham.

MOTORS for all purposes. Motors for your aeroplane. ¼h.p. practical petrol motors; 500 machined sets, 9s. 9d.; cycle car, launch, aerial motors; castings of all sizes; propellers; full list 4d.—Madison Aerial Works, Littleover, Derby.

CASH, Instalments, or Exchange.—Engines, new and second-hand, powers to suit all; repairs to motors, gears, magnetos, coils a specialty, with 13 years' Coventry experience; 2¼h.p. converted to 3½h.p.; see testimonials.—The Record Motor Co., Wembley, Middlesex.

THE VALUE OF RACING.

By B. H. DAVIES.

SOME of the excited spectators of the T.T. Race regard themselves merely as the privileged witnesses of a sporting spectacle. The stay-at-homes, who are not lucky enough even to see it, are often apt to grumble at the expense of the race, which is, of course, passed down from hand to hand until it reaches the "consumer" ("consumer," by the way, is rather an apt description of certain users of motor cycles). These notes are intended to justify the existence and expense of the T.T. Race. Some of our Northern friends are very fond of asking, "What is the good of the A.C.U.?" As the T.T. is an A.C.U. event, I hope they will digest them.

I assert that racing is a factor of enormous power in the development of the motor cycle. Progress there would no doubt have been if there had never been any racing; but racing results in

(i.) Rapid progress.
(ii.) Cheap progress.
(iii.) Compulsory progress.

Rapid Progress.

The rapidity of progress is visible when we compare the engines of 1902 with those of 1910. In 1902 I owned an 84 × 84 mm. engine. It weighed nearly 80 lbs. (as against, say, 56 lbs. to-day), it developed 3 h.p. (as against nearly 5 b.h.p. to-day), and it could maintain its maximum output for about a quarter of an hour from a cold start (as against five hours at least with a first-rate 1910 engine). Picture the maker of that engine attempting to improve his engine without racing. As every engine designer and builder knows, he will probably have to make a dozen experimental engines before he arrives at what he wants. He cannot tell whether these engines are any use or not till he has tested them. Without racing, he can only test them by mounting each engine in a frame, and paying a good tester a high wage to devote six months to knocking that engine about on the road. After the six months are up, he may know from his tester's reports that not one of the dozen experimental engines approaches his ideal, and he may have to begin the whole weary business over again—many a maker has undergone not one, but ten experiences of the kind.

In the meantime there is next year's market to be catered for. There is no time to ascertain whether the experimental engine can be trusted to raise his reputation; so he adds a few talking points to his 1902 engine, he corrects one or two of its simplest and most obvious defects, and markets a 1903 engine which is practically identical with that which he sold in 1902. This is the sort of thing riders had to put up with before the T.T. Race and Brooklands came into being. Either we got a novel but untested engine, which was radically bad as often as not; or else we got the same old engine we had driven in the previous year, with just a few detail alterations.

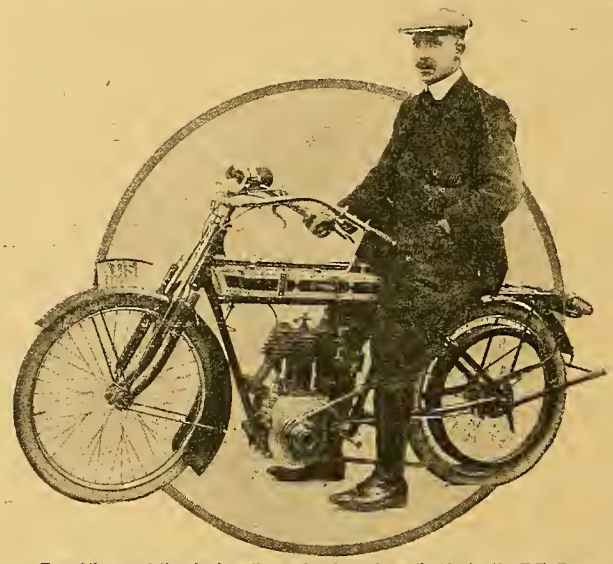
Now picture the same maker with racing to help him, Brooklands available, the T.T. Race in the near future. Five hours on open throttle on the track or in Manxland constitute a more searching test than six months on the road. The new ideas are rapidly verified. Small alterations are incorporated in old engines, the new engine can be built in a month or

The Value of Racing.—

less, and anything new can be tested thoroughly within twenty-four hours of its being completed. The maker no longer follows that elusive will-o'-th'-wisp of the "bench test"—the grave of many hopes and reputations. He takes a season's wear out of an engine in a day on the track. If the idea is imperfect or hopeless, something different is swiftly set up and tested in the same way. Many a designer claims to have learnt more in three months with Brooklands and the T.T. to help him than he had learnt in six years of roadwork. Racing accelerates progress beyond belief.

Cheap Progress.

When you are setting out to produce a better motor cycle engine than anybody else, cheapness is strictly a comparative term. Absolutely it is not going to be a cheap job, unless you have real genius and real luck. But the expense varies. Under the old *régime* you spent months testing a score of designs on the bench and on the road. Under the new *régime* you keep but one tester—yourself, very probably—and you test each idea in a day. If there is something wrong, you do not have to wait months to test a modification of it; you have to wait just so long as the pattern-makers and foundry take to supply the new parts required, and in twenty-four hours after they are delivered you know what the thing is worth. Moreover, you do not have to keep your market waiting. Under the old scheme you had no market at all, or else a poor market, while your tests lasted—and they lasted months. You wanted a big capital to face a year which was all out-goings and brought no income. Now you can enter the business at Christmas, win a race or two by Easter, and be hard pushed for deliveries by Whitsun—this makes for cheap progress, early sales, and economical, rapid testing.



Tom Silver and the single cylinder Quadrant he will ride in the T.T. Race. The engine measures 82×90 m/m, the valves being situated fore and aft. Spring frame and forks will be used, also Simms magneto, Dunlop tyres, Watawata belt, and a new pattern Quadrant automatic carburetter.

Compulsory Progress.

Progress is competitive. Its rate depends upon the fastest man in the trade. When the general rate was necessarily slow, as in the early days prior to Brooklands and the T.T., it was because no individual *could* develop his machine fast. As soon as one individual begins to outstrip the ruck of makers, they all become hungry for improvement in their wares. If I could to-morrow produce a new engine, and beat all the expert road and track racers into fits with it, I should not only benefit myself, I should compel all the existing firms to produce new engines in order to compete with it. Racing provides a few keen spirits with the opportunity of making great strides in efficiency. The stick-in-the-muds were *compelled* to follow suit; and nowadays, except for a few freak side-tracks of the market, every engine maker is out for blood—he is compelled to develop the efficiency of his engines very rapidly in order to live. All the makers are compelled to utilise the opportunities afforded by the T.T. and Brooklands; if they do not, they would soon have to put up their shutters, for others would be picking up saleable knowledge while they were standing still. Hence racing not only accelerates and cheapens the development of the motor cycle engine, but it renders such advances compulsory upon every maker; and the money we spend on racing ensures us a better machine every spring. Moreover, the credit of recognising the value of racing as a factor in development, and of forcing its use upon a reluctant trade and public, must be awarded without any deductions to the much-maligned A.C.U.

J. Mackay (3½ h.p Triumph) topping the hill in the Harrogate M.C.C. competition. This photograph is rather remarkable as it shows the back wheel jumped several inches clear of the ground by a nasty ridge and the rider clear off the saddle. He was nearly upset by this but just managed to keep up till he could stop the machine.

THE TOURIST TROPHY.

GOSSIP CONCERNING NEXT THURSDAY'S BIG RACE.

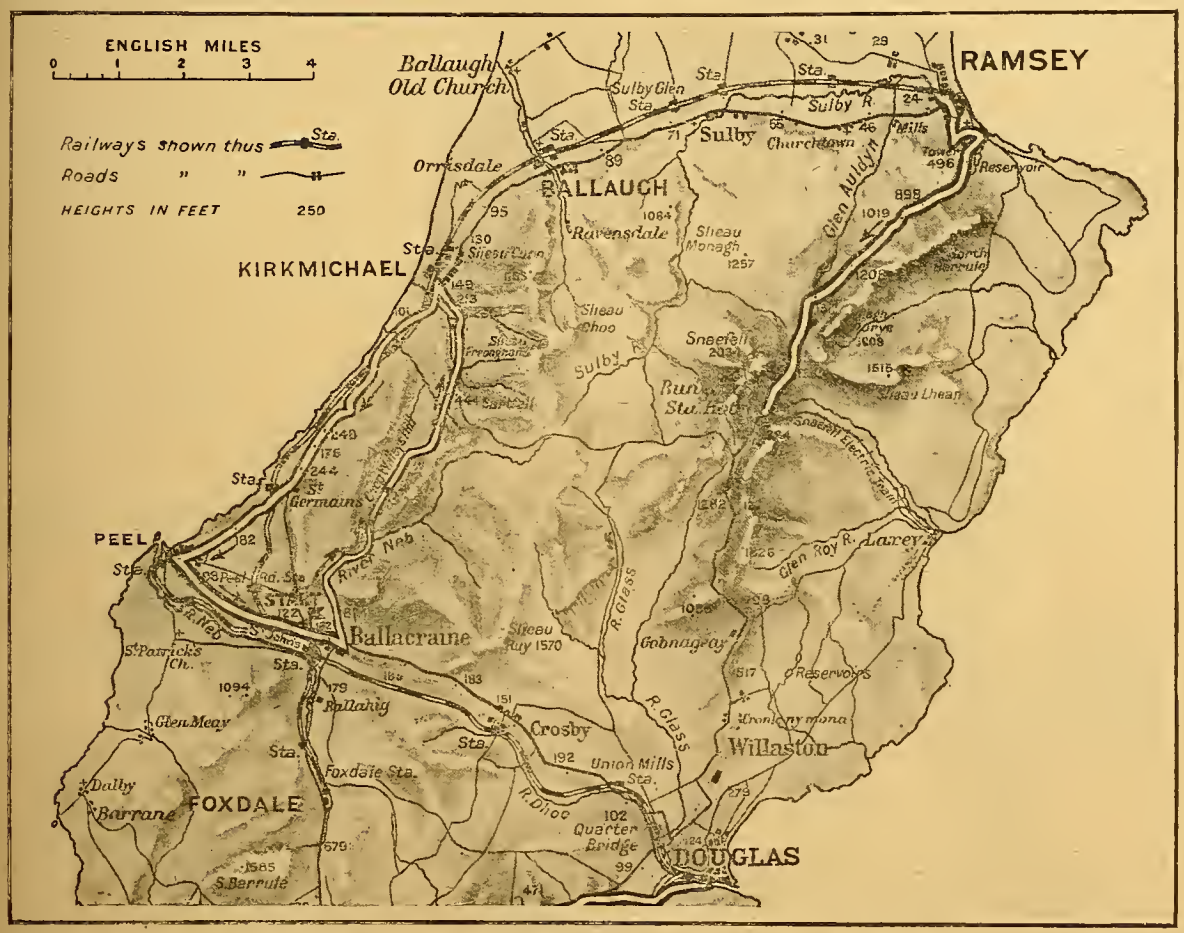
The map on this page shows the T.T. course in the Isle of Man. There was general satisfaction by the announcement in last week's issue of *The Motor Cycle* that the old course was to be used. Starting from St. John's at 10 a.m. on Thursday next, the 26th inst., competitors will be despatched in pairs at regular intervals in the direction of Ballacraine, thence proceeding by way of Creg Willey's Hill to Kirk Michael, back by the coast road to Peel, and completing the triangle to St. John's. Ten circuits will be covered, making a total distance of 158 miles 220 yards.

The prizes will be as last year, viz. : 1st, £40; 2nd, £20; 3rd, £10; 4th, £5. A silver cup will be awarded to the first private owner not finishing among the first three, and a silver medal to all who complete the course.

The entries comprise a record. Eighty-three were received at ordinary fees, *i.e.*, forty-three single-cylinders and forty twins, so that again the feature of the race will be "the battle of the cylinders." Next week's race promises to be the most exciting event in the annals of motor cycling.

Interest in the race is more pronounced than ever. Parties are being made up in most of the large cities.

Practising for the Tourist Trophy on the Isle of Man course commenced yesterday (Wednesday). Competitors are allowed to indulge in speed round the course from daybreak until 7.30 a.m. No competitor is allowed to pass Ballacraine corner after 7.15 a.m.



The T.T. course in the Isle of Man, showing also the venue of the hill-climb, starting from Ramsey, the day following the race for the Tourist Trophy.

Machines will not be weighed this year, but after the inspection by the judges brakes and silencers will be tested for efficiency at St. John's at 10.30 a.m., the day prior to the race.

The A.C.U. headquarters during the Isle of Man week are the Sefton Hotel, Douglas.

Special excursions in connection with the race are being run from Liverpool by the Isle of Man Steam Packet Co., and details will be found in last week's issue, page 424.

On the afternoon of Friday, the day after the T.T. Race, the A.C.U. will hold a hill-climb on the monntain road starting from Ramsey and finishing at the Bungalow. Eight classes have been included, embracing all types.

In connection with mechanical details of the machines, especial notice will be taken of the two-stroke Scotts, the Premiers with auxiliary exhaust release, the new m.o.i.v. Rex twin, and the doings of the Indian tribe—probably the most fancied of the whole of the entrants. Still, the Matchless-J.A.P. machines usually require to be reckoned with.

ROTARY ENGINES.

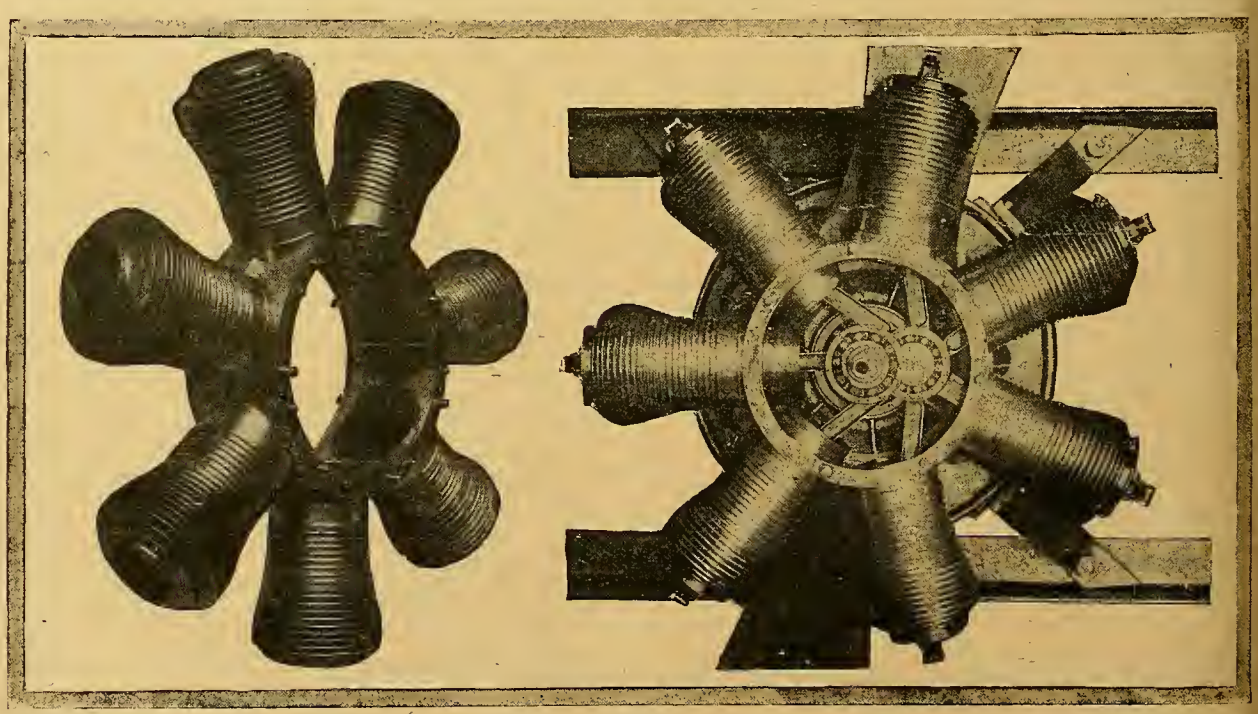
THE splendid flights of the two aviators, Grahame-White and Paulhan, show us many things. They show to the public how far the art of building aeroplanes has progressed; to the student of aviation they show how the French type of machine, at first heavy and unsightly, with its box tail and vertical curtains, has been perfected, and now stands as the best all-round design. It is to the engineer, and particularly to the motor engineer, however, that the full text of the message is shown, for it shows that the Gnome engine has at last gained its rightful position. This is as it should be, as it is without doubt the only true exponent of the rotary air-cooled aero engine. Its makers faced the problem of how to produce a light, reliable, and powerful engine, and did not hesitate to cast overboard the more conventional types, when they found their shortcomings, and go in for an entirely new design.

The Critics shook their Heads.

At first the critics shook their heads, and prophesied no end of troubles, but step by step the Gnome has been tested, short flights leading to longer flights, slow speeds to faster speeds, and all the time the engine has given proofs of its reliability. Few have been its failures, and there must always be some little weaknesses overlooked in new designs.

It is to be expected that when a new and successful design is brought out, many imitators blossom out with similar ideas—witness the Knight-Daimler engine and the Challenge reinforced air tube—but it is strange that no firm has so far imitated the Gnome engine with any success. One would have thought the French motor firms would have seized upon the idea at once, for it is not like them to let a good thing pass [There is more than one French rotary air-cooled engine made for aeroplanes, and on the next page we describe and illustrate a new one to readers of *The Motor Cycle*.—ED.]; and how is it that none of the big motor cycle manufacturers have been taken up with the notion? Are they too busy fulfilling orders for the present type to think about the future?

What most find fault with is the system of lubrica-



The Seven-cylinder Air-cooled Gnome Revolving Engine used by Grahame-White and Paulhan. The steel cylinders measure 4·3in. bore and 4.7in. stroke, and the engine develops 50 h.p.h. at 1,000 revolutions per minute. The weight complete is only 165 to 170 lbs. The left-hand view shows the cylinders and the ring on which they are mounted; the right-hand illustration the engine complete excepting end cover. The end of the hollow stationary crankshaft is discernible in this view. Portions of the propeller blades and the engine supports are also visible.

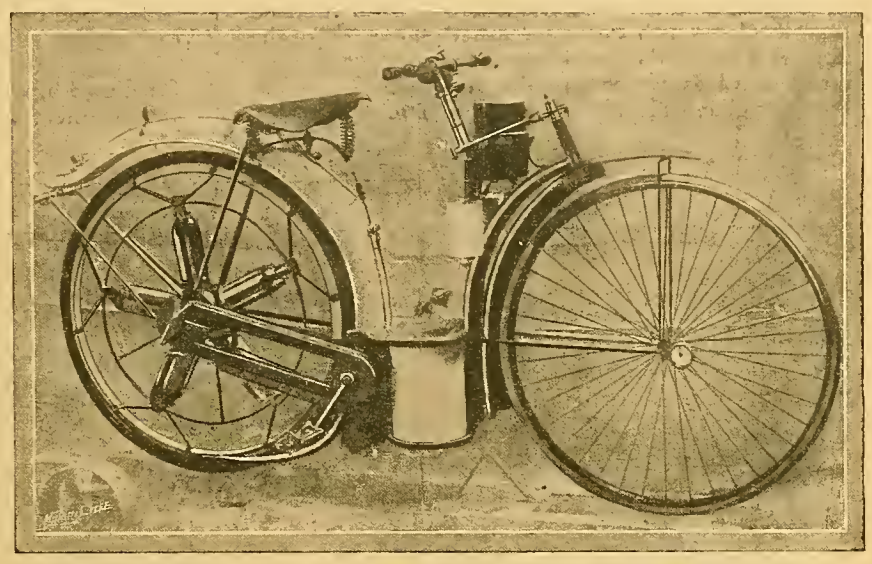
Rotary Engines.—

tion. It is all right for flying men, they say, but it would not do for motor cyclists, for when the engine is started the oil is flung about everywhere, and causes a dense cloud of smoke at the exhaust. It would spoil the appearance of the machine and rider in a very short time. There are three things to blame for this state of affairs: Firstly, the principle of giving the engine plenty of oil to prevent any chance of the bearings seizing; secondly, the system of splash lubrication adopted; and, thirdly, the inlet valves being in the centre of the piston head, the oil has a clear passage into the combustion chamber.

These matters could, I think, easily be remedied by using forced lubrication and moving the position of the inlet valve to the cylinder head. As regards silence, I think by careful designing the rotary engine can be made to have a really noiseless exhaust. The cause of the increased noise is the rush of the exhaust gases meeting the still air. Now, by allowing these gases to impinge upon the air after the manner of the steam in "Hero's" turbine, the gases and air would meet each other at nearly the same velocity, and the noise would be greatly reduced, and at high speeds might cease entirely.

So vast are the possibilities of this type of engine that it would be of little use going into them all at this juncture, when everything relating to them is in a more or less experimental state, but there are two points on which I would like to touch.

One is the idea of using the engine as a balancing agent, something after the manner of the gyroscope. I know most people say this gyroscopic force does not come into action until a huge speed is reached, but I think it is always there, no matter whether the speed is one or ten thousand revolutions per minute. Imagine being able to balance your bicycle when stopped by traffic without any bother, like Brennan's mono-railway train. Yet it might not be impossible with a clutch.



As early as 1896 a rotary engined motor bicycle was built in France. It is illustrated above, and it will be observed that the engine has five cylinders and is located in the rear wheel. Surely this would be a valuable addition to any museum.

Then with a rotary engine the long-wished-for forced induction might become a reality, for when the engine is describing a circular path through the atmosphere the air in front of the cylinders is under compression. With experimenting, it might be possible to utilise this compressed air for increasing the compression at high engine speeds.

These are a few of the points which give the rotary engine such a fascination, and I hope a discussion on them will lead to something tangible in the way of rotary motor cycle engine experiments in the near future.

A TWO-STROKE ROTARY ENGINE.

The simplicity of a two-stroke rotary engine and its possibilities for motor cycle use are appealing to many engineers. To keep up this interesting discussion we give a brief description with two rough sketches of the Farcot engine, for which we are indebted to our contemporary *Les Sports*. Unlike the Gnome engine, which has an odd number of cylinders, the Farcot *aerotwrbine*, as it is called, possesses only two, which are turned from solid steel bars as is the case with the Gnome. The mouths of each cylinder are enlarged to allow them to clear the cranks as they revolve around the fixed crankshaft, the two being bolted together and carrying between them the bearings on which the crankcase and the whole engine revolve. The Farcot is a two-stroke engine, compression being obtained in the crankcase when the opposed pistons come together, the mixture being drawn into the engine through the hollow portion of the fixed crankshaft. Presumably, there is some kind of rotary sleeve valve in the crankshaft to prevent the escape of the gases drawn into the crankcase, but it is not clearly shown in the sketches. The transfer of the gas from the crankcase to the cylinder heads is obtained by means of ports in the sides of the pistons, which com-

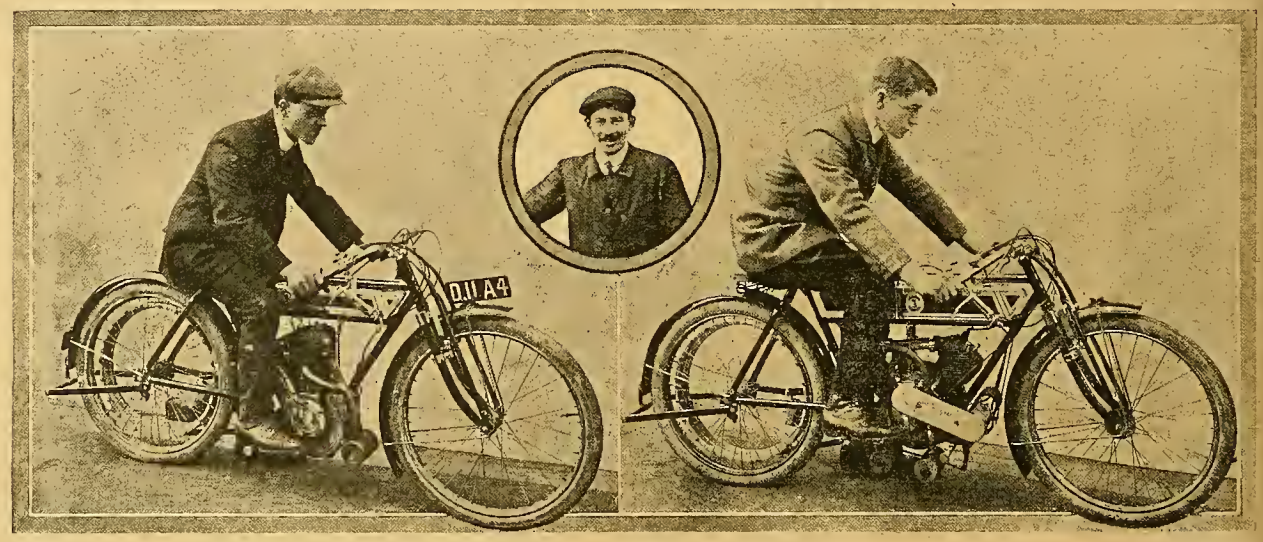
The Farcot two-stroke rotary engine.
D. Fixed distributer.
B. Attachment for carburetter.

Rotary Engines.—

municate with transfer passages attached to the sides of the cylinders. The transfer passages are made of aluminium and lettered A in the sketch fig. 2. The exhaust escapes when the pistons are at the bottom of the firing strokes, and it is claimed that with a revolving engine this system has a turbine action derived from the force with which the exhaust gases strike the air. If desired the gases can be directed against a series of vanes to increase the turbine action. The Farcot engine, which, owing to its two-stroke principle, is, of course, of the most simple construction, is said to develop 28 to 30 h.p. for a weight of 30 kilogrammes, which is, of course, equal to 1 h.p. per kilogramme = 2¼ lbs. The weight mentioned comprises the magneto, carburetter, and pump for circulating the lubricating oil. No details are given as to bore and stroke, but the dimensions must be far greater than the Gnome, as the engine has only two cylinders for its 30 h.p. as compared with the seven cylinders on the Gnome 50 h.p. engine. The absence of poppet valves in the Farcot is a great point in its favour.

THE PREMIER REPRESENTATIVES IN THE T.T. RACE.



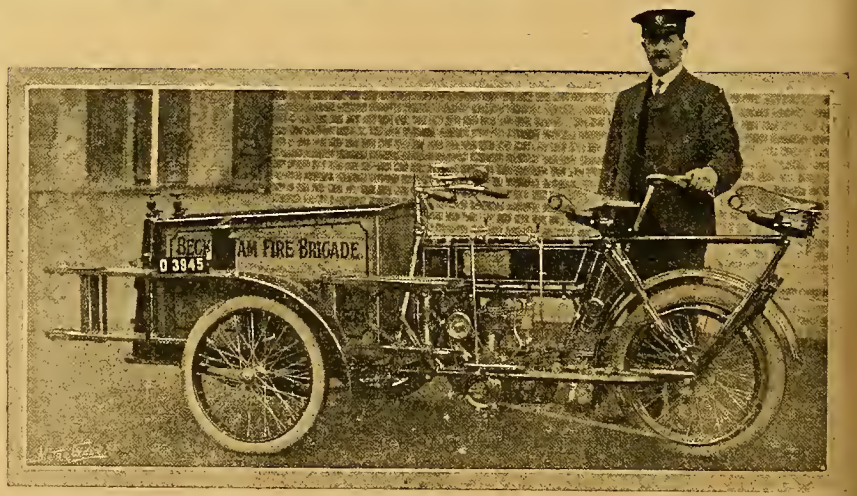
G. E. Stanley astride a 3½ h.p. Premier with auxiliary exhaust ports.

F. Savory will ride a 3½ h.p. single-cylinder similar to Stanley's.

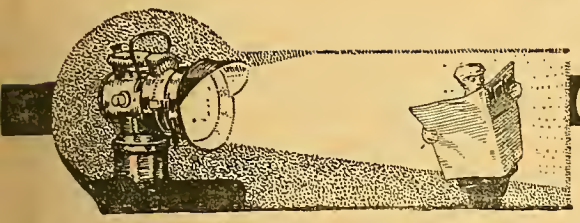
B. Vickers Jones, who will ride a twin m.o.i.v. Premier with cylinders at 90°.

FIRE TRICAR'S GOOD WORK.

THE first aid N.S.U. tricar at the Beckenham (Kent) Station, which was built to the specifications of Mr. H. S. Gear, the engineer, has now been in use for over eighteen months, and, thanks to careful attention *en garage*, we are informed, has made a non-stop record so far. By the use of lighter fittings, Mr. Gear has got the weight down over half a hundredweight. Recently it was timed to attain over 30 m.p.h. on a level stretch of road—evidence that it is maintained in first-class tune. It is interesting to hear that the machine has proved a success, and by reason of its low cost and small working expenses it is surprising that this class of machine is not more in vogue. Only one or two stations in this country at present are equipped with first aid motor cycle appliances, though in Germany tricars are rather largely used both for salvage and postal carrier work. Mr. Gear does not consider a single-seated machine or side carrier at all practicable for this work. He much prefers a two-seated three-wheeler



The first-aid N.S.U. Tricar at the Beckenham (Kent) Fire Station. Mr. H. S. Gear, the engineer who was responsible for the specification of the machine, is standing by its side.



Occasional Comments

"By Ixion"

The T.T. Course in the Isle of Man.

A suggestion came before the Competitions Sub-committee last week that it might be well to increase the length of the Tourist Trophy course. With ninety riders racing over a fifteen mile lap there is a man to every 300 yards of road, and the present course is too cornery and narrow to make riding in such close company either specially safe or specially pleasant. This year the men will actually be started in pairs at intervals of twenty seconds in order to get the last man off before the first man is round at the starting post again. I should say this is a matter which might be referred to the competitors themselves. As a spectacle the race is certainly enhanced by this crowding; that the relative positions of the men are difficult to follow is a drawback which must exist under any conditions. The latest decision of the Competitions Sub-committee was that the course should not be altered, but I think that if the men would prefer to be strung out more sparsely over a longer lap the reform should certainly be engineered if possible, and it might be possible to include the mountain road and its hairpin corner, if such an inclusion is not too dangerous.

Timekeeping in Small Hill-climbs.

Club secretaries always have an anxious time when they come to arrange for the timekeeping in a small closed hill-climb. They cannot afford to engage expert watchholders, and local sporting men seldom possess either the skill or the expensive chronometers essential to correct time taking. I suppose the commonest escape from the difficulty is to employ a single watchholder at the top of the hill, who starts his watch when he sees a flag at the bottom fall; sometimes the men are given a flying start, and the single timekeeper starts his watch at the fall of a flag, which is dropped when the riders cross a tape at full speed. We know very well that on a short hill the three or four fastest men are seldom separated by more than tenths of seconds, or, at the outside, one or two seconds. The methods described leave a large margin for error and resemble most disagreeably the ways of the hedge policeman so often exposed in court. The flag-wagger is almost compelled to fail in accuracy of signalling. He simply cannot drop his flag at the precise tick when each front wheel touches the tape he has pegged across the road, and his variation from too early to too late will often amount to a whole second either way, *e.g.*, one man may be two seconds slower than another competitor, and yet be credited with the fastest time.

Similarly, there is another loophole for error in the timekeeper himself. The chance of his being a little wrong with his watch at the finishing tape is always present, and the best safeguard is to employ none but men with ample experience and a high reputation with speed timing. But under the conditions described a second far more serious opportunity for mistake is added, since the watch is started when a small flag is dropped perhaps a mile away.

It is humanly certain that men have been credited with the fastest times in such events when they have actually been four, five, and six seconds slower than another man returned as much slower. So we come to the very practical difficulty, what is the poor hon. secretary to do?

Let us understand the purpose of these climbs is not to discover the actual time taken by the best *machine* in the club to climb a certain hill, but to discover which *member* can climb hills fastest. I should therefore advise the selection of a straight hill as steep as can be found, but it does not really matter if it is tolerably easy. Send the men up in pairs, starting at a pistol shot or the word "go." The winners in the first round are then pitted against each other, till finally the fastest man is determined. I know no other reliable method of arriving at the fastest man without going to the expense of engaging A.C.U. official timekeepers with £50 chronometers.

More Sporting Events.

A hill-climb on the above lines is far more sporting, both for riders and spectators, than the stereotyped pattern. If a single watch be adhered to, in the hands of an unskilled man, I much prefer the standing start.

A few members of the Reading M.C.C. photographed on the occasion of the inaugural run.

The flag-wagger is then safeguarded against error, for he can drop his flag whenever he pleases, and the sole responsibility for mistakes then rests on the man with the watch. It is no use attempting to get accurate results with two £5 chronometers. No matter how cleverly they are operated, there is likely to be a serious discrepancy between them before all the riders have gone up. I must plead guilty to a strong penchant for the standing start in all motor cycle events.

As many of our Brooklands photographs show, it puts a higher value on the personal factor, and in club events a premium should be put not on the man who can buy the latest and most powerful machine so much as on the rider who can keep his mount in perfect tune and handle it smartly.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

A Carburetter Experience.

[4766.]—Regarding "A. M. G.'s" letter [No. 4725], I was troubled with the same experience, and came to the same conclusion as he did, but, instead of removing the plunger and thereby being unable to flood the carburetter, I shortened it, and also shortened the guide an equal amount. I found that this overcame the trouble and that I could get a higher level of petrol in the jet whilst machine was stationary. E. HEATHCOTE BEAL.

Motor Cycling in India.

[4767.]—The great difficulty the motor cyclist has to contend with in India is the byle gharrie (bullock cart). These carts proceed along the roads just anyhow. The driver is fast asleep very frequently, and they are a perfect nuisance. No motor cycle horn is capable of awakening the sleeping gharrie walla, at least I have not found one. Has any horn been fitted to the exhaust pipe as is done in motor cars? Is this feasible? Can any reader inform me of some really efficient alarm? QUI HAI.

Bengal, India.

The Taxation Question.

[4768.]—Your correspondent, "A Lover of Justice," is quite right. It is a shame, when a working man or an impecunious young fellow can just manage to raise five to nine pounds to buy a second-hand mount, that he should have to plant down 25s. (and shortly 30s., I suppose) before he can take it on the road. But has it occurred to your correspondent that this is just the reason why second-hand machines are so extraordinarily cheap? If one could take a machine on the road on payment of, say, 5s., or nothing at all, I should expect to see second-hand ones go up two or three pounds at the least owing to the greatly increased demand. J.H.R.

The Spring Quarterly Trials.

[4769.]—I have seen no word of thanks recorded in your excellent paper for your kindly thought in providing the tea for us riders in the last A.C.U. Quarterly Trials. May I venture to be one of those who publicly congratulate and thank you on what was a kindly act, and a very thoughtful one. I for one appreciated it, and I think that many more of the riders will join with me in admitting that we ought to say thank you for your thought of us. The trials are very trying times, and this tea is one of the things that make them homely, so perhaps you will publish this letter to show that the action you took is thought well of, like most of the things in your paper. Do not be shy at publishing your own praise, you deserve it this time. Do you not agree, readers of *The Motor Cycle?* A pat on the back may do us another good turn next time, eh! and we may get the same comfort as we got this time, when we found *The Motor Cycle* thinks of its readers in the Quarterly Trials.

(Rev.) R. MEASURES.

P.S.—May I suggest that we all buy an extra copy of the paper to show our appreciation.

Rotary Engines.

[4770.]—Your leading article on "Rotary Engines" recalled to my mind a short run about two years ago on one of the Barry motor bicycles, fitted with a two-cylinder rotary engine. Although the machine was only in my hands for a very short time, I was much struck by its good qualities. One of its peculiarities was that the valves had no springs, and worked by centrifugal force, with the result that the engine had to make one or two revolutions before there was any compression. The carburetter was attached below the hollow crankshaft, within about two inches of the ground, and the whole thing was fitted in a standard Chater frame, with a guard above the cylinders. The machine was extremely nice to drive, very flexible, and free from vibration, and, of course, there was a considerable saving in weight and an absence of overheating. I cannot speak as to the power developed or as to any difficulty in lubrication, but it struck one as being an engine with a great future.

If some of those enthusiasts who advocate water-cooling for motor cycles were to turn their misguided energies towards the perfecting of a rotary engine of this type, they would be doing some good, not only for themselves, but for everyone. BENJAMIN CONSTANT.

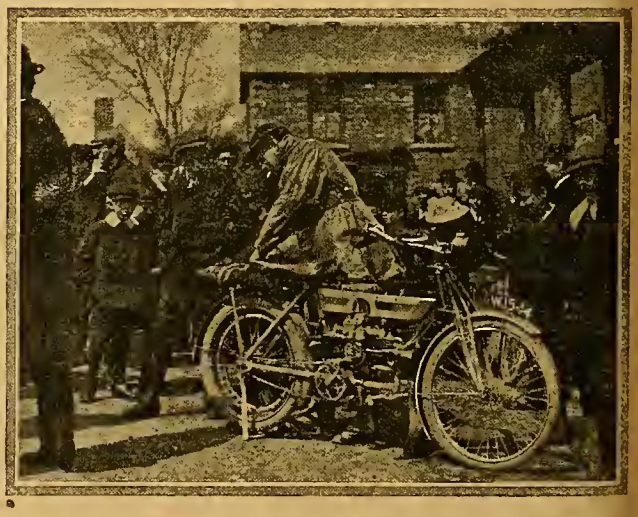
Increase of Speed on Partially Raising the Exhaust Valve.

[4771.]—I read with much interest the letter in your issue of April 28th from the Colville Motor Works with reference to the much discussed question as to why partially raising the exhaust valve lifter causes an increase of speed.

May I venture to suggest that the "bounce" of the ordinary mushroom valve on its seating, after being closed by the cam, is the usual cause of "blow-back" into the carburetter and spraying of petrol through the air inlet—that is, assuming engine is correctly timed. The inlet valve would, under the circumstances, be partially open at the commencement of the compression stroke, thus forcing out again a portion of the charge.

This theory is borne out by the fact that fitting a stronger spring frequently cures the trouble, which would make the valve less likely to bounce on its seating at ordinary speeds. It would be interesting to watch the action of the inlet valve of some machine afflicted with this complaint by means of the revolving mirror to see if this were the case. It is quite possible that this fact has a good deal to do with "abnormal running," about which there has been considerable correspondence in *The Motor Cycle*.

VALVO.



Bradford M.C.C. 200 Miles Trial for the N.S.U. Cup. One of the competitors riding a Douglas, preparing to leave Kendal en route for Keswick.

An Extended Trial of a Scott.

[4772.]—I was much interested in the article appearing in the issue of April 21st describing an extended trial of a Scott motor cycle.

As a rider of one of these machines for about the same distance—700 miles—I can fully bear out all that you say with the exception of the petrol consumption. I found that by fitting a smaller jet than that sent out with the machine this could be very considerably reduced. On the London to Harrogate and back run the machine was doing seventy-five miles to the gallon. This smaller jet gives ample power for ordinary riding, but I found it necessary to put in the larger one for Sutton Bank.

Jet changing on the Scott is a very simple matter, it only being necessary to slide a cover from over the jet and screw jet out with a special key provided.

Perhaps I should add that I have no interest whatever in the Scott Co. except as a satisfied rider of one of their machines.

F. J. BEARD.

Wanted, a Tyre for Irish Roads.

[4773.]—I have been a motor cyclist since February 20th, 1909. I ride a make that is very popular—3½ h.p.—and have nothing but praise for the machine. But oh, the tyres! I ride an average of seventy miles per week, and have ridden out five new tyres since the above time and one half-worn one also. This works out at about 780 miles per tyre. Can I get a rim that will suit a car tyre, or is any motor cycle tyre made like a car tyre? I don't want anyone to recommend any of the ordinary make of cycle tyres, as I do not believe in any of them. Is a 28in. wheel better than a 26in. for going over potholed roads? In conclusion, I may say myself and another are the only motor cyclists in a quarter of a county. Owing to heavy upkeep in tyres we can never recommend motor cycling to the many who make enquiry of us. Hoping that someone will put me up to something in the way of a long-lived tyre for Co. Londonderry bad roads,

T. P. HENRY.

Weight of Twin-cylinder Models.

[4774.]—In "Occasional Comments" of March 21st, "Ixion" remarks on the disproportion of weight and power between the 5 h.p. twin and the 3½ h.p. single. As usual he is shrewdly right, but I should like to tip him an exception in twins—if the model is still made. Some four years ago the "Griffons" had a vogue here and a large number of singles and twins were in use. The singles (of which I owned one) were 75 mm. × 80 mm., rated as 2¾ h.p., and the twins, called 5 h.p., were made up of two of the 2¾ units. Of a large batch of twins two only were imported with accumulator ignition and loop frames. The magneto twins (magneto in tank with shaft drive) were good, but the two accumulator machines were wonderful, and I have not yet seen anything to equal them for general excellence. Both are still running and both have done sidecar solo work ever since they came out over such country as you don't get in England. A few months back I had one on loan, and a scale being handy three of us weighed our mounts fully equipped just before starting on a trip. The weights were so remarkable that I jotted them down in a pocket book. A 2¾ h.p. N.S.U. (80 mm. × 75 mm. I think) came out at 169 lbs., a 1909 Triumph at 192 lbs., and the 5 h.p. Griffon at 165 lbs. All the machines are here, and these weights can be easily verified. Stripped, the twin Griffon would come down to between 140 lbs. and 150 lbs., and as for strength, well, both these looped-frame machines have done more hard and rough work than anything else here, and so far as I know neither has had a structural breakage. In engine flexibility and general smoothness of running, my present mount (a four-cylinder F.N.) is not their superior, but I cannot say the same of the magneto Griffon twins. Of course, these battery machines had their faults, of which for touring purposes the battery was one, and the contact-breaker another. This latter was quite good, but of a most delicate constitution and supersensitive to adjustment.

I wonder if the Griffon people still make this twin model; I should like "Ixion" to try one.

Bloemfontein. J. G. W. GORDON.

Another Tourist Trophy aspirant. F. W. Barnes (3½ h.p. Zenith-Gradua), 85 x 87 J.A.P. m.o.i.v. engine, B. & B. carburetter, Bosch magneto, and Continental tyres.

Water Cooling on Motor Bicycle Engines.

[4775.]—Following my letter of March 3rd (published in the issue of April 14th) regarding water-cooled motor cycles, it may interest readers to know the recent successes of the Lewis machines I wrote about. On the 12th of March two hill-climbing contests, promoted by the Norwood (an Adelaide suburb) Cycle and Motor Club, were held on what we know as the Greenhill Road. This road is noted as a good hill test, and a stiff wind blew down the hill. Lewis, N.S.U., Rex, Triumph, and Norton motor cycles competed, and the chains attached to the pedalling gear had to be removed, making the test very severe, as twenty-one bends (some very sharp) had to be negotiated in a distance of just over four miles. In the higher reaches the hills rise on the one side of the road several hundreds of feet, while on the other side are precipices of two to three hundred feet deep.

The cubical capacity of the Lewis water-cooled engines which were used is 376 c.c., Rex 470 c.c., Triumph 476 c.c., N.S.U. 402 c.c. The results were as follow on the formula $\frac{W}{C \times T^2}$

	Points.
Open Event.	
W. Courtney (water-cooled Lewis)	280
F. C. Gogler (Rex)	218
C. R. Churchward (water-cooled Lewis) ...	176
W. Allnutt (water-cooled Lewis)	136
Continental Trophy (Private Owners Only).	
C. R. Churchward (water-cooled Lewis) ...	203
W. Sampson (Minerva)	154
W. Allnutt (water-cooled Lewis)	135
C. Anderson (Triumph)	124

On February 26th the same club held a petrol consumption test over a distance of twenty-five miles. C. R. Churchward was first, 192 miles to one gallon, weight of machine and rider 365 lbs.; W. Courtney second, weight of machine and rider 333 lbs.; both on water-cooled Lewis motor cycles.

ALFRED MOYLE.

Northfield, South Australia.

EXPERIENCES WANTED.

"W" would be glad to hear of any users' experiences of: (1.) The 1910 Norton 4-5 h.p. single-cylinder long-stroke motor, with or without a passenger attachment. (2.) The Fitall two-speed gear. (3.) The Hellesen system of ignition, especially as compared with magneto ignition.

"W.L." (Edinburgh) would be glad of readers' experiences of the Auto wheel, described in our issue of the 22nd November, attached to an ordinary bicycle carrying a ten stone rider.

"A.I." (Accrington) will be glad of readers' experiences with the Millennium two-speed hub. Is it suitable for sidecar work?

"A.B.D." (Polesworth) would be glad of readers' experiences with a 3½ h.p. Triumph and two-speed gear for occasional sidecar work, with extra cost of running.

SPECIAL FEATURES

THE LONDON-EDINBURGH RUN AND RETURN JOURNEY FOR THE M.C.C. CUP AND MEDALS.

NEXT THURSDAY'S T.T. RACE. ROTARY ENGINES.

The London-Edinburgh Run.

Those who may have felt inclined to criticise the holding of the London to Edinburgh run before the funeral of King Edward must bear in mind that if the competition had not been held at Whitsuntide it could not have been held at all during the present year, and the large number of people concerned would have been put to great inconvenience. Moreover, the holding of the event was justified by the gracious command issued by King George last week.

The End-to-end Sidecar Record.

A prominent amateur motor cyclist, who hails from a town north of the Trent, intends early next month to attempt the John-o'-Groat's to Land's End sidecar record, using a 3½ h.p. single geared 1910 Triumph, and Mills-Fulford sidecar attachment. With good weather and plenty of luck he has hopes of just beating the existing figures. We feel sure all sporting readers will wish him success.

New Records.

We are informed by cablegram from America that De Rosier, on a 7 h.p. Indian motor bicycle on the Los Angeles circular wood track, on May 7th, covered fifty miles in 39m. 13s. and 100 miles in 86m. 14s.

Police Traps.

Motorists along the Birmingham to Stratford Road should ride cautiously between Stndley and Coughton. Motor cyclists are frequently timed on Rose Hill, Lickeys, so that care should be taken not to exceed the limit on the first part.

A Sporting Offer.

We have been asked to insert the following: Two keen motor cyclists offer to challenge any two riders in the world to a match of three miles on a grass track, under A.C.U. rules, for a purse of gold which will be given for the race. The two riders scoring the highest number of points out of three races to be the winners. Further particulars may be obtained from 'Speed," c/o this journal.

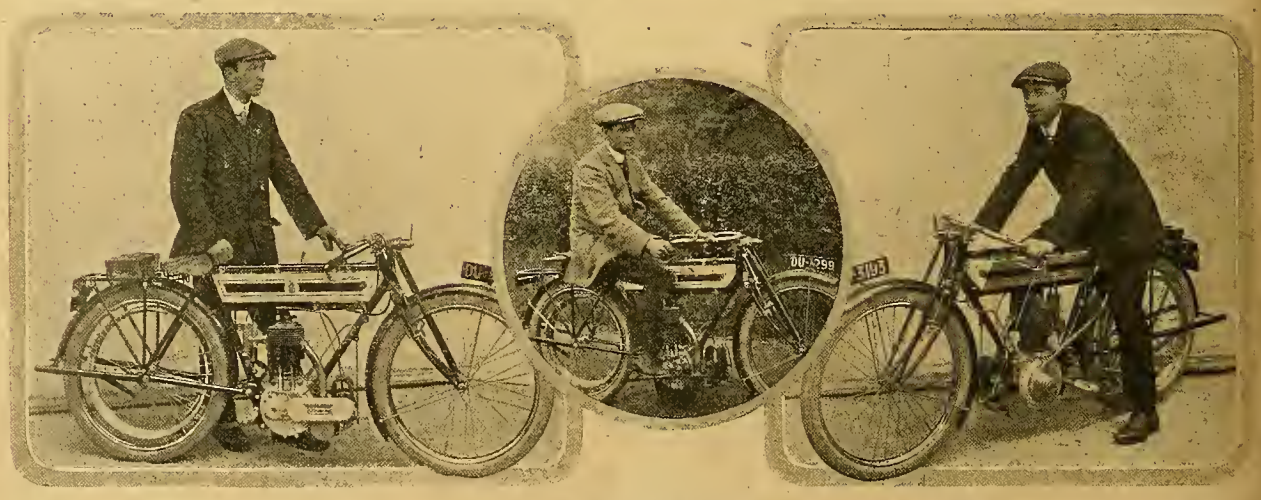
FUTURE EVENTS.

May 26 (Thurs.)—INTERNATIONAL MOTOR CYCLE T.T. RACE.
,, 27—Open Hill-climb in the Isle of Man
June 4—Motor Cycling Club second private race meeting and gymkhana at Brooklands.
,, 6-11—Scottish Six Days' Open Reliability Trial, organised by Edinburgh M.C.C.
,, 18—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CHALLENGE CUP. Competing Teams: Motor Cycling Club (holders), Coventry and Warwickshire M.C., Bristol B. and M.C., Streatham and District M.C., Sutton Coldfield A.C., Edinburgh M.C.C., Southern M.C., Harrogate and District M.C.C., Great Yarmouth and District M.C.C., Herts. County A.C., Essex M.C., N.W. London M.C.C., Oxford M.C.C., Nottingham and District M.C.C., and Sheffield and Hallamshire M.C.
,, 25—Bradford M.C.C. Open Hill-climb.
July 4-9—A.C.U. End-to-end Reliability Trial.
,, 13—Open Irish End-to-end Reliability Trial, promoted by the Ulster Centre.

Harry Martin breaks the Five Miles Record.

It was a cold and cheerless afternoon on Wednesday, the 11th inst., when Harry Martin essayed to break the five miles record (flying start) at Canning Town track. The sky was overcast, and a strong wind blew from the south-east. At 3 p.m. Martin met with his usnal bad luck, as he collided with the railings and dislocated his ankle. However, a mere detail like this did not worry so old a stager as Martin. With assistance the injured joint was replaced, and at the end of a preliminary spin he signalled to the timekeeper, Mr. A. V. Ebblewhite, that all was ready, and started. The plucky attempt was soon successfuly over, and the five miles were covered in 5m. 26s. The best previous performance was by C. R. Collier, who traversed the distance in 5m. 40⅕s. Martin's machine was a Martin-A.S.L., J.A.P. engine, 85 × 60 mm., fitted with A.S.L. vibrationless air spring forks, and Amac carburetter. The tyres were Continentals.

A TRIO OF TRIUMPH RIDERS IN THE TOURIST TROPHY.



W. F. Newsome, who rode the first single-cylinder machine to finish in last year's event.

J. Marshall, who won the Trophy in 1908.

W. Creyton, who completed the course in the eleventh position last year.

All the above machines are 3½ h.p. T.T. Triumphs, with 85 x 88 mm. engines, Dunlop tyres, and Bosch magnetos.

Next Thursday.

The Motor Cycle annual Spring Issue and Special T.T. Number. It will be a much enlarged issue, containing special articles and illustrations of absorbing interest.

Brooklands Meeting.

The Whitsun meeting which was postponed on account of the death of the King will be held on Saturday, the 28th inst. It has been decided to reopen the entries, as it is possible that other motorists may wish to enter, and entries will be received up till 12 noon to-day (Thursday). Details of the two events for motor cycles were given in our issue of May 5th, page 402.

Record Attempts at New Brighton.

The N.C.U. meeting at the New Brighton track on Saturday, the 14th, was held in beautiful weather. On the programme were attacks on the mile motor cycle track record, held by A. J. Moorhouse—1m. 9⅗s. The first to try his luck was E. F. Baxter, T.T. twin Rex. He succeeded in doing 1m. 9⅘s. for the mile, just ⅕s. outside the track record. Then A. J. Moorhouse started on his Indian twin that he will use in the T.T. race, but pulled up at the end of the first lap, as his footrest touched the banking. The rest was raised, then he reeled off a lap in 21⅕s., two in 43⅘s., and a third within 1m. 5⅕s., which was well inside record. In the last lap he had a close shave, as he went up the banking in spite of cutting out. Right on the top he slightly wobbled, recovered, switched on, and finished amid ringing cheers.

The Three Miles Record.

Later Harry Reed on a Dot machine, fitted with one of the new twin J.A.P. engines, 85 by 58 mm., which he will ride in the T.T. Race, went for the three miles record, and covered the distance in 3m. 31⅖s. Then E. F. Baxter (twin Rex) made an attempt, and in the last lap let his machine get slightly out of hand. Everyone expected him to crash into the spectators on top of the banking. But he made a wonderful recovery from what appeared a certain smash, and finished in 3m. 31⅘s., only ⅖s. behind Reed. On examining the machine afterwards it was found the front tyre was flat and that the back wheel was sufficiently out of truth to allow the back cover to be scraped nearly through.

The T.T. Cash Prizes.

The winner of the trophy next Thursday stands a chance of hauling at least £100 in hard cash. The A.C.U. will give £40 to the winner, the Vacuum Oil Co. £25 on condition their oil is used, and Price's Patent Candle Co., Ltd., £21 without any restrictions. It is rumoured that a certain magneto company has also offered £25 to the winning single and twin-cylinder riders.

A. J. Moorhouse breaking the mile track record at New Brighton on his Twin Indian. Time, 1 min. 5⅕sec. The old record stood at 1 min. 9⅖ sec., also by Moorhouse.

Police Traps in the Isle of Wight.

It may interest motor cyclists who intend visiting the Isle of Wight to hear that motor traps are being worked on the main roads.

A Sporting Offer for T.T. Riders.

A real sporting offer exactly describes the gift of twenty guineas that the Price's Patent Candle Co., Ltd., have agreed to make to the winner of the T.T. Race, absolutely unconditionally as to the make of oil used. That Price's hope the winner will be using their brand of oil goes without saying.

A Motor Cyclist Golf Player.

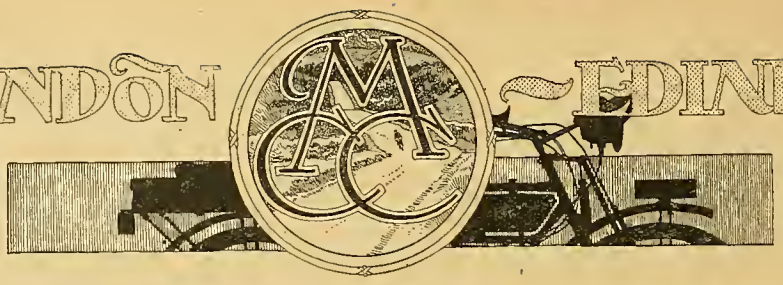
Mr. John Ball, the well-known golf player, has recently joined the ranks of motor cyclists, and, judging from his excellent play, his new hobby does not seem to have affected it.

The Latest Donation to the T.T. Fund.

We have received a cheque for one guinea from the Ulster Centre of the Motor Cycle Union of Ireland towards the Tourist Trophy Race Fund, which we are duly forwarding to the A.C.U.

The London-Edinburgh Run. Early morning in York. A batch of competitors checking outside the Windmill Hotel.

LONDON — EDINBURGH RUN



FROM the number of entries received, and from the universal enthusiasm displayed in connection with it on all sides, the M.C.C. famous run to Edinburgh, which is held every Whitsun, is clearly shown to be the most popular event in the year. Of the entry of ninety-eight motor bicycles and fifteen motor cycles with sidecars attached, the details of which were given in our issue of last week, eighty-eight of the former and all of the latter started on Friday night.

This year the first man was due to start at 9 p.m.—an hour earlier than on previous occasions—and, long before that time a large concourse of people had gathered in the open space at the top of Highgate Hill. Everything was beautifully organised. Motor bicycles and sidecars had their appointed places, and as their time drew near, each man fell into line and proceeded up to where Messrs. F. T. Bidlake (timekeeper), G. F. Sharp, and D. Leechman sent them off at half-minute intervals. Mr. Charles Jarrott, the club's president, was also an interested spectator at the start.

It was a glorious evening; the unsettled weather seemed to have melted away, it was not unduly cold, and the night was clear with a slender moon shining in the north-west. As the time for starting drew near, the crowd thickened, and the glow of acetylene lamps lit up the whole locality. Most men used two up-to-date headlights, some one headlight and an electric lamp in reserve; one or two used only feeble acetylene lamps, which hardly seemed to give sufficient light.

A flashlight picture of the start from the Old Gate House, Highgate. F. T. Bidlake, watch in hand, is about to despatch W. Hornsby, 4 h.p. Cheviot-J.A.P. Behind, waiting his turn, is W. M. T. Atkinson (3½ h.p. Cheviot). Harry G. Bell, the Trials Hon. Secretary, is in the background on Bidlake's left.

As Bidlake and his helpers took up their positions they were quickly thronged by spectators, but the police were

The second breakfast table at York. A few of the competitors snapped just before they resumed the northward journey.

alert, and rapidly opened up a channel through which the competitors could pass, and one mounted constable did splendid service, much to the amusement of the crowd.

The Start.

On the stroke of nine, Dickson (the captain), on a 5 h.p. Indian, was the first to be sent off. It was an impressive scene—the glare of the lamps, the throng of people on the balconies and at the windows of the surrounding houses, the good-tempered and business-like police, their helmets showing up in the glow of the headlights conspicuous among the spectators, and the gaunt figure of the mounted officer, who now and again effectually dressed the line and opened afresh the channel when it became narrow enough to threaten the safety of the riders. Dickson's start evoked a cheer, but whether or not the nation's sorrow had an effect upon the crowd it is hard to say, but the fact remains that until a number of the men had gone there was little cheering. Booth's car was pulled up quite close to the start, and in it sat A. G. Reynolds, who, though well, was hardly fit enough to compete—the first time for many years. One after another at half-minute intervals the men got away, each machine starting with the utmost promptitude—a splendid advertisement of the high pitch of excellence to which the motor cycle has attained. Gwynne went off with three lamps burning brightly. Captain Harkness, on one of the new Enfields, depended on an electric lamp. Many of the men used Crole-Rees's and Bell's route card holders, which they found of the greatest assistance. The ever-smart appearance of H. Roberts's P. and M. aroused much admiration, and the start of Captain Sir Robert Arbuthnot evoked an enthusiastic cheer. B. A. Hill's Kerry, the first machine to start with a free-engine device, also created a favourable impression, and thereafter cheer after cheer went up as each man left. At last the 103 motor cyclists were off and away on their long journey, and it remained but to follow them. It did not take long to get clear of London, as there was little traffic, but three miles from Highgate A. J. Stevens's 3 h.p. Wolf ran into a cart which pulled across the road suddenly, and was rather badly hurt.

London-Edinburgh Run.—

The List of Entrants.

MOTOR BICYCLES.

†E. B. Dickson (5 Indian)
†E. Gwynne (7 V.S.)
*F. Smith (5-6 Clyno)
H. M. Barton (3½ Humber)
Capt. P. J. Hackness (2¼ Enfield)
F. E. Wasling (2¼ Enfield)
P. Philipp (2¾ Douglas)
Mrs. Cooke (3½ Triumph)
C. C. Cooke (3½ Triumph)
P. Janson (3½ Bat)

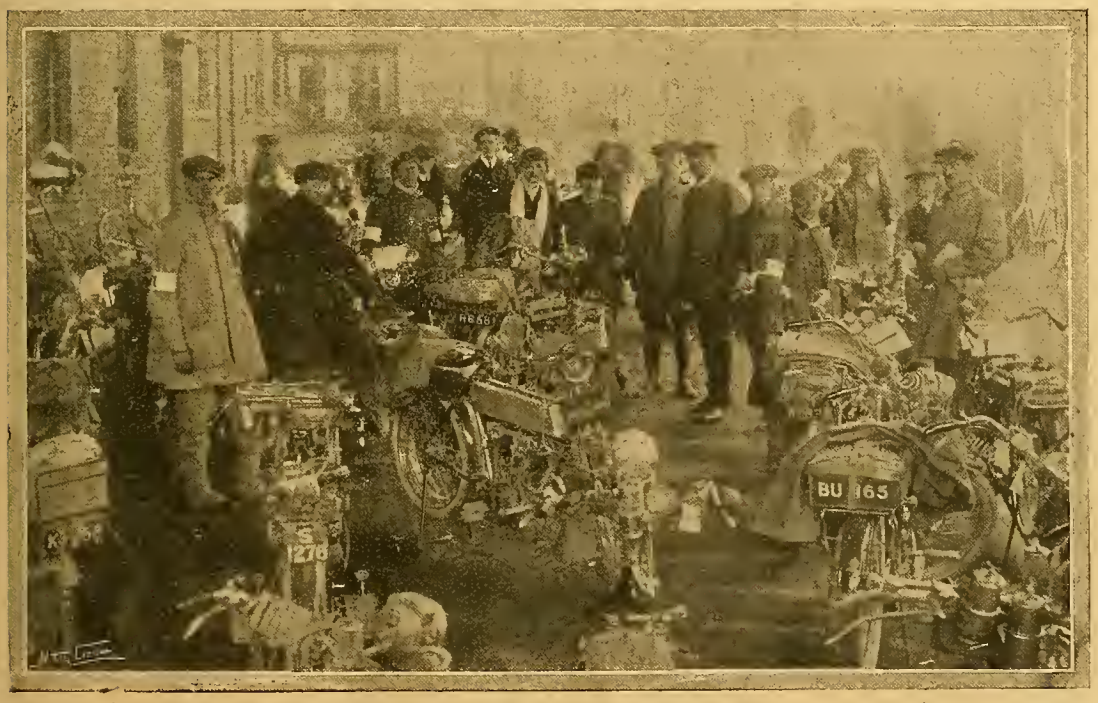
With the exception of the A.C. tricar, all are sidecars.
*Entrants for M.C.C. Challenge Cup.
†Entrants for M.C.C. return journey medals

The Dusty Highway.

The first section is over good undulating roads, and as there had been no time for the men to extend, the dust was appallingly trying; consequently each tried to avoid the other's dust by getting ahead, and the nature of the country being what it is, the men had great difficulty in not arriving at Biggleswade too soon. Those entered for the Challenge Cup, who to win it have to maintain the utmost regularity in running, found the dust a terrible ordeal.



Scene in the yard of the Windmill Hotel, York, 194½ miles from Highgate. The competitors partook of a second breakfast at this point between the hours of 7.30 and 8.30 a.m.

London-Edinburgh Run.—

Just after entering the country beyond Hadley Common, over a mile of freshly-laid tar was struck, which the wheels of the machines threw in all directions.

It was a glorious night; the dry roads seemed to stream ahead in the light of the lamps; every doubtful corner had a man waving the direction with a lamp, and losing one's way was practically impossible. One or two of the sidecars were seen in trouble at an early stage, and here and there

E. W. Brighten's 8 h.p. Chater Lea-J.A.P. and sidecar on arriving at Edinburgh.

a man was seen in trouble with his lamps, but fortunately untoward incidents were few and far between. Everyone is always glad to get to Biggleswade, where he gets a warm welcome at the Swan Inn, and appetising refreshment at a moderate price. There is really no need to stop except to sign the check, but no one passes without enjoying a cup of hot coffee and a sandwich. Inside one could study at leisure the warm but weird head-dresses of some of the men; the appearance called for such remarks as Cook, Peary, and Shackleton, to be overheard.

Machine and man refreshed, they started to cover the next stage—at once the most trying and most easy. Trying, because most of it is accomplished in the dark; but what matter so long as the lamps burn well and the engine hums on its merry tune! Easy, because the roads are splendid and mostly dead flat; and even in busy Buckden all men, including policemen, are asleep. All along the route, however, in the "wee sma' hours" enthusiastic motor cyclists turned up at various places to see the riders pass.

At 2 a.m. the early glimmer of the dawn appeared, and towards 3 a.m., when the stars began to fade, our party looked vainly for the comet, but failed to find it.

It was a gloriously fine morning, and as it became light enough to see without the aid of lamps the men's spirits rose and the pace increased; the only danger was that of arriving too early at Grantham.

Incidents at Grantham.

Hatfield and Biggleswade safely negotiated, the next check was at Grantham, where an excellent and smartly-served breakfast was ready. It was all splendidly arranged; the men checked in at one entrance of the George Hotel yard, had breakfast, and checked out at the other entrance. In the yard Chater-Lea, with his 7-9 h.p. Chater-Lea and sidecar fitted with the new Chater-Lea twin m.o.v. engine, reported lamp and carburetter troubles; J. C. Collins (5-6 h.p. Roc) was trying hard to start his engine without success; P. Stevens (3 h.p. Wolf) reported inlet valve trouble in the first ten miles, but said his machine was going well afterwards. Near Stilton Cooper ran into a lightweight rider who was repairing a puncture in the dark with his lamp hidden, fell over, and knocked the man down. The victim was T. S. V. Phillip, who, Cooper states, had not pulled up near enough to the side of the road. The little Motosacoche had punctured and the rim was bent, and the result of the smash was to break the frame holding the engine and tank; the silencer was also knocked off. A. C. Robbins (3½ h.p. Humber) broke his lamp bracket at Tuxford and had a bad squeak in his engine all the way along. Near Bawtry, Janssen (2 h.p. Moto-Rêve) was seen in trouble with a puncture, and later adjusting his magneto. Close to Retford G. Jacobs (5 h.p. Vindec) was observed dismantling his carburetter.

Until the sun's power was felt it was very cold after leaving Grantham, but an excellent run was made over good roads which followed the old route to Ferrybridge. Near this point Olsson was seen in trouble, and right in the village Oldfield (2¾ Douglas) reported that something was wrong with his engine and that he was retiring.

Branching off to the right a good run was made over fair roads through Tadcaster to York, where the second breakfast was awaiting the competitors.

COMPETITORS LEAVING THE NEWCASTLE AND DISTRICT MOTOR CLUB'S PREMISES.

S. C. Howard (5 h.p. V.S.) and C. J. Janssen (2¾ h.p. Moto-Reve).

W. Cooper (3½ h.p. Bradbury) and S. C. Perryman (3½ h.p. Ariel)

London-Edinburgh Run.—

In the York Control.

The hotel is situated just below the picturesque Micklegate; the weather was now glorious and the sun very hot. In the hotel yard Captain Arbuthnot reported punctures; Jacobs stated that he had run out of petrol near Grantham and had had vave troubles; Dr. Moss Blundell related how he also had been a victim to the puncture fiend; A. H. D'Aeth (7 h.p. V.S. and sidecar) was another who ran out of petrol near Grantham; Janssen was also there and complained of not being very fit, as he had been ill the previous week. In York G. E. Purchase (3½ h.p. Triumph) had his magneto come adrift and could not start, so had to have a screw made to hold it down, and did not leave till one and a quarter hours behind time.

Thanks to the arrows erected by the M.C.C., the excellent organisation of the club, and the splendid behaviour of the police, the way out through York, and, in fact, all the towns, was easy enough to find. After the second breakfast, the going was excellent, but at one difficult corner, well signposted as usual, a careless competitor, reported to be an Excelsior rider, took it too fast, and landed in the hedge. Near York, Gibson reported punctures, and at breakfast was far from happy. In Easingwold Dr. C. G. Watson was hard at work pumping up his tyre, while at Northallerton Purchase was again working at his magneto.

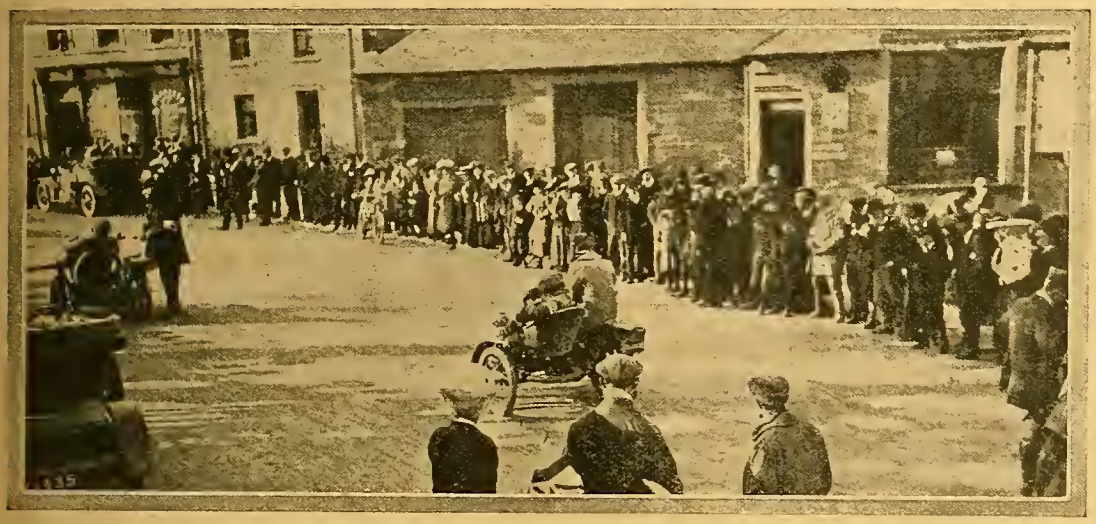
Picturesque Views.

Near Thirsk a fine view of the Hambleton Hills was obtained; far away on the right the white horse cut on the hillside could be plainly distinguished, and in the dim distance the precipitous road up Sutton Bank could be distinctly discerned. In the county of Durham the police behaved admirably; there was a constable stationed at every cross-road, and once we saw a man on a bicycle soundly rated for trying to evade the officer's signal to stop. All round the rather complicated route through Neville's Cross, avoiding Durham, arrows and policemen made losing one's way impossible. Once through the outskirts of Newcastle—always difficult to negotiate—the men by arrangement with the local club were allowed to cross the High Level Bridge without paying toll, and were directed by the police to Claremont Place, where the headquarters of the Newcastle and District M.C. are situated. Here the energetic officials worked things admirably, and to Messrs. W. H. Outwin, F. Mallett, E. Hawkins, B. Bradford, B. Wilson, E. Bates (secretary of the N.E.A.A.), and A. H. M. C. Bell the thanks of all the competitors are due. There is a garden in front of the club house, and here the men were able to store their machines and effect any necessary adjustments in peace and comfort. The arrangements were as good in the club house as they were outside, and even the comfort of the ladies was carefully studied. The luncheon was excellent and smartly served. Vedy, the ex-police superintendent, fine old sportsman that he is, had had trouble on the road—carburetter troubles and a loose magneto transmission cover. These, however, he rectified without much difficulty. Hardy was another of the many victims to punctures.

Over the Moors into Scotland.

After lunch a fine run followed over the moors into Scotland. The road was very rough in places, but all along granite and tar were ready to be laid down. This part of the route is quite new to Edinburgh competitors, and if it is repaired it will be the finest of all routes to the Scottish capital. In the Northumberland portion the gradients are easy, and over Carter Fell (summit 1,500 feet) the road is splendidly engineered, and here many of the competitors suffered with overheating, as the wind had been behind them ever since the start. On Carter Fell J. Godsall towed a lightweight rider up to the top, and as the latter kept his engine firing they climbed at a splendid speed. On the summit an S.A.C. sign marks that Scotland is reached. Thereafter the roads were good to Jedburgh, a pretty town with a fine old abbey, and here was the last check but one. But fifty-four miles remained to be covered, and this was through that beautiful country, the "braes and banks" of which the poets have immortalised. Several steep pitches and one long climb yet remained after leaving the Carfrae Mill Hotel, where R. B. Timmis was seen with tyre troubles, and then a splendid view was disclosed. Right below to the left lay "Auld Reekie" shrouded in mist and thus earning its ancient title. Straight ahead the Firth of Forth and the Fifeshire Hills could be seen, and even the Bass rock could be dimly made out. Numerous Edinburgh M.C.C. members met the men at this section of the route.

From that point right up to Liberton, the last check, the road was vile, and a terrible ordeal to face at the end of so long a journey. Thus terminated one of the most successful Edinburgh runs ever held. Weather, wind, and the roads as a whole had been all that could be desired. The organisation may be summed up in one word—perfect; more cannot be said, and we offer our heartiest congratulations to Messrs. Head, Candler, Jenkins, Gibbons, Bidlake, Bell, and their assistants.



Harold Williamson (5 h.p. Rex Sidette) passing through the lines of spectators at Jedburgh. Williamson's performance surely sets up a new record, for we actually saw this machine in course of construction two days before the start.

Reliability—Thy Name is Motor Cycle.

As may be expected, the proportion of successful competitors was enormous, due not only to the ideal weather conditions, but to the vast improvements made in the modern motor bicycle. The sidecar machines, however, were oftener in trouble than they should have been, and motor bicycles for passenger work require a trifle more attention at the hands of the designer. Serious troubles were practically non-existent, and the commonest cause of stoppages was tyre trouble. In addition to the incidents previously reported, S. C. Perryman (3½ h.p. Ariel) broke his exhaust lifter shortly after starting, and had to use his compression tap instead. Stanley Webb (3½ h.p. Triumph) suffered

M.C.C. London-Edinburgh Run.—

delay through punctures near Darlington, and was so late at the cup check that he resolved to relinquish the idea of competing for that much-coveted trophy. Karslake was troubled with overheating on Carter Fell. Near Jedburgh Williamson, who was driving a smart Rex sidette, the sidecar wheel of which steers in conjunction with the bicycle front wheel, was ditched by two cars, but, fortunately, without suffering serious damage. Of the twelve retirements, Oldfield (2¾ h.p. Douglas) had a seized engine, Timmis (3 h.p. Matchless) suffered serious tyre troubles, Stevens (3 h.p. Wolf) had an accident, Dr. Watson (5-6 h.p. F.N.) had a broken cylinder at Newcastle, and Inkson (3½ h.p. Excelsior) collided with the hedge near Northallerton. In addition to these, J. V. Robinson (2¾ h.p. Douglas), J. Culley (3½ h.p. Triumph), H. E. Davison (3½ h.p. Rex), W. E. Haines (3½ h.p. N.S.U.), E. H. Chayton (7 h.p. Lurquin et Coudert), J. C. Collins (5-6 h.p. Roc, apparently ignition trouble), and C. Patteson (2¾ h.p. Moto-Rêve) must be added to the list of retirements, while the four users of sidecars who retired are J. T. Rankin (5 h.p. Rex and sidecar), A. Mabon (3 h.p. Mabon and sidecar), G. Rowden (7-8 h.p. Bat and sidecar), and A. R. Abbott (8 h.p. Matchless and sidecar). Four sidecars out of fifteen failed to get through, and out of one hundred and three motor cyclists who started only sixteen failed to finish. Subject to confirmation by the committee, seventy-five motor bicycle riders will receive gold medals, and one will receive a silver medal. Of the sidecar riders, eight will receive gold medals, one a silver, and the other a bronze.

The Return Journey Competition.

The return journey for the M.C.C. cup and special medals was commenced at 12.30 a.m. on Monday.

Wasley ran over a cat outside Edinburgh and smashed his lamps, started again late, but stopped at Newcastle outside time. A thick mist hung over Lammermuir, where Gibson led the competitors. The roads were wet and greasy till about 10 a.m. It is noteworthy that four Bradburys started the return run and all finished, despite the fact that Gibson suffered three punctures and other minor troubles. A. V. Deacock had trouble with a butt-ended inner tube at Otterburn. It took twenty-five minutes to take off the cover. Karslake experienced a bad side-slip before Jedburgh, and his two-speed gear seized just before the finish. Duberly was knocked over by a trap at the finish, but was apparently unhurt. Olsson had tyre troubles at Biggleswade, otherwise he did not touch his machine the whole way. Brighte burst a tyre north of Potters Bar. A thick mist at th finish greatly inconvenienced the later arrivals.

The following finished the return journey:

MOTOR BICYCLES.

†E. B. Dickson (5 Indian)
*F. Smith (5 Clyno)
*H. Gibson (3½ Bradbury)
*G. L. Fletcher (2¾ Douglas)
†W. Cooper (3½ Bradbury)
*S. Wright (3½ Humber)
*A. V. Deacock (2½ Wanderer)
*A. T. Stanton (3½ Bradbury)
*H. Karslake (4 Dreadnought)
*C. B. Duberly (3½ Ariel)
S. T. A. Oldfield (2¾ Douglas)
*A. Webster (2¾ Handy Hobart)
†E. Gwynne (7 V.S.)
*G. Wray (3½ Bradbury)
*P. Phillip (2¾ Douglas)
*R. Ellis (5 Rex)
*E. Kickham (2¾ Douglas)
*Eli Clark (2¾ Douglas)
†B. Allan Hill (3½ Kerry Abingdon)
†G. Jacobs (5 V.S.)
*F. C. North (3½ Ariel)
*G. Brough (3½ Brough)
L. G. Byng (3½ P. and M
†A. J. Gilpin (2¼ Enfield)

MOTOR BICYCLES AND SIDECARS.

†E. Frasetti (7 V.S.)
†V. Olsson (J.A.P.)
†E. W. Brighten (8 Chater Lea-J.A.P.)

TOURIST TROPHY RACE.

Special Wires giving Lap Positions.

By arrangement with *The Motor Cycle*, the following firms will exhibit telegrams in their windows on the day of the T.T. Race giving the progress of the race lap by lap:

E.C. District.—A. W. Gamage, Ltd., Holborn.
Richford and Co., 153, Fleet Street.
Hunt's Stores, Newgate Street.
Benetfink's, Cheapside.
Bancroftian Co., Bishopsgate Street Within.
W.C.—Service Co., Ltd., 292, High Holborn.
Taylor and Co., 21a, Store Street, Tottenham Court Road
W.—Maude's Motor Mart, 136, Great Portland Street.
S.W.—Harrod's Stores, Brompton Road.

The telegrams will also be displayed at leading provincial centres. See next week's issue.

The control at Liberton, 2 miles from Edinburgh, where the riders checked before running into the city. The actual finishing point was the Royal Hotel.

SPEED TRIALS AT FILEY.

The speed trials on Filey Sands promoted by the Scarborough Motor Cycling Club on Whit-Monday were considerably marred owing to a dense fog, which prevented a start being made until nearly 5 p.m. The fog kept the sands very wet, and one motor cyclist unfortunately skidded and broke the wire of the timing apparatus. Although this was repaired, the weather conditions rendered the apparatus useless, and the kilometre electrically timed race was reduced to a furlong race, hand signalled by means of flags. The damp atmosphere caused belts to slip rather badly.

Results.

Class 1.—G. Glover 1st, E. Dent and Mason tied for second place.

Class 2.—C. H Pugh, 1st; H. A. Hands, 2nd.

Class 3.—C. A. Bedford, 1st; A. B. Hughes, 2nd; J. E. Trufitt, 3rd; J. A. Tindall, 4th; J. Whitefield, 5th; H. A. Hands, 6th.

Class 4.—C. L. Bedford, 1st; S. Grange, 2nd; J. A. Everingham, 3rd; C. T. Summonite, 4th.

Class 5.—J. F. P. Johnstone, 1st; S. Grange, 2nd; J. O. Truman, 3rd; R. Ellis, 4th; J Wilks, 5th.

Class 6 (for T.T. machines).—F. P. Johnston, 1st; R. M. Knowles, 2nd; C. G. Bedford, 3rd; S. Grange, 4th; J. E. Truman, 5th; J. Wilks, 6th.

The special trophy for fastest time was won by C. L. Bedford in 9⅘s.; F. P. Johnston was second, time, 11⅗s.

THURSDAY NEXT.
THE MOTOR CYCLE SPRING ISSUE and T.T. NUMBER.

Filey Speed Trials. Starting for the Flying Kilometre.

CLUB NEWS.

Herts County A.C.

The open motor cycle hill-climb will take place at Aston Hill on June 11th. The entries number at present eighty-three. Entry forms and all particulars may be had from the hon. sec., Mr. C. C. Cooke, Rose Cottage, North Mimms, Hatfield, Herts.

North West London M.C.C.

The postponed Coventry and back twelve hours' reliability trial will be held on May 28th. Competitors will be allotted the same numbers as before, so that their schedule times will not be altered. Fresh entries will be received by Mr. G. Rowden, 40, Frognal, up till Monday next.

Leeds M.C.C.

Members are reminded of the Kelly Cup Competition which takes place next week-end over an ideal non-stop course. Entries at a special fee will be accepted by the trials hon. secs. up to first post on Saturday next, and competitors are permitted to name their own choice in the matter of average speed to be adhered to. Motor cycles will be despatched in pairs at minute intervals, passenger motor cycles will go singly at similar intervals, and cars last. Thirty seconds will be allowed either side of schedule time without loss of marks.

Southern M.C.

The members of the above club had a very enjoyable time at Lulworth Cove during Whitsun, over twenty members and friends taking part in the run down. Next Saturday there is to be a run to The Crossways at Reigate for tea. Members may now send in their entries for the Triumph Cup competition (for motor cycles only) to Blandford and back on June 5th. Gold medals will be presented to all competitors losing not more than ten points.

Bradford M.C.C.

The annual reliability trials for the N.S.U. Cup were run on the 9th inst. The course was from Bradford, by Skipton, Settle, Kirkby Lonsdale, Kendal, Windermere, to Keswick, where ninety minutes were allowed for dinner at the Keswick Hotel. On the outward journey snow fell heavily approaching Skipton and continued until within a few miles of Settle; again on climbing Dunmail Raise another snowstorm was experienced. The result was as follows:

		Points.
1.	T. Bullus (3½ P. and M.), cup and gold medal	0
2.	C. Sidney (3½ P. and M.), F. Scriven (3½ Rex), E. Holden (3½ P. and M.), silver medals	1
3.	N. Longfield (3½ Triumph)	1¾

J. A. Tindall (Harrogate) starting in the Filey Speed Trials. Note the wet state of the sands. The thick mist prevailing rendered the finishing point obscure.

Club News.—

M.C.U.I. (Ulster Centre.)

A hill-climbing competition under the auspices of this centre took place at Magheramorne, Co. Antrim, on Saturday last. The handicap was based on the bore and stroke of

Ulster Centre M.C.U.I. Hill-climb at Magheramorne on Saturday last. A competitor taking one of the bad corners in good style.

engine, weight of rider and machine, with a penalty for previous wins. Owing to the Whitsuntide holidays the entry was not so large as usual, but the competition proved most successful, and some excellent climbs were made. The surface of the hill was in splendid order, and a couple of bends required great skill to negotiate at top speed. The programme consisted of two events, viz., a class confined to riders who had never won a first prize in any hill-climb, and an open class. In the novice class, L. MacLaine, on a 3½ h.p. Triumph (8s.), was declared the winner, and he actually did the fastest time. Details:

CLASS A. For riders who had never won a hill-climb.

		Gross time. secs.	Handi-cap. secs.	Nett time. secs.
1.	L. MacLaine (3½ Triumph) ...	0 55⅗	... 8	... 47⅗
2.	B. D. Capper (3½ Triumph) ...	0 56⅘	... 8	... 48⅘
3.	J. E. Stevenson (3½ Triumph) ...	0 59⅘	... 9	... 50⅘
4.	W. J. Andrews (5 Rex) ...	0 57	... scr.	... 57
5.	M. J. Lindsay (3½ Rex) ...	1 2⅖	... 4	... 58⅖

CLASS B. Open.

1.	Cecil A. Rea (3½ Triumph) ...	0 59⅖	... 7	... 52⅖
2.	J. Stewart (3½ Triumph) ...	0 59⅗	... 5	... 54⅗
3.	M. J. Lindsay (3½ Rex) ...	1 0⅗	... 4	... 56⅗
4.	C. E. Murphy (3½ Triumph) ...	0 56⅘	... scr.	... 56⅘
5.	B. J. McAllister (3½ Premier) ...	1 0⅕	... 1	... 59⅕
6.	W. J. Andrews (5 Rex) ...	0 59⅗	... scr	... 59⅗

Northern League.

A meeting has been called at the Royal Station Hotel, York, for Saturday, May 28th, at 5.30 p.m., to frame the rules and constitution of the league and discuss any other business. Club officials in the North who have not been notified owing to their addresses not being available to the hon. sec. of the league, will kindly do their best to attend the meeting, which will be of an important nature.

Sutton Coldfield A.C.

In connection with the hill-climb at Coalport, a mix-up occurred in the times in Class III. for T.T. machines as published on page 427 of our last issue, although the formula positions were in order. The correct results are as under:

Position on formula.		Time. m.	s.
1.	Howard Smith (3½ T.T. Triumph) ...	1	12⅕
2.	J. L. Norton (3½ Norton)	1	30
3.	W. D. South (5 Indian)	1	22⅖
4.	James St. John (3½ Triumph) ...	1	48
5.	Rem Fowler (5 Rex Speed King) ...	1	17⅗

Dublin and District M.C.C.

A reliability trial from Dublin to Lisburn and back for the White Cup was held on Whit-Monday. Owing to the exceedingly wet weather on the previous day, only seven started: Doleman (2¾ h.p. Douglas), Valleyar (2¾ h.p. Douglas), C. E. Murphy (Triumph), Healey (Rex), Curtis (Triumph), Walker (Rex), and Woods (Bradbury). One of the Douglas riders retired fifty miles from the finish, and all the others completed the course of 108 miles. The result will depend on secret controls, as most of the finishers completed the journey in schedule time. The weather kept fine, but the roads were muddy from the previous day's rain.

Westmorland M.C.C.

A very successful hill-climb was held by the above club on Scott's Grinns, near Sedbergh, the length of the climb being a mile. The A.C.U. formula was used, and the results were:

	Machine and rider.	Fig. of merit.
1.	R. Hutchinson (3½ h.p. Bradbury) ...	139.7
2.	Harvey Goodwin (3½ h.p. Rex)	146.2
3.	W. Westwood (3½ h.p. Triumph)	146.3
4.	B. Jeffery (3½ h.p. Triumph)	150.3
5.	H. Harrison (3½ h.p. Bradbury)	154.5
6.	T. Armstrong (3½ h.p. Triumph)	160.6

The fastest time was made by W. Westwood—1m. 39s.

Surrey M.C.C.

The twelve hours' reliability competition for the McNab Cup will be held from Guildford to Lyme Regis and back on Wednesday, June 1st. The trial comprises some very hilly country, particularly between Dorchester and Lyme Regis, and should provide a good test of hill-climbing and reliability.

Metropolitan Centre of the A.C.U.

At the monthly meeting of the above centre it was decided to organise two penalty runs—one in the south district, the other in the north of London. A sub-committee was formed to arrange details.

The annual Midland Meet of Motor Cyclists at Stratford-on-Avon on Whit-Monday, which was well attended.

Club News.—

South Devon M.C.C. (Plymouth).

A club has been formed at Plymouth which bears the name of the South Devon M.C.C. The membership is at present fifteen, and the secretary is Mr. R. Birkett, 10, Bedford Terrace, Plymouth.

Reading and District M.C.C.

The above organisation has been reformed, and everything points to a successful year. The annual subscription is 5s. The affiliation question will be discussed at a future meeting. The captain is J. R. Bedford (founder and for five and a half years hon. secretary and treasurer of the Birmingham M.C.C.) The hon. secretary is F. Deacon, 4, Fatherson Road, Reading. The next run is on the 21st inst. to Eversley and Finchampstead; 22nd inst. to Marlow and Dashwood Hill, at 10 a.m. A hill-climb, gymkhana, and paperchase are on the June programme.

A Club for Stockton-on-Tees.

A few motor cycle riders living in the district round Stockton-on-Tees are anxious to form a motor cycle club. Those who are interested should communicate with Mr. Charles S. Watson, Kelvin Grove, Norton-on-Tees.

Perth and District M.C.C.

A limit speed hill-climb was carried through by this club on Lochton House Brae, near Abernyte. The hill, which is about half a mile in length, is not particularly steep. Speeds, which were balloted for, ranged between 12 and 20 m.p.h. The winner, W. A. Hart, on a 3½ h.p. 1910 Triumph, averaged 19½ m.p.h., his balloted speed being 20 m.p.h. The next in order, D. Cairnie, on a similar machine, had the rather harder task to perform of climbing the hill at 12 m.p.h. His speed worked out at a shade over 14 m.p.h.

Amman Valley and District M.C.

At a meeting of motorists in the district of Garmant, Carmarthenshire, it was decided to form a club to be known as above. Rules are now being formulated, and a further meeting is to be held shortly.

Bolton and District M.C.C.

The postponed speed-judging competition to Blackpool (distance 37 miles) for the club gold medal was won by B. D. Leadbetter (3½ h.p. Triumph). The roads were in a very bad state.

A hill-climbing competition will be held on Rivington on Saturday next, 21st inst. Meet at Pack Horse, Bradshawgate, at 1.45 prompt. There will be three classes: 1st, single touring machines; 2nd, twin touring machines; 3rd, single racing machines. The racing class is open for the other two classes. The two first classes will be run on formula. Every machine entered in classes 1 and 2 must be in full touring trim, fitted with horn, tool bag, efficient metal mudguards and silencer, and to be absolutely standard in every respect. The weight of rider in the racing class must not be below the minimum weight of 154 lbs. The racing class will be awarded on time results only. Tourist Trophy mounts must be entered in the racing class. Competitors can ride any machine owned by a club member.

A competitor in the Cambridgeshire M.C.C. Petrol Consumption Test being served with his allowance of fuel. This competition has been declared void, and will be re-run.

Manchester and Liverpool Motor Club Members' Sweepstake Hill-climb near Llangollen. The winner, F. W. Sixsmith (3½ h.p. T.T. Triumph) starting.

Coventry and Warwickshire M.C.

At a well-attended committee meeting of the above club, held on Wednesday last week, the route for the twelve hours' run on June 4th was amended to include the mountain ride from Capel Curig to the summit of the Llanberis Pass and on to Carnarvon for tea. The finishing point will be the George Hotel, Bangor. Badges will be presented to all who complete the run within scheduled time, and special prizes (one for cars and one for motor cycles) to the competitor finishing nearest to twelve hours, provided he does not exceed that time. Competitors who are more than twenty minutes ahead of their correct time at any point will not participate in the above award.

Warrington and District M.C.C.

The above club held a flexibility hill-climb on the 7th inst., the winner to be the one showing the biggest percentage of difference between the fastest and slowest time, clutches and two-speed gears barred. The event was a great success. Times for the first three were as follows:

FASTEST.

H. B. Jackson (3½ h.p. Matchless)	$29\frac{3}{5}$s.
J. L. Oliver (6 h.p. Matchless)	$34\frac{3}{5}$s.
A. V. Baxter (5 h.p. Vindec)	$34\frac{3}{5}$s.

SLOWEST.

J. L. Oliver (6 h.p. Matchless)	$64\frac{1}{5}$s.
H. B. Jackson (3½ h.p. Matchless)	$60\frac{4}{5}$s.
A. V. Baxter (5 h.p. Vindec)	55s.

RESULT.

1.	J. L. Oliver	Difference $31\frac{4}{5}$s.
2.	H. B. Jackson	.. $31\frac{1}{5}$s.
3.	A. V. Baxter	.. $20\frac{2}{5}$s.

The Easter reliability run has been declared a draw between C. E. Kettle (3¾ h.p. Premier) and W. Sutton (3½ h.p. Rex).

Club News.—

Oxford M.C.C.

The results of the members' hill-climbing competition on Irondown, Deddington, on Saturday, the 7th inst., are as under:

CLASS I.—Single-cylinder machines.

Rider and machine.	Cubical capacity.	Time in secs.	Position on formula.	Marks for DuCros Cup.
H. G. Hill (3½ Bradbury) ...	517	39	1	24
F. G. Alden (3½ Triumph) ...	476	41	2	23
W. A. Mathews (3½ Triumph)	499	44⅕	3	22
J. A. Betteridge (3½ Triumph)	476	45	4	21

W. H. Wakefield (3½ Triumph)	499	47	6	19
J. Aldworth (3½ Kerry) ...	476	56⅖	7	18

AWARDS.—Cup for best placing on formula, won by H. G. Hill (3½ Bradbury). Medal for best performance by standard touring machine, H. G. Hill (3½ Bradbury).

CLASS II.—Multi-cylinder machines.

R. A. Bishop (5 Indian) ...	638	38⅖	1	24
A. F. M. Stevenson (5-6 Clyno)	744	36⅘	2	23
H. E. Cohen (8 Matchless) ...	964	33⅗	3	22
E. Packer (8 Matchless) ...	964	37	4	21
G. F. Cooper (5 V.S.) ...	662	46⅕	5	20
W. H. Grand (5 Rex) ...	662	55	6	19

AWARDS.—As for Class I., both won by R. A. Bishop (5 Indian).

Judges, Dr. Turrell and Mr. Boissier; timekeeper, Mr H. A. J. Packford; starter, Mr. Vernon Whitehead.

NEXT THURSDAY'S TOURIST TROPHY RACE.

COMPLETE LIST OF ENTRIES.

THE General Committee of the Auto Cycle Union at a meeting on Thursday, the 12th inst., decided to accept the whole of the entries as below, thus overruling the suggestion of the Competitions Committee to reduce the number to seventy.

Rider and machine.	No. of cyls.	Bore mm.	Stroke mm.	Capacity c.c
H. A. Collier (5 Matchless) ...	2	85.5	58	666
C. E. Bennett (5 Indian) ...	2	71.5	82.5	662.5
G. Lee Evans (5 Indian) ...	2	71.5	82.5	662.5
D. R. Clarke (5 Indian) ...	2	71.5	82.5	662.5
*A. E. Woodman (5 Indian)	2	71.5	82.5	662.5
*W. O. Bentley (5 Indian)	2	71.5	82.5	662.5
J. Marshall (3½ Triumph)	1	85	88	499
W. F. Newsome (3½ Triumph)	1	85	88	499
W. Creyton (3½ Triumph)	1	85	88	499
*C. B. Franklin (5 Indian)	2	71.5	82	662.5
*Noel E. Drury (5 J.A.P.) ...	2	85.5	58	666

*Denotes private owner.

A special meeting of the A.C.U. Competitions Committee was held on Thursday night last, at which it was decided that, in view of the decision come to that evening to take steps to bank the dangerous corner at Ballacraine, the whole of the eighty-three entrants will be started in batches of three at thirty second intervals.

In accordance with the desire specially expressed by the trade that a judge officiating in an open competition should be an entirely disinterested person unconnected in any way with the motor cycle industry, the A.C.U. list of judges has been amended. Those invited to officiate are the following: Messrs. J. W. Orde, R. Todd, H. P. E. Harding, A. G Reynolds, and J. Lyons-Sampson.

On the morning of May 20th no practising on the Isle of Man course will be permitted.

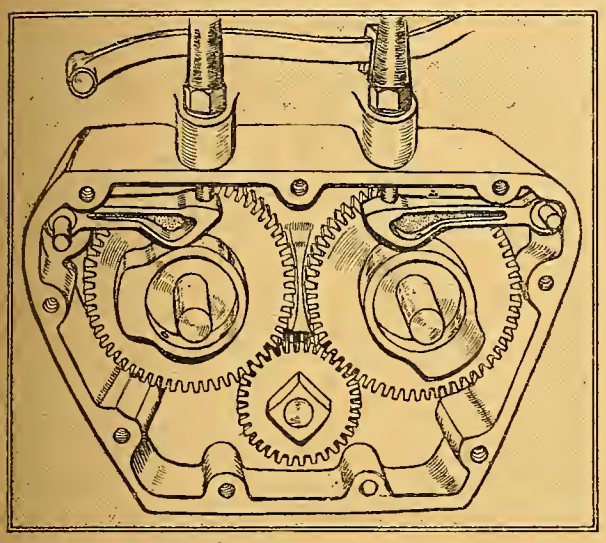
A meeting of the marshals, timekeepers, and all concerned with the organisation of the race will be held at the Sefton Hotel, Douglas, at 8 o'clock on the evening of May 25th. The clerk of the course, who will be responsible for the arrangements, will be Mr. J. R. Nisbet, while the chief marshals will be Messrs. C. E. Rackham, A. Ross, A. J. Macdonald, and R. D. F. Paul.

TOURIST TROPHY MODELS.

THE SINGLE-CYLINDER NORTON.

THE Norton Manufacturing Co. will have two machines in this year's Tourist Trophy Race, both single-cylinder 3½ h.p. The machines are practically standard models, except that they are fitted with a rather shorter wheelbase than usual.

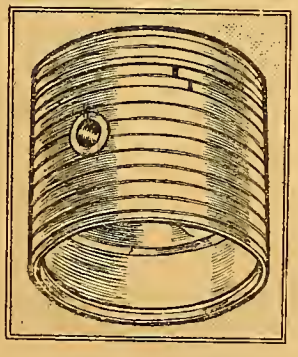
One of the first points which strike one upon inspecting the machine is the design of the tank; compared with the ordinary tank it is of quite different shape, and has a considerably larger capacity. The filling cap is of large diameter, and Mr. Norton claims to be able to fill the petrol tank in no more than five seconds. A separate compartment in front is devoted to lubricating oil, which is supplied to the engine in a novel and ingenious manner that is the subject of a patent.



The timing gear of the 3½ h.p. T.T. Norton. Note the special exhaust valve lifter.

Forced Feed Lubrication.

The ordinary type of hand-operated pump is used, but the plunger is loaded with a spring behind it. At the bottom end of the pump, which projects through the tank, is an ordinary tap, and also a needle valve which can be adjusted very finely. When the plunger is drawn up a charge of oil fills the pump barrel, and under the action of the spring plunger this is delivered to the engine through the needle valve, which can be adjusted to give any desired flow. The plunger rod is calibrated, so that the amount of oil fed to the engine can be ascertained by observing the rate of descent of the rod. This is one of the simplest and most practical lubricating devices we have seen for some time, and we shall not be surprised if it comes into general use

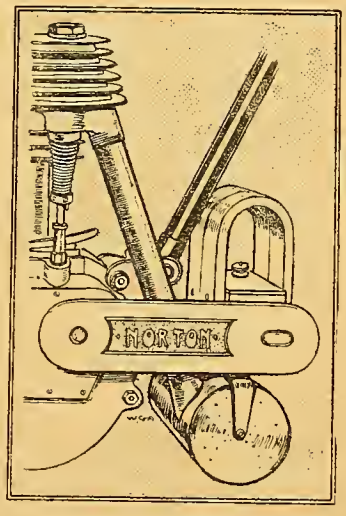


The piston showing hollow gudgeon pin and the oil grooves.

The only part of the engine that has been specially lightened is the connecting rod, which has been extensively drilled. The piston, a sketch of which we give, is notable for the large number of oil grooves with which it has been provided. These are no less than ten in number, two of which are on the two broad piston rings. The last named have a rebate joint.

Petrol and oil tank with large filler caps and forced feed lubricating arrangement.

The timing gear used on the 3½ h.p. T.T. Norton is worthy of special note, by reason of its simplicity, getatableness, and remarkable strength in all parts. The gear wheels, cams, and rockers, are all made of Ubas steel. The cam wheels are drilled through, so that lubricating oil which collects in the interior of the wheel finds its way, by centrifugal force, to the face of the wheel just in front of the cam, so that it is always furnished with lubrication just where it requires it most. The magneto is driven by an enclosed chain, which passes over a sprocket wheel carried by an extension of the exhaust cam wheel shaft.



3½ h.p. T.T. Norton engine, showing straight exhaust pipe entering silencer tangentially.

Specially Arranged Exhaust Pipe.

The position of the magneto is illustrated in one of the sketches, which also shows the long straight exhaust pipe which enters the silencer tangentially, so that the exhaust gases are not obliged to follow any sharp bends, but whirl round the inside of the silencer without meeting any obstruction. In this way they are rapidly cooled, and the result is a free and quiet exhaust.

A special feature of the engine is the size of the flywheels, which contributes in a large measure to the smooth running of the engine and its extreme flexibility. In fact, we know of few engines which will run at such a low speed and continue to fire regularly without snatching as the Norton. The makers' address is Deritend Bridge, Floodgate Street, Birmingham.

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

Fitting Stronger Tyres.

I have a 6 h.p. tricar (weight unladen, 600 lbs.), and, as is generally the case with tricars, I have had a lot of trouble with the back tyre. The covers I have been using are 26 × 2½, and also steel-studded non-skid covers. The covers generally burst after about 400 miles running, either at the bead or else right across the tread. They appear simply to be unable to stand the work. I have been thinking of fitting a 650 × 65 extra heavy voiturette cover. (1.) Would such a cover fit my present rim, or would a new rim be necessary? (2.) Will Michelin and Kempshall covers fit the same rim if I fit a new rim?—R. A.

We think you are very wise to change your cover for a voiturette one. 2½in. motor cycle tyres are barely strong enough for 6 h.p. tricars. It is better to over than to under-tyre a vehicle. There should be no difficulty about it fitting the rim. It would, however, be advisable to write and ask the makers if there would be any difficulty when giving your order.

Storing a Motor Cycle.

Being out of England for three months, my machine is left without attention. I shall keep in a cool, dry, darkened place. Tyres fully inflated, cycle parts vaselined, hubs, bearings, and crank case swilled with paraffin. Please say if advisable (1) to oil crank case; (2) if so, to fill or only as under working conditions; (3) to fill magneto oil wells; (4) to paint cylinder against rust (otherwise than with enamel); (5) to paint tyres with one of the preparations sold?—T. L.

After you have washed out the crank case with paraffin, it would be advisable to put in the requisite quantity of oil. Certainly oil the magneto after washing out the oil wells, and paint the cylinder with Radiolene (sold by Messrs. Bowen and Odery, 62, New Cross Road, London, S.E.) It would also be a rather good plan to suspend the machine clear of the ground, so that the tyres do not continually rest on one place. A preparation on the tyres would be advisable, or they should be sponged with water occasionally.

Illuminating Tricar Numbers.

Please tell me the correct way of lighting a tricar. At the present time the front number is on the right side of body, just behind the lamp bracket. If this is sufficient, I do not see how it was lighted at night.—B. H. W.

If the tricar is registered as a car, it must be lighted as a car by means of a lamp showing a red light behind, and also lighting the rear number. If it is registered as a motor cycle, you may either fit a number plate in front of the front lamp, which will illuminate both sides, or you may light it as a car. The latter way is by far the best, as it also acts as a warning to faster vehicles.

Carburetter Adjustment. Timing of Spark.

(1.) My engine is 76×76 mm., compression good, gear 5½ to 1, does not overheat, but will take no extra air (Amac carburetter), and opening throttle more than half-way has no effect. It runs steadily up to about 15 or 16 m.p.h., but I cannot get above this speed. What can I do to improve it? A.I.V. opening ⅛in., and petrol level just at top of jet. What size should the exhaust pipe be for the above engine? Mine is ⅞in. internal diameter. Is this large enough? (2.) Ignition is coil and accumulator, and with spark fully advanced fires exactly at the top of the compression stroke. When retarded, the piston is ⅝in. down firing stroke. Is not this rather late? (3.) The machine starts easily, but is sometimes inclined to run in jerks. Would the fact that the carburetter is close to the cylinder and no induction pipe worth mentioning account for this?—B. M. W.

(1.) Probably if you fit the carburetter with a slightly larger jet the engine will run more steadily, and will take full opening of the throttle. If, however, the petrol consumption is already as high as it should be—say, ninety miles to the gallon—a smaller sized choke tube or air funnel would have the same effect, and enable you to admit some extra air when travelling rapidly. The petrol level is too high. The timing of the spark is too late. Try advancing the ignition. (3.) The size of the exhaust pipe should be about right. The short induction pipe could hardly account for jerky running. It is probably due to the weak mixture.

C. V. Duberly and F. C. North, two Yarmouth riders in the M.C.C. London-Edinburgh and back run. The machines are 1910 3½ h.p. Ariels.

THREE TWIN REX RIDERS IN THE T.T.

F. Mackay, Harrogate, 4 h.p. twin m.o.i.v. Rex. For description of this new model see last week's issue.

Housing a Motor Cycle.

I have lately bought a new 3½ h.p. Rex, and intend bringing it to my lodgings in London. (1.) Are there any restrictions as to building a shed in the garden at about twelve feet from the house, against a fence dividing two gardens? I shall probably keep no more than one can of petrol. (2.) Would it be advisable to keep this can in the shed?—H.W.

(1.) We do not think so. You can easily get a portable shed and set it up in the garden as far from the house as possible. (2.) There should be no objection to you keeping a two-gallon can in the shed as long as it is well away from the house. It might, however, be advisable for you to consult the district Petroleums Act inspector about the matter.

Timing the Magneto.

I have overhauled my 3½ h.p. N.S.U. with Eisemann magneto. I retimed it as follows: Magneto retarded, piston dead on top of compression stroke, and points of the magneto in the act of parting. (a.) Is this correct, as I find that when I advance the magneto lever fully the platinum points part about ⅛in. before the compression stroke has completed its course? The engine seems to run all right on the stand. (b.) Is the spark expected to take place at the plug the instant the magneto points part? (c.) If it is timed too early, would a fraction cut out of the breaking cam be of any advantage, as when it is put back a tooth it is too slow, and the compression stroke is practically wasted? (d.) Should there be any end-to-end play on magneto armature?—B. W.

(a.) As far as we can gather, you have timed the magneto slightly on the fast side. The points should begin to separate when the piston is at the top of the stroke, and the spark lever two-thirds advanced. If the engine skids the back wheel in starting or knocks appreciably at slow speeds, the timing should be slightly retarded. (b.) Yes, certainly the spark takes place at the plug practically simultaneously with the separation of the points. (c.) Do not on any account interfere with the shape of the contact breaker cam if the timing is too early. You must retard slightly the driving pinion on the armature-shaft. (d.) A small amount of end play would not matter, say 1-64th of an inch, but up and down play denotes worn bearings.

Refusal to take Extra Air.

I fitted an Amac H.B. controlled carburetter to my twin-cylinder tricar with very satisfactory results, but cannot get carburetter to take extra air. Immediately extra air lever is operated engine slows down and stops, also the induction pipe and carburetter are always covered with water due to condensation, I presume. I have now fitted carburetter nearer engine, but there seems very little improvement as far as condensation goes. What do you advise in the matter? I am using 32 spray and 16 choke tube.—T.W.

Jas. Baxter, Musselburgh, who was a competitor in last year's event.

We can only suggest (1) that the jet is not large enough, (2) that the choke tube or air adapter is slightly too large, or (3) that the carburetter is not properly warmed. Putting it near the engine may not cure the trouble. You must take the hot air direct from the cylinder if condensation takes place to any extent.

An Overhaul Needed.

A few months ago I had the cylinder of my 4½ h.p. Lagonda motor cycle bored out and new piston and rings fitted. Since then it has not run at all satisfactorily, as it misses fire badly. I altered the carburetter (a Longuemare) all ways. First larger and smaller jets, then different choke tube, but cannot cure the misfiring. If I adjust contacts so that they bear very hard together the engine fires all right at about fifteen to twenty miles an hour, but over or under that it still misfires. I have broken three contact blades through adjusting the points so hard. I have renewed all wiring. The ignition is by accumulator, make and break contacts, and plain coil (Nilmelior).—W. J. A.

Without seeing the machine it is rather difficult to tell what the trouble actually is. Of course, by altering the carburetter you may have upset things completely, unless you are quite certain of having refitted it as it was previous to the repairs. Also examine your contact breaker. This may be seriously worn and requires new parts and new contact points. The opening of the inlet valve is also important. Three-sixteenths of an inch is approximately the correct amount. Have you tried a different coil, and is the accumulator fully charged? Probably, in your case, it would be better to have the machine looked over by the makers.

Starting from a Standstill.

I have had a N.S.U. two-speed geared pulley fitted to a 3½ h.p. Bradbury motor cycle. Is it possible to start from a standstill? If so, how? I understood this was so when I ordered the attachment, but as far as I can make out it still requires the usual run, etc., which I want to avoid.—G. A.

To start from standstill it is necessary to jack up the machine, engage the high gear, and start the engine by the pedals, put the gear in neutral, then take the machine off the stand, turn the gear control handle slowly to engage the low speed, accelerate the engine, and the machine will glide away without difficulty.

READER'S REPLY.

Belt Jumping off Pulleys.

If "B. W." will run his belt the opposite way I think most likely it will be all right. I have just had a new belt of the same make, and run it about 100 miles. After cleaning I may have put it on the reverse way, and it insisted on coming off, though pulleys and belt are correct angle and appeared perfect. On turning the belt round, the trouble was cured.—H.C.

David C. Bolton, Oakamoor, N. Staffs, probably the youngest entrant. The machine he is depicted with is the ninth he has owned.

Another New Model.

A new model of the Kerry-Abingdon motor bicycle built on Tourist Trophy lines is now in hand, and will be ready in a day or two.

The 1910 Four-cylinder F.N.

After nine months waiting we now learn that the new four-cylinder F.N. is ready for delivery. From all accounts the machine possesses many excellent qualities which we hope to describe as soon as opportunity offers.

R.A.C. Official Appointment.

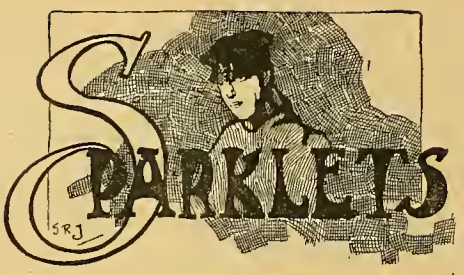
Mr. C. H. Hitchen, Euston Road, Morecambe, has been appointed official motor cycle repairer to the R.A.C. Motor cyclists who may experience any difficulty with their machines in the neighbourhood of Morecambe will have their requirements properly attended to by telephoning to 112, Morecambe, or telegraphing to "Motor," Morecambe.

The Motor Cycle in Distant Lands.

As an evidence of the manner in which modern motor cycles are obtaining a foothold in distant markets, the Lloyd Motor and Engineering Co., Ltd., 132, Monument Road, Birmingham, advise us that through one of their agents in Singapore they have sold two L.M.C. motor cycles with variable gears and free engines to two Johore princes.

Descriptive of the 1910 Brown.

"The 1910 Book of the Brown Motor Bicycle" is an interesting *brochure* describing in detail the various features of the new 85 × 85 mm. model. The successes on Brown motor cycles form quite a formidable list. For this year two models are listed—the Standard and the Tourist Trophy. Five pages are devoted to hints on the management of motor cycles. Brown Bros., Ltd., Great Eastern Street, E.C., will gladly post copies to our readers on request.



Change of Title

The name of E. M. Bowden's Patents Syndicate, Ltd., has, with the sanction of a special resolution of the members, and with the approval of the Board of Trade, been changed to the more simple and convenient style of Bowden Wire, Ltd. All future communications should therefore be addressed in accordance.

A Tyre Catalogue.

We are in receipt of the latest catalogue of Avon tyres, manufactured by the Avon Indiarubber Co., Ltd., Melksham, Wilts. Several patterns of motor cycle tyres are turned out by this company—a hexagon rubber studded motor cycle cover (the studs of which are of a hexagon shape), a round rubber studded tyre, and a fluted pattern. The first two patterns are made in two qualities and the last named in three qualities. The company also lists ordinary endless and butt-ended tubes, a steel studded motor cycle cover, made in only one quality—the best possible—of Egyptian cotton casing, rubber tread and specially hardened studs provided with washers top and bottom. In addition, they also manufacture a tricar tyre of the most substantial kind, plain or fluted, with steel studs, made in three sizes—2¼in., 2½in., and 3in.

The New Premier.

The Premier Cycle Co. have one of their new 3½ h.p. motor bicycles on view at their London depot, 20, Holborn Viaduct, E.C. This is fitted with the new engine with auxiliary exhaust release, recently described in *The Motor Cycle* for the first time.

The Tourist Trophy Race.

Mr. G. E. Roberts, of the Simms Magneto Co., Ltd., will take up his headquarters at the Sefton Hotel, Douglas, I.O.M., so that he may look after the interests of users of Simms magnetos during practice for the Tourist Trophy and also during the race week.

Home-made Tyre Gaiters.

A correspondent sends us a tip well worth following as to how to manufacture efficient home-made tyre gaiters for motor cycle covers. He writes, "I have been using old covers cut in sections (wired ones for preference, or beaded ones with the bead cut off) with holes burnt in them with the heated shank of a rat-tail file, the holes being about an inch apart. These can then be laced over the bad place in the tyre. I always carry a few feet of old tyre ready bored in this way, and then cut off a section suitable for the place required to be protected."

A Comprehensive List.

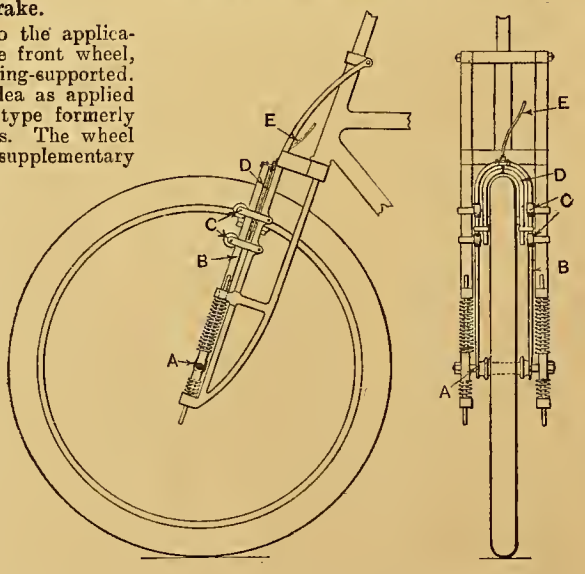
The Service Co., Ltd., 292-293, High Holborn, W.C., have just issued a new list of motor cycles and accessories. In addition to several well-known makes of complete motor cycles, for which the Service Co. are agents, the list contains descriptions, illustrations, and prices of practically every known motor cycle accessory. It is certainly one of the most complete lists ever issued in connection with motor cycles, and we advise readers to send for a copy.

RECENT PATENTS.

By ERIC W. WALFORD F.C.I.P.A.

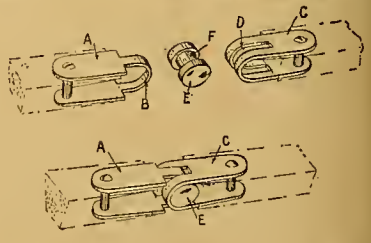
A Front Rim Brake.

The invention relates to the application of a rim brake to the front wheel, when the latter is spring-supported. The drawing shows the idea as applied to a spring fork of the type formerly fitted to the Rex machines. The wheel spindle A carries a light supplementary frame or arch B. This arch always moves with the wheel spindle, and rollers C are provided to act as guides and reduce the friction. The rim brake D is secured to the arch B, and is operated by Bowden mechanism E. It will be seen that as the arch B always moves with the wheel and carries the brake with it, the latter is always in its correct relative position.—R. Barratt, No. 9,504, 1909.



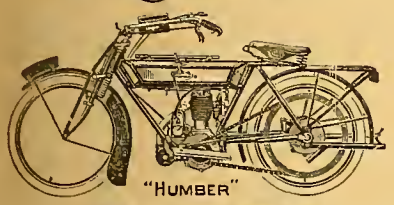
A Detachable Belt Fastener.

This belt fastener comprises a metal strip A, formed with a narrow slot D, to receive the loop B. The ends are put together with the loop in the slot, and through the loop is passed a stud E, which is recessed as at F to receive the loop B. When the fastener is in



place the stud F cannot drop out, as it is held from lateral movement by the engagement of the loop B with the groove F. To disengage it the parts A and C are pushed together allowing the stud to be freed.—W. Pilkington, No. 9,410, 1909.

£56 10 0 for £44 0 0.



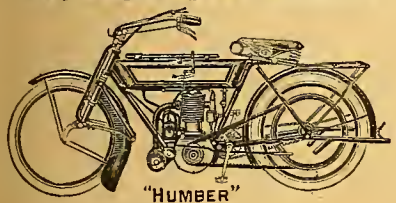
"HUMBER"

1909½ HUMBERS

brand new. These you can hardly tell from 1910 models, being fitted with improved pattern silencers, spring forks, larger pulleys, Roc licensed two-speed gear, h.-b. control, registered tank, high tension magnetos, Dunlop tyres, oil pump operated by foot, stand and carrier, toolbag with all tools fitted to handle-bar. Fully guaranteed.

£44 complete with sidecar.
£40, less sidecar.

1909½ Single Speed Humbers.



"HUMBER"
£3 315s.

Druid spring forks, Bosch magnetos, h.-b. control, pedalling gear, stand and carrier, toolbags, tools, number-plates, etc. Usual price £45. A clear saving of £11 10s. Only Booth's can offer such value.

NEW 1909 ARNOS.

We have a few Brand New 3½ h.p. Models, fitted with magnetos, h.-b. control, complete with stand, etc.
List price £45. Our price, **£26 10s.** Or exchange.

Other Sidecar Machines.

½ h.p. BROWN, twin, 1908, magneto, free engine **£25 10**
½ h.p. REX DE LUXE, Roc clutch, magneto.. **£21 10**
h.p. Twin REX, 1908, magneto, spring forks.. **£24 10**
½ h.p. HUMBER, 1909, two speeds, soiled only **£28 10**

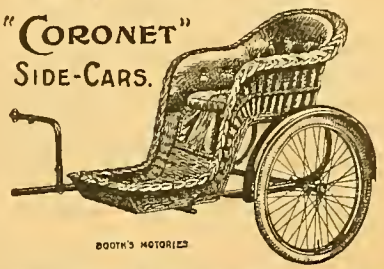
£4 17s. 6d.



We maintain the "Coronet" is the BEST DESIGNED SIDECAR on the Market.

Free from Side-slip.—The "Coronet" Sidecar is attached in three places, the front down tube, bottom stay, and saddle bolt, and can be detached in three minutes. Every tube of attachment is telescopical and adjustable to suit any length wheelbase, any height or width. When attached the combination is as firm and rigid as a Tricar, and entirely free from side-slip, and can be driven safely without passenger if desired.

Delivery from stock to suit TRIUMPHS, REXES, P. & M.'s, N.S.U.'s.
Price £4 17s. 6d. Discount to trade.

CORONET ADJUSTABLE PULLEY.

12/6

The best variable speed pulley on the market. Loose flange securely held in any position by a simple yet ingenious contrivance. Gear can be altered with out the aid of spanners, lock ring easily operated by hand. Buy a "Coronet" pulley and gear your machine suitable for hill-climbing.

Standard makes, such as Rexes, Triumphs, Minervas, supplied without the necessity of sending old pulley for pattern. **Discount to trade.**

"GRIPSKIN" BELTING.

Made from selected parts of hides, correct angle, perfect drive; the best leather belt on the market. Longer life than rubber.

½in., **10d.**; ⅝in., **11d.**; ¾in., **1/1**; 1in., **1/2.**

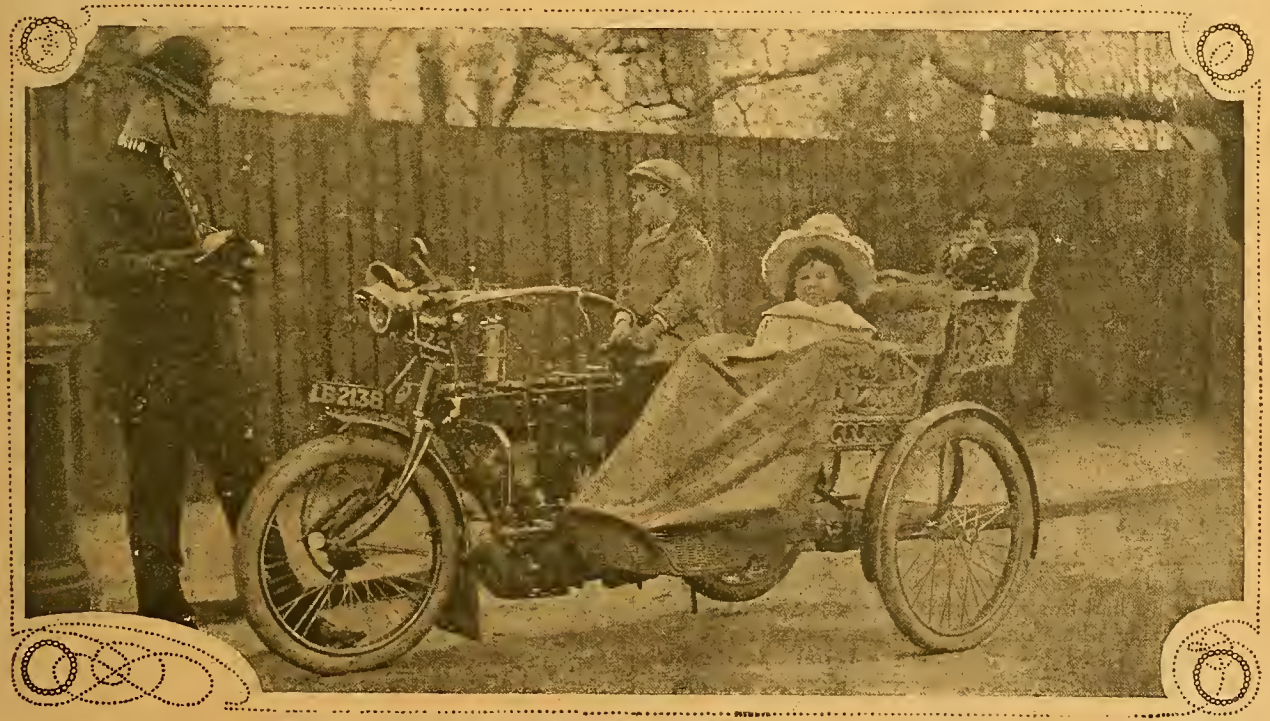
THE TOURIST TROPHY RACE.

HOW THE RESULTS WILL BE MADE KNOWN TO-DAY.

Last week we briefly mentioned the fact that *The Motor Cycle* had made special arrangements to flash the progress of the T.T. Race to various London and provincial districts. By means of special scoring boards which we have distributed, the positions of the leading competitors lap by lap may be seen. Interest in the race is more pronounced than ever, and we expect that many motor cyclists will consult the scoring boards. The result of the first lap should be known soon after 10.30 a.m. A list of firms exhibiting the telegrams will be found in the inner pages. Next week's issue will contain an exhaustive description of the rac



A CLEAR CASE

Being a narrative of a 4,000 miles tour undertaken by two American motor cyclists—Dr. Webster and Mr. W. C. Chadeayne—embracing the British Isles, France, Switzerland, Germany, Holland, and Belgium.

IN this account of a motor cycle tour through Europe I shall try and confine myself to writing of things that may concern those who are interested in motor cycling, and not go into detail about cathedrals, museums, art galleries, buildings, and the time I spent in attending hospital clinics.

Some four years ago I purchased my first motor cycle to use in making my professional calls and found it easier, quicker, and cheaper than using a horse or car. I soon became so enthusiastic over riding that I made trips to different cities within a radius of two or three hundred miles from my home, wherever the roads were in fair or good condition. Perhaps it was hearing of the fine roads in Europe that started me to plan, a little over a year ago, my tour. I spent innumerable evenings reading and planning such a trip in England, France, Switzerland, Germany, Belgium, Holland, Scotland, and Ireland, and I think by the time I was ready to start I could have passed a better examination in geography, history, art, and architecture than I could have passed in college.

Off the Beaten Track.

Judging from my observations, a large percentage of American tourists in Europe go from one city to another along a generally travelled route, so they do not see the typical, native life. I consider a motor cycle the ideal way of touring. It was not necessary for us to consult a time table, but we rode at any time, as far as we desired, and, many times, to out of the way places. The motor cycle as compared to touring with a car is more economical, is easily stored, can go to places that a car cannot go, and is allowed on certain roads that are prohibited to motor cars. Besides, it is able to get through Customs without so much red tape.

Neither Mr. Wm. Chadeayne, of Buffalo, who went with me, nor myself, planned spending much money on the trip, but started out to see all there was to see and have a good time without making an endurance contest of it. Very few times were we charged very high prices as most American tourists. With the exceptions of London, Paris, and a few other large cities we stopped overnight in some tavern or gasthaus in a little village three to six miles from the city we desired to visit the next morning. The accommodation was always good, good plain food, and not only that, but we had the opportunity to see the real native ways of living which one does not see so markedly in the cities. The rates were always better, and then it was only a short ride in the morning to the city to be visited.

The Start from Liverpool.

Upon landing we left all our larger and heavier spare parts with a motor cycle firm to forward if necessary, and carried in the satchels on our luggage carriers the smaller parts and a few clothes. In a trip of this kind it is necessary to have a partner with similar tastes, desires, and disposition, not only for social reasons, but one that can be relied upon in case of emergency. Time and again these qualifications were tested, and we got along most congenially.

Mr. Chadeayne took a Greyhound motor cycle and I a Pierce four-cylinder. We shipped them in one name, and the charge to Liverpool was but five dollars, the rating being upon the cubic foot instead of the weight. Upon landing we had to go through considerable red tape in getting our motor cycles cleared, but there is no duty upon motor cycles taken into Great Britain. Then, before riding them, we had to make several trips to the police headquarters and the Post Office to obtain licences for the machines and also driving licences. These, with the numbers that are required on the front and rear of the motor cycles, cost each of us about £1 10s.

As yet the Americans are far behind the British in motor cycle clothing. We wore a fairly good suit, and then purchased high mackintosh leggings and mackintosh coats that came about three inches above our knees. These protected our clothes not only from the rain and mud (there was more rain than usual in England last summer), but also from oil and dust, so that in a minute's time we could take them off and look fairly respectable in company, in a restaurant, or visiting buildings, etc.

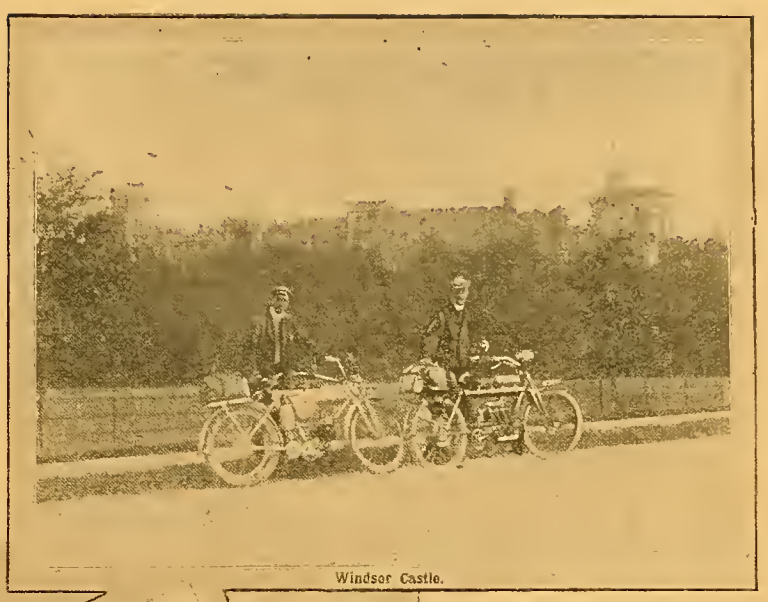
Through the Peak District.

Liverpool has the finest harbour and docks of any city in the world. From here we followed the Manchester Ship Canal to Manchester. This canal is thirty-five miles long, and the large ocean steamers run up to Manchester, making the inland manufacturing city an artificial seaport. Thence we rode to Macclesfield, Buxton, Derby, and Leicester, where we were very pleasantly entertained a few days by friends. While there we saw some of the old pavement put down by the Romans. The roads all through that part are nearly perfect, all the little holes in the country roads are filled, the surface swept, and the turf along the edges trimmed. In many places in the country they are kerbed. All through England they are like a boulevard, being macadamised. They are smooth, seldom straight, but winding, and those that English riders consider bad are better than many of our good, improved roads.

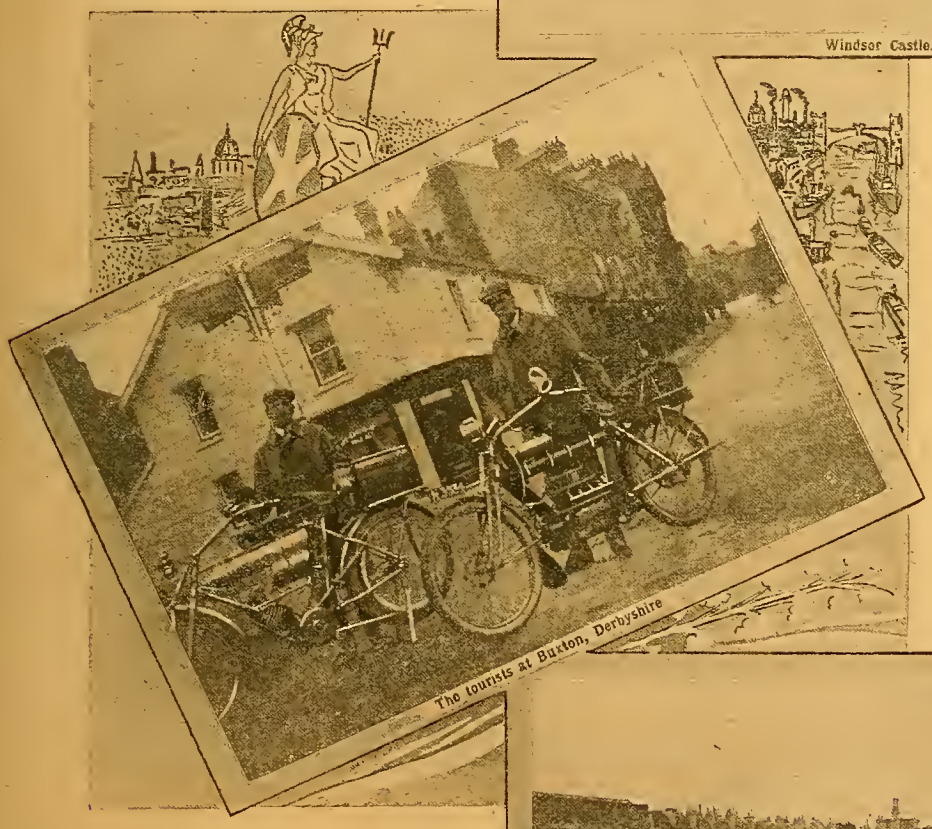
Through Great Britain and the Continent.—

While riding up the "Cat and Fiddle" pass, which is 1,750 feet high, it was raining and we were above the clouds, so could see but a short distance ahead. In order to climb the hill we had to keep our motors going at a pretty fair speed. I came to a "hairpin" turn, my machine skidded and I received a bad fall which skinned my hand and broke my lamp. I was soon on my way, and found Billy at the top of the hill sitting in the rain waiting for me. This reminds me that on our entire trip we had more trouble and spent more time fiddling with accessories, such as lamps, horns, and speedometers, than upon our motor cycles, including the tyres.

Our next ride was to Coventry, the city that at present is noted for the manufacture of bicycles, motor cycles, and motor cars.



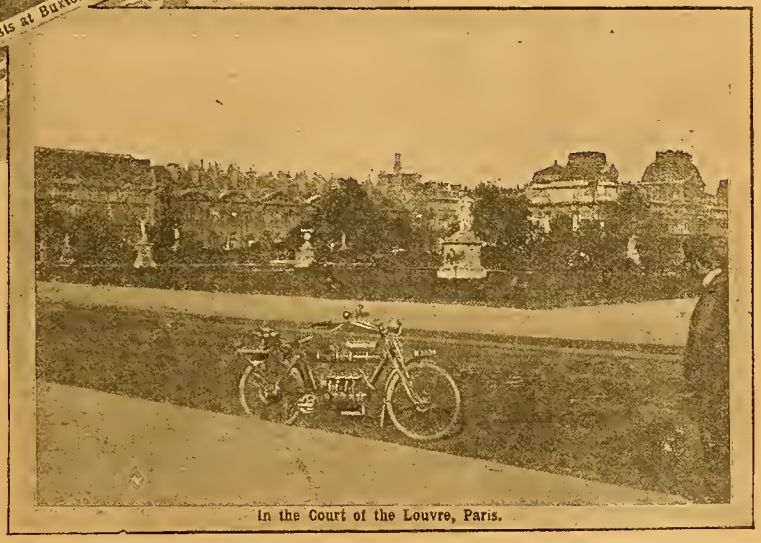
Windsor Castle.



The tourists at Buxton, Derbyshire

to London, a ride of about sixty miles. By taking this zig-zag route from Liverpool to London, we passed through some of the most historical and interesting parts of England. The advantages of motor cycles in London were readily shown, for they enabled us to visit places of interest quickly, not only in the City, but Hampton Court, Windsor Castle, Kew Gardens, and other noted places thirty or forty miles distant. Judging from the interest shown, a motor cycle in the heart of London is an unusual sight. Every day we were riding

Then on to the famous old ruin of Kenilworth Castle, and from there to the town of Warwick, which also has a noted castle. All through this part of the country the scenery is beautiful. While riding over the road to Stratford-on-Avon I had to think of the humorous side of it—how Shakespeare used to plod along that same road on foot and think he was having a fine time, while we were flying along taking things easy. After visiting the historical places of Shakespeare's town we made our way to Oxford, the city of colleges. And then on



In the Court of the Louvre, Paris.

Through Great Britain and the Continent.—

through the central and congested parts of the City on our motors, and had little trouble in getting around. We got about quicker, and saw more than by taking the double-decker trolley cars or sight-seeing autos. We found it advisable in London to join the Auto Cycle Union, which is similar to our Federation of Motor Cyclists, and gave us a great deal of information as to routes, customs, and laws on the Continent, and furnished us papers that greatly aided us in going from one country to another.

From London we rode to the famous Brooklands track. We thought the surface a little rough. I understand the new track at Indianapolis is copied after it.

At Winchester St. Cross Hospital we followed the custom that they have carried out for centuries of giving to all strangers who apply, a dole consisting of a piece of bread and a horn of ale. We drank from the same horn that the late King Edward drank from a few days before. I wish I had a picture of the expression on Billy's face, as it was the first time he ever tasted any kind of liquor. At Southampton we viewed the old walls of the city and also the docks, which have developed rapidly, then sailed for Le Havre, France.

On French Soil.

We arrived in Le Havre about eight o'clock in the morning, and here is where our first trouble started with foreign languages. Knowing that Billy had taken French in one of his college courses, I told him it was up to him to make good in France, while I would be responsible for the German spoken. It is not hard to find English-speaking people in sea-port cities, but, travelling inland as we did, there are many places where the natives seldom see English-speaking people. All through France I discovered that the people could not understand my partner's fluent (?) French, and our fare and accommodation were as limited as his vocabulary. While in England I had thoughtfully provided myself with a pocket tourist translation book. By trial on one desperate occasion I found it useless, and threw the book away. Several times we would be trying to make someone understand what we wanted in our very poor French or German, and the person would speak up and say in very good English, "What is it you want?" Then we did feel small. In one little French town I went to an hotel, and there was a young lady behind the desk. I tried to make her understand in poor French, but without success, that I desired a room. It was only after I drew a picture of a bed that I succeeded. We each had a good laugh, and I got the bed.

In France gasoline is called "essence," in Germany "benzin," while in England it is called petrol. We had very little trouble in obtaining gasoline in any country, but found the price a little higher in some of the little out-of-the-way mountain towns of Switzerland. It was seldom we could get good oil in these small places, so when in the cities we would fill up with a brand we knew to be good, and strap a two or four-litre can on the back of our luggage-carriers. On the Continent the rules of the road are the same as in America, but in the British Isles just the opposite—keep to the left. Several times we were confused by these opposite rules, and had narrow escapes.

Riding beside the Seine.

After some trouble in clearing our machines in Le Havre we started for Paris, 190 kilometres distant, following the picturesque Seine River. We passed through Rouen and Versailles, taking in the palace and the beautiful grounds surrounding it. The roads are fine, straight as an arrow, lined on both sides by rows of trees—a motor cyclist's paradise, and no speed limit enforced. We were stopped at the gates of Paris by guards, who carefully examined our machines and taxed us for the amount of petrol our tanks contained. We were later informed a duty is imposed on all gasoline entering the city, and the price in the city is correspondingly high. We spent six days and nights in Paris, enjoying the sights, and it is certainly a most beautiful and interesting city.

A Visit to the Rheims Flying Ground.

Our next jump was to Rheims, where we spent most of the week watching the much talked about aviation contests. About the best time of our trip was spent in this city. I only wish I knew as much about and took as much interest in aeroplanes then as I do now, for it would have been that much more interesting to me. I hardly felt at the time that we were watching events that will go down in history as these will. Thirty-nine aeroplanes were there, the one of Mr. Glenn Curtiss being the only one from America, and we saw him break the record for ten kilometres. At one time we saw ten aeroplanes in the air—a beautiful as well as a wonderful sight that has never before been seen. When we arrived in Rheims the hotels were filled with thousands of visitors to witness the flights, and while Billy was trying to locate Mr. Curtiss, who is a personal friend of his, I made similar enquiries. A gentleman, who proved to be the British Consul, surprised me by asking in English what I wanted. Here our troubles ended, and high life began. After arranging for the care of our machines we were taken by coach to the American Consul's, where we spent a very pleasant evening. Passes for the aviation grounds were arranged for. The Consul then took us to his very fine residence, where we were royally entertained at dinner, and at about 2 a.m. crawled into the "royal bed," and were calling each other dukes and lords. It is to be remembered that Rheims is the champagne centre of the world. Every detail for our comfort had been arranged. The servants even surprised our shoes by polishing them. Next morning, after a warm bath and a fine breakfast we were furnished with a guide, and taken to the aviation grounds, where we found Mr. Curtiss. A large percentage of the fine champagne consumed is made in Rheims, and we were taken through some of the wine cellars by friends of the Consul. One cellar has eighteen miles of tunnels.

Mountain Climbing on Motor Cycles.

We encountered the first long steep grades in crossing the range of mountains between Besançon and Pontarlier, France, and we were continually riding over mountain roads and passes, up and down grades of from five to twenty-five miles long, the entire length of Switzerland, not knowing what level roads were until we reached the Rhine River. The surface of the roads in Switzerland is fine, and over the principal passes there is a uniform grade, although some of the roads are described better by a remark of Bill's: "It

the opportunity of demonstrating their superlative merits.

All the machines fitted with Kempshalls went through the outward journey with absolutely no trouble whatever.

The machines fitted with Kempshalls which made the return journey (800 miles) likewise encountered no tyre troubles whatever.

Read what the Hon. Treasurer of The Motor Cycling Club, Ltd., thinks of Kempshall Tyres:

Hon. Treasurer: R. CREAK DAVIS,
Standisgate, Southwood Road,
New Eltham, S.E.

Dear Sirs, May 17th, 1910.

I am pleased to say I found the tyres quite satisfactory, and they were not touched at all after I left here. I went across London early Friday morning when the roads were very greasy, but had no sign of a slip.

Coming home from York yesterday the roads were very greasy in places, and after Byleswade for fifteen miles they were in a bad state, but, although I drove fairly fast over these stretches I had no suspicion of a side slip.

I can only sum up by saying I am quite satisfied with the tyres and their behaviour.

Yours faithfully,
(Signed) RICHD. CREAK DAVIS.

Through Great Britain and the Continent.—

seems as though some of the hills were so steep they are tipping over backwards." Riding as we did there was occasionally some little thing the matter that would be put off for fixing up until convenient; or, in other words, our machines were not always in the pink of condition for a hill-climbing contest. Even at this, there were few hills or mountain passes that our motors did not take in good style. In fact, several times we passed large touring cars on the mountains that were running on low gear and being assisted by horses hitched in front. While along this line I am going to tell of an incident that happened to me in the middle of Brünig Pass, Switzerland. It was about three o'clock in the afternoon, in the middle of this pass, and, so far as we knew, several miles from any house or person. To make things cheerful there was a drizzling rain. All at once something gave a couple of bangs, and I felt sure either a connecting rod had broken or I had stripped a gear on the shaft. At any rate we could not turn the rear wheel, so the only thing to do was to go after it and fix it. We took the engine out of the frame, and found a nut had worked loose, and had jammed into the fly-wheel and clutch. Let me tell you there was no loafing on that job, for we worked at it together, and rode to the next village before it was very dark. That was certainly my hoodoo day, for I skidded and fell many times, and always bent my pedal cranks, so that I finally purchased a 14in. wrench to use in straightening them instead of tipping the next village blacksmith for the use of his wrench. At one time I skidded over an embankment, and went down about twenty feet with the machine. There was no harm done, but we had hard work in getting the motor cycle on the road again.

If there is a rider who likes excitement, he should have been with us that day. Many times I had the same sensation I had in a track race I rode in when I skidded on the upper turn, and realised what might happen to me had I been thrown into the outer fence posts. Time and again we rode along passes that were on the edge of a precipice one or two thousand feet nearly straight down, the road, slippery from the rain, winding backwards and forwards around the mountain, so that we could not tell what we might expect to encounter beyond the turn in front of us; and, going up, the machines had to be kept at a fair speed in order to climb the grade. In many places along these cliffs it was impossible to build roads, so tunnelling was resorted to.

(To be concluded next week.)

THE GREAT MOTORCYCLE ROAD RACES OF HISTORY

BRITAIN'S RECORD IN THEM

by B. H. Davies

Demester (Griffon), the first winner of the International Cup for France in 1904.

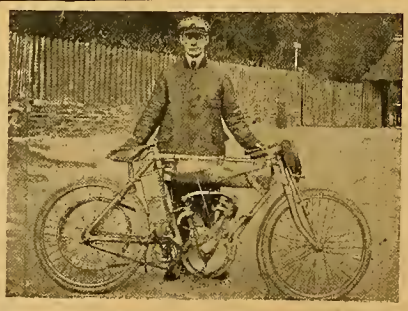
GORGED as our memories are to-day with Stanley Shows, and Edinburgh Runs, and Thousand Mile Trials, and Brooklands and Manx Races, it scarcely seems credible that ten years ago we had no motor cycle clubs or fixtures and very few machines. So recently as 1900 the handful of men who rode and believed in motor bicycles were regarded as dangerous lunatics by the police, as cranks by their brother engineers, and as bounders by society. The chief credit both of producing and booming the motor bicycle must be awarded to France, although to-day she is well behind both England and America. We Britons, according to our national habit, looked phlegmatically on while somebody else did the spade work; also, according to habit; when the motor cycle began to look promising, we suddenly jumped in, took a hand, and began to make things hum; to-day—also according to habit—we are quite at the very topmost twig of the motor cycling tree. But when France was organising motor bicycling events of every conceivable kind, week in and week out, summer and winter, people in England looked askance at the ugly, rattlesome, little abominations which then masqueraded as motor bicycles; neither engineers, capitalists, nor public took any serious interest in them, and if they were occasionally, by dint of sheer importunity, allowed to compete in a trial, they were lumped in with the cars, regarded as intruders, and generally overshadowed by the lumbering four-wheeled automobiles of the day.

It was not until 1902

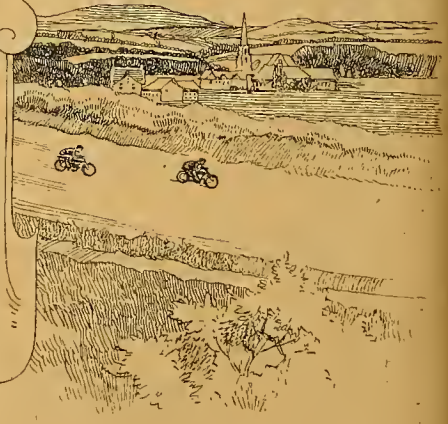
that the motor bicycle gave real promise of its brilliant future. In that year the Automobile Club organised a 650-mile reliability trial for cars, and a few motor bicycles were grudgingly allowed to take part. Two chain-driven Humbers and a belt-driven Ormonde performed with considerable distinction in this trial, especially up the hills. The motor bicycle then first got its teeth into the British public, and has never since let go.

W. Hodgkinson (J.A.P.), one of the three British representatives.

T. Silver (Quadrant), another British competitor.

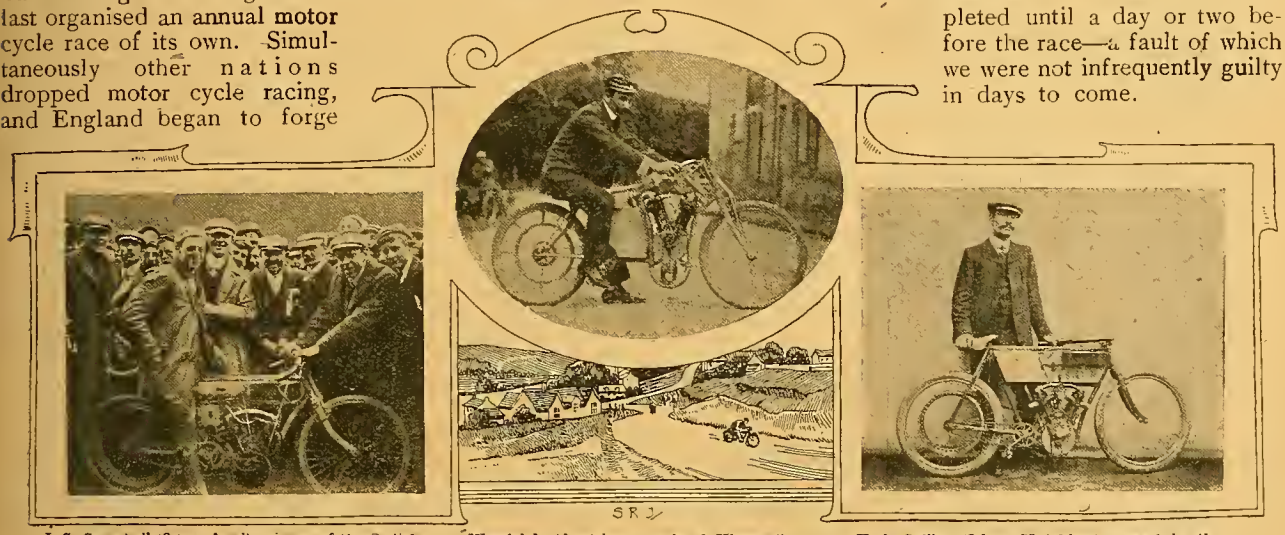


H. Rignold (Lagonda), one of the team representing this country.



The Great Motor Cycle Road Races of History.—

The chief credit of transforming the ugly, shaky, noisy, unreliable, and feeble little machines of 1902 into the splendid types of 1910 must be awarded to the small body of enthusiasts who formed the Auto Cycle Club, as the A.C.U. was then called. Whatever function motor racing may play to-day, it has in the past been the chief factor in moulding the trend of design and in intensifying efficiency. The first motor cars possessed gear wheels which would to-day disgrace a farmyard oilcake grinder in size, material, and weight. The transformation has been accomplished solely by racing, and could not have been accomplished in the same time by anything else. Similarly, it is racing that has made the motor bicycle what it is; and but for the Auto Cycle Club, England would have left motor cycle racing severely alone until quite recent times. When neither the trade nor the public took more than a faint and detached interest in motor cycle racing, the A.C.U. pegged manfully away against tremendous odds, and, aided by a few keen riders and a handful of men with a little money, it kept the ball rolling until England at last organised an annual motor cycle race of its own. Simultaneously other nations dropped motor cycle racing, and England began to forge ahead. America has during recent years displayed an even keener zest for this most educative sport, and as a consequence her industry is now fast overhauling ours. France and Austria, who used to overshadow our crack machines with ridiculous ease, are now toiling hopelessly in the rear—at least as far as racing is concerned.



J. S. Campbell (6 h.p. Ariel), winner of the British Selection Trials of 1905, in the Isle of Man.

Wondrick (Austrian Laurin & Klement), who wrested the cup from France in 1905, averaging 54½ m.p.h.

H. A. Collier (6 h.p. Matchless), second in the British Eliminating Trials. C. B. Franklin was the third member of the team.

1902.

In 1902 motor cycle racing was utterly impossible in England, and even in France the two-wheelers were not sufficiently numerous or important to secure a race to themselves. Race they did, but only as insignificant postscripts to the big car races. A few motor cycles were allowed to start after the last car had departed; they soon overtook the slower and less reliable cars, and for the remainder of their journey were sandwiched amongst the worst car drivers, in terrible dust and uproar, past ditches strewn with wrecked cars and injured men, over roads on which the spectators had encroached to such an extent that the men drove at full speed into an ever opening bottle-neck of human figures.

1903.

England's connection with motor cycle road racing dates from the ill-fated Paris-Madrid Race of 1903, which was abruptly terminated at Bordeaux, as accidents had transformed it into a human holocaust. Six Englishmen entered, but Gordrey's Rex did not appear at the start, so that Arnott on a Werner, Wright and Hacking on Ormondes, and Ball and Leonard on Humbers, alone represented us. Arnott, who is now ranching in British Columbia, managed to obtain permission for the cycles to start last—otherwise they would have been sandwiched among the cars, and some of their riders might have been killed. Arnott was the only Englishman to reach Bordeaux, and though his machine was French he was outclassed for speed. The two Ormondes later performed wonders in the Irish speed trials when properly tuned up; they had really fast 3¼ h.p. engines clipped behind the saddle tube, the rider's legs being protected by wire netting screens. All these machines were outclassed by more powerful French racing machines. One of the Rex features was a surface carburetter, and the Ormonde a flat belt. None were completed until a day or two before the race—a fault of which we were not infrequently guilty in days to come.

1904.

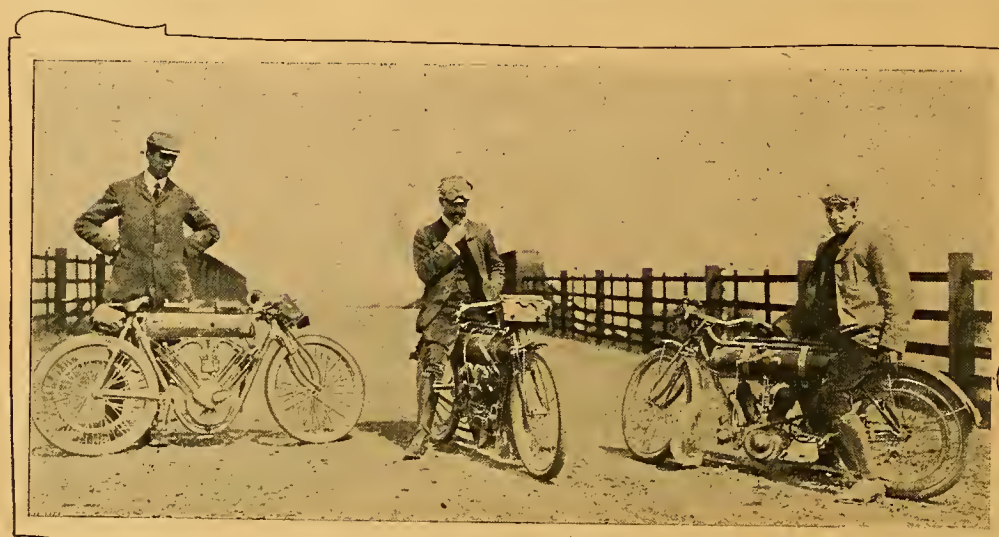
Next year the French Motor Cycle Club took a very important step. The A.C.F. organised only one road race, namely, the eliminating trials for the Gordon-Bennett, for which motor cycles were ineligible. Consequently, a road race confined exclusively to motor bicycles was arranged, under the name of the International Cup. It was open to teams of three riders from each country, and cylinder capacity was unlimited; but the machine complete with pedalling gear was not to weigh more than 110 lbs. The conditions were published in March, the race being dated September 25th; but English firms and riders did not awake to interest till August, and it was not until a month before the race that the A.C.C. at last scraped together a team of three machines, viz., a Lagonda, a J.A.P., and a Quadrant. The firms concerned rushed through a machine apiece, which was simply a light edition of their touring pattern with an untested engine of unusually large dimensions, and the mounts were given to three clever road riders in Silver, Rignold, and Hodgkinson, not one of whom, however,

The Great Motor Cycle Road Races of History.—

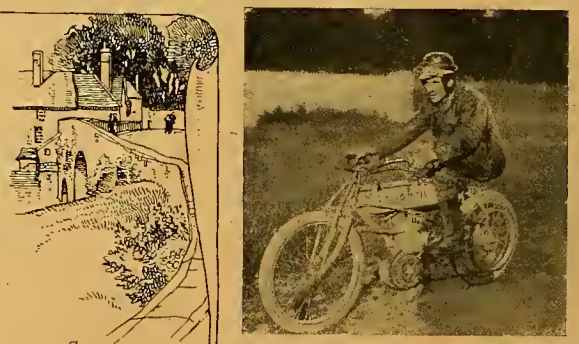
possessed any claim to road racing experience. Neither men nor machines were seriously tested in the race, as all three were soon outed by punctures, in common with the bulk of the non-French competitors. Nails had been plentifully strewn along one side of the road, and the French jockeys alone managed to avoid them. Demester won this race at a speed of about 45 m.p.h., Wondrick (on the Austrian Laurin-Klement) being a bad second.

1905.

The next year marks a new era in road racing from a British point of view. So far, our motor bicycles were among the slowest in the world, and we were the only country which took no interest in racing. The trade began to put these facts together and made a reliable deduction therefrom. So, early in the season the surprised and delighted enthusiasts of the A.C.C. found themselves embarrassed by so many entries for the international team that eliminating trials became inevitable. A Manx course, longer than that now favoured, was secured for May 23rd, the distance was set at about 150 miles, and no fewer than nineteen machines were entered. A modern single-cylinder T.T. machine would make hacks of the entire outfit, though some of them could boast 12 h.p.! Imagine a colossal twin-cylinder engine, slung in a stripped and drilled frame, so that the entire weight was only 110 lbs., of which perhaps 75 lbs. was absorbed by the engine alone on certain machines. I think this entry must be described as the very worst set of motor bicycles ever collected together. The engines were big without being good, and the rest of the machine was pared away to the vanishing point. Not a superfluous inch of wiring could be tolerated, saddle leathers were filigreed out into holes with fretsaws, and the obligatory pedalling gears were scarcely fit for working a toy sewing-machine. Some of the machines were smashed in practice, and others wisely withdrawn. The final starters were Hodgkinson (6 h.p. J.A.P.), C. R. and H. A. Collier (both on 6 h.p. Matchless), Rignold (8 h.p. own make), C. B. Franklin (6 h.p. J.A.P.), J. S. Campbell (6 h.p Ariel), and G. A. Barnes (10 h.p. Barnes). Barnes only started after being pushed off by four men for 400 yards, after which he shot away at 70 m.p.h., and was not seen again. Campbell, H. A. Collier, and Franklin finished in the order named, and so won their places in the team. Their machines were far from reliable, though fast enough so long as they could hold together. In the international race, held on the old thirty-three mile course of the Dourdan road, near Paris, which was circled five times, we were outclassed from the start both in men and machines. Our mounts were inferior, our men short of road racing experience. No one was astonished when our three men were tailed off with two Germans after the first lap. Only Collier was able to keep going any further, and he finished last. In one respect this race was extraordinarily sensational. The French cracks were beaten to the world by Wondrick on a Laurin-Klement. He averaged 54½ m.p.h., and this must rank as the greatest feat on record in motor cycle racing, when we reflect that his machine scaled but 110 lbs., developed 5 h.p., and was fitted with surface carburetter, flat belt, tremendous metal brake levers, and low tension magneto.



The British team in the International Cup Race held in Austria in 1906. The riders are(from left to right) C. B. Franklin, H. A. Collier, and C. R. Collier.



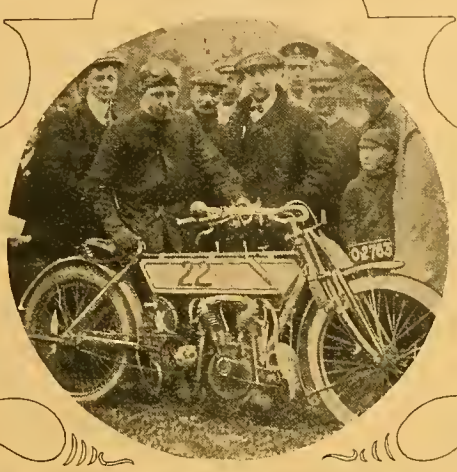
Ed. Nikodem (Austrian Puch machine), successful in the 1906 race for the International Cup. Obruba (Austria) was second and H. A. Collier (England) third.

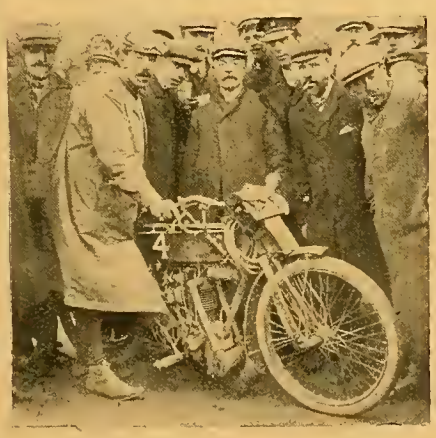
1906.

Matters looked much more hopeful for 1906. The trade was making more money, and could afford to spend more. Our machines were improving fast, and

The Great Motor Cycle Road Races of History.—

several makers and jockeys could now claim a modicum of road racing experience under Continental conditions. But towards April disquieting rumours arose about the cup race. The French, after their manner, lost interest as soon as they got beaten. There are plenty of excellent sportsmen in France, but the octopus of commercialism has always wound its tentacles closely round motoring sports across the Channel, and the trade did not want to hear any more of the cup, especially as Wondrick's win had shifted the venue to Austria. Wondrick's firm also refused to compete. A win would gain them little, a loss would cost them much; moreover, they disliked the conditions, especially the weight limit and the necessity of pedalling gear; they wanted to perfect the roadster mount, not to develop a breed of freaks. However, the race was arranged, though Laurin-Klement and the leading French firms boycotted it. Immediately the A.C.C. found itself in a difficulty. The cup race was dated for July 8th, and the Manx car race week for September—where were the selection trials to be held? Lord Derby came to the rescue with the offer of a four-mile course in Knowsley Park, where the two Colliers fought out an eliminating trial with Butt on a Quadrant, Morewood on a Westlake, and Franklin on a J.A.P. The two dark horses were soon out of it, but C. Collier reeled off twenty-seven laps at 41 m.p.h. and became England's first string, with his brother and Franklin as his supporters. The cup race was run off at Patzau in Austria on July 8th, and in the absence of the leading French celebrities and the Laurin-Klement team, our men certainly seemed to hold a good chance. Only H. A. Collier survived the first lap, and he finished third, with but one man behind him. The regulations were flagrantly ignored by the Austrian riders. One of the rules stated that the course was barred to all but competing machines after the start, but a small host of motor cyclists patrolled it in the reverse direction, carrying tyres and replacements for the Austrian machines. The Marquis de St. Mars, who, with Mr. Mervyn O'Gorman, usually shepherded our teams on the Continent, entered a strong protest, but it was in vain, and so Collier was robbed of the honour of winning the last race for the International Cup. Ed. Nikodem (Austria), riding a twin-cylinder Puch, won, averaging forty-eight miles per hour throughout the 155¼ miles course. Obruba (Austria) was second, and H. A. Collier (England) third.





H. Rem Fowler (Norton - Peugeot), winner of the twin-cylinder class in the first Tourist Trophy Race.

C. R. Collier, the first winner of the Marquis de Mouzilly St. Mars' Tourist Trophy in 1907.

1907.

Nobody was surprised when in 1907 the race fell through altogether after the fiasco of 1906. The expense of competing in a distant continent was enormous, and the chances of fair play for any but the home team were never too good on Continental soil. Yet racing possessed its old value. It remained, and must ever remain, the most searching test and the most popular advertisement; it accelerates development as nothing else can; and in this impasse the A.C.C. did not fail the industry. The marvellous efficiency of our invincible 3½ h.p. roadsters to-day is a direct result of the 1907 policy of the A.C.C. As soon as it knew the International Cup Race was dead the first Tourist Trophy Race was organised, under conditions designed to improve roadster patterns, rather than to foster the production of freaks and monstrosities, such as had disfigured the races for the cup. Fierce discussion raged for months over the detail conditions, and the promoters are hardly to be blamed if they allowed themselves to be influenced by the car racing theories of the A.C.G.B. and I., and introduced the factor of fuel economy now discarded. This factor necessitated two classes, as the same fuel limit would not suit both singles and twins, and the limits were finally fixed at one gallon per ninety miles for singles, and one gallon per seventy-five miles for twins, weight and cylinder capacity being otherwise unlimited, but pedalling gears made compulsory. Technically the policy was sound. It put a premium on the small efficient engine, propelling a light but completely reliable machine. If the opportunities for practice had been greater this basis might have been retained; but in actual practice

The Great Motor Cycle Road Races of History.—

it was found to impose a niggling set of conditions, and compelled makers either to produce a special engine, or to run a standard engine below its full efficiency. The modern basis of a limited cylinder capacity has been simpler and pleasanter to work, and provides a more sporting race. Seventeen singles started, and eight twins, of which eight singles and three twins were officially "placed," the remainder being either hopelessly slow or unreliable. The actual fuel consumption in the race varied from 129 miles per gallon (Brice on a 3½ h.p. Brown) to seventy-seven miles (Wells on a Vindec). The average speeds worked out as follows: C. R. Collier (single-cylinder Matchless), 38.5 m.p.h.; J. Marshall (single-cylinder Triumph), 36.5 m.p.h.; Rem Fowler (twin Norton), 36.2 m.p.h., the latter thus winning the twin-cylinder class. All of these speeds would have been enhanced if the race had been run under cylinder capacity limitations, instead of on a basis of fuel economy. The race provided an excellent spectacle, slightly marred by the confusion due to singles and twins competing simultaneously for one set of awards. Every maker and rider concerned gathered a quantity of valuable experience, and the only dissatisfied participants were the twin-cylinder men, who, by a severe handicap, were represented as inferior in speed to the singles. Some reform of the conditions before 1908 was inevitable.

J. Marshall (½ h.p. Triumph), winner of the second race for the T.T. After the 1908 race, the fuel consumption limit was abandoned and engine capacity restricted instead.

H. Reed (Dot-Peugeot), the fastest competitor in the twin-cylinder class of the 1903 race.

1908.

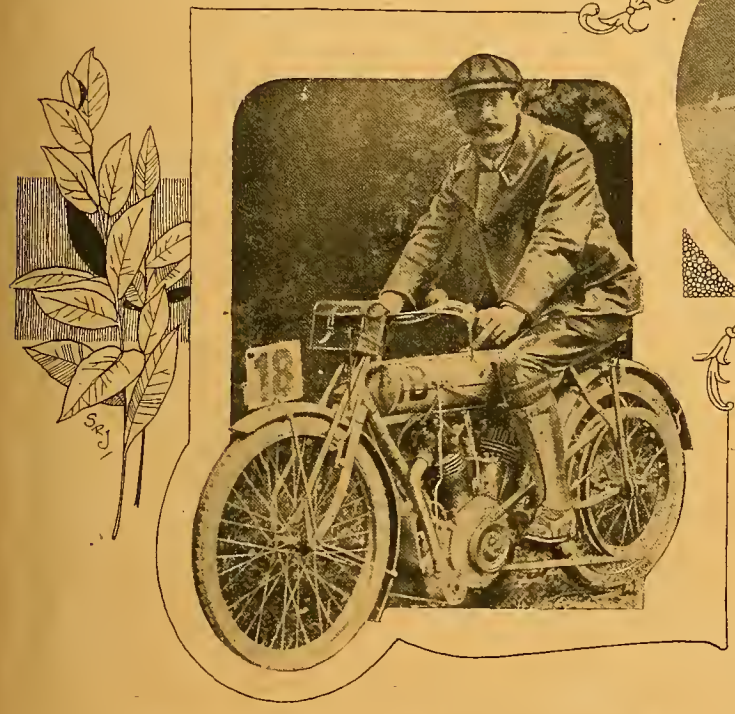
After much discussion pedal assistance was abolished and the petrol limitation was retained for 1908, but the allowance was cut down, singles now having to cover a hundred miles on a gallon, and twins eighty. This necessitated the two separate classes and two sets of awards as before. The event proved tremendously popular, and thirty-six machines actually started out of thirty-seven entries; but the twins proved the more popular, twenty-one coming to the post as against fifteen single-cylinders. Interest was chiefly concentrated on the duel between J. Marshall, a comparatively young Jehu, who had come to the front very rapidly on Triumph machines, and the two veteran Colliers, who as in 1907 elected to ride single-cylinder Matchless machines with J.A.P. engines. In 1907 H. A. Collier had smashed his piston in the ninth round, but his brother had estimated his carburetter adjustment slightly more accurately than Marshall, and beat him by two miles in every hour. In 1908 the chance of H. A. Collier's running the couple close increased the excitement, but he never showed very prominently, and ran out of petrol before the finish. His brother and Marshall fought out a battle royal, and by a turn of fortune's wheel Marshall scored a very popular victory, riding brilliantly, and defeating his more practised rival by 2m. 10s. at an average speed of 40.4 m.p.h. The twins were again beaten for speed, H. Reed registering a 38½ m.p.h. average with a Dot-Peugeot. Twenty machines completed the distance (the slowest averaging nearly 30 m.p.h.), so reliability was clearly on the up grade.

1909.

Last year saw further alterations in the conditions, which were of a popular character, and procured a record entry. The fuel restrictions were abolished, and cubical capacity introduced as the deciding factor, singles being allowed 500 c.c. and twins 750 c.c. The two-stroke engine also made its first appearance. An even more radical alteration was the including of singles and twins in a single race, and, as events proved, the handicap advantage had been transferred to the twins. Previously these machines had been repressed by a harsh fuel limit, but now the race was made a gift for them by an excessive advantage in engine dimensions. This advantage has been reduced for the race of 1910 by the reduction of the twin-cylinder capacity to 670 c.c., but few riders consider

The Great Motor Cycle Road Races of History.—

that the single cylinders have any reasonable hope of victory to-day. The Collier-Marshall duel was terminated in sentiment, as the Colliers naturally elected to ride twins. Marshall put up a magnificent ride as far as the seventh round in an effort to hold his own with the twins. He was second, and only three minutes behind the leader, when trouble overtook him. C. R. Collier was "outed" early on by his belt coming off, but his brother had a rare battle with Lee-Evans, riding the 5 h.p. Indian. Evans led for five laps, and started the sixth round with a two-minute advantage, which he lost when he stopped to fill his tanks. Collier snatched a lead of seventy-eight seconds in this lap, and as his machine ran better and better, while the Indian fell away a trifle, he eventually finished a good winner by four minutes, after averaging close on 50 m.p.h. Lee-Evans averaged 48. After Marshall's retirement, Godfrey on a Rex and Newsome on another Triumph ran each other hard for the third place, which meant the fastest single

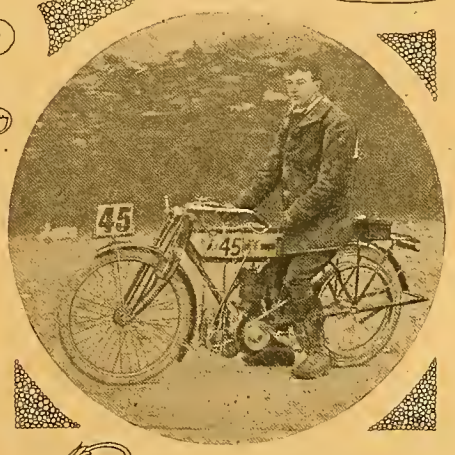


H. A. Collier (5 h.p. Matchless-J.A.P.), winner of the Tourist Trophy in 1909.

in the race, Newsome eventually getting home twenty-one seconds ahead. Collier registered the record lap (18m. 9s.), and Newsome did the best lap time of the single-cylinders (18m. 51s.) Nineteen riders completed the course, but the deficit was due rather to a killing pace than to any lack of reliability. To-day's race promises to be even more exciting, and to demonstrate the attainment of even higher efficiency. Barring accidents, the struggle for the first few places will be grim and desperate.

The T.T. Regulations Discussed.

Upon the events of this year's race the future will largely depend. The regulations remain a matter of somewhat keen controversy. One party assert with truth that with a little more experience we shall be able to balance the respective capacity limits for single and twin so accurately that in future races no prophet will be able to foretell whether a single or a twin will win. A perfect handicap of this design would inevitably produce the most sporting race, and, once settled, should not require varying from year to year. Another view, which I personally favour, considers that this policy will not serve to improve the breed of twins. Amongst a certain class of riders the twin-cylinder is deservedly popular; but the twin-cylinder enthusiast does not want a machine which in efficiency is the bare equal of a 3½ h.p. single, carries more weight, and is twice as complicated. What



W. F. Newsome (3½ h.p. Triumph), who rode the first single-cylinder machine to finish last year.

he wants is an altogether faster and more powerful machine. Whether he wants it for solo or passenger work, he wants it of from 5 to 8 h.p., and he is not concerned as to a few extra pounds of weight. The present T.T. regulations do not cater for such a machine; they rather tend to produce a special type of twin-cylinder, gradually dwindling in horse-power. If under the 1910 regulations the single is again outclassed, a further dwindling in twin-cylinder h.p. will be apparent if the policy is persisted in. Consequently, many people will prefer to see the T.T. split into two separate races—one starting early in the morning and concluding by noon, the other following immediately afterwards. This would avoid the confusion caused in 1907-8 by running two races simultaneously, and would develop each type of machine along independent lines. But the A.C.U. may turn out to be perfectly correct. The market for high-powered twins may gradually decrease, and the small twin of about 4 h.p. may be its solitary survivor. If the sidecar survives, there will be a demand for twins of from 7-8 h.p. Personally, I should welcome the double race for 1911, with a 750 c.c. or 800 c.c. limit for the twins. If in succeeding years a smaller twin seems desirable, the statistics of intervening races will render a return to the single race under an even handicap a simple proposition.

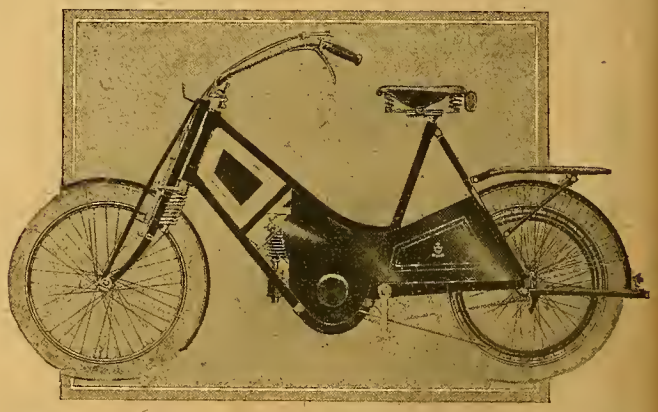
"By Ixion"

Semi-automatic Carburetters.

happen to possess "inside" knowledge that several leading firms have automatic carburetters practically ready for the market, and the unmechanical amateur may pluck up heart of grace in consequence. At this year's shows he will find machines which make far less exhausting demands on his intelligence than those of 1910. He will find carburetters which will enable him to climb hills like Birdlip and Sunrising with no other manipulation than rushing at them on an open throttle, and possibly retarding his spark a notch or so towards the summit; he will no longer fail because he muddles his air lever at a critical corner or patch of grease. Another firm inform me that they do not propose to adopt the automatic principle in its entirety. They are not yet satisfied that they can procure the same maximum efficiency without an adjustable air intake, so they will retain the two-lever control; but they are incorporating an automatic air device which will transfer the onus of the more delicate adjustments from the rider to the engine. Riders who are *au fait* with car hill-climbs will be aware that many sensational cars are fitted with carburetters which can be driven all day long without touching any engine lever save the throttle; yet for sprint purposes these cars are fitted with an extra hand-operated air valve, which enables the cute driver to coax a few more revolutions out of the engine, and also to snatch an even more terrific acceleration from it. The carburetter to which I am now referring is designed on these lines. An engine provided with this vaporiser can be started, speeded up furiously, and driven up precipitous hills without touching any lever but the throttle, nevertheless an air lever is provided. The engine is so little sensitive to this air lever that a muddlesome use of it will never stop the engine, or prevent its taking a bad hill in its stride; yet the cute driver can employ this lever to obtain fractionally better results. Several samples of this new carburetter will figure on racing machines in to-day's T.T. Race, where it ought to be of value. For instance, if a clump of riders essay the tortuous bends on the foothills of Creg Willey and interfere with each other, the hampered men can temporarily ignore the air setting and drive solely on throttle and valve lifter without fear of pulling up. Under such circumstances the rider of a 1909 carburetter might have to operate all his levers like greased lightning, and, if he blundered, might fail to climb the hill. Thus, an automatic carburetter will eliminate the personal factor in driving.

Bravo "Experientia Docet."

I do not know when I have read a letter with greater pleasure than No. 4757. The rider lives in the neighbourhood of Sutton Bank, and points out that, while perhaps few standard touring machines can climb Sutton after they have done a little work and dropped a percentage of "tune," Sutton is nothing of a climb compared with many other ascents in the neighbourhood. In other words, he presses home a strong indictment of single-geared machines. I have always asserted that a man who has once ridden a *good* two-speeder will never ride anything else. The recent craze for free engines is a mere compromise. In my opinion the free engine does not afford half so pleasant a start as walking a machine off on its low gear. It may be easy to balance a machine as it moves off from rest on a clutch; it is in my opinion easier to step calmly and deliberately on board when the machine is already popping along at five miles an hour. It may be easy to dawdle along in thick traffic slipping the clutch with delicate toe pressure; it is considerably simpler to drive on the valve lifter or throttle with a low gear engaged. When we come to steep hills, the emergency low gear makes a start from rest possible on most English road gradients with ease and certainty. I recently borrowed a free engine machine in perfect order, and I made certain experiments on hills with it. I took it to a steep hill with bad corners, which required a slow speed to negotiate with safety. If the clutch were slipped to reduce pace to a comfortable and safe figure, after turning the bend the engine failed to pick up the load with a single gear on the gradient, nor could it be reasonably expected to. I do not know a single argument in favour of the free engine clutch which is not an argument in favour of variable gears, and which does not apply with double force to variable gears. I regard the free engine as a temporary compromise, and I am glad to see from recent patent lists that one or two big firms, who have not so far ostentatiously dabbled in variable gears, have at last donned their thinking caps. I even venture to prophesy that ere long the standard 3½ h.p. machines will fall into two classes—the light, nippy, stripped, sporting T.T. mount, and the genuine go-anywhere tourist, with efficient springing fore and aft, ample weather protection, capacious luggage accommodation, and a change speed gear.



The Hobart Handy Ladies' Motor Bicycle weighing complete 105 lbs. The engine is 70 × 78 mm., fitted with adjustable pulley and free engine operated by a lever on the handle-bar. The tyres are 24 x 2¼. The dressguard and engine cover are made of sheet metal.

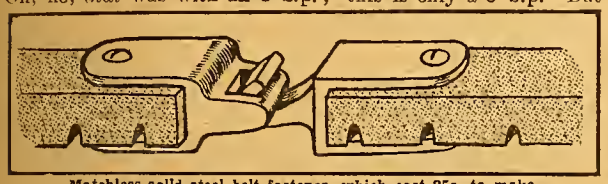
Lightning Interviews with T.T. Favourites.

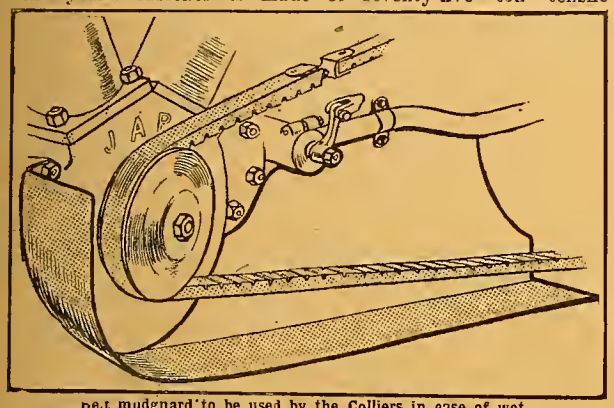
H. A. COLLIER. I found the winner of last year's T.T. Race in the stable of an inn hard by the Tynwald Hill. Here, in company with his brother, C. R. Collier, and H. V. Colver, he was assiduously tuning up his 6 h.p. twin Matchless-J.A.P.

"Yes," he said, in answer to my enquiries, "this is exactly the same machine as I have ridden at Brooklands. I have not altered it in any respect. Eighty miles an hour? Oh, no, *that* was with an 8 h.p.; this is only a 6 h.p. But



Matchless solid steel belt fastener, which cost 25s. to make.

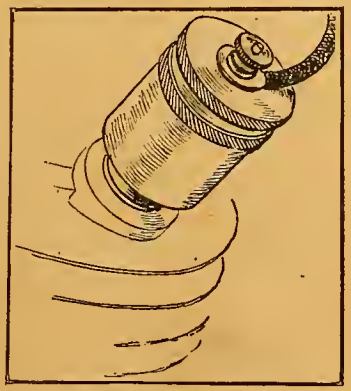
these machines will travel; we shall make them move if they want to pass us. I reckon the race will be won at fifty miles an hour or more this year; the twins especially have come on a lot. I don't see much change in the course. There are some nasty patches of loose stones, but I suppose they are going to be rolled in. Any remarkable points about the machine? Well, there's this belt fastener. Charlie had trouble last year through his fastener breaking, so we made up our minds not to have the same experience again. This year's fastener is made of seventy-five ton tensile



Belt mudguard to be used by the Colliers in case of wet.

strength chrome steel, and cut out of the solid bar; it plays the bear with the milling cutters, but that doesn't matter so long as it's what we want. No, it isn't cheap. I reckon each one costs about 25s.—there's so much labour on them. It's the starting and stopping that smash the ordinary fasteners—they won't stand the snatching of these big twins—but it would take a big engine to do much damage to this sort.

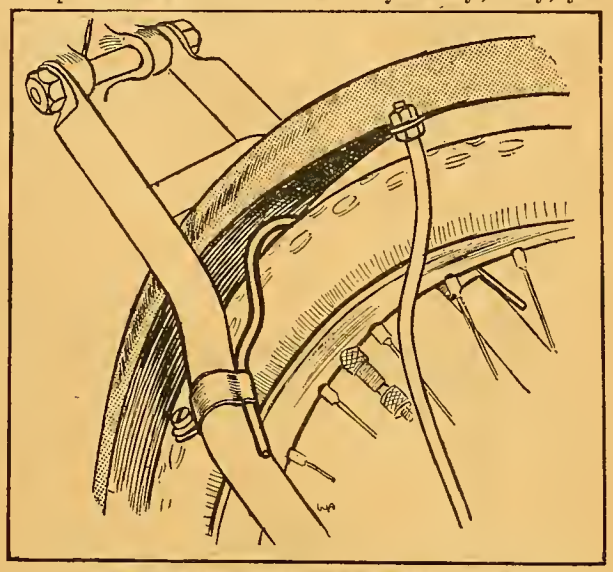
"Everybody's asking me if I'm not afraid of the race being held on a wet day. Well, of course, a lot of the belt-driven machines will start giving trouble, and that'll make it all the easier for the chain-drivers, but I don't expect our bicycles will suffer anything from wet. This shield here keeps all the mud off the belt. You could take the machine through the worst rain and roads, and your belt would never slip an inch. Then, in case it *does* rain, I've got this little fibre sparking plug cover to prevent mud and wet getting thrown on to the front plug and causing 'shorts.' Oh, yes, we make them ourselves—turn them out of the solid—and a nasty job, too. The fibre has a regular grain to it, and you have to cut across it.



A special plug cover to prevent misfiring by wet. (See interview with H. A. Collier, last year's winner.)

"Oh, and there's this nail catcher; it's out of sight and out of the way, but it does its work all right. I really believe it prevents ninety per cent. of the punctures that we'd get otherwise. Still, we've brought over sixteen pairs of tyres, and we can soon get some more if they don't last.

"No, we don't have any difficulty in keeping ourselves fit. See that hill over there—I suppose it's really a mountain—it looks easy enough, doesn't it? Looks as though you could run up it. We all of us tackled it yesterday; why, you



A simple nail catcher to be used by the brothers Collier.

can't walk up it, it's too steep. We were three hours getting to the top, and we had to come down—well, sitting. And we've brought a football this year just to give us something to play with. One of these days we shall have a match, 'Plumstead Matchless' *versus* the 'Tynwald Hillians.'"

Then, running out with his motor bicycle, H. A. Collier jumped into the saddle, and soon I could only hear the distant soothing purr of his J.A.P. engine.

* * *

G. LEE EVANS. The wigwam of the Red Indians is at Peel, and here I found G. Lee Evans, who ran so good a second in the 1909 race. I was lucky enough to catch him between the attractions of a motor fishing boat and a skating rink.

"What do I think about the course, and about my chances, and about the other machines? Well, as a matter of fact, I *don't* think about them. I never think about *anything* when I'm motor cycle racing. It doesn't do. Anyhow, it's not much good you trying to interview *me*; I'm no good at that sort of thing. Oh, well, I'm really no judge of it at present, for I've only been halfway round as yet—we only came over the day before yesterday—but I think it's better and smoother than it was before. This isn't the same machine as I have been using on the track; it has a lower gear, but if I find the engine will pull the machine up the hills on a higher gear I shall fit it. Yes, all the machines are standard in every particular.

"Wet; no, indeed, *we* don't want wet, we want the Indians to win on a fine day. If it was a wet day, people would simply say, 'Oh, you won because your bicycles were chain-driven; if it had been fine you would have been beaten.'

"I don't think there's any sense in trying to save time round the corners; you stand too much chance of losing more seconds than you gain in having to pull yourself straight after you've managed to get round—if you do. It's a case of going a good steady speed and keep on doing it, and the race won't necessarily be won by the fastest machine. Reliability has as much to do with it as pace. I believe that the whole art of motor cycle racing—on the road at all events—

Lightning interviews with T.T. Favourites.—

lies in knowing when to go all out and when to slacken speed."

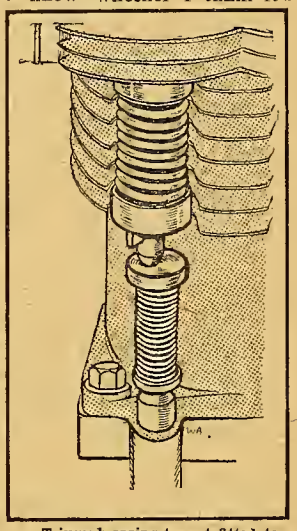
Which sentiment shows *one* reason why Lee Evans has been so successful. Another, he would tell you, is the Indian motor bicycle.

* * *

J. MARSHALL.

Second in the single-cylinder class in 1907 and first in 1908, Marshall has already written his name large on the scroll of T.T. honours.

"The course? Well, I don't know whether I think it's better or worse than last year and the year before. It's certainly easier, and that's one of the points I don't like so much. Take the Ballacraine corner, for instance—well, that's all been banked up, and the result is that that part of the circuit is ever so much easier than it used to be. It doesn't call for half as much skill in going round it as it did before, and I think that's rather a disadvantage. It makes the T.T., which is the only road race, too much like a track race, and it doesn't give a man who is a good road rider any advantage over somebody who goes 'blinding' round all the corners.



Triumph spring tappet fitted to exhaust and inlet valves to prevent bouncing and consequent breakage.

"Still, I think it will be a close race. I don't expect to win it myself; in fact, I don't see how any single-cylinder machine can have a chance to beat the twins. Oh, yes, there's no doubt the Triumphs are faster than they were last year. You see, the 85 mm. × 88 mm. engine was new to us last year, and we didn't know so much about that particular size as we do now. Since then we've done a good deal of experimenting, and the result is that this year's machines are quite three or four miles an hour faster than last year's.

"No, there's nothing new about them, except one little detail; they're just ordinary Triumphs. This spring tappet is the only alteration, or, rather, I should say, it's an addition. It's just a spring under the tappet which acts as a sort of dashpot to the valve, and prevents it hammering. I don't really know whether it makes the engine give any more power; anyhow, it doesn't give any *less*, and I think it's a little quieter. The point is the valve stands a much better chance of lasting, because it's not so likely to knock its head off, and, after all, if you've got a certain amount of speed, reliability is what wins you the race."

* * *

F. A. McNAB.

The phenomenal success which this great rider—he stands some 6ft. 2in., if not more—has achieved on the track has caused him and his machine to be quite a centre of interest. The manner in which he folds himself up and packs himself on to his machine is a masterpiece of specialised anatomical adaptability, which results in his being a firm favourite with the crowd.

"Win? Bless you, no, I don't expect to stand a chance with the twins. What I'm out for is to finish ahead of all the other singles. Still, I shan't go 'blinding' round corners, because I intend to finish somehow or other. That being so, I haven't lightened my bicycle at all, as I hear some competitors have; on the contrary, I've made it a good deal heavier, for the machine I am riding is my Brooklands racer with a much heavier and stronger frame. That back stay from the rear hub to the crank case? Well, I should rather think I have retained it! I believe that the extra rigidity it gives to the frame is more than helpful on greasy roads, and that isn't only my experience by any means. Spring forks? No, thank you, not for me! All right for touring, but no good for racing—at least that's *my* opinion.

"What do I think of the course? Well, of course, it's rather hard for me to give an opinion, because it's my first T.T. road race. I don't think it is any too easy; in fact, just the reverse. I believe a little more banking up at some of the corners would have been an improvement.

"Oh, by the way, there's one point that might interest you. My engine has not only a ball bearing crankshaft, but a ball bearing big end, and I daresay it's the only one of its kind in the race. Then, again, I believe I'm the only rider using dry batteries. As you know, I believe in them."

Practising on the Course.

Although practising commenced on Wednesday last week very few machines turned out on that day; in fact, not more than half the competitors had arrived in the island in time to make the necessary preparations. Thursday morning, however, saw a good muster of riders, the following being out on the course: H. A. Collier, Bennett, Lee Evans, Clarke, Woodman, Bentley, Marshall, Newsome, Creyton, Drury, Colver, C. R. Collier, A. H. Alexander, F. A. Applebee, Myers, Norton, McNab, J. R. Alexander, Philipp, Moorhouse, Scriven, Quentin Smith, Murphy, Crundall, Yates, Baxter, Grange, Abbott, McMinnies, F. W. Applebee, and Brown.

Accident to A. E. Woodman.

The morning was marred by a most regrettable accident to A. E. Woodman, the young New Zealander, who has already won his racing spurs on the Indian machine at Brooklands. The stones laid down on the road between Cronk-y-Voddy and Kirk Michael were still unrolled, and presented a nasty danger spot to all the competitors. It appears that in traversing this loose metal one of Woodman's tyres was punctured. He effected a repair, but it was evidently done too hastily to hold up, and whilst descending the hill and taking a corner a mile past Kirk Michael the tyre—the front one—gave out. The machine plunged towards the left side of the road, where Woodman was thrown off, his right leg striking the wall and being badly fractured. This unfortunate mishap practically put a stop to practice for the day.

Woodman was making his first trip round the course, and cannot have been aware of its trickiness, else he would not have travelled so fast as to cause so grave a disaster.

Poor Woodman has had to pay a cruelly heavy penalty for his misfortune on Thursday. It has been found necessary to amputate his leg.

In the highland parts of the course the roads were firm, dry, and in good condition, but the rain of the previous day had resulted in the road from Peel to Ballacraine being sufficiently greasy to cause some riders a good deal of inconvenience. Amongst the minor incidents were mishaps to Smith, Crundall, and Applebee, but none of them required more than patching with sticking plaster.

Myers and Philipp, whose Scott machines have aroused the liveliest enthusiasm in Douglas, where it is confidently asserted that they are ladies' machines, and that ladies will ride them in the race itself—the practice only being carried out by men riders—did some remarkable speed work, and took the corners in fine style. The former rider had a narrow escape from colliding with some cows which had been allowed to stray on the course. The carelessness of farmers in this respect is causing a good deal of annoyance.

Owing to the King's funeral on Friday practising was entirely suspended.

A Racer with 18in. Wheels.

The machines which have arrived in the island so far show a remarkable freedom from freakishness. Perhaps the most *outré* machine is a 5 h.p. twin-cylinder A.S.L., which has only 18in. wheels. It has, of course, been subjected to a good deal of good-tempered badinage, and has been christened "the motor-propelled roller skate." The Premier and Moveo machines are put up at the Sefton Hotel, Douglas. The former look a very speedy and handsome team. The Moveo team is composed of two twins and one single. These machines have J.A.P. engines and their most notable individuality is that the magneto is situated behind

Practising on the Course.—

the cylinder and level with the cylinder head, where it is driven by an enclosed bevel gear and an inclined shaft.

Crundall and Yates's chain-driven Humbers seem very speedy, and their machines have some very novel features; many regard these riders as dark horses.

Among the private owners Drury and Franklin are thought to stand a good chance, as they have previous acquaintance of the course.

Saturday Morning at Ballacraine Corner.

With the recommencement of practice on Saturday all traces of the greasy wet which Wednesday's rain had produced on some parts of the course were lost, and it was therefore in the pink of condition, with the exception of the patches of stones, which have now been thoroughly rolled in—and quite time, too—but which on Saturday morning were still muddy from the rolling operations.

Nearly all the competitors had arrived in the island on Saturday, and there was accordingly a very large muster of machines for practice. The following riders were on the course: H. A. Collier, Colver, and C. R. Collier (Matchless); Bennett, Lee Evans, Bentley, Franklin, J. R. Alexander, Moorhouse (Indians); Marshall, Newsome, Creyton, Adamson, Quentin Smith, Murphy, McMinnies (Triumphs); Godfrey, Alexander, F. A. Applebee, Rem Fowler, Scriven, Bolton, Baxter, Grange, Bagshaw, Abbott, Woodward, Baxter, and Ellis (Rex); Myers and Philipp (Scotts); Crundall, Yates, Brown (Humbers); Stanley, Jones, Shaw (Premiers); Slaughter, Groves (Ariels); F. W. Applebee, Chase (Centaurs); Sirett, Heaton (N.S.U.'s); Pimm (A.S.L.); Scale (Scale); Rea, Loxham, Holding (Moveos); Norton, Brewster (Nortons); McNab, Gibson (Trump-J.A.P.'s), Reed (Dot); and Blumfield (Blumfield).

There was, unfortunately, one mishap, which has removed a second rider from the race. Quentin Smith, a local competitor, ran into Adamson, whose belt had broken whilst ascending the hill near Kirk Michael; both were thrown, with the result that Quentin Smith had his collar-bone broken, while Adamson got a bruise or two.

It is a pity that some of the competitors desire to make, or renew, their acquaintance with this tricky course at such a high speed, as there is still plenty of time, at the time of writing, to develop speed. Generally speaking, the old hands, those to whom this is their third or fourth T.T., set a remarkable example of care and self-restraint, and one cannot help noticing how quietly and warily they negotiate corners which must now be quite familiar to them.

Fine consistent work has been done by the Matchless stable, those three redoubtable "C's" who have jockeyed so many winners; whilst the neat little twin Premiers have shown that as speed-machines they are a pair very much to be reckoned with. The Indians and Triumphs, as might be expected, uphold their reputations for consistency and speed.

It seems extremely probable that the average speed of last year's winner, viz., 49.002 miles per hour, will be improved on, as several competitors have already beaten the previous figures in practice without pushing their engines to the limit.

On Saturday afternoon a meeting of the Manx Automobile Club was held at Mr. T. Moore's beautiful residence, "Billown," between Ballasalla and Castletown, to which the competitors were invited. Very few, however, turned up, and they missed, therefore, a most delightful afternoon.

I returned from watching the practising on Monday with the settled conviction that, unless the conditions governing the negotiation of Ballacraine corner be radically altered, there will be an outcry against repetition of the race next year—at any rate on the present course. Ballacraine corner consists of two branches of four cross roads which lie on the side of a slight hill, which results in the banking of the road, itself lying in exactly the reverse direction from what it should. To make matters worse, the turn is, if anything, sharper than a right angle, and the road up which the competitors go is completely hidden by the Ballacraine Hotel wall, which forms the actual apex of the angle. Worse still, the road is none too wide, the surface is by no means perfect, and the turn is faced by an ugly wall of rough limestone. Now, there is a great temptation to get round this corner at a good speed, inasmuch as one comes downhill towards it. The descent is admittedly slight, but still a hill. Competitors then turn the corner, and go up a hill with quite a noticeable gradient. In view of the dangerous character of the road in its ordinary state artificial banking fashioned out of planks of wood and having an angle of about 60° and a total length of as many feet has been erected against the stone wall. This, of course, permits the corner to be taken at a slightly higher speed because it virtually gives the road a few feet more width.

Accident to Brewster.

This morning there were at least half a dozen mishaps at Ballacraine, all of which might have been attended with most serious consequences, and one of which escaped being fatal by one of those miraculous instances of good fortune which come so regrettably seldom.

Brewster, on a Norton, in attempting to take the corner at an altogether impossible speed found himself unable to turn sufficiently to get to the artificial banking, and dashed head on into the stone wall. The front of the machine was completely smashed, but the rider fortunately escaped with severe concussion, though at the time of writing the extent of his injuries are not yet known. An inspection of the machine revealed the fact that the brakes were not in the best of order, and further it is said that Brewster's eyesight is not unimpeachable. Neither of these facts, however, ameliorate Ballacraine corner, for men of experience, whose eyesight and brakes are beyond reproach, found themselves in great difficulties from which they were lucky enough to escape with nothing worse than a few bruises and a scratch or two. Accidents will happen even on the best of courses, but still one cannot help feeling that if there are so many minor mishaps in practice, when there is no need to go at full speed, matters may be more serious in the actual race. Talking over the question with several competitors I learnt that none of them relish it, and that most of those I spoke to would like to see it made a control. Several rightly argue that if artificial banking is necessary the race has ceased to retain its true "Tourist" character. The most notable performers during practice on Monday morning were: Bowen (Bat), who got round the course in 19m. 45s.; Stanley (Premier), 19m. 45s.; and H. A. Collier (Matchless) and Eric Myers (Scott), both of whom took 20m. The above times are unofficial, but may be taken as fairly accurate.

W.G.A.

,, 30th	... ...	9. 3 ,,
June 2nd	... ...	9. 6 ,,

Excursions to the Isle of Man.

As a result of the paragraph in *The Motor Cycle*, Mr. E. G. Young, of Nottingham, made up a party of fifteen Nottingham motor cyclists to travel to the Isle of Man to witness to-day's race for the Tourist Trophy.

London-Edinburgh Awards.

The committee of the Motor Cycling Club met on Monday evening to consider the awards in connection with the London-Edinburgh and back run. The official list is given on another page of this issue. Our list of survivors in the double journey competition published last week was unfortunately incomplete, the names of J. S. Holroyd (Moto-sacoche), Stanley Webb (Triumph), and W. S. Squire (Quadrant) being omitted.

The T.T. Race—Its Origin.

To-day, when so much interest is being taken in the result of the great race for the Tourist Trophy, it is opportune to point out to our readers that the original suggestion for holding the race emanated from us when proposing the "Sport and Pastime" at the Auto Cycle Club annual dinner, on January 17th, 1906. We said then we hoped that some competition could be arranged on the lines of the Tourist Trophy for motor cycles. (The Tourist Trophy referred to was, of course, the car trophy.) The original suggestion was that the engine dimensions should be limited to 80 × 80 mm., and the weight of the machine 130 lbs. with mudguards and brakes.

The Daily Press Again.

A Doncaster paper referred to the London-Edinburgh run as a "non-stop motor cycle race from Edinburgh to London"—quite an amusing specimen of jump-conclusion news reporting.

T.T. Riders at Brooklands.

A number of Tourist Trophy competitors have entered for the races at Brooklands on Saturday. Immediately after the race they will leave the island for the Weybridge track.

Police Traps.

We have received information of a police trap working between Frimley Green and Farnborough Station, and between the Queen's Hotel, South Farnborough, and a house about 100 yards further along the main road.

French Motor Cyclists and Aviation.

Lucien Lesna, the ex-champion road crack, who met with a very bad smash whilst competing in the Paris-Madrid race on a motor cycle, which resulted in a stiff leg for life through injuring his knee cap, is now experimenting with flying machines at Pau. Another old-timer, Victor Rigal, who was an expert on the motor tricycle, is now a successful aviator.

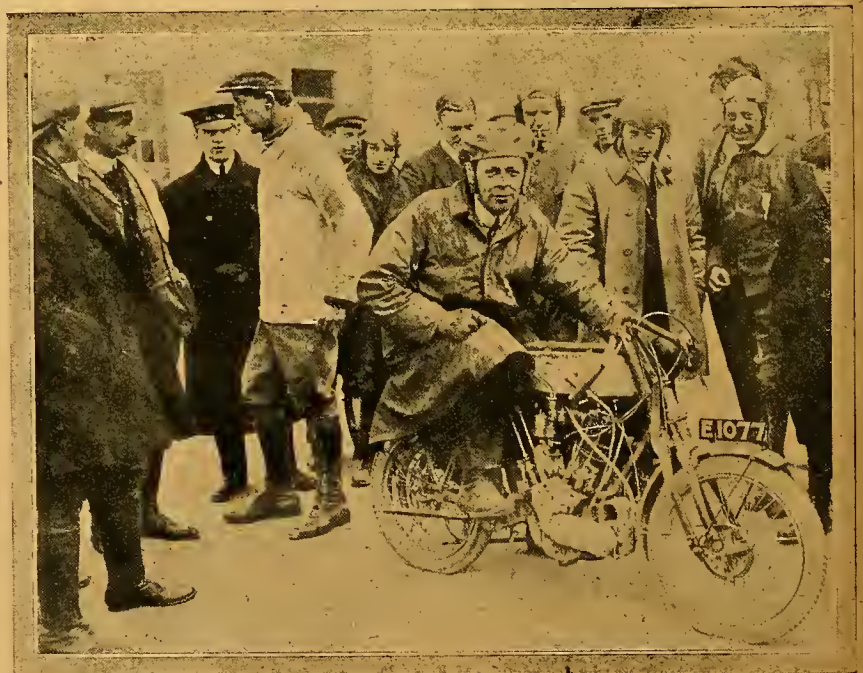
Saturday's Meeting at Brooklands.

Next Saturday the postponed Whit-Monday meeting takes place at Brooklands. After the postponement had been decided upon the entry list was thrown open again, and there are twelve competitors in the May Handicap, and twenty-seven in the Whitsun Handicap.

Fresh Records by Martin.

Harry Martin put up two new records at Glasgow on Saturday last, the occasion being the Celtic F.C. and West of Scotland Harriers' joint sports. Martin rode a 6 h.p. twin Martin-J.A.P. with A.S.L. suspension. The track was Parkhead, and was in excellent condition, and is one with which Martin is quite familiar. The first record to be attacked was that for the three miles made by Martin on this same track two years ago. With his machine in perfect tune, the rider wasted no time in starting, and was soon in front of his previous time, with the result that he brought down his record from 3m. 36⅗s. to 3m. 20⅕s. Later he started on an attempt to improve the existing record for the mile of 1m. 6⅖s., and succeeded in reducing it by 1⅖s. Not satisfied with the margin, he made a further attempt, and cut off another fifth of a second, bringing the record down to 1m. 5⅕s. These figures are not to remain unchallenged however, for on June 4th the Collier brothers are due at Parkhead and will endeavour still further to reduce these times.

PRACTISING ON THE MANX COURSE.



S. Findlater (A.S.L.-J.A.P.), 18in. wheels, B. and B. carburetter, Bosch magneto, Moseley tyres. A number of T.T. competitors may be recognised in the background, including Slaughter, Dayrell, Alexander, and Yates. At the extreme left are F. Straight and G. E. Roberts.

M.C.C. LONDON-EDINBURGH RUN RESULTS.

A COMMITTEE meeting of the Motor Cycling Club was held on Monday evening to consider the awards in connection with the above run at Whitsuntide. The penalty for being fifteen or more minutes ahead of schedule time at any point of the run was disqualification.

Gold Medal Winners.

E. B. Dickson (5 Indian)
E. Gwynne (7 V.S.)
F. Smith (5-6 Clyno)
H. M. Barton (3½ Humber)
Capt. P. J. Harkness (2¼ Enfield)
F. E. Wasling (2¼ Enfield)
P. Philipps (2¾ Douglas)
P. Janson (3½ Bat)
G. L. Fletcher (2¾ Douglas)
W. Hornsby (4 Cheviot, J.A.P.)
W. M. T. Atkinson (3½ Cheviot)
G. Wray (3½ Bradbury)
J. S. Holroyd (1½ Motosacoche)
R. G. Fray (1¾ Motosacoche)
H. Gibson (3½ Bradbury)
C. B. Ferguson (3½ Triumph)
A. T. Stanton (3½ Bradbury)
R. Ellis (5 Rex)
H. Roberts (3½ Phelon and Moore)
W. Pratt (3½ P. and M.)
P. Shaw (3½ Phelon and Moore)
E. Kickham (2¾ Douglas)
H. G. Byng (3½ Phelon and Moore)
L. G. Byng (3½ Phelon and Moore)
T. S. V. Phillip (1½ Motosacoche)
Capt. Sir R. K. Arbuthnot, Bart., R.N. (3½ Triumph)
G. Lee Evans (5 Indian)
S. Wright (3½ Humber)
F. H. Mullett (3½ Triumph)
B. C. Howard (5 V.S.)
W. L. Squire (3½ Quadrant)
B. Allan-Hill (3½ Kerry-Abingdon)
W. Cooper (3½ Bradbury)
J. Eastwood (3½ Bradbury)
S. Webb (3½ Triumph)
P. Platt (3½ Bradbury)
R. M. Brice (3½ Brown)
G. W. Raper (6 N.S.U.)
G. E. Purchase (3½ Triumph)
S. W. Carty (3½ N.S.U.)
L. A. Baddeley (4½ Paddeley)
D. S. Baddeley (6 Baddeley)
Eli Clark (2¾ Douglas)
H. W. Turner (3½ Triumph)
P. E. Tolfree (3½ Matchless)
A. V. Deacock (3 Wanderer)
J. Godsall (6-7 Bat)
A. C. Robbins (3½ Humber)
H. Karslake (4 Dreadnought)
F. A. Hardy (5 V.S.)
R. C. Davis (6 Griffon)
W. C. Wasley (2¾ Douglas)
C. S. Perryman (3½ Ariel)
J. Stevens (2 Wolf)
P. Stevens (3 Wolf)
Dr. C. B. Moss-Blundell (3½ Triumph)
F. C. North (3½ Ariel)
L. Vedy (3½ P. and M.)
P. R. Heighton (3½ Humber)
C. B. Duberly (3½ Ariel)
G. E. Roberts (3½ Rex)
A. G. Peppercorn (3½ Triumph)
G. Brough (3½ Brough)
W. Price (3½ Rex)
G. Jacobs (5 Vindec)
A. Webster (2¾ Handy-Hobart)
A. J. Gilpin (2¼ Enfield)
E. R. Hibbert (5 Rex)
J. H. Slaughter (3½ Ariel)
W. W. Douglas (2¾ Douglas)
F. Watson (3½ Triumph)
H. G. Bell (2¾ F.N.)

PASSENGER MACHINES.

H. Williamson (Rex Sidette)
V. Olsson (J.A.P.)
E. W. Brighten (Chater-Lea, J.A.P.)
W. Lamm (5 V.S.)
E. Frasetti (7 V.S.)
W. Watson (9 Chater-Lea, J.A.P.)
A. H. D'Aeth (7 V.S.)

All the above are sidecars.

Silver Medal Winners.

A. L. Colyer (3½ Humber)
E. T. Newton-Clare (5-6 A.C. tricar)

Bronze Medal Winners.

E. J. Pocock (6 Matchless and sidecar)
W. Chater-Lea (7-9 Chater-Lea and sidecar)

The Double Journey Competition.

Those who completed the double journey of 800 miles, and will receive special gold medals, are as undernoted:

E. B. Dickson	*E. Kickham	*C. B. Duberly
E. Gwynne	S. Wright	*G. Brough
*F. Smith	*Eli Clark	*W. L. Squire
*G. Wray	*A. V. Deacock	*S. Webb
*H. Gibson	G. Jacobs	*A. Webster
J. S. Holroyd.	*H. Karslake	V. Olsson
*P. Philipps.	*A. T. Stanton	E. Frasetti
*G. L. Fletcher	Allan Hill	A. J. Gilpin
H. Roberts	*F. C. North	E. W. Brighten
W. Cooper		

*Signifies competitor for the M.C.C. Challenge Cup.

WINNER OF THE M.C.C. CHALLENGE CUP.

The winner of the Motor Cycling Club Challenge Cup, awarded to the competitor covering the double journey (out and home) closest to schedule time, is G. Brough (3½ h.p. Brough); total variation in time, 10m. 43s.

Harold Karslake (4 h.p. Dreadnought) is the runner-up for the cup with a total variation from schedule time of 16m. 39s.

The committee has also awarded a special gold medal to F. J. Jenkins, whose Rover car carried the travelling marshals. The accuracy of the timing was greatly facilitated by the loan to the club of six Kew certificated watches which were provided by Messrs. Rotherham and Sons, Ltd., of Coventry.

TO-DAY'S TOURIST TROPHY RACE.

Where "The Motor Cycle" Telegrams will be Displayed.

Only a small proportion of the thousands of our readers will be able to witness the Tourist Trophy Race in the Isle of Man, which starts to-day at 10 a.m., and as the daily press takes little or no cognisance of this event we have arranged in the four large centres of the motor cycle industry and pastime, namely, London, Coventry, Birmingham, and Manchester, to display wires which will show the first, second, and third riders at the end of each lap. Thus the progress of the race may be watched at the following points:

LONDON.

E.C.—Bancroftian Co., 49, Bishopsgate Street Within.
Benetfink's, 107, Cheapside.
Hunt's Stores, 104, Newgate Street.
A. W. Gamage, Ltd., Holborn.
Richford and Company, 153, Fleet Street.
W.C.—Service Co., Ltd., 292-293, High Holborn.
Taylor and Co., 21a, Store Street, Tottenham Court Road.
North British Rubber Co., corner of Long Acre and St. Martin's Lane.
W.—Maude's Motor Mart, 136, Great Portland Street.
Selfridge's (Motor Department), Oxford Street.
S.W.—Harrods Stores (Motor Department), Brompton Road.
E.—Eastern Garage, 48, Romford Road, Forest Gate.
S.E.—Collier and Sons, Ltd., 18, Herbert Road, Plumstead.

COVENTRY.

Iliffe and Sons, Ltd., Hertford Street.

BIRMINGHAM.

T. Clayton and Sons, Ltd., 125, New Street.

MANCHESTER.

Triumph Cycle Co.'s Depot, 160, Deansgate.

Practising on the T.T. course. A competitor about to pass another at full speed.

It is interesting to know that the Triumph Company have insured all the private owners riding Triumph motor cycles. The names of the intrepid band of men are, J. W. Adamson, H. Lister Cooper, W. G. McMinnies, Quentin Smith, Howard Smith, and C. E. Murphy.

The Triumph Company will present gold medals to all private owners riding Triumph machines who succeed in finishing the course.

CLUB NEWS.

Doncaster and District M.C.C.

The speed-judging competition on the 16th inst., from Doncaster to Worksop, *viâ* Tickhill, resulted as follows: 1st, J. S. Smith (3 h.p. Bradbury), average difference from schedule 46½s.; 2nd, G. W. Dew (3½ h.p. Triumph), average difference from schedule 62s.

Edinburgh M.C.C.

On Saturday last the Edinburgh Motor Cycling Club held a members' speed contest in the grounds of Whitehall, Rosewell, which were placed at the club's disposal by kind permission of Col. Wardlaw Ramsay, one of the hon. presidents of the club. The surface of the avenue being of the very smoothest, and the day being fine, made the contest a great success. There was a big turnout of spectators.

CLASS I.—One Mile. (For machines with engines of 520 c.c. or under. Flying start.)

	Rider and machine.	m.	s.
1.	P. E. Tolfree (3½ Matchless)	1	16 3/5
2.	N. Macmillan (3½ Scott, two-stroke) ...	1	23 1/5
3.	C. H. Macmillan (3½ Scott, two-stroke)...	1	28 2/5
4.	C. E. Stewart (F.N., four-cylinder) ...	1	29 3/5

CLASS II.—One Mile Novice. (For machines of any capacity. Flying start.)

1.	D. Cairns (5 Rex, twin)	1	15
2.	R. Dixson (3½ Matchless)	1	21 2/5
3.	C. E. Stewart (F.N., four-cylinder) ...	1	25 2/5

Edinburgh M.C.C. Speed Contest at Colonel Wardlaw's estate, Whitehill. Start of the final of the half mile race. On the left A. Macmillan (5 h.p. Bat-J.A.P.), the winner; on the right D. Cairns (5 h.p. Rex Speed King).

CLASS III.—One Mile. (For machines of any capacity. Flying start.)

1.	C. McGregor (3½ Bat)	1	8 1/5
2.	A. Macmillan (Bat, twin)...	1	8 3/5
3.	P. E. Tolfree (3½ Matchless)	1	15
4.	D. Cairns (Rex, twin)	1	16 2/5
5.	N. Macmillan (3½ Scott, two-stroke) ...	1	22 2/5
6.	Colin Macmillan (3½ Scott, two-stroke)	1	25 2/5

CLASS IV.—Flexibility Class. (Same gear to be used both in fast and slow times, slipping clutches barred.)

1. N. Macmillan (3½ Scott, two-stroke).
2. C. H. Macmillan (3½ Scott, two-stroke).
3. R. White, jun. (3½ Triumph).

CLASS V.—Half Mile. (For machines of any capacity. Standing start.)

1. A. Macmillan (Bat, twin).
2. D. Cairns (Rex, twin).

Worcestershire M.C.C.

The opening event takes place on June 9th in the form of a speed-judging competition. W. C. Ward has been elected captain and R. A. N. Hall vice-captain.

York County M.C.C.

At the week-end a hill-climb was held on Kirkstone Pass, the winner being F. Scott, on a 3½ h.p. Triumph. The fastest time was made by F. C. Speke (8 h.p. Speke and Ramsden).

Essex M.C.

Members and friends are asked to take special note of the event of Saturday, May 28th. This will take the form of a blockade running competition with the members of the Bancroft's School Troop of Boy Scouts.

Southern M.C.

The above club held a speed-judging competition last week-end over a nine-mile course on a Surrey road. The winning competitor was only three seconds out, as will be seen by the following results: 1, W. H. Nixon, 3s. slow; 2, H. Billing, 19s. fast; 3, H. W. Toler, 26s. fast.

Leicester and District M.C.C.

The class winners of the hill-climb on the 19th inst. are: Class I. (under 500 c.c.)—S. Briggs (3½ h.p. Triumph).
Class II. (over 500 c.c.)—R. Canham (6 h.p. Matchless).
Class III. (open).—Dr. C. B. Moss Blundell (3½ h.p. T.T. Triumph).

Burnley Victoria M.C.

This club held its first hill-climb on Saturday last in beautiful weather. The hill selected, Salterforth, near Barnoldswick, is one of the steepest in the district. The competition was decided under the A.C.U. formula. There was a large number of motor cycles entered, mostly 1910 patterns. The first event was for motor cycles with engines under 500 c.c. This was won by H. Halstead (3½ h.p. 1909 Triumph). The second was for motor cycles any capacity, and was won on formula by H. Walton (2 h.p. Moto-Rêve), who managed to reach the top by pedalling. The fastest time of the day was made by W. Tennant (5 h.p. V.S.); his time was 51 secs. = 28 miles per hour.

Derby and District M.C.C.

The results of the Whit-Monday reliability trials are given below. The course was 110 miles in length.

1. A. Mitcham (3½ h.p. Rex), cup and gold medal.
2. V. Clark (3½ h.p. Bradbury), silver medal.
3. H. Scarratt (2¾ h.p. Douglas), silver medal.

The following qualified for bronze medals: G. Baker, F. J. Ford, Boissier, Hewitt, Linnell, and Jordan.

Steps are being taken to pick a team for the M.C.C. Inter-club team trial on June 18th.

Birmingham M.C.C.

The above club held its annual Whitsuntide reliability trial to Lincoln and back on Tuesday, the 17th inst. There were twelve entries, and eleven started. All got through to time with the exception of one, whose machine suffered from a broken petrol pipe. Results are as follows:

Rider and machine.	Time lost or gained.	Total marks.	Order.
S. K. Jones (3½ L.M.C.)	10m. ...	940 ...	1
H. D. Jones (3½ New Comet) ...	23m. ...	858½ ...	7
R. Samson (3½ Reg-Samson) ...	46m. ...	664½ ...	10
H. J. Cox (1¾ Singer)	— ...	736 ...	11
W. H. Eggington (3½ Triumph) ...	15m. ...	904½ ...	2
H. J. Woodgate (3¾ Premier) ...	17m. ...	891½ ...	4
F. S. Whitworth (2¼ Enfield) ...	30m. ...	816¼ ...	8
R. W. Duke (3½ Triumph)	17m. ...	894¾ ...	3
D. Arter (3½ James)	21m. ...	873½ ...	5
W. Ryland (7 Matchless)	37m. ...	795½ ...	9
J. Troman (3½ Triumph)	22m. ...	871 ...	6

Each competitor had 1,000 marks allotted at the start, and for every ten seconds late or early at checking places one mark was deducted. The prizes are: First, Sangster Challenge Cup and club gold medal; second, club gold medal. Silver medals to all competitors whose performance is sufficiently meritorious; bronze medals to all completing the double journey in nine and a quarter hours.

Club News.—

Scarborough and District M.C.

In our report of the Speed Trials at Filey, held by the above club on Whit-Monday, the names of the machines ridden by the winners were not mentioned. They were as follows :

Class I.—G. Storey, 2¾ h.p. Minerva.
Class II.—C. H. Pugh, 3½ h.p. Minerva.
Class III.—C. L. Bedford, 3½ h.p. Triumph.
Class IV.—C. L. Bedford, 3½ h.p. Triumph.
Class V.—F. P. Johnston, 7-8 h.p. Matchless-J.A.P.
Class VI.—F. P. Johnston, 7-8 h.p. Matchless-J.A.P.

Motor Cycling Club.

The second race meeting and gymkhana will be held on Brooklands track on Saturday, June 4th. The motor cycle events will be :

Race for ordinary "touring" mounts with single-cylinder engines not exceeding 300 c.c. capacity. For novices only. Handicap. Distance, two laps of the track.

For ordinary "touring" mounts with multi-cylinder engines not exceeding 400 c.c. capacity. For novices only. Handicap. Distance, two laps of the track.

For ordinary "touring" mounts with single-cylinder engines not exceeding 550 c.c. capacity. For novices only. Handicap. Distance, three laps of the track.

For ordinary "touring" mounts with multi-cylinder engines of a cubic capacity between 400 and 1,000 c.c. For novices only. Handicap. Distance, three laps of the track.

For any type of motor bicycle with single-cylinder engine not exceeding 550 c.c. Handicap. Distance, three laps of the track. Open to any member of the club.

For any type of motor bicycle with multi-cylinder engine of a cubic capacity between 400 and 1,000 c.c. Handicap. Distance four laps of the track. Open to any member of the club.

Invitation Race for Silver Cup.—Between riders of leading makes of motor cycles. Distance, three laps of the track. This is to be a sporting race between selected representative drivers of the most popular makes of motor bicycles as offered to the public. The committee invite applications from members who desire to take part in the contest, and will carefully consider every application and select one suitable machine of each recognised make submitted to them.

Hill-climb.—Flying start. Open to any member of the club. On any type of motor bicycle. Handicap.

Richmond and Surbiton M.C.

The annual general meeting was held recently at the residence of Dr. Paul, when it was agreed to change the name of the club from "The Richmond and District Motor Club" to "The Richmond and Surbiton Motor Club." The Hon Sec. presented the accounts and his report for the past year, which was a very favourable one, the club having made great strides, and the prospects for the ensuing year appear to be even more favourable. It was decided to appoint Dr. Paul as the captain of the motor cycle section. There will be four valuable silver challenge cups for competition this year. The Hon. Sec. tendered his resignation owing to pressure of business, but as the members present declined to accept it he agreed to continue. The Marquis de Mouzilly St. Mars was again elected president of the club, and a vote of thanks was passed for his very generous support in the past. Anyone wishing to join the club should communicate with the Hon. Sec., Mr. H. C. King, "Walton House," Surbiton Road, Kingston-on-Thames.

Coventry and Warwickshire M.C.

Entries may now be sent in for the twelve hours run along the Holyhead Road to North Wales, fixed for the 4th prox.

Competitors in the Redditch and District M.C.C. Hill-climbing Competition, the results of which were given on page 427.

West Essex A.C.

The above club issues a monthly club journal which gives particulars of competitions, notices from the hon. secretary, answers to correspondents, etc. The issue for April is the twenty-eighth number which has been circulated among the members, and contains among other features an article entitled "Prominent Members of the Club." The member whose motor cycling career is described in No. 28 is Mr. Victor Baldwin, the hon. sec.

The winner of the hill-climb is R. D. Willett (Humber), whose figure of merit was .0127, which was closely followed by W. E. Gunnett (Triumph) with .0124.

The next competition will be held on June 12th, for the president's trophy. This trial is open to all classes of motor vehicles.

Efforts are being made to hold an inter-club run with the Essex and Walthamstow clubs, and it is suggested that the rendezvous be at Clacton-on-Sea or at Newmarket.

Members of the York County M.C.C. assembled at Roundhay prior to a run to Bylands Abbey.

SOME SUGGESTED HOLIDAY TOURS IN ENGLAND

THE extraordinary manner in which the motor cycle industry has flourished in Britain may be ascribed to the fact that this country of ours is more suited than any other to motor cycle touring. To take them as a whole our roads are better as regards surface than any other country in the civilised world. Naturally, they are not so good that they will not stand improvement, but taking them on the whole, they do not leave a great deal to be desired in this respect. Of course, abroad (in Italy, France, Germany, and Switzerland) in the mountainous portions the gradients are not so steep as those to be met with on many main roads in England, but, generally speaking, the surface is by no means perfect.

In this short article it is proposed to divide the country into three sections—Northern, Southern, and Central. These divide themselves naturally into east and west. Take, for instance, the North.

NORTHERN SECTION.

North-west.

On the west side, Lancaster, being accessible from the thickly populated districts round Liverpool, Manchester, Preston, Bradford, and Leeds, lends itself as a very good starting place for a tour in the most attractive districts which England can offer. Lancaster may truly be said to be "the Western Gate to the North."

Striking due north, we follow the John-o'-Groat's route to Kendal, whence the Lakes are easily reached. Immediately after leaving Kendal one is surrounded by the beautiful scenery at the northern end of Lake Windermere. On through Ambleside and Grasmere, the pretty little lake of Thirlmere, close to Helvellyn (3,118 feet), the second highest mountain in England, and on to Keswick, with Derwentwater on the left, and along the shores of Lake Bassenthwaite to Cockermouth. Here we turn right, and, striking north-east, pass through Bothel to Carlisle, proceeding thence to Brampton, which lies upon an interesting piece of road which extends from Alston to Barnard Castle. This section is well worth remembering, as those who travel by the north-eastern route of the Great North Road can utilise it by branching off at Scotch Corner, and extending the route we have just given from Brampton North to Longtown and to Gretna Green, thus reaching Glasgow without passing through any large towns the whole way from London.

Turning to the right at Barnard Castle we go through Bowes, Brough, Kirkby Stephen, Sedbergh, Kirkby Lonsdale, and back to our starting place—a distance of 213 miles in all. The scenery almost the whole way round is particularly beautiful, and the road as far as Carlisle is good, thereafter it is likely to be rough and hilly, but the scenery is so attractive that the route is well-worth covering. So much for the North-western corner.

North-east.

A place equally accessible for those living in the North-eastern parts of the thickly populated districts of Northern England is Ripon, easily attained from Bradford, Leeds, Wakefield, Doncaster, York, and the surrounding towns. Crossing Leeming Lane shortly after leaving the starting point we reach Thirsk, the headquarters of the Auto Cycle Union when the Sutton Bank hill-climb is held. Those who are anxious to test the hill-climbing powers of their machines will find Sutton Bank on the direct road to Helmsley.

The climb is well worth making, though, of course, difficult, but when once the summit is reached the view over the surrounding country is perfectly magnificent. However, those for whom Sutton Bank proves difficult to cross, the route may be varied by going due south through Thirkleby, Coxwold, Helmsley on to Pickering, where strike south, and go through Malton, and continue on through Great Driffield to Bridlington, whence an excursion to Flamborough Head is well worth while.

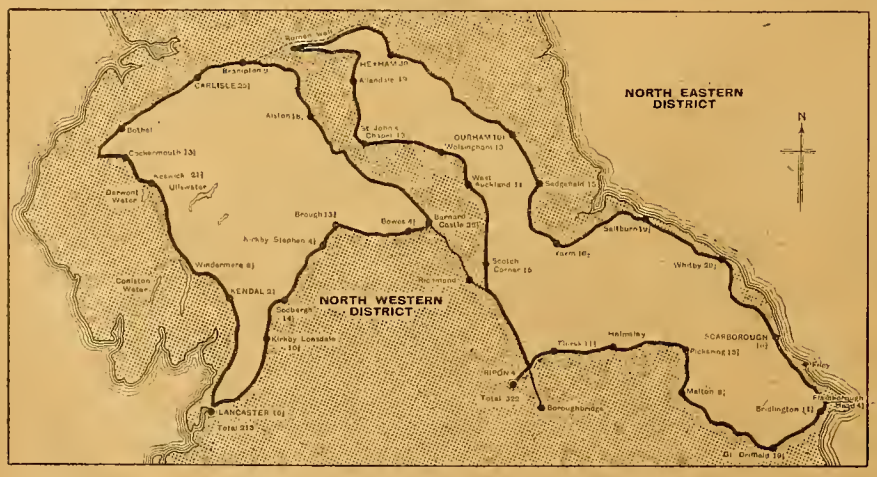
A most beautiful run may then be made along the coast, just skirting Filey and on to Scarborough, one of the most beautiful of Northern watering places, and beyond to Whitby and Saltburn. Shortly after leaving Saltburn the coast is left behind, and we go through Yarm, skirting Stockton, and then straight north to Sedgefield. Follow the main road that leads to Durham, which, as all the world knows, possesses one of the most interesting cathedrals in the country.

A Famous Door Knocker.

An interesting point about Durham Cathedral is that it possesses a famous door knocker, which, if held by a fugitive from justice in mediæval times rendered him in sanctuary, so that the pursuers could not touch him. After Durham we then rapidly leave the colliery district, and, striking north-west, make for Hexham. Here an excursion may be made along the more northern of the two roads to Brampton, which skirts the great Roman Wall made during the Roman occupation to keep out the Picts and Scots. We are now but a few miles from Brampton, mentioned in the other tour. However, we turn eastward at the next important turning on the left, and retrace our steps through Haltwhistle to Allendale, and, striking south, meet the fine moorland and hills to Wolsingham and West Anckland.

The last section of the route will be a severe test for any single geared motor bicycle, but motor cyclists must always remember that in the most beautiful country the steepest hills are encountered. A magnificent run after leaving West Auckland can now be made down Leeming Lane, through Scotch Corner, back to Ripon, whence we started. Leeming Lane is the last trace of the great road made by the Romans up which they sent their garrison to look after the defences of the Wall mentioned previously.

Would that this road were remade along its whole extent, leading as it



Some Suggested Holiday Tours in England.

does due north, it could be made to miss all the populous districts, and bring the motorist to Scotland in the greatest possible comfort, and enable him to maintain a speed impossible in congested districts.

A Through Route to Edinburgh.

Part of the route we have given, namely, from Durham to Hexham, can be utilised as a through route to Edinburgh. It may be joined from West Auckland, striking through a little place called Riding Mill, and thence *viâ* Corbridge to Jedburgh, thus joining the road followed by the competitors in the recent London to Edinburgh run. Unfortunately, however, the whole way from West Auckland to Corbridge, appallingly steep hills are encountered. The connecting link between the two routes we have given lies between Barnard Castle and Scotch Corner. while just off the route is Richmond, a town well worth visiting.

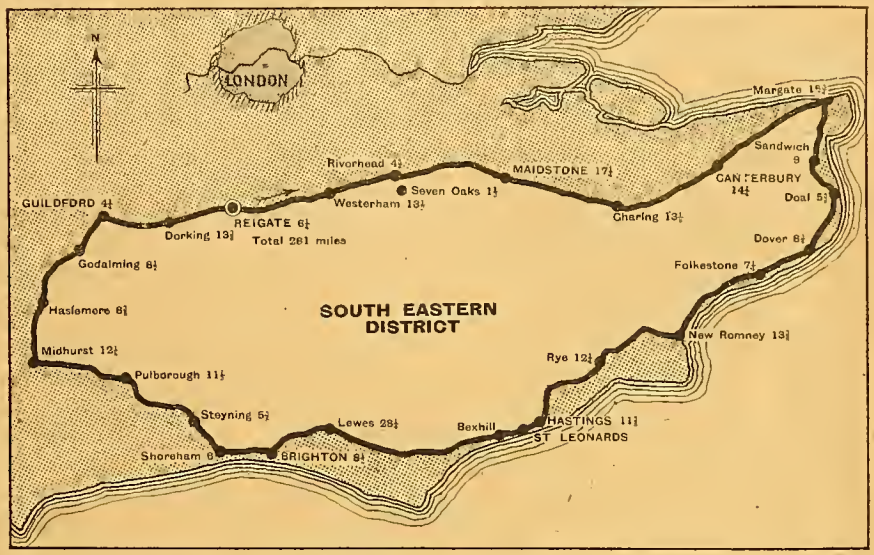
SOUTHERN SECTION.

South-west.

An excellent starting point for a tour in the lovely South-western district of England is Salisbury. The city possesses a cathedral of matchless beauty, the spire of which is the highest in Britain. Leaving the town, we strike off in a south-easterly direction to Romsey, and here turn due south for Lyndhurst, there entering the New Forest. Six and a quarter miles from the latter town we leave the Lymington Road, and turn to the right for Ringwood, then, striking due west, passing through Wimborne (famous for its Minster), an exceedingly beautiful ride follows through Bere Regis to Dorchester, and on through Bridport, along a hilly, but pretty, road through Seaton to Exeter, famous for its Cathedral.

The direct road from Exeter is exceedingly bumpy owing to a motor 'bus service, so we recommend our readers to go through Credition on to Okehampton, where almost adjacent are the Artillery ranges. Launceston is then reached, after encountering the steep hill into the town, and we enter the lovely district over the moors to Bodmin. From Bodmin on, more moorland is traversed, and there is a fine straight road avoiding all big towns past Blue Anchor, Mitchel, and Zelah to Redruth. It was here that the Cornish police "distinguished themselves" last year by instituting a police trap right in the middle of the moor—miles from any human habitation. Their action, however, has not since, we are glad to say, been repeated.

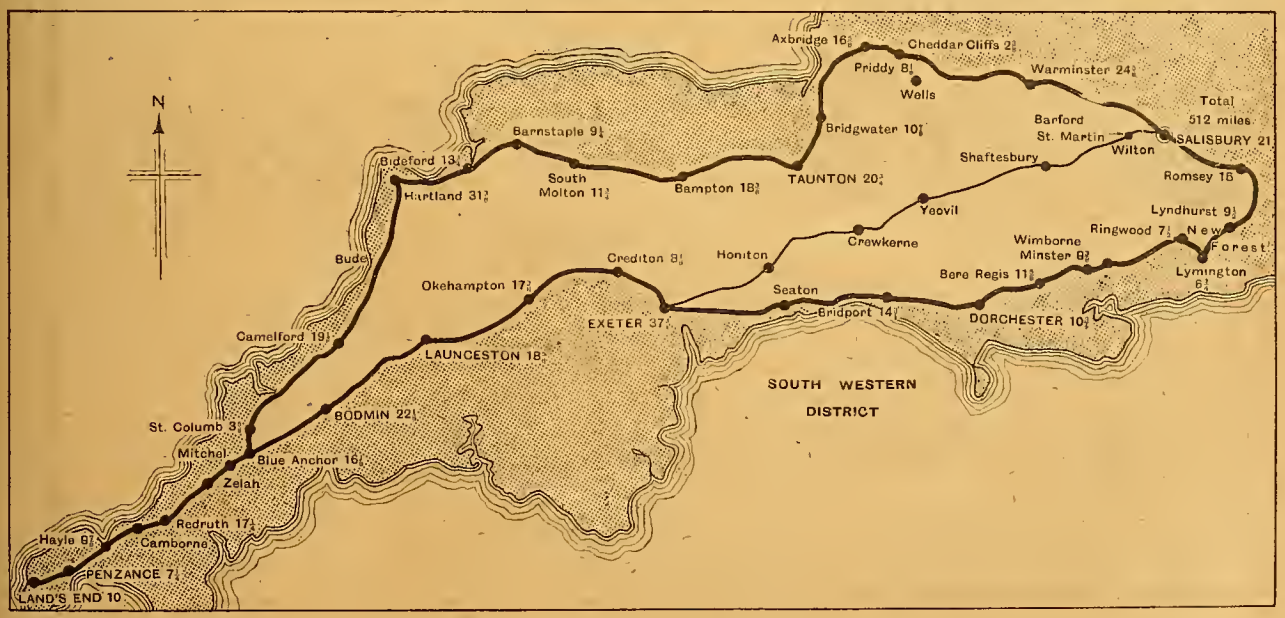
From Redruth, through Camborne and Hayle we pass through the tin mining district—not a very pleasant run for those on holiday bent and in search of good roads and scenery, but, happily, soon traversed.



An Ideal Resting Place.

Penzance, situated on the beautiful Mount's Bay, is an ideal resting place. The climate is mild, and the vegetation semi-tropical. Land's End, which certainly should not be missed, is but a run of ten miles. Here the rocky coast presents a magnificent spectacle. From Penzance we retrace our steps to Blue Anchor, and then strike north to St. Colomb, and on through Camelford, closely passing Bude, a famous West-country seaside place, to Hartland and Bideford, made famous in Macaulay's poem.

The Northern route *viâ* Ilfracombe and Minehead is perhaps the most beautiful, but the route we have given is hilly enough in all conscience, and unless the rider is equipped with a first-class hill-climber, he had better follow the route through Barnstaple, South Molton, and Bampton, which is some-



what easier after Taunton, where follow the Bristol Road to Axbridge, and there turn right to Cheddar Cliffs, an exceedingly beautiful ride. The circuit is completed to Salisbury by passing through Warminster.

If the rider has not time to pass through the New Forest, the journey may be curtailed by going through Shaftesbury, Yeovil, Crewkerne, and Honiton on the direct road to Exeter. After leaving Salisbury, we turn right at the village of Barford St. Martin, a turning which may be very easily missed.

South-east.

Quite a pretty tour, well within reach of the Metropolis, may be obtained, which totals some 261 miles, by starting from Reigate and going due east along the ancient Pilgrims' Way through Westerham and Riverhead to Reigate. From Reigate to Riverhead the road is hilly, but there are no hills which should present any difficulty to a modern motor bicycle. After passing Maidstone, the county town of Kent, we reach Charing, and fourteen and a quarter miles further on the cathedral city of Canterbury.

At Margate we touch the coast, and then strike south to Sandwich, a most interesting old town, well worth visiting. Skirting the coast we go through Deal and Dover, and along a hilly road to Folkestone. All the way along the coast, skirting New Romney, fascinating country is traversed. Hastings and St. Leonards are practically one. Then we pass Bexhill, and on to Lewes, where the rider must be careful, as the police are extremely active.

On entering Brighton it will be advisable to ask for the inland road to Shoreham, as that along the coast is very bumpy. Through Steyning to Pulborough the road extends through ideal English scenery, but here again the police are very much down upon those who exceed the legal limit, while further on, at Midhurst, the bench is said to be one of the most anti-motorist in the kingdom. All along the remainder of the road the greatest caution should be exercised, and especially after traversing Haslemere, when the town of Godalming is reached. Here the slightest breach of the ten-mile limit is rigorously dealt with. Reigate, our starting point, is reached through Guildford and Dorking.

In the above routes the distances are, as far as possible, those given in the "Contour Route Book" (Gall and Inglis), but occasionally, where we have left the beaten track, we have had to rely on other sources, and in these cases the distances are only approximate. The thin line given in the Northern Section denotes those roads which connect the North-eastern and North-western tours.

CENTRAL SECTION.

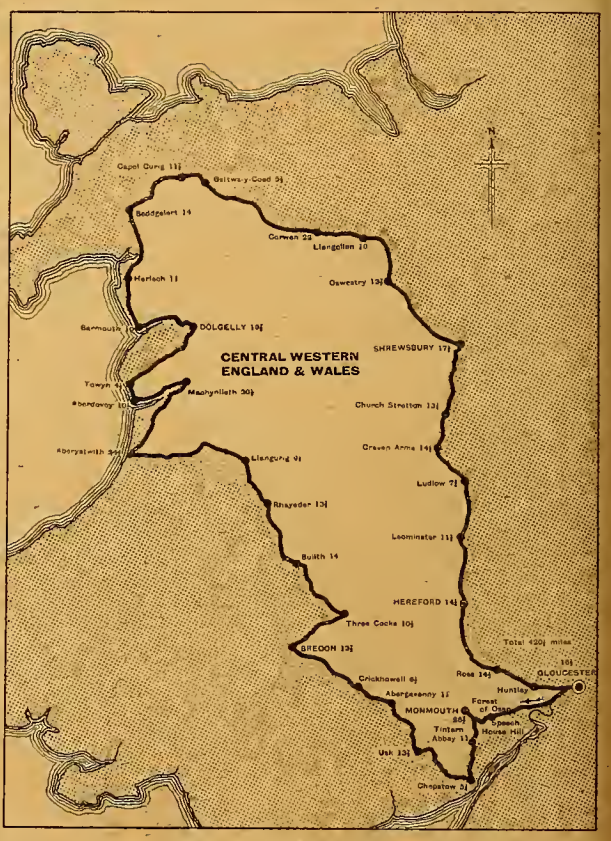
Western England and Wales.

All that section of England which borders on Wales possesses good well-kept roads, and is replete with historical associations. Gloucester, the ancient cathedral city, makes an admirable starting point for a tour. Leaving Gloucester we follow the Severn Valley, and just after Westbury pass through Little Dean, and enter the beautiful Forest of Dean. The road leads into the ancient town of Monmouth, which is well worth a visit. From here we retrace our wheel tracks for a short spell, and, bearing right at the first important road fork, enter the Wye Valley, one of the most beautiful rides in England, and more than half-way to Chepstow pass Tintern Abbey, which, on account of its situation and beauty, is well worth inspection.

Usk, another old-world town, is but a short ride from Chepstow, and but eight miles or so further on we cross the border into Wales, and enter what may be termed the Welsh Lowlands.

All along the valley, through Crickhowell the scenery is very pretty, and the district is known as Talgarth Black Forest. From Brecon the road takes a north-easterly direction to the Three Cocks Inn, an important road junction, where the right-hand road passes through Hay to Leominster. Here, however, we turn sharp left, and proceed to Builth, and thence to Rhayader. At this point, some two or three miles off the road, are two large lakes which supply Birmingham with water.

Here the scenery becomes particularly fine, and after leaving Llangurig, we skirt the southern slopes of Plynlimmon, 2,468 feet. Close by the Wye rises, and not far also from the source of the Severn. Up to Llangurig the road rises steadily till an altitude of 900 feet is reached, and continues to rise till the summit 1,400 feet above sea-level is attained.



At the Dyffryn Castell Hotel the traveller may either follow the main road by Ponterwyd, or go by the Devil's Bridge, a fine run through mountainous and well-wooded country. The rider's choice should depend upon the hill-climbing powers of his mount, as the road to Aberystwyth by the Devil's Bridge is beset with numerous stiff gradients requiring both skill and care.

From Aberystwyth a pretty road extends to Machynlleth, but several stiff gradients are encountered. Before entering the last-named town the river is crossed, and then a turn to the left is taken, bringing the rider on the road to Aberdovey, and once more to the coast.

The sea is kept on the left as far as Towyn, and here the road strikes once more inland, becoming hilly and rather rough, but better near Dolgelly. At Barmouth we strike the coast once more, which we follow to Harlech, where is the famous castle. At Penrhyn, known to the world for its slate quarries, we strike inland, and leave the sea for good, passing through a glorious district to Beddgelert, where is the grave of Gelert, Prince Llewellyn's famous hound.

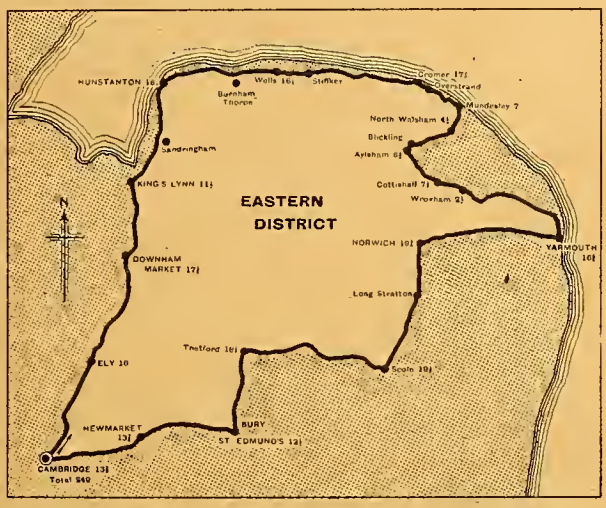
The Highest Mountain in England.

Snowdon, 3,560 feet, the hightest mountain in England and Wales, is seen on the left if the day be clear. At Beddgelert we bear right, and hereafter the right-hand road is aways taken till Capel Curig is reached, where the Holyhead Road is joined. From this point on to Shrewsbury there is no difficulty in finding the way, as the road is signposted "To London" by the Royal Automobile Club. The surface is, for the most part, good, though apt to be motor worn in places. Telford's famous road is beautifully graded, so from Capel Curig onwards the rider need not fear the hills. In this section the rider passes through Bettws-y-Coed with its famous Swallow Falls and Fairy Glen, Llangollen, and Gobowen.

At Shrewsbury the Holyhead Road is left, and thereafter follows a pretty and interesting ride through Church Stretton to Ludlow, a quaint old town, where there are some fine old houses and an interesting old castle, and on to Leominster and the cathedral city of Hereford. From here on to Gloucester the road is excellent and very pretty.

Eastern District.

Eastern England has quite a fascination of its own. The rider must not expect to find beautiful scenery, but the district is intensely interesting, is extremely healthy, bracing, and invigorating, and has some of the finest churches to be seen in the British Isles. Yet another point to be considered is that the yearly rainfall is moderate. On account of its accessibility, and the fact that in itself it is a most interesting place, Cambridge makes an excellent starting point. Our first destination is Ely, a fine run over excellent roads with two fine "all out" stretches.



At the end of the second of these, right in the heart of the Fen country where one least expects it, is an awkward bridge, marked by an ordinary red triangle, but with a special danger signal, so narrow and dangerous is it. After Ely, where the finest cathedral in England is to be seen, the road is not very interesting, but the surface is good. After leaving Littleport, a great place for skating on the rare occasions offered in these islands, we cross the Ouse and follow the meanderings of that river for some time, then suddenly crossing it where least expected.

Beyond Southery we leave the bleak Fenland and enter the county of Norfolk, where the country becomes wooded and the roads good. Entering the village of Denver caution should be exercised, as the approach is made by negotiating two corners, the second of which, skirting the churchyard which forms part of an ellipse, is banked the wrong way. Here, in 1904, a Bradbury tricar charged a cottage in the Six Days A.C.U. Trials.

Lynn is an interesting old town, and from the Quay quite Dutch in appearance. It contains two fine churches, the best of which is St. Margaret's. One enters the town through an ancient gateway, and if one be so minded the traffic beset portion may be entirely missed by turning to the right after entering the gateway, bearing right and then turning left, soon a level crossing is reached, and at the next turning to the right the main road to Hunstanton is joined.

The road to the latter seaside town is good, and the first object of interest to be encountered is Castle Rising, well worth a visit. Next we pass the outskirts of Sandringham, the country home so dearly loved of our late King, and where he caught his last fatal chill. The coast road skirts Hunstanton, and now we enter Nelson's country.

Leaving Old Hunstanton, Holme Church tower, a landmark for miles around, comes into view, and here there lives the sole surviving member of the Nelson family in Norfolk. Nelson's birthplace, Burnham Thorpe, lies inland some two miles or so from Burnham Market. On to Cromer, always in sight of the sea or the sandhills, which combat its ravages, the road winds. Blakeney and Stiffkey have magnificent churches, while Weybourne beach should not be missed. Here the shingle shelves abruptly down to the sea, and so deep is the water that a battleship may come quite close in.

All round the north-east corner the sea has made fierce incursions to beyond Cromer. Overstrand Church, whose ruined tower is a lonely landmark, is interesting as having inspired Clement Scott's well-known song the "Garden of Sleep."

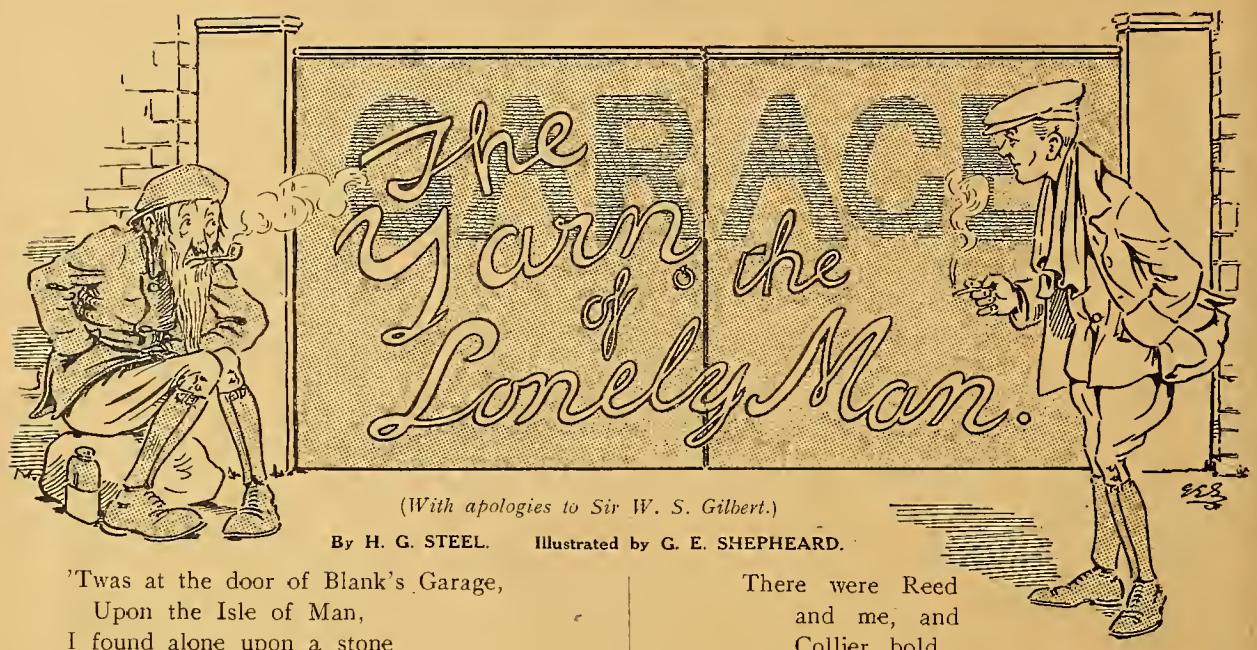
Turning inland at Mundesley we pass through North Walsham, and make for Blickling, beyond Aylsham, a fine old Elizabethan mansion, once the home of the ill-fated Anne Boleyn. Cottishall, one of the prettiest villages in Norfolk, is then reached, and here and at Wroxham excellent sailing on the rivers and broads may be obtained. From Wroxham to Yarmouth the Broad district is traversed, and at Ludham Bridge the yachts may be seen sailing on three rivers—the Bure, the Ant, and the Thurne—while right opposite are the ruins of St. Benet's Abbey, of which the Bishop of Norwich is the Abbot.

Yarmouth, the best known of all Norfolk watering places, is then reached, and after a fast run through Hele, Norwich comes into sight. Here the cathedral, the ancient Erpingham Gate, and the Guildhall should claim the attention of the tourist. From Norwich a fast run may be made to Scole, and then follows a trip across country to Thetford, and then along the main road to Newmarket, once a splendid road, back to Cambridge, but now sadly deteriorated. The ten-mile limit in the latter town, though unnecessarily long, should be rigidly observed. Two miles from Newmarket the Cambridge Road branches off to the left.

Northern League of Motor Cycle Clubs.

A lengthy printed list of the "Proposed Rules and Constitution of the Northern League of Motor Cycle Clubs" is just to hand. The headquarters are the Royal Station Hotel, York. Clubs having less than twenty-five members shall have two representatives, fifty or over three representatives, one hundred or over four representatives on the council. No business will be transacted at any meeting unless four or more clubs are represented. The annual general meeting will be held in the month of February each year. The trials, competitions, etc., held under the auspices of the League will only be open to *bona-fide* amateurs, but a trade class may be included if sufficient entries warrant it. Clubs affiliated to the League will pay a fee of 10s. 6d. for each 25 members or portions thereof. As soon as the rules are accepted we shall publish them *in extenso*.

Dutch Motor Cycle Club's first summer meeting of 1910. The photograph was taken at Apeldoorn, the summer residence of Queen Wilhelmina. There are two British machines in the group, a Douglas, and a Matchless, the remainder are of the F.N. and N.S.U. make.



The Yarn of the Lonely Man.

(With apologies to Sir W. S. Gilbert.)

By H. G. STEEL. Illustrated by G. E. SHEPHEARD.

'Twas at the door of Blank's Garage,
Upon the Isle of Man,
I found alone upon a stone
A dirty weird young man.

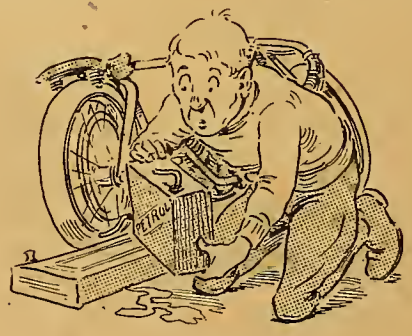
His hair was weedy, his beard was long,
And lanky and long was he;
And I heard this wight by the door recite
In a singular minor key.

Oh, I am a Reed, and a Collier bold,
A Chase, and a fast Godfrey,
And a Marshall tight, likewise a Wright,
And also Applebee.

And he looked so wild that I said to him
That drinking had been he;
For I'll eat my hand if I understand
However you can be

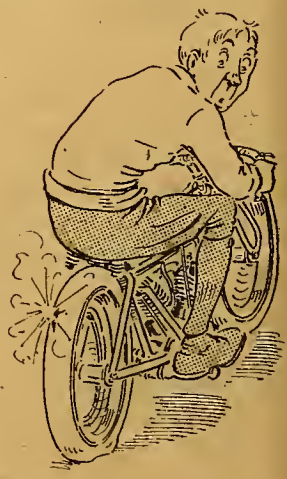
At once a Reed, and a Collier bold,
A Chase, and a fast Godfrey,
And a Marshall tight, likewise a Wright,
And also Applebee.

With the peak of his cap at the back of his head,
As motor cyclists larn,
And, taking a drink, and giving a wink,
He spun this painful yarn:



There were Reed and me, and Collier bold,
With spark advanced a going,
When my belt came adrift, and I had to shift
With Collier's, was I knowing?

But I bent it on, and away we jumps
As merrily as bells;
Then my tube it pops, and I suddenly stops,
But I borrows one of Wells.



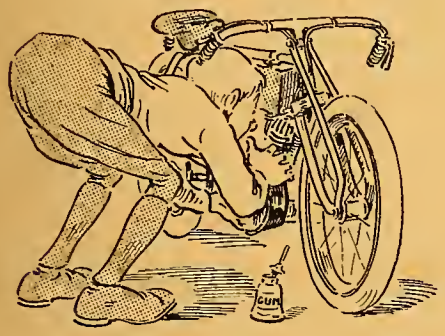
And after this I'm out with Chase,
Along of fast Godfrey,
When my gudgeon pin drops down within,
And my fly-wheel's all at sea.

Then Chase he takes a flywheel off,
And gives it unto me,
While a piece of tin makes a gudgeon pin
In the hands of fast Godfrey.

You will smile, I know, but after this
I flew up Sutton Bank;
And the only tale I had to wail
Was a bent and leaky tank.

The Yarn of the Lonely Man.—

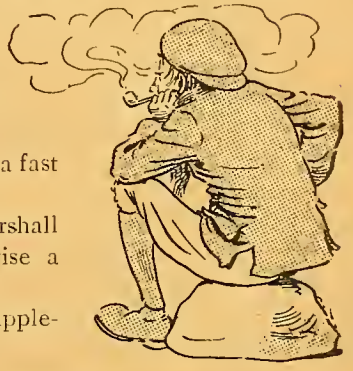
But Marshall tight then hove in sight,
And so soon did he begin
That with many a spank he made a tank
From a worn-out petrol tin.



I journeyed home, and I entered then
For the End-to-end that night,
With a new brake drum, stuck on with gum,
That was made for me by Wright.

So only Applebee is left,
And I don't mind telling ye
That a little fake of which he spake
Won a medal gold for me.

And I never larf, and I never lie,
And I never lark nor play;
But I sit and smoke, and a little joke
I have, which is to say—



Oh, I am a Reed, and a Collier bold,
A Chase, and a fast Godfrey,
And a Marshall tight, likewise a Wright,
And also Applebee.

Scene at the start of the M.C.C. London-Edinburgh Run from Highgate.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Oily Crank Cases.

[4776.]—I notice frequent reference made to oily crank cases. Possibly my experience may be of interest to some of your readers troubled in this way.

I use a modern machine of standard make. In the beginning I had to complain of the oil getting outside crank case and gear case. The makers' advice was "oil very carefully, preferably in small doses frequently repeated."

Still the trouble continued. Then I fitted a home-made non-return compression-release valve, thereby securing a partial vacuum inside crank case and gear case whilst the engine is running. This has absolutely cured the trouble.

I think if some accessories maker were to market an article of this kind he might find a paying demand for it. I know of at least three widely used standard engines that are sent out without being fitted with non-return, compression-release valves. As a consequence they soon get dirty and oily outside the crank case. W.

Automatic Carburetters.

[4777.]—May I be allowed to state some views on the above subject, which I have not before seen in your valuable paper. Now, what do pleasure riders want with a machine with one lever, and the further you push it the faster the bicycle goes? Surely half the fascination of motor cycling is to try your machine up the steepest hills. What does it matter if you fail? Try again.

I am very surprised at the position taken up by a sporting fellow like "Ixion" in this matter. I should like to know what will become of our hill-climbs if a man has simply got to sit tight and push a lever to get up. No, the automatic contraption is for the business man who has no time to return to the bottom of the hill and try again, or else push wearily up. Give me the good old two lever pattern and a sporting try.

In conclusion, I might say I am quite prepared for the exclamations this letter will doubtless call forth.

TAP TWIDDLER.

The Auto-wheel.

[4778.]—As manufacturers of the Wall Auto-wheel, we shall be glad to answer the enquiry of your correspondent in your issue of the 12th inst., not to encourage his cheap wit, but to enable us to give some information to many of your readers, who are no doubt generally anxious to know something of the Auto-wheel.

We may say at once that the press were not in error in their statements regarding the utility of the Auto-wheel, and repeated tests and trials have proved that it possesses all the advantages which were originally claimed for it.

In a case where the prospects are of so great magnitude it is necessary for the manufacturers to produce it in such a form as can weather all criticism, and in such quantities as can meet the enormous demand, which, even without seeing it in action, the public from all parts of the world have already made, and these considerations have decided the manufacturers to reserve to themselves the right to select the proper time for its introduction. We can, however, assure your readers that that time is now not far distant, and when it comes they will not be disappointed with the usefulness and efficiency of the device.

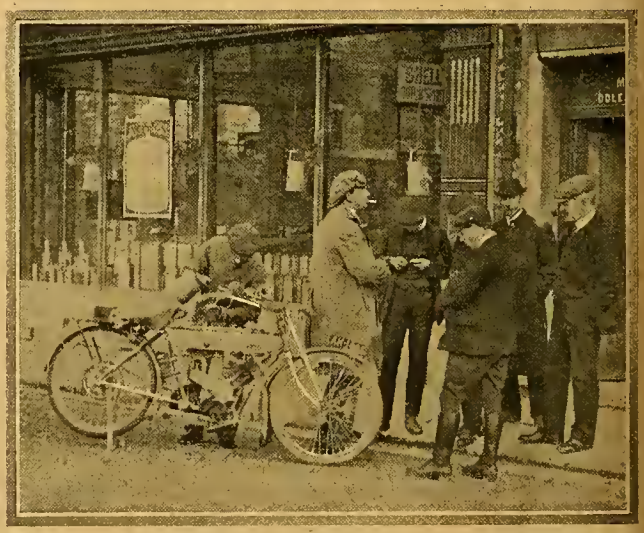
A. W. WALL. LTD.

Road Improvements.

[4779.]—The varying surface of the old "North Road," noted on the M.C.C. London-Edinburgh run, stands for a good argument for national control of road making.

The road surface after passing Newcastle-on-Tyne might certainly be improved upon by skilled treatment, so that it might compare favourably with the greater portion of the road south. It is a puzzle how the "corrugated roads" were made over the Scottish border, and perhaps the money expended in erecting ten-mile limit signs may better add to the comfort of travellers, although the "corrugated roads" may have the same effect (perhaps more so) as these warning signs.

Take the Coventry-Birmingham road for an example. There you will find the best and absolutely the worst main road in the kingdom, in different sections. The middle and Birmingham sections are, or were at Easter, a disgrace to the ratepayers of that district.



Bradford M.C.C Bradford-Keswick-Bradford Reliability Trial for N.S.U. cup. T. Bullus (3½ h.p. P. & M.), the ultimate winner, is seen at Kendal, checking and replenishing tanks.

Two weeks ago I passed over the main road from Yarm to Thirsk, and between the sixteenth and eighteenth milestones from Thirsk I came to a single row of stones running parallel and about six inches from the right wheel track on the outside and in stretches of from forty to a hundred feet. These stones were placed on a good hard surface, and later I discovered a man with a hoe distributing them in a single row as above stated.

As it was about 2.15 p.m. on a Saturday I have a suspicion that these stones were only another sort of mileage per hour limit sign, and hope that any motor cyclist or cyclist who suffers injury to self or machine through these obstructions will bring the matter home to the authorities in that section through one or other of the motoring organisations.

H. W. TURNER.

DUNHILL'S MOTORITIES
FOR MOTOR CYCLISTS.

"PONCHO." Best Double Texture Material, 32/6.

DUST CAP, 3/6.

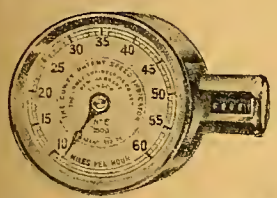
TROUSER OVERALLS.
Made from Finest Double Textnre Waterproof Material, 18/2.

HILLINGDON CAP, 5/6.

SINGLE TEXTURE FAWN WATERPROOF CAPE, 7/6.

PUSH ACTION SWITCH, 3/-.

HANDLE-BAR SWITCH for Magneto, 3/-.



"COWEY" SPEED INDICATOR, 4 Gns.
This Indicator can also be supplied indicating speed and distance in Kilometres.

VOLTMETER, 4/6

MOTOR CYCLE VALISE, 8/6.

"MATCHLESS" SPRING FORK ATTACHMENT.
Easily fitted and very effective. 15/6 per pair.

HANDLE-BAR SWITCH, 3/-.

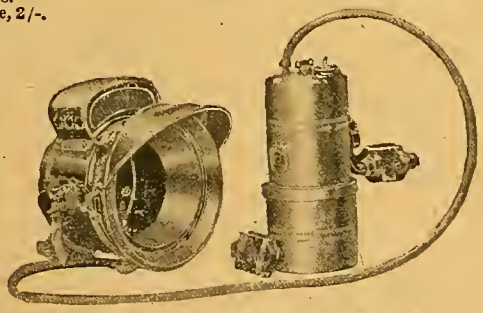
CARBIDE CARRIER,
Complete, 1/8.
Filled with Carbide, 2/-.

OLEO PLUG, 4/6.

SPARKING PLUG, 6d.

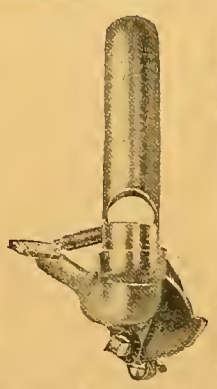
Automatic Vertical DROP BACK REST.
Very comfortable and absolutely safe.
12/6.

CORN EMERY POWDER,
For grinding valve seatings 6d.



MOTOR CYCLE LAMP AND GENERATOR.
Well made, with powerful lens mirror reflector which magnifies to a great extent. Can also be used for Tricars, 27/-

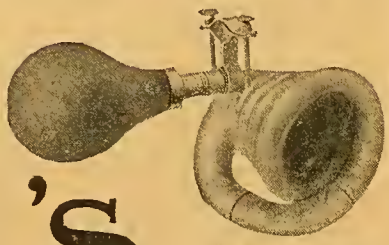
BELT PUNCH, 2/-



EXHAUST WHISTLE, 10/6
Very Mellow Note.

TREBLE-TWIST, NICKEL-PLATED HORN,
Very deep note. 5/6.

Write to Dept. "M" for Motor Cycle Catalogue, sent free on request.



"INVISTOR" HORN.
Loud and penetrating.
8/-.

DUNHILL'S

359-361, EUSTON ROAD, LONDON, N.W.

88, CROSS ST., MANCHESTER. 72, ST. VINCENT ST., GLASGOW.

Some folks think LIGHTWEIGHTS are unsuitable for touring--some of them are--but the

Motosacoche

(The Gentleman's Motor Cycle)

REIGNS SUPREME, and one was ridden from

LONDON TO EDINBURGH AND BACK

In M.C.C. Reliability Trials in schedule time.

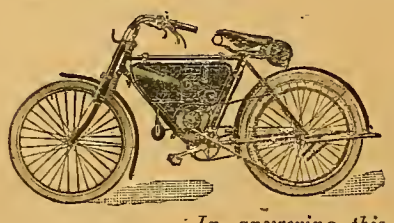
Don't forget the AND BACK

and on ONE BELT—a WHITTLE.

Two other MOTOSACOCHES which were ridden and entered by private owners arrived at Edinburgh in Schedule Time.

Only Three Started and they all qualified for GOLD MEDALS.

This is where you laugh—and think what 1½ h.p. can do when the engine is made as it should be—but you haven't to think very hard—after all—to understand why this is. All users of these beautiful little engines will understand, and the bicycles—well, the Rover and Singer Companies make the best cycles in the world, and they make them for the MOTOSACOCHE—so when you come to think of it there's nothing wonderful about a MOTOSACOCHE being ridden from London to Edinburgh AND BACK.



To prospective purchasers a trial ride is better than all the talk of

MOTOSACOCHE LIMITED,

65, HOLBORN VIADUCT, E.C.

In answering this advertisement it is desirable to mention "The Motor Cycle."

Belt Fastener Screws: A Suggestion.

[4780.]—I should like to call attention to a detail in belt-fastener construction which would make very decidedly for comfort and ease of manipulation. It is simply this, that the head of the pin which passes through the belt to attach the fastener be made square, so as to take the small spanner which is to be found in everyone's tool kit nowadays. I cannot recollect having seen this mentioned before (though I have looked through my back numbers of *The Motor Cycle* for the last three years), and I know of no make of belt-fastener the pin of which is not round-headed with a slot in it for the use of a screwdriver. Retain the slot by all means, it is necessary to start the pin in its thread when screwing it up, but most of us have had the experience of a pin rusted in, or whose thread was burred by contact with the pulley, to move which the screwdriver was totally inadequate. I have never yet spoken to another motor cyclist who did not agree as to the superiority of a square head, and about a month ago when I mentioned it to the Service Company they told me they had just had some pins of that description made to the order of a customer. So, although it may seem a small matter about which to write so much, as it appears to be a very real and general want I have thought it worth while to raise the question for decision in the columns of your valuable paper. D 7985.

The Northern League.

[4781.]—With reference to your leaderette on the above, I should like to ask you what the A.C.U. has done to conciliate Northern clubs, and also what inducements it has offered to draw these clubs into the fold. These questions

Meet of the Winchester and Surrey Motor Cycle Clubs at Winchester.

have been asked by the Northern League clubs before now, and the A.C.U. has not been able to give any reply. Can you?

The riders of the North do not expect to work independently of any other body, and the chief point of contention is not as stated in your article, but is simply this. The clubs who have formed the Northern League do not think it reasonable that they should have to pay a fee to the A.C.U., simply because they send out an invitation to several neighbouring clubs to meet together at some point of interest, and hold a competition for purely nominal prizes with no idea of making any profit on same. It is surely too bad to put a heavy tax on hospitality.

It is my personal hope that the Northern League will acknowledge the A.C.U. as governing body, but I am bound to say that the officials of the A.C.U. are very lax indeed in their methods, and anything but conciliatory towards the officials of the League. The question to be answered first of all is, "What benefit can the clubs forming the Northern League derive from becoming affiliated to the A.C.U.?" If the reply is "None whatever," the Northerners will stand clear. We have yet to hear from the A.C.U. of anything it has done to assist the sport in the North. Has it no reply? PRO MOTOR.

Increase of Speed on Partially Raising Exhaust Valve.

[4782.]—With all due respect to correspondents who have endeavoured to explain the above subject, I fail to find anything yet to cure my 3½ h.p. Triumph, which has this puzzling complaint. The engine is perfect, and timed correctly; the timing I have varied a tooth either way, both inlet and exhaust, yet it has not cured it. Naturally, I find the motor runs better when timed as sent out by the makers, viz., inlet valve begins to open when ¼in. down the suction stroke, giving plenty of time for exhaust valve to close definitely, which it does exactly when on top of stroke. This dispenses with the explanation *re* bounce of exhaust valve ("Poney's" letter, 4754). I rode one hundred miles with exhaust valve partially raised, and I lost compression. On taking out the exhaust valve, I found it pitted, caused by not being closed. I admit holding up exhaust is no cure, but did it for experiment. After trying everything I saw in *The Motor Cycle*, and using my own experience, I must confess I am beaten. I feel certain, if the cause and cure could be found, more power would be the result from most engines.

I yet await some other explanation, which I will readily try. TRY AGAIN.

The London-Edinburgh Run.

[4783.]—I have read with interest the comments of Mr. Morris in *The Motor Cycle* of May 12th, and have also a grievance against the M.C.C. My case is as follows: I entered a Scott for the London-Edinburgh run on April 14th, and received particulars in due course. As soon as I received my route cards, being desirous of working out the times and having the cards specially treated so as to make them weatherproof, I wrote to two officials of the M.C.C. asking them for my starting number. I received a similar reply from both, namely, that my starting number was 7. Accordingly I worked out the times and got my cards in order. When I received the official programme for the run I found that I was No. 99. As I had made all arrangements to start 7, I did not consider this was fair treatment to be suddenly removed to the end of the list. Accordingly I wired to the M.C.C., stating that under these circumstances I should not take part in the run. On Friday morning, at 11.30, I received another wire, this time from one of the M.C.C. officials, as follows: "You can start 7; explain to you Highgate." This, however, was received too late to be of any use to me, as I had by then made other arrangements. FRANK PHILIPP.

The Motor Cycle in the United States.

[4784.]—A great deal has been written concerning the differences between American and English machines, but as yet no one seems to have quite hit the point. The reason for these differences is not a difference of opinion as to what is best in design but the different conditions under which the machines are designed to run. I am living at present in a city of 110,000 people in one of the most thickly settled parts of our country, yet I know of only four roads out of the town that would be marked upon an English road-map. Under such conditions foreign machines do not show up very well, and I have tried both English and German. The frames, tanks, rims, spokes, and hubs will not stand the hammering of our rough roads. I have ridden the same machines in England and found them perfectly satisfactory. The engines are certainly wonderful.

The best form of transmission devised so far seems to be unknown in England, although it is immensely popular here. It consists of a flat endless leather belt about one and a half inches wide made of two thicknesses of leather with canvas sewn between to make it stretchless. This runs over leather faced pulleys and has a spring idler to maintain the tension. The idler can be slacked from the saddle, giving a fine free engine. It has the rubber V belt lashed to the mast.

I do not expect to ride in England again for quite some time, but English roads figure prominently in my dreams of heaven, and *The Motor Cycle* is like a voice from above.

Connecticut, U.S.A. LN 5142.

SUMMARY OF CORRESPONDENCE.

"H.E.W.I." (Chatham) would like to join another motor cyclist who is also a fisherman for a fourteen days' holiday in West Ireland in June. Objects, fishing and motor cycling.

"INCREASE OF SCHPEED ON OBENING DER EGGSHAUST."

"YOU must get her oudt into der oben air," says der doctor.

"Dot's all righd, Herr Doctor, dot is, to talk like so, but how's she goin' to valk when she's got der sky-attics or voteffer you calls it, eh?"

"Drive," says he.

"Mein Gott," I says. "Vos you t'inkin' I vos made of gold, Herr Doctor. Dose drives costs lots of monies. Ve, ve ain't all doctors, you know."

"Oh, vell," he says, "if you brefers to lose her—"

"Look here," I says, "if you vants trouble, dot's der vay to find it, talkin' about me vantin' to lose der leedle voman!"

He laughs. "Dere, now," he says. "Vhy don' you get a motor? No, not like dot von of mine, but a motor bike und sidecar."

"Doctor," I says, "I'll do it."

Und dot vos der peginnin' of all de troubles. Ja. Now, der first t'ing to do, says I to mineself, is to get to know all about dose machines, und I buys a paper called der *Motor Cycle*, und on der first page I sees a schplendit article on "Ingrease of Schpeed on Obenin' der Eggshaust."

"Beim Gott!" I says, "dot's written by an eggsbert, dot is. Vhy he makes it as plain as plain, vot?"

Und I turns ofer der page und sees anodder article, "Ingrease of Schpeed on Obenin' der Eggshaust." Eh? Oh, noddings, onlies dot feller proves dot der first feller dunno vot he's talkin' about. Und each veek I buys dot paper, und each week de boor editor gets bombarded mit letters on "Ingrease of Schpeed on Obenin' der Eggshaust." Eferybodies agree dot dere's noddings like it for geddin' up schpeed, und eferybodies gives a different reason for it. Neffer mind, my poy, I says to mineself, I dunno vhy it is, but it don' matter so long as ve gets it.

Und den I sells my "Dashrot Tenshows"—Eh? Ya, rubbers, of gourse—und goes along to der blace vhere dey sells motor bicycles. Vell, shust so soon as I gets in I sees der machine for my monies. I dunno, I t'inks dey calls it a twin or somet'ings, but it had a big Union Jack painted on der front und a figure of Pritannia rulin' der vaves on der mudguard. Und dot's vot I like, dot is; none of your foreign machines for Isaac Isaacstein; no, sir!

"How much?" I says, lookin' at der vone negsd to it—Omba I t'ink he calls it.

"Und dis vone?" I says, quite casual like, bointin' to der vone mit der oldt flag on it.

Vhy, I couldn' hardlies pelieve it; it cost less monies dan der Omba vot hadn' got no flag nor no Pritannia nor noddings!

"Gimme Pritish goods efery time," I says "You can send on dis vone mit our flag on it."

He schmile, und he schmile, und he schmile; so amusant is it to see batriotism in a Pritisher.

Und der negsd day I unpacks der sidecar un der "A.B.C.D." Dot's der name of der bicycle.

"Dere now, Repecca, my tear," I says,

"dot's der leedle turn-oudt dot's goin' to pring back der roses to your cheeks."

Eh? Vell, I dunno as it did. Dot "Ingrease of Schpeed on Obenin' der Eggshaust" is a bit of, of vot common beobles calls "swank." So soon as I gets dot plessed machine to go, I obens der eggshaust, und der tamned t'ing schtops! I tries it ofer und ofer again, till der sv—— bersbiradion vos runnin' off of me. Petveen me und you, dose fellers dot writes about it are esgabed lunadics.

Den der garbureddor goes wrong, und den me und der inlet valve schprings ve bot' loses our temper, und she schtarts poppin' back. "For repairs?" Ya, I eggsbect.

Und den der enamel chips off, und dere underneat', for der amusemend of eferybodies, vos der vords "Made in ——."

"Py Chingo!" I says, "dot's a fine t'ing, dot is; Isaac Isaacstein ridin' a machine 'Made in ——,' shust like he vos a foreigner hisself!" Und I takes it back to der beobles vot sold it.

"Here," I says, "vot's dis?" I says.

"Union Jack," he says.

"Und dis?" "Pritannia," he says.

"Und I buys it pecause it's Pritish. Is it?"

"Vell," he says, "it ain't eggsactly *all* Pritish."

"Der tyres?" "Sherman."

"Der frame?" "Pelgian."

"Der enchine?" "French."

"Der magneto?" "Svedish."

"Der lamp?" "Austrian."

"Vell," I says, "I subbose der gas at least—"

"Amurrican."

"Of gourse, natürlich," I says, "I might haf known vhere all der gas comes from. Ain't dere noddings dot's Pritish?" I says.

"Dere's der Union Jack," he says, "und Pritannia, she's Pritish, ain't she?"

"Vot's dot 'A.B.C.D.' mean, anyvays?" I says.

"Actiengesellschaft Bruxellois Cosmopolite Deutschlands."

"Gott in Himmel!" I says. "How much you gif me for der lot?" "Twenty pounds," he says.

"Done," I says.

No, I don' ride a motor bike no more. Me und Repecca ve goes oudt in our leedle donkey cart, und vhilst she finds t'istles for der donkey and roses for her cheeks, I writes letters to der editor on der "Ingrease of Schpeed on Obenin' der Eggshaust."

ZENITH-GRADUA

52 Gns.
No extra charge for J.A.P. engines.

For RELIABILITY.

Starts at a Walk.

Climbs Anything.

Muswell Hill, N. 2/5/10.

Gentlemen, ... No doubt you will be pleased to hear the ZENITH-GRADUA I had of you is giving the greatest satisfaction. Using it every day for business purposes I find it always ready for work, and have yet to see its equal for RELIABILITY. As for the Gear, it is a great benefit to have a machine that you can ride through the thickest of traffic without dismounting and be able to ride up anything in the way of hills, no matter at what pace you arrive at the foot. The machine has had no replacements with the exception of one nut cost 2 l., and one new cover after 7,200 miles. This speaks very highly of the quality of your splendid machine, which is in perfect condition and climbs as well as ever. I climbed Muswell Hill daily, and have started from a standing start on this hill, also on the steepest part of Swain's Lane, and to anyone knowing these hills they will know what a severe test this is. Have never had a mechanical failure. If you like to make any use of this, you are at liberty to do so, as it cannot be too widely known what a splendid mount the Zenith-Gradua Is. Yours etc.....

Equally suitable for Speed or Traffic Work.

The GRADUA GEAR fitted to TRIUMPHS—12 Gns.

ZENITH MOTORS, LTD., WEYBRIDGE.

The

"HANDY HOBART"

Simply Perfect in Construction. Perfectly Simple in Use.

Lightweight Motor Cycle.

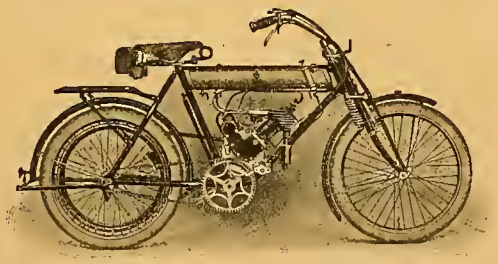
MOTOR CYCLING CLUB'S

HILL CLIMB, KOP HILL:

1st. F.N., weighing 159 lbs.
2nd. F.N. with two-speed gear, weighing 185 lbs.
3rd. "Handy Hobart," weighing 109 lbs.
63 Entrants.

M.C.C. London to Edinburgh.

"Handy Hobart" accomplished the DOUBLE JOURNEY and qualified for Gold Medal.



PRICE 35 GUINEAS.

2¾ h.p. Single-cylinder Engine, automatic carburetter, Bosch magneto, Hobart adjustable pulley, Druid spring girder forks, handle-bar control.

LADY'S MODEL NOW READY.

Complete Illustrated Catalogue and particulars from —— **HOBART BIRD & Co., Ltd., Dept. H22, Coventry.**

Full Marks

for

Hill-climbing
Silence
Cleanliness
Brakes
Stand
Luggage Carrier

and

General Reliability

were awarded to the

ROYAL ENFIELD Lightweight

in the recent AUTO CYCLE UNION TRIALS.

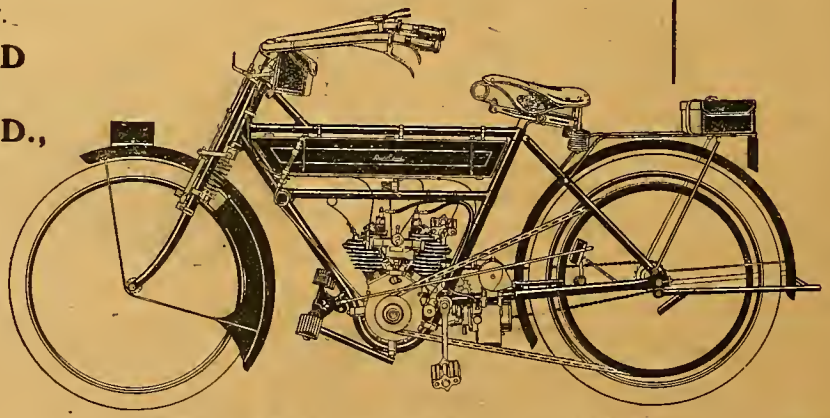
Note that, and also that among the seventy Competitors there were two Enfields, and each secured the same award and, out of a possible 180 marks, received 179.

By such a rec rd, unapproached by any other similar machine, they proved beyond dispute that they could do that which no other Lightweight could accomplish, and—

Remember, the bike that bears that name will achieve more for you than any other—hence, before you buy, ask the Company for List and address of nearest Agent.

Dept. 17.

ENFIELD CYCLE CO., LTD., REDDITCH.



TWO MODELS—prices £40-3-0 and £43-5-0.

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

Absence of Compression.

I have a 3½ h.p. 1907 Quadrant, to which I intend fitting a new piston and rings. Will you kindly inform me what are the signs by which to know if the cylinder requires reboring?—W. T.

If after fitting new piston rings, and proving that the valves are in perfect order and the joints quite gastight, you still get insufficient compression, it is time the cylinder was rebored.

Butt-ended Tubes.

I should be extremely obliged if you could give me any information respecting butt-ended inner tubes. What is the fault with them?—B. H. W.

All the butt-ended tubes made by the best-known makers are satisfactory, provided they are properly fitted according to the instructions. The only fault with them is that, after continued use, the ends are liable to rub through and cause a leakage. Of late, however, we have heard no complaints in this connection. They are a great convenience when changing tubes.

Gear for Sidecar Work.

I am thinking of fitting a new 80×94 a.o.v. Peugeot engine and Mabon clutch to my motor cycle. (1) Would this be a satisfactory combination to pull a sidecar, weight of myself and passenger 22 stones, on average roads? (2) Would the above clutch assist me in climbing stiff hills? (3) Would a 6 to 1 gear be suitable for the country to the N. and N.W. of London? (4) Do you think above combination would take passenger up Muswell Hill on a 6 to 1 gear (ignition is by accumulator and coil)? (5) Which of the three types of sidecar is the easiest to pull?—C. B. R.

(1) The machine would take a sidecar satisfactorily on average roads, but a change-speed gear would be advisable for ease of starting and hill-climbing. (2) The clutch would be of little assistance in hill-climbing. (3) A 6 to 1 gear would be about right for climbing average hills, but would be too low to allow the engine to keep cool on level roads. (4) We doubt if it would take two people up the hill with a 6 to 1 gear. (5) There is very little difference. Perhaps the flexible and castor wheel types are the easiest to pull.

Opening of Valves. Dripping Carburetter.

(1.) I find the opening of the automatic inlet valves of my four-cylinder motor cycle to be $\frac{3}{16}$ths of an inch. The consumption is not more than seventy-six miles to the gallon. Would a smaller opening reduce consumption and increase efficiency of engine? If so, could the top of the valve stem be threaded to take a nut for adjustments? (2.) When petrol is turned on, it overflows from a hole beneath the jet chamber for about a minute. The needle has not been touched since I bought the machine (July, 1908), but an experienced chauffeur of my acquaintance looks at the needle very doubtfully when I suggest grinding in.—C.F.Y.

(1.) We think you ought not to complain of the consumption of seventy-six miles to the gallon in a four-cylinder engine, and we should therefore recommend you to leave the valves alone. If, however, you prefer to try the experiment, the simplest way out of the difficulty would be to insert four thin, equal size washers between the spring cap and the seating through which the valve spindle passes. (2.) We do not think the needle valve requires to be ground in. Probably if you just tap it gently the petrol will cease overflowing. In any case, if the carburetter does not drip when the engine is running, it would be inadvisable to disturb the adjustments, particularly as you say the petrol only drips for about a minute.

The Scorcher's Dream.

A Machine to Start without Exertion.

I travel England, Scotland and Wales, and am forty years of age, and about 14 st. My heart is weak, and I cannot run when starting, although I am active and healthy generally. I am never ill, and my samples are about 2 lbs. in weight. If you know of any motor bicycle which would particularly suit me kindly name it.—L. M.

If you have a weak heart and do not care about pedalling or running the machine and jumping on, we should recommend a medium weight, single-cylinder machine, fitted with a two-speed gear and free engine for starting from a standstill. We cannot recommend any one specific make. The better plan in your case would be to obtain a trial of the machine before deciding to buy it.

A Beginner's Mount.

(1.) I am thinking of buying a motor cycle, but, unfortunately, I cannot afford more than £7 or £8. I have, however, seen lately in your advertisement columns several machines second-hand for about that price, and I should be obliged if you would tell me if a good and reliable one could be obtained for about that figure. I weigh 8½ stones. (2.) As I do not care for accumulators, do you recommend a Hellesen dry battery? Also is the latter suitable for a trembler coil?—B. O.

Of course, you cannot expect a really good motor cycle for the price mentioned. You could with the exercise of discretion and with the assistance of an experienced friend obtain a serviceable second-hand mount of old pattern, which would serve splendidly as a learner's machine. (2.) Certainly if the machine is provided with a make and break contact and plain coil, you can use a dry battery, but you must not use a dry battery under any circumstances with a trembler coil, as the latter is much too extravagant in current consumption.

Position of Engine.

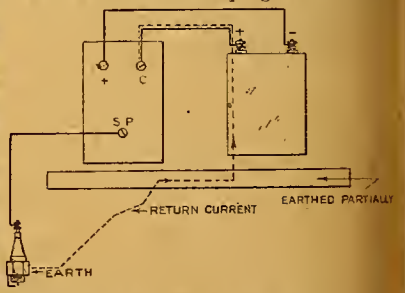
I am having a new machine built, with all the improvements I fancy on the new 1910 machines. I have been told that a 3½ h.p. engine, if built on the frame inclined, will lubricate itself better, and will keep cooler, than if placed vertical. Is this so? How can I tell the size tyres I shall want (measure rims)? What gear do you recommend for sidecar work? With 3½ h.p., would an adjustable pulley be advisable?—B. C.

We do not think you will find that an engine in the inclined position will lubricate better than if vertical. The vertical position is by far the most popular, and there is certainly no difficulty in oiling this type of engine. Measure the rims across from edge to edge. We should recommend a 5½ to 1 gear for sidecar work. Certainly an adjustable pulley would be necessary, and a two-speed gear would be advisable. Without one, pedalling assistance would frequently be necessary.

An Errant Spark.

I noticed recently a series of small sparks jumping between low-tension wire and frame at every explosion. Having taken the accumulator, trembler coil, and sparking plug out, I connected them up, earthed the plug thoroughly and insulated both accumulator and coil well. Every time I made contact the spark occurred at the plug, but at the same time the shocks coming through the low-tension wire were such as to render it difficult to hold it by hand, although the insulation is sound, the wiring being new. The coil in question has three terminals for connecting up only, viz., to sparking plug, battery, and contact breaker. On the platform carrying the trembler there are two more terminals, one of which is not screwed into the coil right up to its shoulder, but there is a small clearance between platform and shoulder, and small sparks also occur here when firing. When the accumulator is put on the table without being insulated by rubber matting, the slightest wet spot on the bottom part of the casing will at once draw sparks out of the table when firing. Do you think the coil is at fault?—C. S. N.

The trouble seems to be due to the fact that the coil has no separate earth return, consequently the high-tension current is free to return to the coil, after jumping the sparking plug gap, through the accumulator, consequently, if the accumulator is at all wet from acid, sparks will come from it, and this is somewhat dangerous, as, if the accumulator is made of celluloid, it might easily catch fire. Beyond this objection there is no particular harm, and if you use a high-tension cable for the wire from which you get your shocks, the trouble will be overcome to a slight extent. It appears that the table on which the experiment is carried out is not perfectly insulating. If the wood is slightly damp, the reason can easily be seen by sketch. In the construction of coil with three terminals, the inside end of high-tension winding is connected to primary, so that the return for high-tension current, after jumping the plug (when same is in the engine), is through the frame and contact breaker, through primary circuit back to coil through C terminal. When the plug is unearthed.



and the coil and the accumulator partially insulated on the table, the return can only be made through earth, and then to the weakest part of insulation between earth and primary circuit. If the accumulator is wet, the weakest part of the insulation would be through the wet celluloid. If the operator stands on earth and touches primary wires, the current would then pass through the body to primary, causing shocks. With reference to the other two terminals on top of the coil, it is rather vague what these are for, without knowing make of coil. Probably they are for ease of assembling coil, and are merely clamping screws for joining two internal connections. If one of these connections is in high-tension circuit, a bad connection would cause sparking. If the coil and accumulator were perfectly insulated no spark would take place at the plug.

SCENES ON THE M.C.C. ANNUAL LONDON-EDINBURGH RUN.

(1) Final Preparations. (2) Ye Olde Gatehouse, Highgate, the starting point. (3) First stop, Biggleswade. (4) A lady who drove through the twenty-four hours run alone. (5) Three sidecars in the night. (6) Leaving Grantham. (7) Officialdom at York. (8) Voices in the night, "Keep to the left." (9) Outside the Windmill, York. (10) Anything serious? (11) The mining district. (12) Back views, Newcastle-on-Tyne.

READER'S REPLY.

Belt Jumping off Pulleys.

I should like to point out to "B. W." that I was troubled with my belt jumping off although the pulleys were in perfect alignment. I finally traced it to the V groove of rear belt rim not being upright.—F. T.

Lessons from the T.T. Race.

THE fourth race for the Tourist Trophy was even more successful than its forerunners, the number of entrants and actual starters being larger than ever before. Interest in the event was even more pronounced, and a great crowd assembled at the starting point. Again we have to chronicle a British success—in fact, never has the list of leaders presented a more all-British aspect, as the first eleven machines to complete the course are of English make. Turning now to the duel between single and twin-cylinders—which is, after all, the main feature of the race—we observe that six of each type are among the fastest dozen. This year twenty-nine completed the course before the roads were declared open—a larger number than hitherto, chiefly owing, of course, to the increase in the number of competitors. In connection with the mechanical features of the winning machines, it may be said that history has repeated itself. Twin-cylinder machines occupy first and second places, with single-cylinders third and fourth. Overhead mechanically operated valves were, as last year, fitted to the winner's mount, and side by side valves to the first single to finish. A number of multi-cylinder machines are rather low down the list. This is not entirely due to their inferior speed but to the troubles met with during the race. It must always be remembered that racing is far and away the most severe test to which a motor cycle can be put. It is the pace that kills. It has been demonstrated that the single-cylinder machine again holds pride of place for efficiency, for, although ten minutes separate the fastest twin and the fastest single, this period is very small when one considers the greater capacity of the twins. Comparing the times with those of last year, there is an improvement, for this year's winner, using an engine 80 c.c. smaller than last year's winner, succeeded in reducing the time by 6m. 13⅘s. The winning single this year improved on last year's best single-cylinder time by as much as 13m. 12s.—a striking advance, as last year's performance was considered a great feat. The time record for a lap was also beaten in several instances. This is another factor which attests the all-round improvement that has taken place during a comparatively short period of eight months, and furnishes a proof of the good effect of the T.T. Race.

We are glad to have to report no serious accidents, despite the very high speeds and the tortuous and dangerous character of the course. There is a soul of goodness in things evil. Owing to the serious accident during practice, competitors learnt that it was better to use discretion in dangerous places, and preserve a chance of finishing. We believe that every rider started in the race with a determination to risk nothing—a practice which has served well in the past. Lastly, we must not overlook the excellent organisation of the Auto Cycle Union, which was well nigh perfect.

Being a narrative of a 4,000 miles tour undertaken by two American motor cyclists—Dr. Webster and Mr. W. C. Chadeayne—embracing the British Isles, France, Switzerland, Germany, Holland, and Belgium.

(*Concluded from page 465.*)

There would be no use in my trying to describe the most beautiful scenery of Switzerland. It is so different from anything I have ever seen. Words, or even an artist, cannot do it justice. One has to see it to appreciate it. The cities we visited were Neuchatel, Thun, Interlaken, Lucerne, Zurich, and Baden (Swiss). Most of these cities remind me of our fashionable summer resorts, for there are so many visitors and sightseers, and, as is to be expected, high prices.

Doubtless you have heard of the man who went to Interlaken for a change and a rest—the hotelkeeper got the change and the waiters the rest. We seldom stopped long enough in a place to have our washing done, so if we could not get someone to do it for us we did it at night ourselves, rolled it up, and some time the next day dried it. I remember one day stopping about half way up a mountain, and stringing up a line for our clothes to dry while we stretched out on the grass to enjoy the scenery and eat a lunch. While there I said to Bill, thinking he had supposed I should not be able to rough such a trip: "You haven't heard me kick on any accommodations, have you?" "Accommodations!" he said. "We haven't had any accommodations to kick on."

Military Discipline in Germany.

From Switzerland we took a little ferry boat across the Rhine to Walshut, Germany. We had no more than landed than we felt the atmosphere of German rules, laws, and the wonderful military discipline. There, soldiers are seen in all cities and often in the country, and are by far the best drilled and the neatest appearing of any we saw. Their noon military band concerts are exceptionally fine. Upon entering Germany the tryptique we received from the British Auto Cycle Union and the certificate from the German Consul to Great Britain helped us a great deal in obtaining our "Steuerkarte," or pass card, that we had to carry with us and show if requested, and every time we entered or left the country it was stamped. We were required to carry on our machines large number-plates, larger than most car numbers. The Germans can trace a person at any time and to any place, for you cannot stop over night except at a licensed gasthaus or hotel, and when you register, your name, address, nationality, age, where you came from that day, where you are going, and when you expect to start, are all written down. These "biographies" are collected every morning by the police and kept on record. By going to the police station you can usually locate your friends. Our touring in Germany was mostly along the Rhine River, riding backwards and forwards, taking in the places of particular interest. Few houses are seen in the country, but the villages are only three to five miles apart, so the men, women, and children walk to their little farms. The soil is very fertile, and they raise all kinds of crops. But their vineyards are their greatest source of income. At places hundreds of acres can be seen, and the sides of the hills and mountains are terraced so as to make more growing surface.

As to the condition of the roads, I believe I should express it about right if I said the Germans don't know what bad roads are, except that most of the villages are paved with rough cobblestones.

A Shortage of Petrol.

While riding along one morning in the middle of the Black Forest, it seemed to us the farthest distance from a village that we were at any time on our entire trip. Billy ran out of gasolene, and, thinking that I had plenty in my tank, put his machine in a ditch to syphon some from my motor cycle into his, and found I had only a few ounces left. By holding up our machines and flooding the carburetter we could ride for about a quarter of a mile; then we repeated the operation until we reached a small village, and a little benzene was obtained at an apothecary's shop to carry us to Baden-Baden.

When I left home several of my friends remarked: "Look out, Doc., and don't get pinched for fast riding." There were several police traps in England and in different localities on the Continent, but we were very fortunate in never having to meet "His Honour." My worst scare was in Mainz. I was riding carefully, but a young boy ran out in front of me, and my machine knocked him down. Of course, three or four policemen happened to be near and saw the whole affair, so I was imagining all the things that would doubtless happen to me, for I had been told by several car owners of the severe fines that had been imposed upon them for the most trivial accidents. I stopped as soon as possible and went back. The police never said a word to me, but raised the dickens with the kid and sent him home. It was a frequent occurrence all through the Old Country for crowds to gather around our machines, much more so than in America. Even the women would apparently go into details. In Strasburg, as in several other cities, the police had to keep the crowd away as it was stopping traffic. Upon my return home a doctor asked me how the drinking water was over there. I told him I did not know. My sister then asked if the beer was so much better than our American beer. I said,

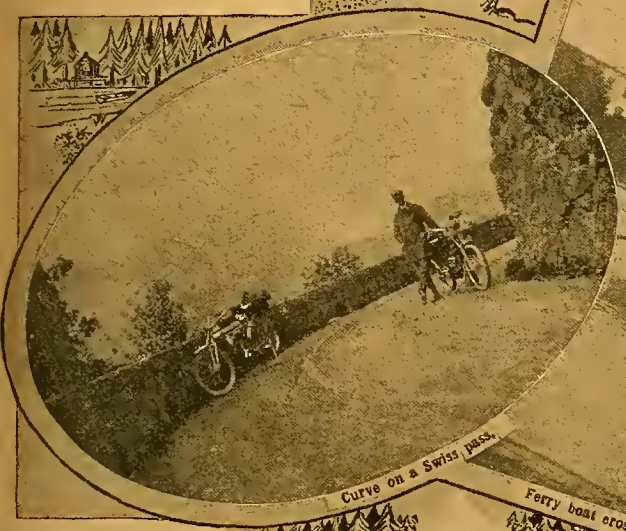
Through Great Britain and the Continent.—

"I think it is. German beer here is ten or fifteen cents a glass, while over there it is two or three cents, so with the idea of being economical I drank all I could in order to save money."

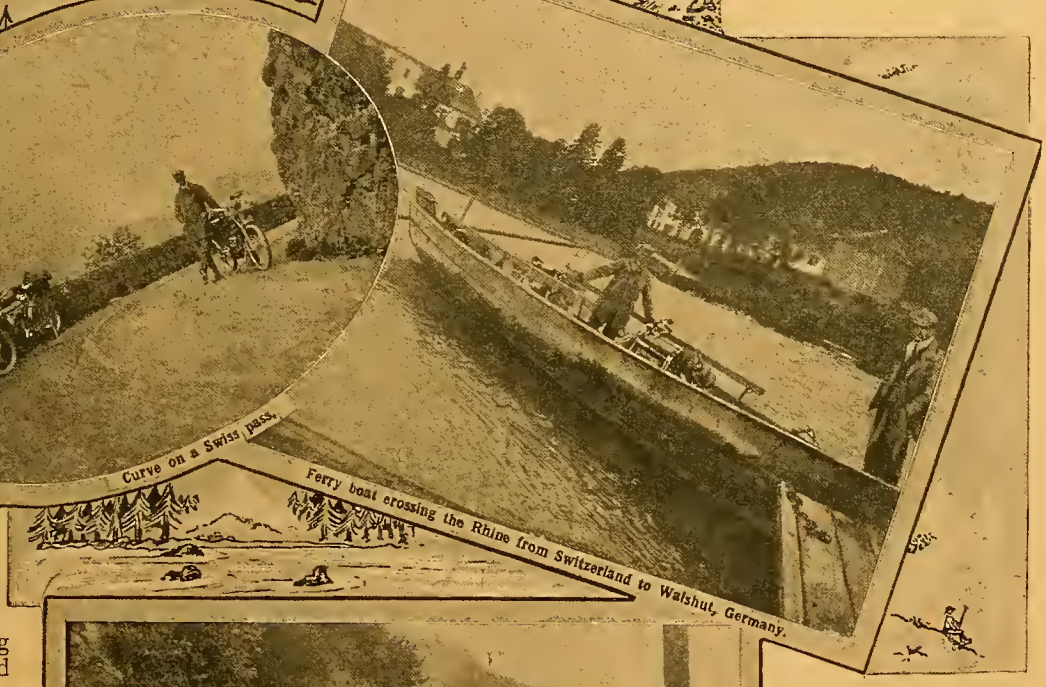
The Rhine Valley.

The interesting, historical, and beautiful part of the Rhine is from Bingen to Bonn, or possibly Cologne. There is hardly a turn in the river that does not present some new, magnificent view

View of the Rhine River, Castle in distance.

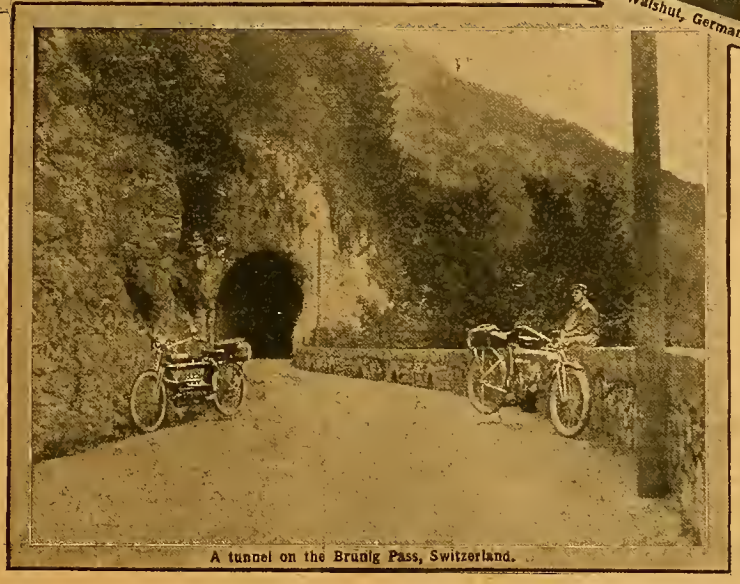


Curve on a Swiss pass.



Ferry boat crossing the Rhine from Switzerland to Walshut, Germany.

nd one or two astles or ruins of astles. I never ppreciated a motor ycle more than along ere. In fact, we had he advantage over ll other kinds of ourists whether they ode by train, boat, icycle, or went on oot. We had the dvantage of all with one of the disadvantges. We would ften stop and take n the scenery, or ossibly climb up and o through some of he castles. Between Heidelberg and Mannheim Billy ran into a log; the dog went ne way, the machine nother, and Billy



A tunnel on the Brunig Pass, Switzerland.

still another, breaking his handle-bars and skinning his knees. He was eating a sandwich at the time, and the first thing he did when he got up was to take another bite. As a motor cyclist usually has two or three skinned knees we paid little attention to his knee, but in the course of a couple of days it became infected, so he took the boat at Coblentz and rode to Cologne, and I rode my machine along beside the boat. At Cologne I was drafted into the service as doctor and nurse for a few days until he was able to continue on the trip.

Advice to Avoid Belgium.

If any of you are planning a similar trip, take my advice and cut out Belgium, if riding a motor cycle. The roads are very rough, being paved between the towns with Belgium block or cobblestones. Even Billy, who was riding on his Greyhound shock absorber, could not help but

Through Great Britain and the Continent.—

recite a Golden Text once in a while. We visited the principal points of interest in Liège, Brussels, and Antwerp. In Liège we were shown great attention by the officials of the F.N. Works, and were taken all through their factory, which employs 3,500 men and over 900 women. The men were very much interested in our Yankee motor cycles.

The scenery and customs of the people are different in every country; this was markedly so in Holland, which is low and level; good roads, built mostly on the top of the dykes; and the large four-armed windmills that move slowly, as the Dutch people, but they get there all the same. These windmills are not only used for pumping water from the dykes, but for all kinds of power, as in grinding grain, etc. I imagine Rotterdam is a little on the order of Venice, for there are canals all through the central part of the city which are filled with barges and fishing boats and many steamers. While we were in Rotterdam there were quite a few cases of Asiatic cholera in Holland, so instead of sailing from here to Leith, Scotland, as we had planned, we returned to Antwerp and sailed from there. We did not want to run the risk of being held up in quarantine when we reached Scotland. Although we carried folding pocket cameras, the pictures taken were not always satisfactory; many times we were unable to obtain the views we desired, but we could obtain postcards of these views, and brought back a fine collection of 700 or 800 photographs and cards, which I have arranged in an album in the order we saw them. This makes a very interesting, illustrated story of our trip.

A Glimpse of Scottish Lochs.

Our voyage from Antwerp to Leith across the North Sea was stormy and rough. Edinburgh is one of the most beautiful cities I have seen, and I cannot blame the Scotch for being so proud of it. On the way to the Trossachs, or lake regions, we passed through Stirling and went to see the famous old castle. Motor cycles and cars are not allowed on quite a few of the roads around Loch Katrine and Loch Lomond. We also found that to be the case on many of the roads in Switzerland. We took long chances in riding over some prohibited roads. Then we walked over roads Scott trod upon when he was writing "The Lady of the Lake." Riding back from these Highlands, which are certainly beautiful, we came over a road that was little used and was very hilly, up and down all the time. The way our motors went flying up and down and around turns reminded us of being on a "roller coaster." Once both of us came very near going over a precipice at the top of a hill where there was a sharp turn. Our route to Glasgow was in a round about way through Dumbarton and following the Clyde river, which, near Glasgow, is lined with some of the largest ship-building plants in the world. I have been an enthusiast for sports and racing ever since I attended high school; some twelve years ago when in college I held a state record, and the last couple of years I have done more or less motor cycle racing. Many times on my trip I thought, "What's the use?" Why not take things easily and thoroughly enjoy ourselves as we have done on our entire trip? There is not near the wear on the machine nor the great likelihood of a dangerous or fatal injury. Practically all there is in racing is the little glory for a time to the one that wins.

A Hurried Visit to Ireland.

Sailing from Glasgow, we arrived in Belfast, land, about seven o'clock in the morning. Here found a large modern city and saw two of the lar boats in the world under construction. We loo around this city until nine-thirty, and were told was seventy-five or eighty miles to Dublin; so thought this would be just a nice, easy day's ri All the morning and until three in the afternoon kept stopping in the little villages and visit the people that live in the little one-storey, tile thatched roof cottages, which are all white-wash That day we rode some twelve or fifteen miles out our way, broke an exhaust valve, and had two pu tures. We had intended to spend several days Ireland, but found our boat for America sailed fr Liverpool the next noon; so we had to reach Dub in time to take the boat for Liverpool at eight o'cl that evening. At three o'clock we were in Newry, a found an Irish mile is much longer than an Engl mile, and we had seventy-four English miles betw us and Dublin. To add to our troubles, Bill accumulator gave out, and it is almost impossible get dry batteries anywhere in the Old Country, so took a rope and towed him over "The Rocky Ro to Dublin." The roads were fairly good, but the s face was rough, and there were a great many hil However, my Pierce never ran better, and by both of pedalling up the hills, and sticking to it, we reach Dublin in time to catch the boat. This was the m of an endurance run, for that length of time, I ha ever made. Our clothes were wet with perspiratio and Billy looked like a mud ball from trailing behi me in my dust.

On Board an Atlantic Liner.

Our trip abroad was ended in Liverpool. W hurriedly rushed our luggage and parts to the wha and found the gang plank pulled in and the boat rea t sail. It was only through the kindness of some the officers we met on the way over that we we allowed to take our motor cycles aboard uncrate This, however, gave us the opportunity on our retu voyage, with the assistance of the engineers, overhaul our motors thoroughly. These we found excellent condition considering the distance travelle which was about 4,000 miles. Our machines, wi riders, luggage, etc., weighed 390 and 420 lbs. respe tively, and we made the entire trip on one set of tyre but found it necessary to replace our rear covers wi spares we had carried over.

There is one more incident I am going to tell a I will close, for I have written more now than I ha expected when I started to write this account of o tour. Before sailing for Europe we neglected to ta out papers of declaration, so upon our return we ha a great deal of red tape to go through with at t American custom house to clear our motor cycle Without exaggerating, we had to wait our turn for signature or stamp on papers with fourteen differe clerks. The last clerk we went to, took the paper an examined it carefully, then turned and studied abo five minutes, looking all through a book he had besi him. Finally he said, "Where is the dog now; o the boat? I can't find any duty on dogs." I sai "What dog?" "Why, the Greyhound." The shi ping bill was made out, one Pierce motor cycle, a one Greyhound (ditto). We all then had a good laug

OCCASIONAL COMMENTS

BY "IXION"

Carbonised Deposit in Engines.

During the present year I have noticed how much more carbon is deposited on the innards of my engine by certain brands of oil, as compared with others. That perhaps is common knowledge, but I have also noticed that some brands deposit a much *softer* carbon than others. The deposits with one oil may be as hard as rock, and very difficult to remove from the somewhat inaccessible roof of the cylinder, whereas the deposit from another oil is easily scraped off by a few magic passes from a long-handled screwdriver. Some day, perhaps, we shall see our cylinder heads machined up to a glasslike polish inside, with a surface to which no deposit could cling at all obstinately. In the meantime, it is wise to discover a brand and grade of oil which result in the *minimum quantity* and the *softest quality* of deposit for the engine in use, and to clean the engine out every thousand miles. An ancient and thick deposit is remarkably hard to dislodge.

A Team Prize.

Now that the T.T. is over I cannot help thinking that a team prize would be a most desirable adjunct to the Manx prize list. As an old cross-country runner I am not used to seeing all the credit go to one crack who finishes first when a compact block of men from a rival club finish close behind him, a few seconds slower. Applying this to the T.T. Race, who deserves the most praise, the firm who, thanks to a single rider endowed with exceptional pluck and tuning powers, get one machine home near the top of the list, or the firm who get a compact little band of three or four machines home in a clump amongst the first dozen? In which several samples finish high up, whether one of them wins outright or not. Some day we may see a big motor cycle race between teams of three riders apiece representing the crack clubs of the country, but that day is not yet.

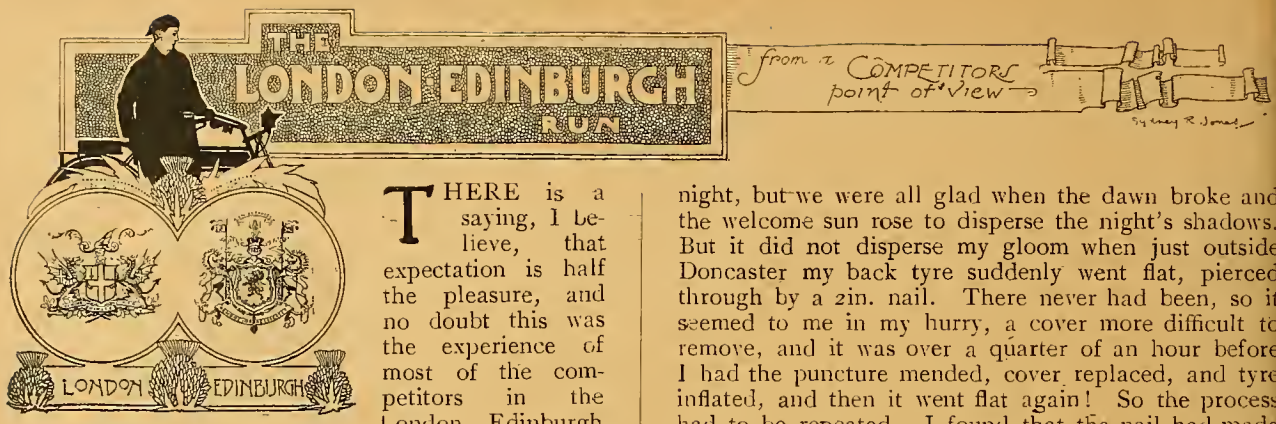
The Springing Question.

I am rather sorry that more of our big manufacturers are not working energetically at anti-vibration devices of a more wholesale character than mere insulated forks and saddle mountings. Without doubt the non-sporting type of rider is vastly on the increase, and it is vibration which is going to hamper our invasion of this field. The sporting and utilitarian riders are as far as the poles asunder. The one is young and a trifle volatile—he rather enjoys hanging on by his eyebrows while the machine bucks and cavorts over a six inch rut. The other is middle-aged and a trifle fussy and valetudinarian; he hates the jars his spine and wrists receive from most modern machines on an ordinary potholy highway, and as for the real bumps he is subjected to on the rough byroads along which business often drives him, they inspire remarks which contradict his apparent respectability. Quite a number of these up-to-date "knights of the road" have written me of late asking me where they can get a machine as reliable as the so-and-so with a properly sprung and cushioned frame. A light, perfectly sprung frame is the crying need of the market to-day, and I know few people who are aiming at it. I say "light" advisedly, because the type of rider I refer to has no intention of using a 250 lb. touring mount.

Reserve Petrol.

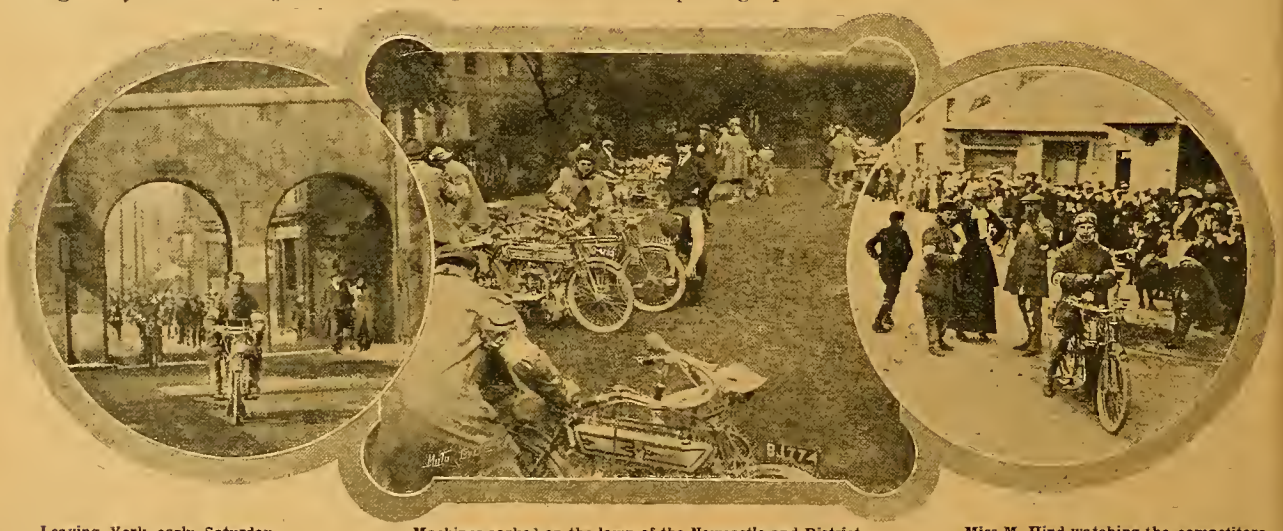
Even with a good gauge some anxiety is often present in a rider's mind about the quantity of spirit remaining in his tank. He is too lazy, maybe, to dismount and read the vertical gauge set in the side of his tank (I must admit I prefer the horizontal type of gauge in the tank top, though it is comparatively obsolete nowadays), and he trickles gaily on till the anxiety becomes acute, when he finds to his horror that he has barely a cupful of spirit remaining, and not the haziest notion as to where the next garage is. I have been using a patent three-way petrol tap. It has the normal "off" and "on" positions, but the usual "on" position, in which the carburetter can drain the tank, is reserved for emergencies. In the ordinary way the tap is set in a special "on" position, which merely opens a special stub petrol pipe, projecting vertically upwards an inch or so from the tank bottom. When the engine stops for want of petrol, the spirit below this level is still in the tank, and will suffice to propel the machine for twenty miles or more, according to the length of the stub pipe. This is a very ingenious and comforting little device, which deserves to be better known.

A group of members of the Edinburgh M.C.C., photographed outside the residence of Col. Wardlaw Ramsay, the honorary president.



THERE is a saying, I believe, that expectation is half the pleasure, and no doubt this was the experience of most of the competitors in the London - Edinburgh Run. For weeks past the selection of sparking plugs, spare belts, new tyres, and the tuning up of a motor cycle had been the order of the day. Perhaps, as in my case, a new machine was going to be tried over the lengthy course. So with engines tuned to a hair at 9 p.m. on the 13th ult., the competitors rode off one by one into the dark and commenced the long and nearly always eventful ride to the Northern capital. Thanks to the excellent arrangements which had been made by the M.C.C., no one should have experienced the least difficulty in finding his way out of London, or, for that matter, through any of the large towns through which we passed, and it was entirely my own fault that I took a wrong turning in Newcastle and went for some miles in the wrong direction before discovering my mistake, and here a cold shiver went down my back that I might run out of petrol when off the route. Night riding is an art. In the dark a breakdown or puncture is heart-breaking, and what is so simple to put to rights during the day is crowned with difficulties at night. I nearly came to grief near Stevenage where the road was in course of repair and the stones not rolled in. Why, by the way, is not a law passed making it obligatory for contractors to leave a red lamp burning in front and behind these patches of unrolled stones?

Grantham was reached about 2.30 a.m., where a repast had been prepared. It had been a glorious night, but we were all glad when the dawn broke and the welcome sun rose to disperse the night's shadows. But it did not disperse my gloom when just outside Doncaster my back tyre suddenly went flat, pierced through by a 2in. nail. There never had been, so it seemed to me in my hurry, a cover more difficult to remove, and it was over a quarter of an hour before I had the puncture mended, cover replaced, and tyre inflated, and then it went flat again! So the process had to be repeated. I found that the nail had made two punctures, which at any other time, I suppose, I should have noticed at the first onset. How true it is that troubles never come singly. No sooner had I remounted, determined to bustle along and make up for time lost, than I found that the plug in the back cylinder was sparking so badly as to necessitate a change. And a Sandow must have screwed it in, so difficult was it to remove! Owing to these mishaps I arrived at York at 7.59 a.m., eight minutes late (not counting the fifteen minutes allowed), so I had only just time to fill up the petrol and oil tanks, and escape from the clutches of a particularly strong-minded photographer.



Leaving York early Saturday morning.

Machines parked on the lawn of the Newcastle and District Motor Club-house.

Miss M. Hind watching the competitors leave Jedburgh. W. Price (8½ h.p. Rex) is ready to start.

I left York at 8.5. It was here that the second breakfast was provided for all who were either early or lucky enough to take advantage of the arrangements. On leaving York it nearly frightened me to death to come suddenly on a string of policemen (one just outside York, and one in every village as far as Thirsk) with huge notebooks in one hand and watches the size of turnips in the other. I was informed later that they had no sinister intentions towards the competitors, but that they were only timing us to satisfy their curiosity, or for amusement. For many a long mile I pictured myself in the dock, and thought out a defence which, I am sure, would have reduced any court to tears. I should here like to testify to the extreme consideration shown to us by the police, and

The London to Edinburgh Run.—

to acknowledge the help they so readily accorded us on those occasions when we had need of it. I was struck by the general interest taken in the run, and all along the route there were groups of spectators to watch the procession of motor cyclists. Their comments were always to the point, and sometimes amusing. One old dame across the border asked her aged spouse, "Weer do e' carry t' coal?"

Some of the Scottish scenery was very fine, and the Cheviots, which had to be surmounted, looked their best, and I should have liked them even better if at the steepest part of the hill my belt had not commenced to slip and forced me to pedal. How beautiful everything looks when one's mount is pulling its best! And this probably accounts for my remembering a scene near Earston, I think, when a moorland rolling from the dark and far-off Cotton Hills, whose summits clouds enshrouded, looked purple in the distance, but seeming to gather colour in its course, tumbled to our feet garbed in all the varied hues of spring. One other scene where field and furrow, wooded hills and shaded valleys, stretched out in vast expanse beneath us; and on a sunny slope half hidden by large clumps of trees a hamlet lay; and past its tiny church and old-world mill a shallow stream was slowly winding, as if afraid to face the world beyond. One of the bicycles here appeared to reciprocate the feeling. Near Liberton there was a small boy with a long rope and a sportive goat, and their combination nearly effected my downfall. On another occasion when passing two other competitors and riding three abreast, the back tyre of the cycle on my left burst, causing the rider to swerve violently over in my direction brushing my arm, and giving me a momentary vision of biting the dust. I arrived at 6.36 p.m. at Edinburgh with plenty of time in hand, having had an interesting and thoroughly enjoyable ride. My 2¼ Enfield carried me extraordinarily well, and never gave me a moment's anxiety.—P. J. HARKNESS (Capt.)

Spectators lined the main street of Jedburgh. Our picture shows a not too energetic competitor securing an easy start.

The contributor of this article, Captain P. J. Harkness, who rode his 2¼ h.p. Royal Enfield in the London-Edinburgh run and won the club gold medal.

SOME T.T. NOVELTIES.

WE saw several interesting features on the Moveo machines, which hail from Preston. The whole power plant is contained in one unit, which can be bodily removed from the cycle frame by the undoing of a couple of nuts and the disconnection of the petrol and oil pipes and the control wires. The magneto is mounted on a platform at the rear of the engine, this platform being formed in one with the main engine bearers. The magneto itself is readily detachable by means of a wing nut which secures the holding-down strap. The base of the magneto is held in place by a couple of spigots, which fit into holes bored in the platform. The magneto drive is by means of a double bevel gear, the pinions of which run in grease-tight cases. The transmission-shaft consists of two halves screwed together in such a way that this shaft can be lengthened, thus allowing any wear in either or both of the bevels to be taken up. The tank is made with a small compartment between the oil and petrol compartments, which serves as a container for paraffin.

A First Aid Motor Cycle.

The St. John Ambulance Brigade, Park Vale Division, Leicester, has the use of a first-aid motor bicycle belonging to a private owner. This machine carries everything necessary for various kinds of accidents, including a portable stretcher which is long enough to take a person 6ft. high. The machine is a Triumph, and across the back carrier are slung pannier bags bearing the well-known St. John Ambulance sign.

SPECIAL FEATURES

THE INTERNATIONAL TOURIST TROPHY RACE (Specially Illustrated Description)
THE LONDON TO EDINBURGH RUN: From a Competitor's Point of View.
THROUGH GREAT BRITAIN AND THE CONTINENT (concluded from page 465).

Police Traps.

On the London Road, Thornton Heath, between the Pond and Norbury Station, on various stretches of road about five hundred yards in length, the police are "disguised" in lounge suits and straw hats.

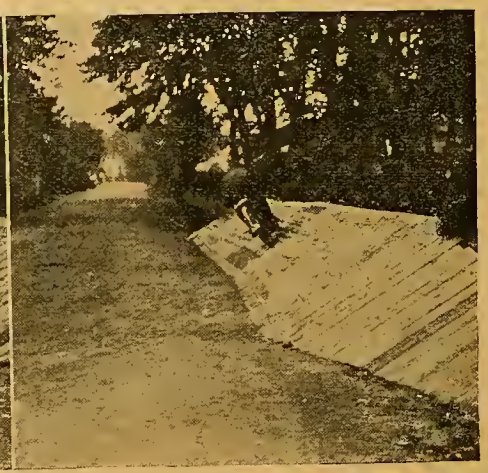
Hill-climb in New South Wales.

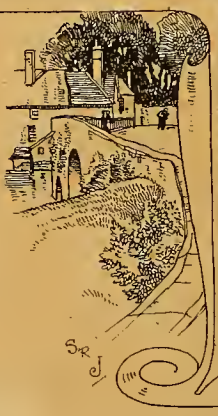
The Motor Cycle Club of N.S. Wales held a hill-climb, open to members of the N.S.W. Cyclists' Union, on the Baden Hill, Coogee, Sydney, on Saturday, April 16th. There were sixteen competitors, who were first called upon to make a timed trial climb for the purpose of handicapping. Any competitor who proved more than ten per cent. faster than his trial climb was disqualified. Competitors raced in pairs, winners racing in pairs again, until the final winner was discovered. In the final, W. L. Cobb (3½ h.p. Triumph), 6s., time 36⅗s., and A. Levi (2¼ h.p. F.N.), 15s., time 45⅗s., dead-heated, but the latter was disqualified under the aforementioned rule. Fastest time was made by the club's hon. sec., W. W. Reynolds, whose 3½ h.p. Triumph climbed the hill in 32s.

Sidecars and Single Gears.

That it is possible to tour long distances with a single-cylinder motor bicycle and sidecar with fixed gear is amply proved by the experience of Mr. A. Cecil Sheppard, of Bath, who recently took a passenger weighing eleven stones, and two fair-sized luggage bags, from Bath to Stirling, and returned *viâ* Edinburgh, Dunbar, Newcastle, and York. The run from York to Bath, about 230 miles, was made without a stop. Slight trouble was experienced with the engine in one section through being put off with an inferior oil [a common complaint.—Ed.], but the total distance travelled was 930 miles in seven days, a very good performance under the circumstances.

Practising Incidents in connection with the Tourist Trophy Race.





1. E. S. Myers has a little difference of opinion with his Scott at Ballacraine.

2. R. Lord (3½ h.p. Rex) trying the artificial bank at the same corner.

3. F. W. Dayrell repairing a puncture in the rear wheel of his 5 h.p. Bat, assisted by W. E. Cook, who is so well-known to Brooklands habitués.

Youthful T.T. Competitors.

Fred Turvey, of Sunderland, was, we believe, the youngest competitor in the T.T. Race. He is 18 years of age. David C. Bolton, who hails from Oakamoor, Staffs, is only a year older.

Specifications of T.T. Winners' Machines.

C. R. Collier's winning Matchless had a 5 h.p. J.A.P. twin-cylinder 85½ × 58 mm. V type engine, capacity 666 c.c., with overhead mechanically-operated valves, Amac carburetter, Bosch magneto and plugs, Hutchinson tyres, Shamrock Gloria belt, Brooks saddle, and Davison tank stoppers. He used Pratt's .680 spirit and Moebius oil.

W. Creyton's Triumph (the first single-cylinder to finish) was a standard T.T. model, 85 × 88 mm. engine, capacity 499 c.c., Bosch magneto, Dunlop tyres, Shamrock Gloria belt, Forward fastener, Middlemore saddle. He used Pratt's spirit and Price's oil.

An Echo of the Edinburgh Run.

An energetic member of the M.C.C. Committee who was largely responsible for the success of the competition was Mr. F. J. Jenkins, who on a 15 h.p. Rover car preceded the first of the competitors on both the outward and the homeward journeys, and saw that every checker and timekeeper was in his place. Accompanying him were Mr. R. H. Head, the chairman, and Mr. A. Candler, the secretary. Where they thought it desirable these three far-seeing officials posted extra checkers to show the way, and additional arrows to mark the route. Thanks to the 15 h.p. Rover the officials were able to put the finishing touches to their excellent organisation. We do not know Mr. Jenkins's motto, but there is no doubt it should be "*Finis coronat opus.*"

Scottish Six Days' Trial.

The organising committee of the Scottish Six Days' Trial has decided to extend the date of entry till Saturday next, June 4th. This has been rendered necessary on account of the date being rather close to the Tourist Trophy Race, which has so fully occupied the attention of motor cyclists recently. Several special prizes are being given for this event, the latest being a special prize to the value of £5 for the best performance on Ross's motor spirit, supplies of which will be obtainable all along the route. Manufacturers of lightweights are reminded that a special prize is being presented by the Edinburgh M.C.C. for the best performance of a lightweight machine, which with an extra ten minutes on each section for this type should prove an inducement. Passing as this trial does through the most beautiful parts of Scotland, it will prove a most enjoyable trip to those participating. The following is a list of the entries up-to-date: S. J. K. Thompson (7-8 h.p. Bat and sidecar), P. W. Bischoff (3½ h.p. Triumph), W. Pattullo (3½ h.p. Triumph), J. T. Wood (3½ h.p. Zenith Gradua), W. Pratt (3½ h.p. Phelon and Moore), Bert Yates (3½ h.p. Humber), W. W. Douglas (2¾ h.p. Douglas), G. L. Fletcher (2¾ h.p. Douglas), J. S. Holroyd (1½ h.p. Motosacoche), J. Donaldson (3½ h.p Bat), and H. S. Bilbe (3½ h.p. Humber).

FUTURE EVENTS.

June 4—Motor Cycling Club second private race meeting and gymkhana at Brooklands.
" 6-11—Scottish Six Days' Open Reliability Trial, organised by Edinburgh M.C.C.
" 18—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CHALLENGE CUP. Competing Teams: Motor Cycling Club (holders), Coventry and Warwickshire M.C., Bristol B. and M.C., Streatham and District M.C., Sutton Coldfield A.C., Edinburgh M.C.C., Southern M.C., Harrogate and District M.C.C., Great Yarmouth and District M.C.C., Herts. County A.C., Essex M.C., N.W. London M.C.C., Oxford M.C.C., Nottingham and District M.C.C., and Sheffield and Hallamshire M.C.
" 25—Bradford M.C.C. Open Hill-climb.
July 4-9—A.C.U. End-to-end Reliability Trial.
" 13—Open Irish End-to-end Reliability Trial, promoted by the Ulster Centre.

East Sussex M.C.C.

On Wednesday, the 25th ult., a reliability and speed-judging contest was held on a nine mile course four times round, which went off splendidly. Marks were given for ease of starting, nearest to eighteen miles per hour, brake test, and condition of machine at finish.

The brake test was proved by having secret controls, who hid in the hedges, and as soon as the machine was opposite the hiding-place the controller sprang out calling upon the rider to stop. The best performance was by C. Dale, riding a 3½ h.p. Triumph, who pulled up within seven yards.

The nearest approach to correct time was by G. T. Scott, who was only 6m. in advance of correct time. He should have been 1h. 56m. 40s., instead of which he was 1h. 50m. 35s.

Although of quite recent formation, the club is going strong, numbering twenty-seven members to date. Runs are well attended, and great enthusiasm is being shown by individual members of the club in competitions, which are only small at present.

Motor Cycling Club.

A very full programme of races and gymkhana sports has been obtained for the race meeting and gymkhana, which takes place at Brooklands on Saturday, June 4th. The two most popular items of the programme are the hill-climb and the skilful driving competition, to win which about forty competitors will strive. For the invitation race, a really representative entry of 3½ h.p. single-cylinder machines has been obtained. It is hoped to secure a good sporting match which will demonstrate the relative speed qualities of the makes represented. Tickets can be obtained from S. H. Fry, 5, Highbury Grove, N.

Two difficult turns on Snaefell Mountain (see pages 514F and 514G).

J. Baxter (5 h.p. Rex) negotiating one of the bends in good style. S. C. Perrymen (5 h.p. Blumfield) travelling well.

SATURDAY'S RACING AT BROOKLANDS.

THE mere fact that there is a race meeting at Brooklands seems to have a most desirable effect on the weather, and last Saturday was no exception to the rule, for ideal conditions favoured the third meeting of the year, which had been postponed from May 16th. A fair number of people turned up to witness the motor racing and flying, and, as usual, the motor cycle races were best filled. It was natural to expect that, with the Tourist Trophy Race in the Isle of Man only two days before, and the hill-climb actually the day before, entries for the motor cycle races would be affected. This was not the case, as there were only four withdrawals from the original entries, and three new men entered after the postponement. There were, on the other hand, a good many non-starters in both races.

It is always a difficult matter to follow the motor cycle races, as the numbers and colours are never visible from the paddock; in fact, the latter might easily be dispensed with, and nobody would be any worse off. Some of the motor cyclists still persisted in riding about the paddock before their race, and were reprimanded by Major Lloyd.

The May Handicap.

The first motor cycle race was at 2.20, and was styled the May Motor Cycle Handicap for all classes of motor bicycles, the cubic capacity of whose engines exceeds 500 and does not exceed 1,000 cubic centimetres, and the distance was 8½ miles. Of fifteen entrants seven did not start, including the Collier Bros., leaving eight to compete as follows:

Rider and machine.	c.c.	start.
W. E. Cook (N.L.G.)	995	scratch
A. Oberländer (N.S.U.)	995	0m. 9s.
W. Chitty (Frays)	964	0m. 9s.
H. V. Colver (Matchless)	666	0m. 21s.
J. T. Bashall (Bat)	666	0m. 30s.
H. E. Parker (N.L.G.)	945	0m. 30s.
F. H. Arnott (V.S.)	662	1m. 27s.
H. G. Partridge (N.S.U.)	808	1m. 33s.

Partridge had far too much start and was never caught, although Bashall was well up at the finish and was barely a quarter of a mile behind. After coming under the bridge for a second time Cook was seen to stop, and the order of finishing was Partridge, Bashall, Oberländer, Colver, Chitty, Arnott, and Parker. About half a mile separated Partridge and Oberländer at the finish, and the men were very much spread out, there being no close racing. The winner's average speed was 55¾ miles per hour.

The Whitsun Handicap.

In the other race, the Whitsun Motor Cycle Handicap, for all classes of machines whose cubic capacity does not exceed 670 cubic centimetres, there were twenty-nine entrants, of whom twenty-two started, the Colliers again being absentees. The starters were:

Rider and machine.	c.c.	Start.
H. V. Colver (Matchless)	666	scratch
J. T. Bashall (Bat)	666	0m. 6s.
W. E. Cook (N.L.G.)	482	0m. 40s.
F. H. Arnott (V.S.)	663	0m. 44s.
R. T. Exshaw (N.L.G.)	482	0m. 52s.
F. E. Barker (Buchet)	331	0m. 56s.
A. Brunton (New Century)	349	0m. 56s.
V. Yates (Rex)	499	1m. 2s.
A. Wilkie (Triumph)	499	1m. 2s.
W. A. Jacobs (Rex)	499	1m. 2s.
Capt. Sir R. K. Arbuthnot, Bart., R.N. (Triumph)	477	1m. 2s.
W. Chitty (Frays)	340	1m. 2s.
H. Hunter (Triumph)	499	1m. 12s.
G. F. Hunter (Triumph)	499	1m. 12s.
J. Kennedy, jun. (Triumph)	499	1m. 12s.
A. C. Maitland (Trump)	488	1m. 12s.
W. Dewar (Triumph)	477	1m. 20s.
A. Oberländer (N.S.U.)	314	1m. 28s.
H. G. Partridge (N.S.U.)	314	1m. 28s.
R. C. Sykes (Quadrant)	349	1m. 32s.
H. C. Tyler (Exmouth)	269	1m. 38s.
F. E. Broome (F.N.)	413	1m. 48s.

Broome started badly, but once again the scratch men were handicapped out. Maitland on his Trump overhauled all in front of him, and got home some two or three hundred yards from Dewar, who was a long way ahead of G. F. Hunter. Then followed Yates, Barker, Sykes, Bashall, Colver, Jacobs, Exshaw, Tyler, Brunton, Cook, Wilkie, Oberländer, and Arnott in the order named. The winner's average speed was again 55¾ m.p.h.

The handicappers were Messrs. A. V. Ebblewhite and T. D. Dutton, while the former officiated as starter and the latter as circuit counter.

Competitors in the Whitsun Handicap at Brooklands last Saturday.

NEXT BROOKLANDS MEETING.

The following motor cycle races will be run at Brooklands on the 18th inst., under the auspices of the Brooklands Automobile Racing Club. Entries close at noon on the 9th inst.

THE SUMMER MOTOR CYCLE HANDICAP. Entrant of winner to receive ten sovs. or cup at option. Second, five sovs. Third, three sovs. Engines not exceeding 670 c.c. capacity. Distance about 5½ miles.

JUNE MOTOR CYCLE HANDICAP. Entrant of winner to receive ten sovs. or cup at option. Second, five sovs. Third, three sovs. For motor bicycles with engines between 500 and 1,000 c.c. Distance about eight miles.

LONDON-EDINBURGH RUN.

In the list of awards published in *The Motor Cycle* last week, W. Chater Lea (7-9 h.p. Chater Lea and sidecar) should have been under the heading of the gold medal winners, and J. Winslow (5 h.p. Rex) should be added to the list of bronze medal winners. The majority of our readers are doubtless unaware that the 7-9 h.p. Chater Lea was fitted with this firm's new model twin-cylinder 85 mm. × 85 mm. engine, which made its first appearance in open competition in the above run. This 7-9 h.p. machine is designed primarily for passenger work, for which it is eminently suitable.

T.T. RACE PRELIMINARIES.

MEETING AT DOUGLAS. THE BRAKE AND SILENCER TESTS.

On Tuesday evening last week a meeting was held at the Sefton Hotel, at which Mr. J. R. Nisbet, who, as clerk of the course, was practically in supreme command, addressed the assembly. He called the men's attention to the fact that the brakes and silencers would be tested at St. John's at 10.30 on Wednesday, and that on their prompt attendance then and on the day of the race depended the good name of the A.C.U. and the success of the race. On the Wednesday armlets for the men and attendants would be given out. He pointed out how the men would be allowed one attendant each, and that this rule would be strictly enforced. Mr. Nisbet expressed himself pleased to see Brewster present, and said he had his sound constitution to thank for his rapid recovery. After going into sundry details, Mr. Nisbet pointed out the seriousness of the competition, that it was a serious trade event, and in the course there were several obviously dangerous points, at which he urged the competitors to keep cool and collected, and remember they were sportsmen and give and take with one another. There should be no passing at corners or within reasonable distance of such dangerous places as Ballacraine. As regards the arrangements, there would be on the course about twenty police (all first-aid men), doctors at the most dangerous places, marshals and boy scouts; there would be two depots, at either of which a man could station his attendant—that at St. John's would be obvious, but the Kirk Michael depot would be marked by a green banner.

At 10.30 on Wednesday morning the competitors had their last ordeals to go through—the silencer and brake tests. On assembling at St. John's all the men were sent on the direct Glen Helen Road, past the historic Tynwald Hill, over a bridge spanning a babbling brook at the foot of the steep incline utilised last year for the two final tests. The ever-energetic Mr. Nisbet marshalled them at the foot, and in response to signals from the chief marshal, Mr. R. D. F. Paul, they were sent up singly, Messrs. J. Lyons-Sampson, A. G. Reynolds, and H. P. E. Harding judging the silencers.

On their arrival at the summit the competitors turned to the left and were lined up in the order in which they reached him by Mr. E. M. P. Boileau, forming up in line along the Upper Peel Road. The silencers were deemed satisfactory, and anything in the nature of a fake was thus rendered discernible. Actually nothing of the kind was found, but pre-eminently above the others the Scotts and Indians distinguished themselves as regards absence of noise.

Some delay was occasioned by several competitors, some of whom could not climb the hills, and by some who were not ready. In the brake test the judges stood halfway down the short steep hill, and at the waving of a flag each man had to apply his brakes. Here again the judges passed all as being satisfactory. The road was signalled clear, and each man was sent down as nearly as possible in order. As they passed the judges each man went to the Green at St. John's, and took up his post where his wooden front number plate was set out. When every man was in his place the judges inspected the machines in order, seeing that every motor bicycle conformed with the regulations.

Following the judges came Mr. V. A. Holroyd with the armlets—white armlets for the riders and yellow armlets for the one assistant allowed to each man—while Mr. Beasley followed with the seals and wire. The frames only were sealed. The examination passed off well enough, but some difficulty was experienced with the tyres. According to the rules, each competitor had to use 2¼in. covers, and in some instances the cover was found to measure 2⅛in. This caused some discussion among the judges, who measured a tyre on one of the marshal's machines and found it to be 2⅛in. across. Consequently this standard was adopted,

J. R. Nisbet and G. E. Roberts despatching competitors singly for the silencer and brake tests on a steep gradient near St. John's, the day prior to the race.

BRILLIANT weather again smiled on Mona's Isle, its sporting inhabitants, and on the competitors and numerous spectators who had come to see the great event. After an early breakfast we left Douglas with the sun shining brightly in a cloudless sky, an ideal morning for the great road race. St. John's looked its best, and as we arrived the chief officials were busy putting the finishing touches to the organisation. Down the direct road to Glen Helen the men were arranged on each side against pegs bearing their correct numbers. Messrs. G. E. Roberts, Otto Thomas, and E. M. P. Boileau were busy driving in pegs in the depôt enclosure marking where the various machines were to draw up. These were grouped according to the different makes, and when the task was quickly over, petrol, oil, and other supplies were smartly laid out by the attendants behind the groups of numbers. The notice board with Mr. J. Baines in command was, as may be supposed, double as large as last year, and at the end of this the depôt was arranged. At 9.30 a nasty sea-fog blew over and enveloped Slieau Whuallian, the mountain which dominates St. John's, and threatened to envelope the whole island. However, we were all cheered by the local weather prophets, who said it only meant heat, and their forecasts proved true. Near the start there lives a farmer who appears to be one of those people who like to assert their rights, and to prove that he was entitled to use the roads as long as they were open he chose to drive his cart on the highways during practice, though the other islanders, true sportsmen that they are, desisted. Just at the moment when all the competitors were at their posts and the spectators were lookingat them with interest, the farmer, just to show he had a right to be on the road, drove down the line, and naturally met with some opposition, which he in turn resented. Shouts of derision arose, and when he tried to use his whip on those objecting to his presence and it was taken away from him, the welkin rang with cheers. The genial Manx police came forward and gently remonstrated, but all to no purpose. Deprived of his whip, the farmer used his reins on a too obtrusive spectator, which at once settled the matter. The pony was immediately removed from the shafts and the cart shoved on the green, while the unsportsmanlike owner was left with the animal using language which was far more forcible than polite. Yells and howls of derision followed, mixed with reports from a toy pistol, which set the animal plunging, and smashed Bentley's front number plate. Fortunately Mr. Salmon made a suggestion to Mr. Straight, who came forward and laying a kindly hand on the farmer's shoulder said, "You seem to be a strong man, come and help us to keep order," and, putting a "committee" badge on the old fellow's arm, won him over at once, thus putting an end to all bad feeling and quickly turning an enemy into a firm friend.

With regard to the competitors the following two alterations were made at the last moment. Pollard took Silver's place, and Fenn was appointed to ride Ariel No. 61. Those who were definitely known not to be starting were A. E. Woodman, who met with the sad accident in practice, and the similarly unfortunate Brewster, Quentin Smith, and Findlater, while beside these J. H. R. Loxham (whose twin Moveo was not really ready in time) changed machines with Houlding and rode as No. 41, F. G. Edmonds who had not arrived, Bagshaw whose entry had been withdrawn. Savory and Shaw did not figure in the timekeepers' list. A further addition was Abbott, who burst a tyre immediately before the start and had no time in which to change the cover. J. Baxter caused much amusement by carrying his tyre pump in his gaiter. The above will give the reader some idea of the preliminaries, but a few further words about the arrangements may be of interest. A telephone had been installed between St. John's and Ballacraine, and the instrument at the start stood on a platform on which Mr. Nisbet could keep in touch with the marshals under him in both places. We carefully examined Ballacraine Corner on our way out, and noted how vastly it had been improved, as at the very point where dry skidding might take place the tarmac had been laid down. Except for the mist which at 10 a.m. had lifted a little, the weather conditions were perfect; the dust was certainly bad in places, but the road in the neighbourhood of the start had been watered. A light south-westerly breeze blew in the direction of Ballacraine. At 10.12 the first pair of competitors began to move out under the direction of the marshals, and as H. A. Collier came in sight of the huge crowd just disgorged by the last train, cheers rent the air. Round them were grouped Ebblewhite and Glazebrook, the timekeepers, and the judges, Messrs. Lyons, Sampson, Reynolds, and Harding, while a battery of cameras were trained on them.

The Start at 10-15 a.m.

At 10.15 H. A. Collier (5 h.p. Matchless) and C. E. Bennett (5 h.p. Indian) started together, the Indian fired first but Collier was soon under way. The rest followed in pairs at 20s. intervals. Evans, another favourite, and D. R. Clarke, both on Indians, were then sent off, while Bentley, another Indian rider, started alone. Marshall and Newsome, both on Triumphs, got off smartly amid cheers. Creyton, the Manxman (3½ h.p. Triumph), and, of course, a favourite with his compatriots, and Franklin (5 h.p. Indian) both got off well, while Drury (5 h.p. J.A.P.-Chater Lea) and H. V. Colver (5 h.p. Matchless) also started in good style. C. R. Collier (5 h.p. Matchless), who was cheered to the echo, and Pollard (3½ h.p. Quadrant), went off together, Collier getting away smartly and kicking against the ground to help his engine. Godfrey, who came in for the acclamation of the populace, and Alexander, both on 3½ h.p. Rexes,

The International Motor Cycle Tourist Trophy Race.—

were next despatched, Frank Applebee (Rex) and Sproston, also on a Rex, whose plucky performance last September was not forgotten, followed. Myers (5 h.p. Scott) and W. H. Bashall (5 h.p. Bat) were the next pair. Thanks to his free engine and two-speed gear Myers was away well before the other machine had begun to fire. J. T. Bashall and H. H. Bowen, whose practice performances had won them the popular favour, were next to go, both on 5 h.p. Bats. Norton on a 3½ h.p. Norton and Witham on a 5 h.p. Bat then left, the Bat getting away first. McNab (3½ h.p. Trump) and J. R. Alexander, jun. (5 h.p. Indian), followed, McNab quickly disposing of his bulky being into the smallest possible space. Stevens and Reed, one on a 5 h.p. and the other on a 3½ h.p. Dot, were then sent off. Butler, the other 5 h.p. Dot rider, and Phillips on the 5 h.p. Scott, were sent off next, the latter making a splendid start. Moorhouse (5 h.p. Indian) started alone. The remainder were sent off as follows: H. L. Cooper (3½ h.p. Triumph) and H. R. Fowler (3½ h.p. Rex), J. Scriven (4 h.p. Rex) and J. W. Adamson (3½ h.p. Triumph), C. E. Murphy (3½ h.p. Triumph) alone, D. C. Bolton (4 h.p. Rex) and H. Houlding (3½ h.p. Moveo), Howard Smith (3½ h.p. Triumph) alone, J. F. Crundall (3½ h.p. Humber) alone, B. Yates (3½ h.p. Humber) and J. Baxter (4 h.p. Rex), F. Mackay (4 h.p. Rex) and W. E. Grange (3½ h.p. Rex), J. Gibson (3½ h.p. Trump) and D. B. Rea (3½ h.p. Moveo), G. E. Stanley (5 h.p. Premier) alone; B. Jones (5 h.p. Premier) and F. W. Barnes (3½ h.p. Zenith Gradua), P. Weatherilt (3½ h.p. Zenith Gradua) and J. R. Woodward (3½ h.p. Rex), J. Slaughter and A. G. Fenn (both on 3½ h.p. Ariels), W. G. McMinnies (3½ h.p. Triumph) and F. W. Dayrell (5 h.p. Bat), H. J. Scale (3½ h.p. Scale) and F. W. Chase (3½ h.p. Centaur), S. C. Perryman and N. F. Holder (both on 5 h.p. Blumfields), F. Turvey (3½ h.p. Humber) and H. Martin (5 h.p. A.S.L.), R. Pimm (3½ h.p. A.S.L.) alone, E. F. Baxter (4 h.p. Rex) and F. C. Wood (3½ h.p. N.S.U.), J. F. Sirrett (3½ h.p. N.S.U.) and W. Heaton (5 h.p. N.S.U.), A. Oberländer (5 h.p. N.S.U.), R. Lord (3½ h.p. Rex), and F. W. Applebee (3½ h.p. Centaur), R. Ellis (3½ h.p. Rex) alone, D. M. Brown (3½ h.p. Humber) and S. Wright (3½ h.p. Humber). The last to start was J. Lang (5 h.p. Tee Bee). In all seventy-three started out of eighty-three. The number thirteen was not allotted. All of the crowd waited in silent expectation. The start had been most successfully carried out, and it only remained to spot the leader of the procession.

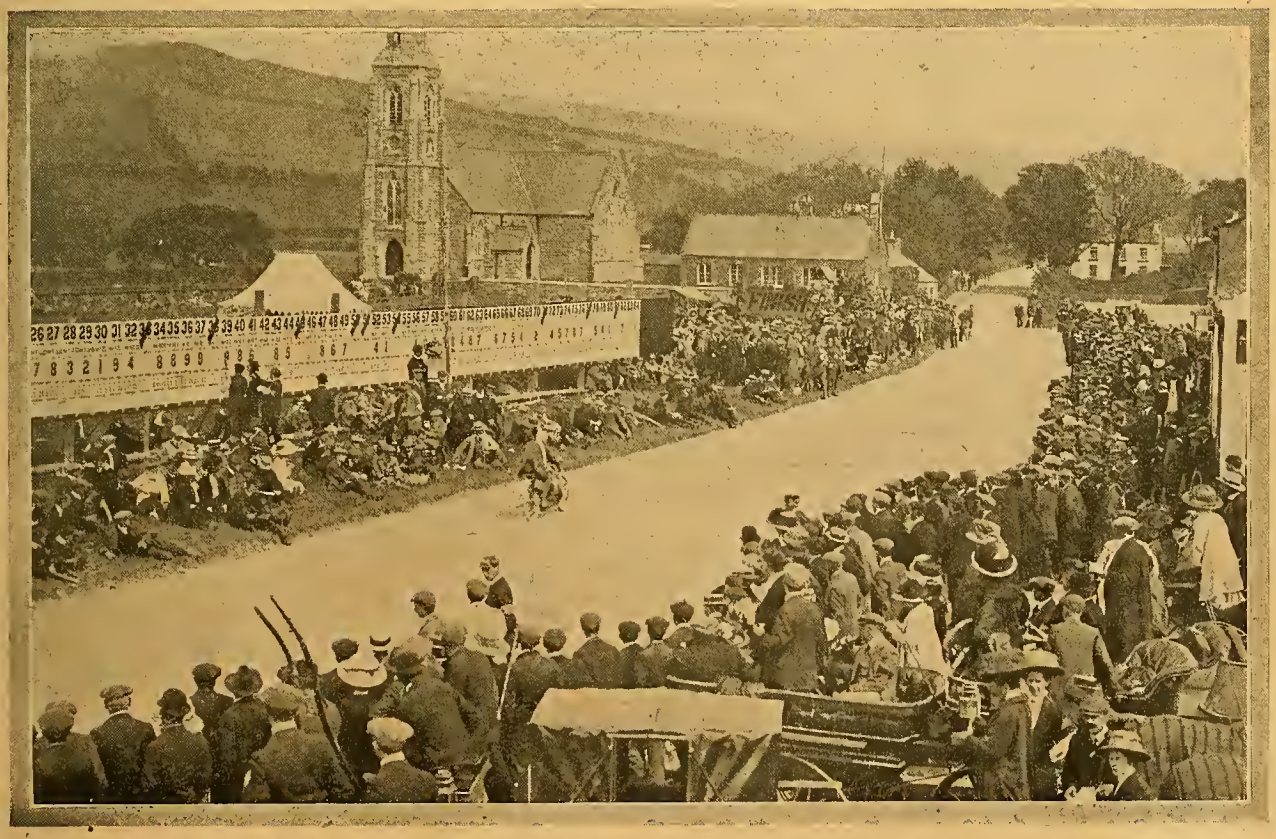
Incidents of the First Lap.

In a few minutes H. A. Collier flew past, well ahead of everybody else. It would be useless to give the order in which the others *passed*, as it would be meaningless, but below are given the first six in each lap in their order of time.

The following shows the positions of the leaders at the end of the first round:

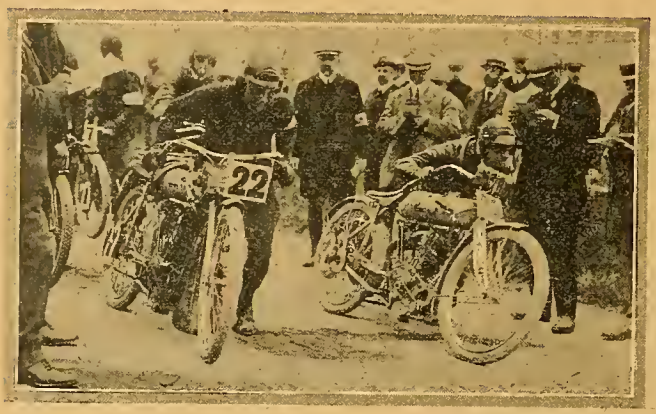
		Lap time.
1.	W. H. Bashall (5 h.p. Bat)	18m. 15s.
2.	H. H. Bowen (5 h.p. Bat)	18m. 28s.
3.	B. Jones (5 h.p. Premier)	18m. 33s.
4.	H. Reed (5 h.p. Dot)	18m. 44s.
5.	C. R. Collier (5 h.p. Matchless) ...	18m. 54s.
6.	F. W. Dayrell (5 h.p. Bat)	18m. 58s.

The first round was full of incidents. J. T. Bashall retired with a broken pulley near the Devil's Elbow. A message was delivered by a boy scout that a doctor was wanted at Glen Helen. This, it is presumed, was for Bennett, who fell at the foot of Creg Willey's Hill, suffered several flesh wounds, and had to withdraw. Butler retired near Peel. Yates was put out of the running with engine trouble between Kirk Michael and the Devil's Elbow. Rea was stopped by a broken pulley. Pimm stopped with a flat front tyre at the St. John's depot, and Lee Evans did likewise. Martin had trouble with both brakes and fell at Creg Willey's Hill, and later had to retire through valve trouble. S. Wright fell out with a broken crankshaft. Bentley's back tyre burst while travelling at high speed coming down from Creg Willey, but fortunately without falling off. Godfrey retired through a broken piston. Scale broke his pulley near Ballig Bridge, and Barnes and Weatherilt nearly collided near St. Germans.



Scene at St. John's, the starting and finishing point. The scoring board is plainly discernible. N. F. Holder (5 h.p. Blumfield) is the rider in the picture.

The International Motor Cycle Tourist Trophy Race.—



J. T. Bashall and H. H. Bowen, two private owners of Bat-J.A.P. machines starting. Bowen led for three laps.

In the second lap Franklin retired with inner tube trouble. Owing to a bad batch these tubes caused the downfall of the Indian competitors in the race. Noel Drury's engine seized in Glen Helen, probably through ball-bearing trouble. Pollard, the Quadrant rider, lost the cover of his magneto contact breaker, with the result that the latter would not stay in position. Norton broke an inlet valve rocker; and Stevens, the Dot rider, was another who had to withdraw. As H. A. Collier passed on his second round he was heartily cheered, and hearing or perceiving the acclamation he waved his hand in response. W. H. Bashall wobbled alarmingly as he entered the St. John's straight, and as he came into sight his goggles were seen to have fallen over his face. After repairing his tyre Lee Evans got away again amid cheers. The second lap positions were: Growing times.

1. H. H. Bowen (5 h.p. Bat) ... ... 36m. 39s.
2. B. V. Jones (5 h.p. Premier) ... ... 37m. 10s.
3. C. R. Collier (5 h.p. Matchless) ... 37m. 11s.
4. H. Reed (5 h.p. Dot) ... ... 37m. 23s.
5. F. W. Dayrell (5 h.p. Bat) ... ... 37m. 51s.
6. H. A. Collier (5 h.p. Matchless) ... 38m. 9s.

It will be seen that Bowen had assumed the lead, Jones had taken second place, and C. R. Collier third. Reed had kept his position, Dayrell had gone up a place, Collier had taken up sixth position, and Bashall had dropped behind.

In the third lap Bowen made the fastest lap of the day—17m. 51s., equal to 53.11 m.p.h.—but he charged the wall at Ballacraine Corner, and later retired with a broken frame on Creg Willey's Hill. In this round Witham stopped at St. John's, and Reed, who had broken his exhaust valve lifter, had to use his switch to slow down at the corners. On failing to restart on one occasion, his belt jammed, broke his pulley, and caused his withdrawal. Fenn was put out of the running with a broken connecting rod. E. F. Baxter retired, and Pimm withdrew through tyre troubles. Third lap positions:

1. H. H. Bowen (5 h.p. Bat) ... ... 54m. 30s.
2. C. R. Collier (5 h.p. Matchless) ... 55m. 35s.
3. B. V. Jones (5 h.p. Premier)... ... 55m. 51s.
4. W. H. Bashall (5 h.p. Bat) ... ... 56m. 30s.
5. H. A. Collier (5 h.p. Matchless) ... 57m. 1s.
6. F. W. Dayrell (5 h.p. Bat) ... ... 58m. 26s.

It was clear that C. R. Collier, the favourite, really meant business, and had crept up to second place. Jones dropped back one place, and so had Dayrell, while H. A. Collier and Bashall had gained ground.

In the fourth lap there was plenty of excitement. W. H. Bashall stopped at the depot at St. John's to fill up with petrol, and owing to the absurd regulation that competitors had to fill up their own tanks his hand shook, and the petrol was spilt over the hot engine. Instantly machine and rider were a mass of flames. For a few moments matters looked most serious, but Bashall was wrapped in coats, and

The Manx farmer, his pony, and the crowd. See page 506.

Boy scouts assist in keeping the route clear. They were posted all along the Glon Helen road in sight of each other.

save for a few burns was unhurt. The blazing machine lay on the ground, and the burning coat was in the road. People rushed forward, but, fortunately, the marshals kept the course clear, only just in time, as Marshall dashed through the flames, on his fourth round. McNab stopped at the depot for replenishments. Near Knocksharry, Gibson broke an exhaust valve, bent the new valve, and could not get it to work again. He had previously dropped his silencer. Lang on the Tee Bee withdrew. Moorhouse, another Indian unfortunate, had tube troubles, and Witham, who was travelling very fast, passed the starting point with a broken mudguard, and later retired. Fourth lap positions:

1. H. H. Bowen (5 h.p. Bat) ... 1h. 12m. 23s.
2. C. R. Collier (5 h.p. Matchless) ... 1h. 14m. 15s.
3. B. V. Jones (5 h.p. Premier) ... 1h. 15m. 53s.
4. W. H. Bashall (5 h.p. Bat) ... 1h. 15m. 57s.
5. J. Marshall (3½ h.p. Triumph) ... 1h. 18m. 43s.
6. A. Oberländer (5 h.p. N.S.U.) ... 1h. 19m. 9s.

It will be noted that the bad luck of Bowen and Bashall, the two unfortunate Bat riders, effaces them from future lists; hard indeed, considering their high positions. Bowen's ultimate withdrawal was in the fourth lap. Collier kept his second place, while Marshall and Oberländer had worked their way up. At the end of the fifth lap, Crundall fell near Kirk Michael, broke his petrol union, set his carburetter on fire, spoilt the float, turned his broken petrol pipe into the float chamber, and tried to continue, but all to no avail. Wood (N.S.U.) fell at St. John's and withdrew. Jones, who was always in the first three, retired through engine trouble.

The International Motor Cycle Tourist Trophy Race.—

Half Distance.

Fifth lap positions:

1.	C. R. Collier (5 h.p. Matchless) ...	1h. 33m. 24s.
2.	H. A. Collier (5 h.p. Matchless) ...	1h. 35m. 34s.
3.	A. Oberländer (5 h.p. N.S.U.) ...	1h. 38m. 43s.
4.	W. Creyton (3½ h.p. Triumph) ...	1h. 38m. 48s.
5.	W. F. Newsome (3½ h.p. Triumph)	1h. 39m. 19s.
6.	F. Philipp (5 h.p. Scott)	1h. 39m. 46s
7.	J. R. Alexander (5 h.p. Indian) ...	1h. 40m. 7s.
8.	J. Scriven (4 h.p. Rex)	1h. 41m. 30s.
9.	J. W. Adamson (3½ h.p. Triumph)	1h. 41m. 30s.
10.	H. Lister Cooper (3½ h.p. Triumph)	1h. 44m. 5s.
11.	C. E. Murphy (3½ h.p. Triumph)	1h. 44m. 57s.
12.	J. Marshall (3½ h.p. Triumph) ...	1h. 46m. 16s.

It will be seen by the above list of the first dozen that C. R. Collier assumes the first place and his brother leaps forward to second, after losing time through changing a plug. Oberländer comes third, and Marshall, who suffered a burst tyre, drops back to twelfth. It also shows how the other Triumph riders were proving their worth (especially Creyton, who jumped from eighth to fourth position), and how Philipp's Scott had come up into sixth place. In the sixth round Frank Applebee retired with a broken tappet rod, Crundall had finally to withdraw for the reasons already stated, and Mackay withdrew through tyre troubles at Kirk Michael depôt. Lord, another Rex rider, fell and broke his petrol pipe near St. Germans.

A remarkable snapshot during the race. F. C. Wood's N.S.U. clear of the ground on Ballig Bridge. The rider has also been jolted off the saddle.

Scene on the course in Glen Helen. W. Creyton leading.

Sixth lap positions:

1.	C. R. Collier (5 h.p. Matchless)...	1h. 51m. 45s.
2.	H. A. Collier (5 h.p. Matchless)...	1h. 54m. 33s.
3.	W. Creyton (3½ h.p. Triumph) ...	1h. 58m. 2s.
4.	J. W. Adamson (3½ h.p. Triumph)	2h. 1m. 11s.
5.	J. Scriven (4 h.p. Rex)	2h. 1m. 21s.
6.	H. L. Cooper (3½ h.p. Triumph)...	2h. 4m. 32s.

Here it will be seen that the brothers Collier keep their positions, Oberländer loses his place through his belt coming off and smashing his stand clip, Philipp loses sixth place through having to stop for petrol, Creyton assumes third position, and the first three never alter their order to the end. Adamson, Scriven, and Cooper move up in the scale. In the seventh round Houlding fell and retired through his saddle breaking at Ballacraine Corner. Oberländer gave up at Kirk Michael through a broken exhaust valve, and McNab was put out of the running through his cylinder head blowing off. Seventh lap positions:

1.	C. R. Collier (5 h.p. Matchless)...	2h. 10m. 18s.
2.	H. A. Collier (5 h.p. Matchless)...	2h. 13m. 55s.
3.	W. Creyton (3½ h.p. Triumph) ...	2h. 19m. 11s.
4.	J. Scriven (4 h.p. Rex)	2h. 21m. 33s.
5.	J. W. Adamson (3½ h.p. Triumph)	2h. 21m. 33s.
6.	F. Philipp (5 h.p. Scott)	2h. 21m. 35s.

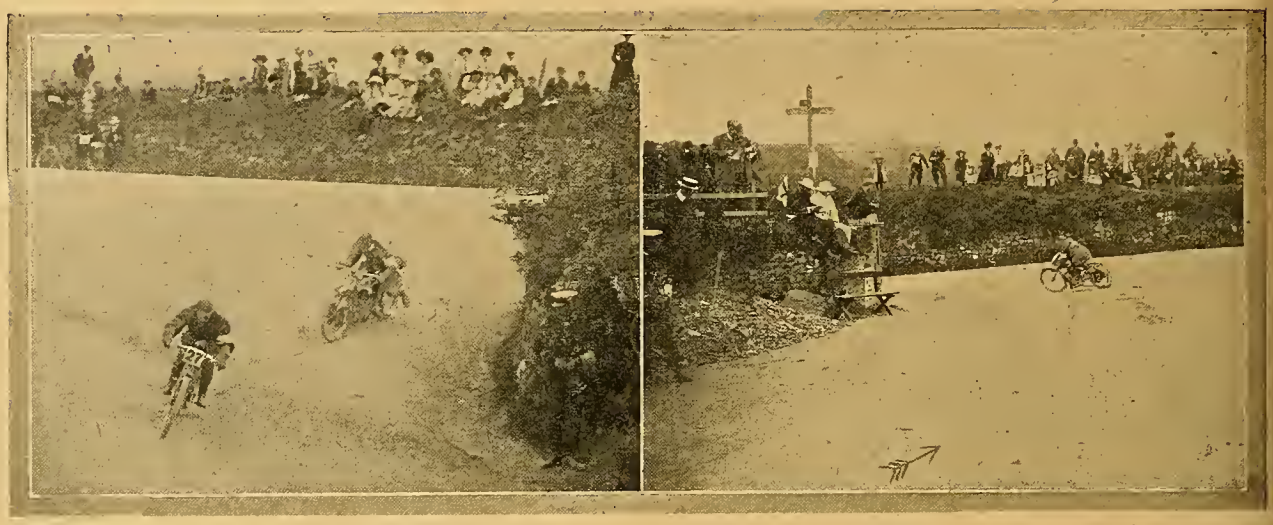
The first three now inseparable keep their places, C. R. Collier making fastest time in this lap, but Scriven steals a march on Adamson, and Philipp again appears on the list. Adamson had three stops during the race—two for petrol and one for oil—at least one of which he found afterwards was unnecessary. News also came to hand that Myers had suffered two punctures as well as plug trouble. Marshall was the fastest of the single-cylinders in this lap, doing his utmost to make up time lost in repairing a burst tyre in the fifth lap. Eighth lap positions:

1.	C. R. Collier (5 h.p. Matchless)...	2h. 28m. 49s.
2.	H. A. Collier (5 h.p. Matchless)...	2h. 34m. 1s.
3.	W. Creyton (3½ h.p. Triumph) ...	2h. 38m. 42s.
4.	J. W. Adamson (3½ h.p. Triumph)	2h. 41m. 19s.
5.	F. Philipp (5 h.p. Scott)	2h. 42m. 9s.
6.	J. Scriven (4 h.p. Rex)	2h. 43m. 28s.

Adamson, it will be noticed, again assumes fourth place, while Philipp goes up one in the list. In the ninth round Barnes (3½ h.p. Zenith) retired at the top of Creg Willey's hill through tyre and valve troubles, and Dayrell's rear cylinder head blew off. Myers again suffered plug trouble, and, having used up his spares, had perforce to run on one cylinder for three miles until he came on Godfrey, who was a friend in need, but further delay ensued in removing the faulty plug.

H. H. Bowen (5 Bat-J.A.P.), who, until a fall at Ballacraine, was leading. He continued for a short distance, but afterwards his frame gave way. Hard luck indeed!

The International Motor Cycle Tourist Trophy Race.—



Competitors negotiating the acute bend at Kirk Michael, which almost resembles a >. It is rendered more difficult by the fact that it is on a falling gradient. H. V. Colver (Matchless) is seen in the right hand illustration and A. H. Alexander (3½ Rex) and J. R. Alexander (5 Indian) in the other.

Ninth lap positions :

1.	C. R. Collier (5 h.p. Matchless-	2h.	48m. 23s.
2.	H. A. Collier (5 h.p. Matchless-	2h.	53m. 26s.
3.	W. Creyton (3½ h.p. Triumph) ...	2h.	58m. 13s.
4.	J. W. Adamson (3½ h.p. Triumph)	3h.	1m. 53s.
5.	J. Scriven (4 h.p. Rex)	3h.	3m. 34s.
6.	H. L. Cooper (3½ h.p. Triumph)...	3h.	4m. 53s.

About twenty-five minutes past one, C. R. Collier romped in a winner, with his brother second, and Creyton (the first single-cylinder rider) third. It was seen from the last five laps that his win was practically certain, and as the time of the finish approached Mr. Schulte, the sportsmanlike director of the Triumph Co., got ready a bottle of champagne and two glasses for the two brothers Collier. The result of the race was most popular, and the position in which Creyton finished highly pleased the islanders. Creyton is a Manxman, who was formerly ostler in an hotel, and being bitten by the motor fever he took to motor cycling, with what result may be clearly seen. Collier's average speed was 50.7 miles an hour, against 49.002 by his brother last year. C. R. Collier's fastest lap was 18m. 17s., as against 18m. 9s. by his brother in last year's race. The riding of the Matchless team was quite remarkable. Finishing first, second, and tenth, they rode consistently throughout. C. R. and H. A. Collier were said to be the most cautious at all the dangerous places, and yet their machines were reliable enough and fast enough to win. The arrangements were excellently carried out—even better than before, thanks to the presence of a strong man behind the organisation. Every precaution was taken against accident, and no accident worth mentioning occurred, though the lessons learned from the previous sad mishaps were undoubtedly taken to heart. Only in one respect was there a complaint, and that was against the working of the scoring board. Mr. Baines did his best, but his task was far beyond the powers of one man, so great was the size of the board.

At the meeting of competitors, it will be remembered, Mr. Nisbet urged those taking part in the race to show consideration to their rivals, and not pass at the corners and

Ballacraine Corner, a right-angled turn, where a large crowd congregated. The banking to assist the riders is shown in the right-hand illustration.

Lap Scoring Board, showing Results at a Glance.

P. Butler, 5 Dot (30)	Retired before completing first round in Peel.										
B. Yates, 3½ Humber (46)	Retired through engine troubles at Kirk Michael.										

The International Motor Cycle Tourist Trophy Race.—

dangerous bends. So well was this sportsmanlike idea carried out that many of the marshals who were to make reports of what happened, especially as regards examples of unsportsmanlike behaviour, had no comments to make. In motor cycling, at any rate, are the sporting traditions of Britons brilliantly upheld.

At the conclusion of the race the first twelve machines were pushed into the enclosure (the crowd cheering as each went by), and were there examined by the judges, who verified the measurements, and found these, we are glad to say, correct.

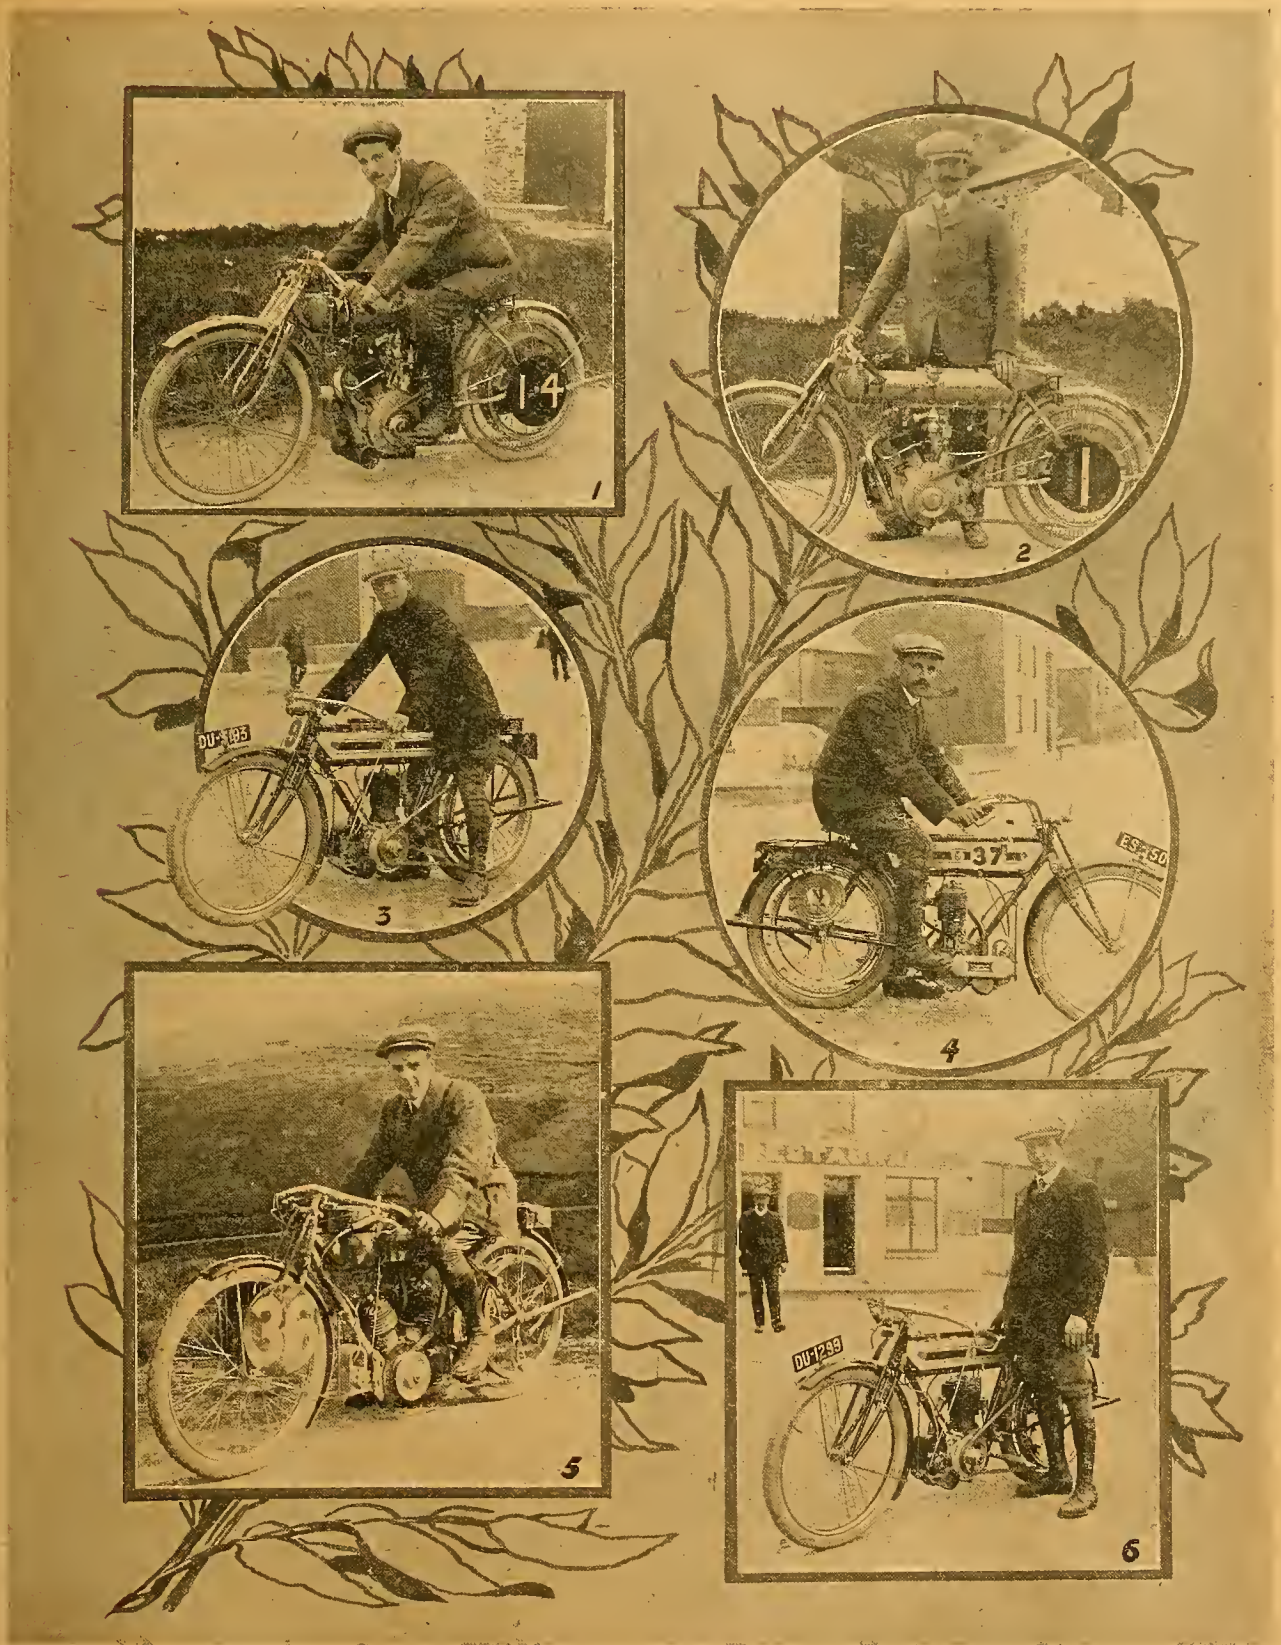
C. R. Collier finished about 1.25 p.m., and after this the interest of the crowd began to flag, and many became restless. A number, however, had to finish, and among these may be mentioned the hard case of Sirrett (N.S.U.), who was close behind another competitor who had just completed his tenth lap. Sirrett mistook the signal, and thus was prevented from finishing the course, though he had plenty of time in which to do so.

On the way to Glen Helen. One of the prettiest spots on the course. Ballig Bridge, in the foreground, proved a stumbling block to a great many competitors.

Impressions at Ballacraine and Ballig Bridge.

After my experiences of the practice I came to the conclusion that the place *par excellence* to make my headquarters was St. John's, for here, not only could the start and the finish be seen, but also access was easy to Ballacraine Corner, that cemetery of hope; Ballig Bridge, where the machines leap into the air; and the unnamed bridge which squats diagonally on the course between St. John's and Peel. By careful dodging and the occasional use of a motor bicycle, I managed to keep my actual absences from the course down to a very few minutes. The first place I went to was Ballig Bridge, which from the scenic point of view is probably the most charming spot on the course; here a surprisingly small number of people had collected, and were dotted amongst the golden gorse on the hillside at various vantage points. Scarcely a better position could have been chosen for watching sensational riding, and very sensational indeed it was. The first man to fly by, taking the corner in magnificent style, was Bennett on an Indian, who, starting level with H. A. Collier, had managed to snatch thus early a lead of between two and three hundred yards. Generally speaking, the order over the bridge was the same as at starting until No. 14 (C. R. Collier) pulled up just before the bridge and spent several precious moments in making some adjustment, apparently to his carburetter. Three hundred yards further on he had stopped again. The first incident to send the spectators' hearts into their months came when Bentley, on an Indian, leapt over the switchback bridge and twisted his front wheel in mid-air. His subsequent course for the next fifty yards was meteoric and startling, as his track was not unlike the section of a corkscrew along its major axis. Scarcely had the spectators got their breath back when Newsome, on a Triumph, taking the turn a shade too wide, had some little difficulty in preventing his machine unceremoniously entering a cottage by the front door. Three or four minutes later Alexander and Applebee, both on twin Rexes and hard on each other's heels, did much the same thing, and only saved themselves by superlative skill. It was noticeable that neither of them switched off, but wrenched themselves back on to the course and disappeared round the corner towards Glen Helen as if they had only been carrying out their usual itinerary. Moorhouse spent a long time at the bridge, a victim of the tyre trouble which

THE VICTORIOUS COMPETITORS IN THE TOURIST TROPHY RACE.



(1). C. R. Collier, winner of the Marquis de Mouzilly St. Mars trophy. Machine 5 h.p. Matchless-J.A.P.

(2.) Last year's winner, H. A. Collier (5 h.p. Matchless-J.A.P.), the second to finish, 5½ minutes behind his brother.

(3.) W. Creyton (3½ h.p. Triumph) the first single cylinder rider to complete the course.

(4.) J. W. Adamson (3½ h.p. Triumph) the first private owner past the finishing post.

(5.) Jack Scriven (4 h.p. twin Rex) a private owner fifth in order of speed.

(6.) J. Marshall (3½ h.p. Triumph), winner in 1908 and sixth to finish this year.

The International Motor Cycle Tourist Trophy Race.—

dogged all his *confrères*. The manner in which Philipp and Myers on their Scotts negotiated the bridge was an eye-opener to everyone, for whereas if *all* the machines did not actually come over with *both* wheels off the ground, all but the Scotts had at least the front wheel in the air.

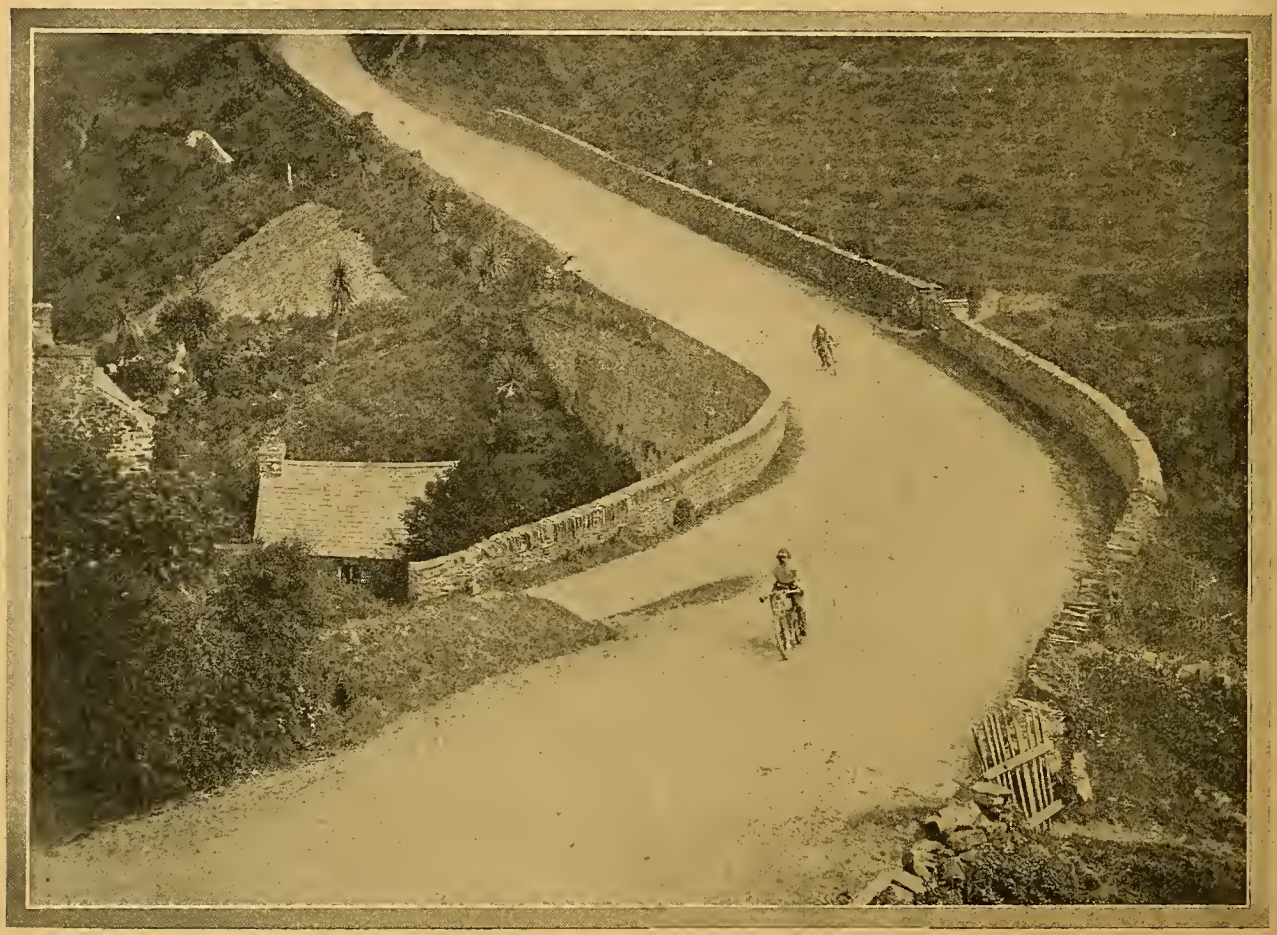
Quite the fastest over the bridge in the second lap was Jones, on a twin Premier, who in one lap had passed no fewer than thirty-two competitors, and was going in magnificent style.

A steeplechase over hedges and ditches quickly took me by a short cut of my own discovery to St. John's, where, of course, interest in the race was centred, although from the spectacular point of view the endless succession of machines whizzing by was apt to grow a trifle monotonous, especially if one were not doing a little private lap scoring, for the official scoring board was never within less than twenty minutes of being up-to-date.

Perhaps the most comfortable place of all to watch the progress of the race was from a steep hill overlooking the bridge between St. John's and Peel, where one might lie and bask in the sun and see the machines first as the nuclei of puffs of dust in the distance; one had, too, practically a bird's-eye view of the bridge. Contrary to my expectations there were no incidents here of the sensational type, which speaks in high terms of the rider's skill, for there is no doubt that this bridge is very much harder to tackle than that at Ballig, for whereas the latter can be clearly seen from the hill down which one approaches it, the former is "blind," and it was therefore necessary to have a flag-wagger here.

I had left my machine at St. John's, and thanks to it I lost no time getting to Ballacraine Corner, where I was just in time to see Bowen bring off quite the most hair-raising waltz that this year's race and practice have yet brought forth. This was particularly unfortunate, as he had been doing some most remarkable times, and was undoubtedly prime favourite for the race if one may judge from the amount of money which was placed upon his chance. Ten minutes before he came to grief an amateur bookie did brisk business with an offer of "fours" against Bowen, business which proved highly profitable, with remarkably quick returns. Lust for speed and the consciousness that he was rapidly overhauling everybody else evidently proved too much for the famous Bat rider, for he rode at the corner at a pace which was much too high. The moment he realised his mistake he switched off and crammed on his brakes. By this time he was already close against the wall, so that he was forced to make a sharp turn, with the result that he cut a complicated figure involving at least one and a half complete turns and fell backwards into the wall with the machine on the top of him. A great burst of cheering arose when Bowen pluckily got up, picked his machine up, and started punching and thumping the handle-bars back into position. In less than a couple of minutes he was off again going apparently as well as ever, but alas, fated to come to grief with a broken frame a short distance further on. Alexander, on his Indian, directly afterwards took the wooden banking in the most advanced manner, that is to say he went right up to the very top and came down again with a thump that took a lot of his speed off.

After this I spurted back to St. John's, rough and tumbled across to Ballig, where I saw a fine race between the Collier Bros. and Creyton, and then back to St. John's in time to act as a policeman in keeping the crowd off the course and add my voice to the cheers which greeted C. R. Collier when he purred past the winning post.



W. E Grange (3½ Rex) and D. R. Clarke (5 h.p. Indian) speeding along the coast road to Peel.

The International Motor Cycle Tourist Trophy Race.—

Observations at Kirk Michael Replenishment Depot.

The north-western corner of the triangle is an execrable V turn on a falling grade, and so dangerous that no rider dare play tricks with it; everybody switches off a hundred yards away, and rounds it at a crawl. The many heavy tosses sustained here in previous years are to be ascribed to brake failures rather than over lurid corner work, and this year the road on to Ramsey was kept clear and open for any rider whose brakes had become weakened. Quite a number of men exhausted surplus impetus by thus running off the course, notably on two occasions, when clumps of four and six riders stormed up to the V with only a few feet between them. The number of spectators at the corner was considerably in excess of previous years, and even the women and children managed to keep in touch with the positions of the leading men—no easy matter, especially in the first few laps, when the thundering procession was practically continuous, but the slow pace round the V renders the numbers legible. Two hundred yards up the road towards Creg Willey summit was a green banner, denoting a replenishing depôt in charge of C. E. Rackham. Here were located supplies for the Matchless, Indians, Scotts, and some of the Rexes and Triumphs. Oscar Hedstrom and Wells soon had cause to look glum at the disappearance of some of their cracks, and ere long Bentley walked disconsolately in with a mangled sample of the special American inner tubes, which were responsible for the Indian *débâcle*. These tubes had been over vulcanised at the lapped joint, and ripped like blotting-paper in patches. Bentley's tube had split for ten inches when he was possibly touching 70 m.p.h. in the swoop down from Creg Willey summit, and he had the most strenuous half minute of his life in fighting the machine as it bucketed to and fro across the road. The first lap showed that W. H. Bashall meant business, and could he but keep on the road he would extend the Colliers. Lee Evans hunted Collier round the V only a yard astern, and Jack Marshall was hanging on to them like a terrier. The shuffling of positions corresponded in the main with those at other points of observation, and the special interest here lay rather in many duels for precedence round the bend, and in the varying dexterity with which the riders replenished their tanks at the depôt.

On the first lap Franklin pulled up and changed the tube in his back wheel, thus losing a lap. When restarting he jammed his coaster hub at the V. W. H. Bashall was second man round in the second lap, having done very fast time, while Jones on the twin Premier was also travelling superbly. On the third round 58 and 69 both came up too fast in close company, and had to shoot down the safety road. Creyton and Newsome were not a machine's length apart, having raced 38 miles side by side.

On the fourth lap, H. A. Collier stopped to fill with petrol, and was off again in 27s. His tank had a huge Davison filler, and his attendant slapped in spirit in record time from an ordinary two-gallon can, which had been provided with an air vent in the bottom by the simple process of banging a cold chisel through it. Bowen shot ahead just as Collier was starting away again. Marshall tore down the hill, just leading Clarke's Indian, which shot ahead as Jack stopped for petrol. The small screwed filler caps on the Triumph tanks wasted a lot of time by comparison with the Davison bungs. The Indians similarly wasted time in filling their oil tanks, but Wells had a good thing in half a dozen huge squirts. These were kept ready filled with lubricant from a bucket, a cork stopping up the nozzle. One and a half squirts would fill the tanks in five or six seconds. Creyton nearly sacrificed his chances after refilling in this lap. He was just starting

off when his machine burst into flames, and he paused in dismay, but with a roar of "Get on!" from the attendants he leapt into the saddle, and the wind extinguished the flames within fifty yards. Franklin came down the hill at a truly frightful speed in this lap, but Sproston, whose luck is usually bad, had to stop for tyres and petrol. Several riders signalled as they passed the depot that they would stop on the next lap, and in each case an attendant was out waiting in the road with all supplies ready a quarter of an hour later. Charlie Collier stopped to replenish on his fifth lap, and H. A. shot past before his brother got away. Even the leading men asked anxiously where they stood, whenever they paused at the depot, and as the tale of laps grew longer many riders lost count of the distance they had done. The fastest men were all early starters, and were anxious lest one of the later starters should be circling round quite as fast seven or eight miles behind them, so true is it that "lookers on see most of the game."

By the sixth lap a twin-cylinder victory seemed a moral certainty, and now occurred the sensation of the day, six riders descending from the heights above so close together that a large blanket would have covered them. Luckily, four of them funked rounding the V in such close company, and they tailed out into a string ere the dangerous angle was attained.

On the seventh round, Oberländer, who had raced with remarkable consistency, parted with his chance. His belt pulled through and damaged the clip of his stand just as he applied his brakes for the V. In his anxiety he made an error of judgment, and tried to remove the stand instead of strapping it up. He broke the crossbar, and it took him a long while to secure the legs separately. By the time he had further fitted his spare belt, he had lost about a lap, and went on very disconsolately, reappearing two or three laps later in hopeless trouble with his exhaust valve. The poor fellow sat on a bench in the garden at the depot, the picture of disappointment. Mackay presently walked his machine down the hill, the joint of his second butt-ender having collapsed after repeated repairs. He reported a very narrow escape. He was chasing Bowen down Creg Willey at a furious speed, when the latter's frame broke. The Bat went one way, its rider the other, and Mackay shaved in between them by an inch or two.

On the eighth lap, Scriven made a very clever restart after a petrol stop. He had previously broken his valve lifter, but managed to push off his racer while half lying across the top tube to hold up a tappet on the far side. Considering that this must have hampered him, his position in the race was excellent.

On the ninth lap, "Pa" Applebee came in disconsolately exhibiting his petrol pipe, which had come clean out of the tank. MacMinnies hereabouts encountered his sole trouble, his exhaust valve jamming in the guide. He had ridden very consistently and steadily, though never fast. Just before the course was thrown open, Dayrell's back cylinder failed between the Devil's Elbow and Peel.

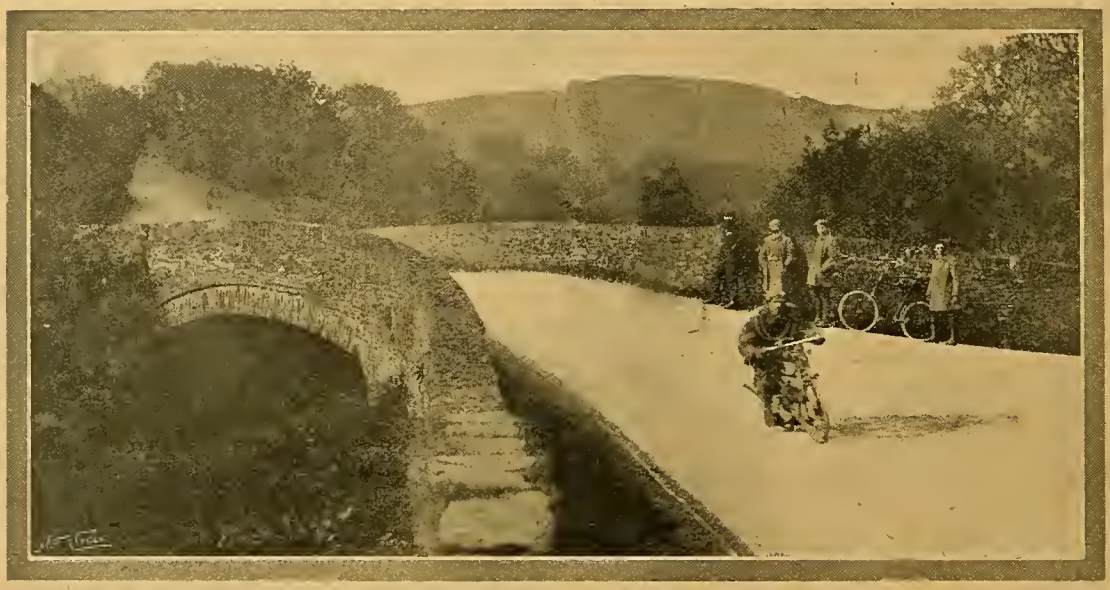
The Race as seen from Knocksharry.

After witnessing a dozen competitors start from St. John's, I mounted my motor bicycle and sped across the inside of the course by a short cut along a very lumpy and disused road to a point midway between Peel and the Devil's Elbow. Here I had a clear view of the course for more than a mile, and arrived just in time to see H. A. Collier come thundering past. Lee Evans followed a minute later, followed by Bentley, Clarke, and Marshall. The latter was starting well, for he overtook and passed Clarke on the stretch of road I surveyed. The dust was appalling; several times bunches of competitors were tearing along in a cloud, and so thick was the dust that at times it was difficult to discern the numbers. How the hindermost were able to steer at such tremendous speeds is a puzzler. It was clear that Bowen and Bashall were the fastest over the stretch of road near Knocksharry. The Colliers appeared to be taking matters easily the first round or two. It was a fine sight as over sixty competitors filed past at speeds varying from 50 to 70 m.p.h. Sometimes there would be a gap, then a constant stream, the hinder men fighting their hardest to gain the lead to avoid the dust. On the second lap H. A. Collier had retained his lead, but it was seen that the favourite, C. R., was making headway, as he had almost caught up his brother. Colver had suffered a stop, and he was making strenuous efforts to pick up time. Then followed almost in a heap, Marshall, Clarke, Bowen, Newsome, and Creyton. Bowen had crept up several places, and his corner work was extremely clever. Jones struck me as going particularly well. Newsome and Creyton again passed in line next round, only a machine's length separating them. Bashall and Reed were going great guns, and in a moment or two Godfrey, the two Alexanders, and Colver passed in a bunch, fighting out an extra race for the first position. Then a competitor was observed pushing his machine by the roadside. It proved to be J. T. Bashall, who was very disconsolate, for he said his Bat was running as well as it had ever done, when the outer pulley flange broke in pieces—the result of drilling too many holes on the belt line. The next incident was an exciting duel between F. Philipp and J. Lang. It was a very even race, and both were lost to view still side by side. The two-stroke Scott machines excited the keenest admiration, the beautifully healthy purr of the engines being a pleasant change from the crisp bark of the majority of the other machines. F. W. Applebee (Centaur) broke his belt on the first round—by the way, to improve the flexibility he had fitted his belt with twenty-four fasteners! Having refitted a belt of ordinary pattern he continued, but on the next lap sustained a fall, breaking his left footrest. Butler had apparently lost a lot of time, and passed with his engine running on one cylinder. Slaughter's Ariel showed a surprising turn of speed—for the rider is no lightweight. He was unfortunate with his belt, which demanded no fewer than six stops. On the third lap Bowen had worked into first place, and his Bat was perceptibly several miles per hour faster than any other on the course. The question was, would his pace last? H. A. Collier followed in a minute or two, apparently imperturbed by being passed by Bowen. C. R. Collier followed about a mile in the rear, his stand trailing on the ground as he passed. Fenn did not seem happy, but Dayrell passed going great guns. Perryman on the blue Blumfield was travelling exceptionally well, although his machine seemed to be too long in the wheelbase for racing purposes, and consequently rather unsteady on lumpy surfaces. Harry Bashall seemed to be improving in speed. Single com-

A stretch of road near Kirk Michael showing competitors in full flight.

The International Motor Cycle Tourist Trophy Race.—

petitors now sped past, until it was Woodward, Brown, and Lord's turn to fight out a little battle royal of their own. Brown had dispensed with goggles, so his plight, sandwiched in the bunch, may be imagined! The Bats were still further improving their positions, for Bowen was well ahead on the fourth round. Alexander's Indian was not travelling so fast on the fourth lap, and Colver's engine was misfiring. When the two Colliers passed leading in the fifth lap everyone was asking what had become of Bowen and Bashall—two of the most popular competitors. There was genuine sorrow when their fate was afterwards learned. For four laps Creyton and Newsome were inseparable twins, but then the Manxman found some more speed in his machine, and with increasing confidence and encouragement from his friends at all points of the course, he gradually forged ahead, riding superbly to the finish. J. Gibson broke a valve soon after passing the Devil's Elbow, and a spare he fitted had a bent stem and stuck in the guide. After replacing this he restarted and covered a fast lap, afterwards retiring. J. L. Norton was another of the unfortunates, for an inlet valve rocker broke, delaying him some time. He contrived to make his engine run up to 30 m.p.h. by fitting a weak spring to the inlet valve so that it would work automatically. As he could effect no further improvement in speed he gave up. A favourite with the Manxmen who were dotted here and there around the course was D. M. Brown, a Douglas rider of a Humber. As he appeared lap after lap with clocklike regularity he was cheered again and again. The Colliers in the second half seemed to be settling more to their work, and were negotiating corners faster and closer. C. R. Collier had gradually left his brother in the rear, although both led the vanguard. Their wonderfully consistent riding excited the keenest admiration of the crowd, and few had doubts but that they would finish successfully, knowing their prowess. Myers hereabouts suffered a puncture, although travelling splendidly. Witham completed several laps at a fast pace, but his rear mudguard was swaying about dangerously on the back tyre. Chase was delayed near the Elbow by a broken valve, and a little further on Drury's engine seized temporarily. Adamson, Murphy, McMinnies, and Cooper were travelling well, and looked sure finishers early on. They were not exceptionally fast, but were reeling off laps at a steady 48 m.p.h. As Moorhouse passed Scriven on one occasion, he called out urging his friend to success. It may be observed here that all the competitors proved most sportsmanlike. There was no attempting to keep others in the rear, and no dangerous scrapping on corners. Many of the competitors had dropped out by the eighth lap, making matters more pleasant for the survivors. For two or three laps the leaders were isolated, and had no dust to hamper them—a different state of affairs from the first hour. After the brothers Collier had passed on the tenth lap, the writer scurried back across country—just in time to see the winner finish. Several competitors who eventually finished were then passing St. John's on their ninth lap.



Another view of Ballig Bridge. About half a mile further along the course the ascent of Creg Willey's Hill commences. The road from Ballacraine may be seen in the background on the left.

Interview with the Winner.

After having tea at Peel and hearing Martin, Dayrell, Evans, and Bentley fight their battles over again, we set out for Douglas, and at St. John's were lucky enough to meet C. R. Collier walking back from the post office. Here was an opportunity not to be missed. Beckoning to the happy victor, whose face was wreathed in smiles of recognition and happiness, and who looked wonderfully fresh and fit after his splendid ride, we warmly congratulated him, and asked him for his views of the race.

"A very easy affair," he replied. "I had no trouble, and my machine carried me through in excellent form."

"Did you find the dust very trying?" we ventured, knowing that dust was one of the enemies the competitors feared most.

"No," he answered; "it worried me very little, as I saw very few competitors."

This is quite extraordinary, but it is nevertheless a fact that the leaders in these races see very few of the other men, despite the number on the course. We feared at first that the mist would hamper the men on the higher ground; but this Collier assured us was not the case.

"It has been an ideal day," he said. "Everything was in our favour, but the race has been harder each year."

"What did you think of the condition of the course?" we asked.

"It is certainly rougher than it was last year," he answered. "It is a pity so many official and other cars are allowed on it, as they have damaged it somewhat."

"Do you think," we suggested, "that any better course could be found?"

"No," he replied, "I am quite satisfied, and if all the corners were treated with Tarmac it would be ideal. It has already been improved a good deal, especially in Peel, but, provided the speed is not increased, I am quite satisfied."

Knowing that a few technical details would interest our readers, we then asked Collier how he liked his new short stroke engine.

"It runs a good deal faster," he replied, "but does not give quite the same power. Still, it has enough, as you can see, but as it has a high compression it knocked somewhat on the hills, but all the others did, didn't they?"

Not wishing to keep our victim longer from his well-earned rest, we renewed our congratulations, and wished him equal success next year. Thus ended a glorious day in the annals of motor cycling.

The International Motor Cycle Tourist Trophy Race.—

Of the four Tourist Trophy Races which have been held, C. R. Collier won the first and fourth, whilst his brother won the third, and in 1908, when Marshall won, C. R. Collier was second. The 1910 race will always be remembered for the fine weather which prevailed before and during the time when it was held. All will admit it was a glorious success, and the finest motor cycling road race which has ever been held. The public are inclined to look upon racing as useless, but it must be remembered that the T.T. is a reliability trial, inasmuch as the competing machines are within a very little of being perfect touring mounts. Now, while motor bicycles will run through a trial at a legal limit average for 1,000 miles, and seventy or eighty per cent. will finish, this is not the case if the machines are hurried, and occasionally motor cyclists do drive at over twenty miles per hour. Consequently the T.T. is of inestimable value, and by its means margins of safety which tend to make the modern machine more reliable are discovered. The necessity of these races is shown by the fact that out of seventy-two starters only twenty-nine completed the course, and though numerous failures are due to accidents, a glance through the tables which appear elsewhere in this issue proves that mechanical troubles are more prevalent than they should be. Again, the Manxmen and all other good sportsmen are keen to see another race in the island, which we trust will receive the support it deserves.

Presentation of the Trophy.

The presentation of the trophy was made at the Douglas Palace on Thursday evening in the presence of a huge crowd by Mr. C. T. W. Hughes Games, Chairman of the Manx Highway Board, who congratulated the A.C.U. on the organisation of the race.

Mr. C. R. Collier, in replying, acknowledged the courtesy and hospitality shown to the motor cyclists by the inhabitants of the island.

A special gold medal was presented by Mr. Cowell, of Douglas, to Mr. D. M. Brown (Humber), who is a Manx resident, and completed the course. By the way, Creyton, who rode the first single-cylinder, hails from Ramsey.

T.T. Notes.

In last week's issue we described the machines ridden by Groves, Fowler, Slaughter, Scale, and Honlding as being fitted with Bosch magnetos, but have since been informed that the above riders' machines, as used in the race, were fitted with Simms high-tension magnetos, made by the Simms Magneto Co., Welbeck Works, Kilburn, N.W.

The Motor Cycle T.T. telegrams posted up in the windows of the Matchless showrooms at Plumstead were read by thousands. An extraordinary scene was presented in the dinner hour, when hundreds, including many of the mechanics from the Government workshops close by, were amongst those waiting for the news. About 300 were present when Miss Collier, smiling and looking supremely happy, posted up the final wire. Then the waiting hundreds gave cheer after cheer. Someone suggested a cheer for Creyton, and this was taken up with enthusiasm.

Their success was the whole talk of the town that evening. It was not unexpected, however. Colliers are proverbially lucky, and everyone anticipated that one of the two Colliers or Colver would win.

It is worth noting that both H. A. and C. R. are teetotallers, and are practically non-smokers.

The Triumph Cycle Co., Ltd., Coventry, write: We hear from our Manchester depôt that *The Motor Cycle* scoring board was a great success, and we should like to thank you for placing this at their disposal, and wiring them the results of the T.T. Race.

The Manx police are excellent fellows, a trifle too lenient perhaps (an error on the right side), and not very good at handling a crowd, but thorough sportsmen. After the farmer's horse had been removed from his cart, just before the race, a constable remarked to our correspondent, "They ought to strip the harness off the horse now." Superintendent Cain, who in Col. Freeth's absence through illness was in charge of the police arrangements, acted promptly when Bashall's machine caught fire, and quickly wrapped the plucky but luckless rider in a coat, thus saving him from severe injury. Sergeant King, whom Mr. Nisbet was giving a lift in his car, jumped off the step while the car was moving, fell, and cut his forehead rather badly—thus he whose duty it was to prevent accidents was unfortunate enough to experience one himself.

NORTHERN LEAGUE OF MOTOR CYCLISTS.

The annual meet and reunion will be at York on Military Sunday, June 5th. The League has made arrangements for luncheon to be served at 1.30 at the Royal Station Hotel at a charge of 2s. 6d., which includes free garage of machines.

It is hoped that all supporters and friends of the League, attached or otherwise, will attend the luncheon. Dr. W. H. Coates (Army Motor Reserve), a vice-president of the League, has kindly consented to preside. After luncheon a group photograph will be taken in the hotel grounds.

Will all club secretaries make a note of these arrangements, and advise the manager of the hotel as to the number of their members who will attend the dinner?

A meeting of the League was held on May 28th to consider and pass the proposed rules and constitution, which it was decided should be printed and sent out to all the clubs in the North.

More offers of support, both financial and otherwise, were received, and representatives from the Hull, Scarborough, Middlesbrough, Leeds, and Harrogate Clubs attended the meeting. It was also decided that the League title should be "The Northern League of Motor Cyclists," not "clubs," as hitherto.

One important point which was decided was that individual members should be admitted on payment of 10s. 6d. per annum.

The first meeting of the Council will be held shortly, as soon as the affiliation agreements have been signed and fees paid. The Council will then proceed to make arrangements for the first meet and competition. A hill-climb on Gunrowby Hill and a competition at Harrogate were suggested.

HOMEWARD BOUND.

Machines stacked on the foredeck of the "King Orry" on the return journey from Douglas last Saturday morning. There were 85 motor cycles on the boat.

THE SNAEFELL HILL-CLIMB.

The hairpin bend near the commencement of the hill-climb from Ramsey to the Bungalow at the summit of Snaefell. F. W. Chase (3½ Centaur) is seen rounding the curve.

The event which terminated the Isle of Man motor cycle race week was a hill-climbing competition on Friday afternoon from Ramsey to a point half a mile on the Ramsey side of the Bungalow Hotel. There were 83 entries, divided into eight classes, and the competition proved most interesting. The start was made close by the Hairpin Corner, and the distance is just over five miles. The surface of the road is very loose and gritty, but good on the whole. The climb up Snaefell, though stiff, is not too much for a really good 3½ h.p. touring machine. The steepest gradients occur on the first two miles, but, to add to the severity of the test, the road winds backwards and forwards, two curves—the Hairpin and the Gooseneck—being exceptionally difficult to negotiate. The last three miles of the climb is of easy gradient, the road, however, still winding and the bends being just too acute to enable the motor cyclists to round them without switching off. A fairly strong wind generally assisted the competitors, except at two points, where it occasionally upset the steering. Quite a crowd collected at the Hairpin Corner expecting to see some thrilling incidents, but there was little in the way of excitement to reward their curiosity, for most of the competitors travelled very cautiously at the Hairpin. The A.C.U. officials got the competitors away very smartly, and interest never flagged. There were a number of failures—J. L. Norton (Norton) failed to negotiate the severe bend, and in trying to remount missed his footrest and fell over the machine. He again pluckily started, and completed the climb at a rattling pace. Godfrey (Rex) suffered a bad fall after completing the most severe part of the climb, Fenn (Indian) failed owing to an error of judgment, Marshall (Triumph) was again dogged by ill luck, for this time his front tyre burst, and Bowen (Bat-J.A.P.) was too anxious to travel at full speed before he had accounted for the bends.

One of our staff took up his position at the upper of the two dangerous bends on the mountain road. While far less acute than the Ramsey hairpin, it makes an interesting standpoint, as the engines are already heated by several miles of stiff collar work, and unless the riders are very adroit the engines begin to knock on the steep corner and stop immediately above it. Every rider, except those on the Scotts, switched off at varying distances below the bend, and the great majority of the engines clanked heavily when the machines got their noses straight and work recommenced.

Class 2A.—Hoffman's Scott registered a magnificent performance—neat, fast, and devoid of fuss. Eastwood's Bradbury came round slowly, but picked up easily and well. Owers lifted his valve too early, and was slow in consequence.

Class 2B.—None of the Indian riders in this class shut their extra air below the bend, and being too busy to adjust it on the knuckle they found a difficulty in picking up afterwards. Dickson and Fenn had to jump off and run alongside. Hugh Gibson came up very fast, and had almost to stop in order to get round.

Class 3A.—Barnes smartly lowered his gear on the corner, and, picking up well, got away in grand style. Norton tickled his carburetter as he wrenched his machine round, and the long stroke engine ate up the gradient in response. Slaughter handled his machine better than any of his predecessors. The Triumph trio were magnificent, Jack Marshall being a shade the neatest and fastest. Turvey showed great respect for the bend, Chase was neat but slow, and the remainder mostly set their hot engines knocking. Adamson rode up to his reputation, and made the corner of the afternoon.

The Snaefell Hill-climb.—

CLASS 4A.—Evans did better than any other Indian, and his machine was more silent than any except the Scotts. Myers rolled smoothly round at a great pace. Bolton outshone all the other Rexes. Sproston had to get off and run. Perryman approached too fast, and apparently had to use his brakes.

CLASS 4B.—Moorhouse tried to close his extra air on the bend, and failed. Bentley was good, but Fenn, as usual, provided the chief sensation. He tore up to the corner at a perfectly crazy speed, though he stopped his engine lower down than anybody else. In the centre of the bend he performed a gigantic skid, rolling over and over in a cloud of dust. Picking himself up, he made a most plucky effort to restart, but the heavy machine was too much for him, and he fell gasping into the gorse at the roadside. Franklin picked up more smoothly than the other Indians, but the twins, on the whole, showed no superiority over the singles in this respect, probably owing to their gear ratios being high in view of the speed stretches higher up.

At the Finish.

There was nothing in particular to record at the finishing point. Those competitors who successfully completed the first couple of miles were easily capable of accounting for the remainder of the ascent. Nearly all the machines travelled very fast, the T.T. mounts in particular being wonderfully even. Some competitors wasted several seconds at every corner owing to switching off too early or too often. One or two, in their desire to waste no time, swerved very close to the edge of the road, where there was an almost sheer drop of several hundred feet.

The Results.

The times were announced early the same evening, and are as under:

CLASS 2A.—For genuine standard touring machines with engines having a cylinder capacity not exceeding 750 c.c. (Special and "Tourist Trophy" types of machine barred.)

P. Platt (3½ h.p. Bradbury)	9m. 44s.
J. Eastwood (3½ h.p. Bradbury) ...	9m. 49⅖s.
G. H. Owers (3½ h.p. Bradbury) ...	10m. 53⅖s.
J. A. Hoffman (4 h.p. Scott) ...	11m. 23⅕s.

CLASS 2B.—For genuine standard touring machines with engines having a cylinder capacity not exceeding 750 c.c. (Special and "Tourist Trophy" types of machines barred.) (Private owners.)

W. D. South (5 h.p. Indian)	9m. 43⅗s.
Hugh Gibson (3½ h.p. Bradbury) ...	9m. 47⅕s.
E. D. Dickson (5 h.p. Indian) ...	10m. 46⅕s.
G. H. Owers (3½ h.p. Bradbury) ...	10m. 53⅘s.
J. H. Hoffman (4 h.p. Scott)... ...	11m. 23⅕s.
A. G. Fenn (5 h.p. Indian)	1h. 10m. 18⅗s.

CLASS 3A.—For single-cylinder machines which competed in the T.T. Race. Not exceeding 500 c.c.

W. F. Newsome (3½ h.p. Triumph) ...	8m. 43⅗s.
W. Creyton (3½ h.p. Triumph) ...	8m. 54s.
J. W. Adamson (3½ h.p. Triumph) ...	8m. 56s.
H. Lister Cooper (3½ h.p. Triumph)...	9m. 5s.
C. E. Murphy (3½ h.p. Triumph) ...	9m. 21s.
J. Slaughter (3½ h.p. Ariel)	9m. 23⅘s.
W. G. McMinnies (3½ h.p. Triumph)	9m. 32⅗s.
F. W. Barnes (3½ h.p. Zenith-Gradua)	9m. 37s.
D. M. Brown (3½ h.p. Humber) ...	10m. 6⅘s.
W. H. Groves (3½ h.p. Ariel) ...	10m. 18⅖s.
R. Lord (3½ h.p. Rex)	10m. 23⅖s.
A. H. Alexander (3½ h.p. Rex) ...	10m. 39⅖s.
F. Turvey, jun. (3½ h.p. Humber) ...	10m. 56⅖s.
J. Norton (3½ h.p. Norton)	11m. 2⅕s.
W. E. Grange (3½ h.p. Rex) ...	11m. 29⅗s.
F. W. Chase (3½ h.p. Centaur) ...	11m. 34s.
A. R. Abbott (3½ h.p. Rex)	12m. 20⅗s.
F. W. Applebee (3½ h.p. Centaur) ...	12m. 47⅗s.

CLASS 3B.—For single-cylinder machines which competed in the T.T. Race. Not exceeding 500 c.c. (Private owners.)

J. W. Adamson (3½ h.p. Triumph) ...	8m. 56⅕s.
H. Lister Cooper (3½ h.p. Triumph) ...	9m. 5s.
C. E. Murphy (3½ h.p. Triumph) ...	9m. 21⅘s.
W. E. Grange (3½ h.p. Rex)	11m. 29⅗s.

CLASS 4A.—For multi-cylinder machines which competed in the T.T. Race. Not exceeding 670 c.c.

W. O. Bentley (5 h.p. Indian) ...	8m. 49⅗s.
G. Lee Evans (5 h.p. Indian) ...	8m. 52⅗s.
W. Heaton (5 h.p. N.S.U.)	9m. 3s.
Eric S. Myers (5 h.p. Scott)	9m. 30⅖s.
F. A. Applebee (5 h.p. Rex)	9m. 41⅘s.
David C. Bolton (5 h.p. Rex) ...	10m. 14⅖s.
S. C. Perryman (5 h.p. Blumfield) ...	10m. 17⅕s.
H. Bowen (5 h.p. Bat)	13m. 32⅗s.

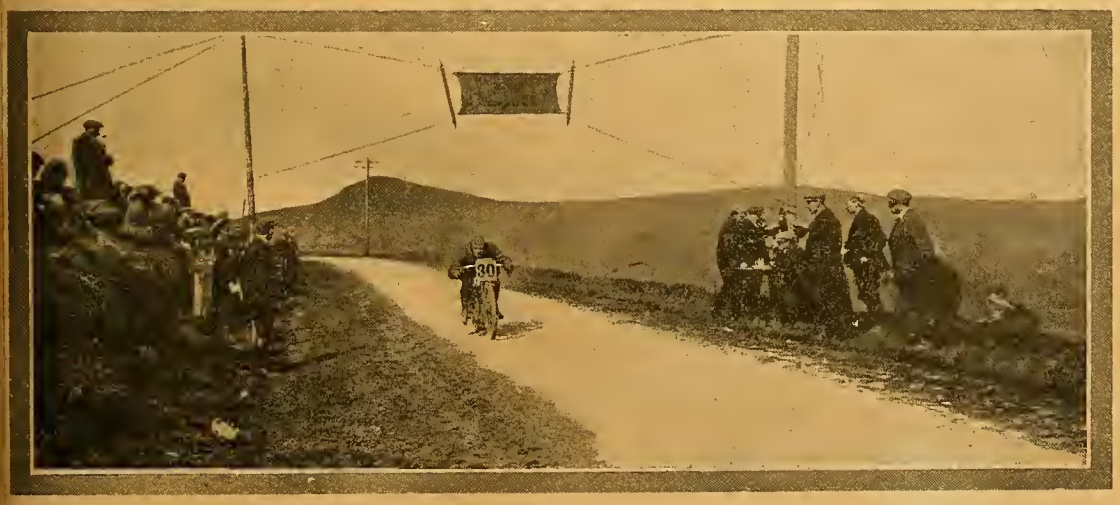
CLASS 4B.—For multi-cylinder machines which competed in the T.T. Race. Not exceeding 670 c.c. (Private owners.)

W. O. Bentley (5 h.p. Indian)... ...	8m. 49⅗s.
C. B. Franklin (5 h.p. Indian) ...	8m. 59⅕s.
J. Scriven (5 h.p. Rex)	8m. 59⅗s.
S. A. M. Witham (5 h.p. Bat-J.A.P.)	9m. 8⅗s.
P. Butler (5 h.p. Dot-J.A.P.) ...	9m. 18s.
J. Baxter (5 h.p. Rex)	9m. 57⅕s.
D. C. Bolton (5 h.p. Rex)	10m. 14⅖s.
H. H. Bowen (5 h.p. Bat)	13m. 32⅗s.
A. J. Moorhouse (5 h.p. Indian) ...	19m. 28⅖s.

CLASS 5.—For any type of machine not exceeding 1,000 c.c.

E. H. Lees (7 h.p. Indian)	8m. 55⅗s.
J. Scriven (3½ h.p. Ariel)	8m. 59⅘s.
W. Heaton (5 h.p. N.S.U.)	9m. 3s.
S. A. M. Witham (5 h.p. Bat) ...	9m. 8⅗s.
P. Butler (5 h.p. Bat)	9m. 18s.
J. F. Slaughter (3½ h.p. Ariel) ...	9m. 23s.
Eric S. Myers (5 h.p. Scott)	9m. 30⅗s.
W. H. Groves (3½ h.p. Ariel)... ...	10m. 18⅗s.

It will be observed that W. F. Newsome (3½ h.p. Triumph) accomplished the fastest time of the day.



A competitor at the finishing banner near the Bungalow at the summit of Snaefell Mountain. The time'keeper's telephone is stationed on the right.

Continen

READ what Competitors in the Tourist Trophy think of "Continentals."

Pneumique, London.

Continentals behaved very satisfactorily. Finished unscratched.

SPROSTON.

Pneumique, London.

Continental Tyres were quite satisfactory in T.T. Race. PHILIPP.

Pneumique, London.

Very pleased with Continental Non-skid Tyres—absolutely no trouble.

J. F. SIRETT.

Pneumique, London.

Continental Tyres gave no trouble whatever, and finished in splendid condition. A. H. ALEXANDER.

Pneumique, London.

Finished fifth in the T.T. Race Had no trouble whatever with Continental Tyres. JOE SCRIVEN.

Pneumique, London.

Continental Tyres ran through the Tourist Trophy Race without the slightest trouble, and free from skids. W. HEATON.

Pneumique, London.

Very pleased indeed with Continental Tyres used in the Tourist Trophy Race. HARRY REED.

Pneumique, London.

Continental Tyres fitted on my "Trump" have given every satisfaction dur ing Tourist Trophy Race and practising. GIBSON.

Pneumique, London.

Continental Tyres used in Tourist Trophy Race and practising gave the utmost satisfaction, and consider them the very best thing on wheels.

SCALE.

Pneumique, London.

Cannot speak too well of Continental Tyres, which I rode in Tourist Trophy Race. None better. DAYRELL.

Pneumique, London.

Pleased I rode Continental Tyres in the T.T. Race, as I experienced no trouble whatever. Extremely satisfied with their behaviour.

WEATHERILL.

Tyres

Motor-cyclists should write for our new Illustrated Booklet on "Continental Tyres and Belts"--Free on request.

Pneumique, London.

Continental Tyres gave complete satisfaction in T.T. Race. LORD.

Pneumique, London.

Was more than pleased with Continental Tyres, which took me through in my T.T. Rex without any trouble whatever, 4h. 5m. WOODWARD.

Pneumique, London.

Most pleased with Continental Tyres in Tourist Trophy Race. Although only finished nine laps officially, found them very fast. BANNS.

Pneumique, London.

Delighted with Continental Tyres, which gave me no trouble whatever in T.T. They are both fast and durable. Tyres on my machine are in perfect condition. McNAB.

Pneumique, London.

Continental Tyres stood the T.T. course A1. Highly satisfied. Finished the course without any tyre trouble whatever. W. E. GRANGE.

Pneumique, London.

Fell at Ballacraine, and hurt back. Completed seven rounds. Tyres showed no signs of wear. Shall use in all events this season. HOULDING.

Pneumique, London.

Continental Tyres gave us every satisfaction both in the race and practice. SCOTT ENGINEERING CO.

Pneumique, London.

Continental Tyres I used on my Rex in practising and Trophy Tourist Race behaved excellently. Consider non-skid most efficient. H. REM FOWLER.

Pneumique, London.

Continental Tyres on my Tourist Trophy N.S.U. simply splendid. No trouble whatever. WOOD.

Pneumique, London.

Continental Tyres on my Tourist Trophy N.S.U. gave me entire satisfaction. Had no trouble whatsoever. Although the course was very rough and flinty, not a scratch on my tyres. OBERLANDER.

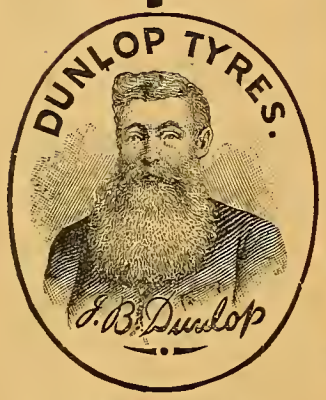
Pneumique, London.

Tyres behaved splendidly on my T.T. machine. PERCY BUTLER.

In answering this advertisement it is desirable to mention "The Motor Cycle."

WHERE AWAY THIS YEAR?

We are not curious, but just want to remind you that it doesn't much matter where you travel or how far you travel if your motor cycle is fitted with



TRADE MARK.

DUNLOP

RUBBER-STUDDED TYRES.

However rough or broken the road surfaces you may have to traverse, you'll find these tyres equal to any emergency, because they are made specially strong for touring—extra strong walls, extra thick tread—extra good quality of rubber.

MAKE A POINT OF EXAMINING ONE.

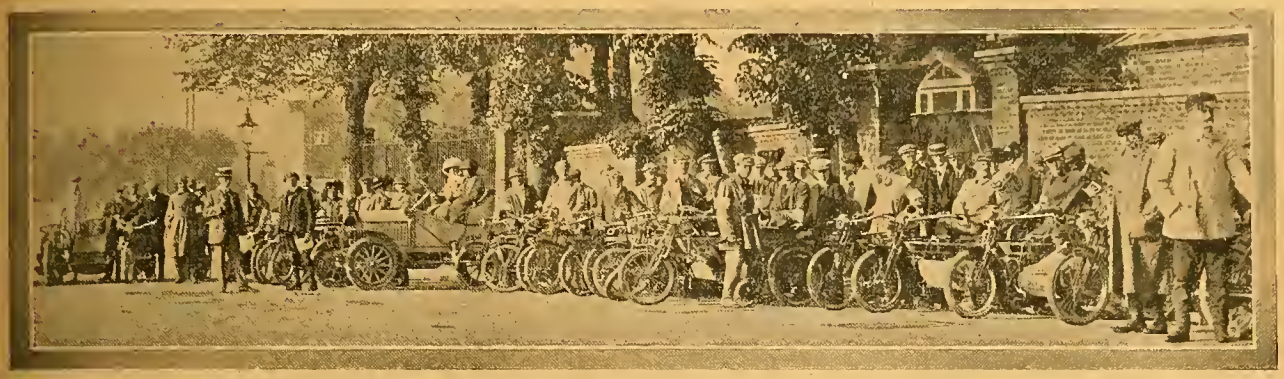
THE DUNLOP PNEUMATIC TYRE CO., Limited, ASTON, BIRMINGHAM; Alma Street, COVENTRY.

Branches—London, Nottingham, Manchester, Newcastle, Bristol, Leeds, Liverpool, Glasgow, Dublin, Belfast.

NOTE—Tyres from which the Dunlop Co.'s private marks have been removed are not guaranteed.

LONDON TO COVENTRY AND BACK.

THE NORTH-WEST LONDON M.C.C. TWELVE HOURS RUN.



N.W. London M.C.C. 12 hours run to Coventry and back. Competitors lined up before the start at the Jack Straws Castle.

THE above event (which was postponed in consequence of the late King's death) was run off most successfully last Saturday. The object of the trial is to prove reliability and ability to run to time. There were three secret checks each way and a control at each end.

The Start.

At 6.30 a.m. Jack Straw's Castle at Hampstead presented quite an animated appearance, as by that time nearly all the competitors had arrived and were busy getting their armlets fixed and giving their machines those finishing touches that all keen competitors delight in.

Mr. T. G. Blundell, jun., smartly marshalled the men into their places, and No. 1, E. W. Ashworth (5 h.p. V.S. and sidecar), was punctually sent off at 7 o'clock by Mr. H. V. Davidson, jun. The other competitors were then despatched at one minute intervals as follows:

E. A. Colliver (3½ Triumph)
E. W. Brighten (8 J.A.P. s.c.)
C. Williams (8 J.A.P. s.c.)
J. Doe (2¾ Douglas)
C. Crole Rees (6 Advance s.c.)
H. Hill (8 Bat)
H. J. Pooley (3½ Premier)
E. G. Westacott (3½ Triumph)
E. Gwynne (3½ T.T. Triumph)
G. H. Hollis (3½ Triumph)
R. Scott (5 Indian)
G. B. Owen (3½ Ariel)
Miss Berend (2 Moto-Rêve)
W. Cooper (3½ Bradbury)
A. C. Robbins (3½ Humber two-speed)
C. J. Burton (T.A.C. s.c.)
G. E. Purchase (3½ Triumph)
H. C. Bean (3½ Triumph)

The route followed was *viâ* Watford, Berkhampstead, Aylesbury, Bicester, Shipston-on-Stour, and Warwick, and as Brockley Hill just beyond Edgware is about a mile long, and fairly steep near the top, we found several motor cyclists here to see the competitors climb it. It must be said that many of the machines made a very poor show. Colliver, who arrived first, came up fast, and showed himself a practised hand at hill-climbing. Ashworth had plenty in hand on the low gear. Brighten also came up well on the low gear. Doe was slow, but did not pedal. Williams dismounted and ran alongside. Crole Rees shed his passenger, who helped by pushing. Hill was fairly fast, and obviously had plenty in hand. Pooley's engine was knocking badly, and he stopped near the top. Westacott was slow, and his engine was knocking badly; he also had to pedal to finish. Gwynne was very fast. Hollis's engine was knocking, and he pedalled near the top. Scott came up comfortably with plenty in hand. Owen's engine knocked slightly on the steepest part. Miss Berend pedalled slightly at the steepest part and a little near the top. Cooper came up slowly, because he was ahead of time and thought he was in a secret check. His engine behaved splendidly, and there was no sign of a knock, as in the other machines that came up slowly. Robbins was very slow, as his belt was slipping, and he dismounted near the top. Burton's T.A.C. was in very poor trim, as he dismounted on the steepest part and ran alongside all the way up. Purchase came up well, but pedalled near the top. Bean pedalled all the way up.

The First Secret Check

was four miles beyond Aylesbury, and several competitors were caught considerably ahead of time. Pooley was in trouble with a slack tyre near Tring, and Scott had a broken chain near Aylesbury. A number of the earlier ones were detained at Bicester level crossing, and stopped here for petrol. This was unfortunate, as the next secret check was only about three miles beyond, and they were consequently considerably out. Near Middleton Stoney we came up with Mr. G. Rowden (trials hon. sec.) with Mr. C. A. Stern (hon. sec.) in his sidecar. He was marking the course with the excellent N.W.L.M.C. arrows, but had, unfortunately, had an argument with a large nail and punctured his back tyre. Several of the competitors were here shortening belts and making sundry small adjustments. Near Chipping Norton Pooley's bad luck in tyres again overtook him, and he had a

THREE SURVIVORS IN THE 12 HOURS LONDON-COVENTRY AND BACK RUN.
H. J. Pooley riding a 3½ h.p. Premier. E. Ashworth (5 h.p. V.S. and sidecar) starting. H. Hill (8 h.p. Bat-J.A.P.) approaching Golder's Green.

London to Coventry and Back.—

double puncture in the back tyre. This provided rather an amusing incident at the next secret check—the mile-post ten miles south of Warwick. Pooley had stopped to pump up his back tyre, as he had left it slack in mending the puncture, and just as he had finished happened to notice the small red flag of the secret check quite close to him. He gave an exclamation, and rushed his machine down to the check with the stand trailing. He was quite upset, and seemed to think that a secret check should be easily seen! Other competitors fell right into the check, and a number were ahead of time.

Crole Rees had something amiss with his engine at Bicester, and was considerably delayed, but was again on time at this check. Burton had trouble all the way to near Bicester, and he was finally out of the competition here through the worm wheel on the back hub coming unscrewed and jamming. It took him four hours to get right, and he then returned to Hampstead to see the finish.

A Lady Competitor's Misfortune.

Miss Berend punctured the rubber petrol pipe from the auxiliary tank on the carrier near Shipston, and ran out of petrol. She took the carburetter to pieces, thinking it was a choked jet, and finally had to walk over a mile to get more petrol. Later on she was met by the returning competitors near Kenilworth with a broken belt fastener, and then decided to return without checking into Coventry. Mr. Rowden replaced the fastener, and she forthwith returned to London, arriving a few minutes after the last competitor.

The Coventry control was very ably conducted, and competitors had to proceed at once to the King's Head Hotel and give up their machines to a marshal. One hour was allowed for lunch and control, and the machines were handed back in time only to fill up with petrol and oil and to get back to the check, half a mile outside the town.

All the starters from London arrived excepting Miss Berend and Burton, and they all checked out to time.

The first secret check was near Bicester, and again the level crossing delayed some of the competitors. Miss Berend, who had just caught up the last man, was very unfortunate, as the gates were shut right in front of her, and she had the mortification of seeing all the other competitors disappear in the distance.

The second check was on the London side of Aylesbury, and most competitors were well on time here. Pooley complained of overheating in consequence of the following wind. The third check was in Collin Deep Lane, near Hendon, and was one of the best checks, being immediately round a blind corner. On the last hill near the finish Crole Rees had a slipping clutch, and only just managed to get up. A large crowd of motor cyclists and spectators gathered to see the finish, and Miss Berend received quite an ovation for her pluck in returning by road after her troubles. The return journey was practically uneventful, and all the competitors to check out of Coventry arrived at Hampstead to time.

The winner of the cup and the other awards will be announced after the checking sheets have been collected and the times worked out and passed by the judges, Messrs. R. G. Booth and H. G. Cove.

Messrs. Glynn Rowden and A. C. Stern are to be congratulated on the organisation, and thanks are due to Dr. Watson for taking the official watch through on his Bedford car.

CLUB NEWS.

Southern M.C.

The Triumph cup reliability trials will be held on June 5th, to Blandford and back. Competitors are asked to meet at the tenth milestone from London, on Staines Road. Gold medals will be awarded to all competitors finishing with a loss of not more than ten points. Entries are still required to complete team for the M.C.C. inter-team trials for *The Motor Cycle* cup. Members joining at once may compete in above events.

Herts County A.C.

The motor cycle section of the above club will hold an eliminating competition on Saturday next, to select teams for the M.C.C. inter-club team trials, and the A.C.U. inter-club championship trials. The competition will start from the Red Lion Hotel, St. Albans, at 3 p.m. The route will be to Daventry, *via* Redbourne, Dunstable, Fenny Stratford, and Weedon, returning by the same route. Bronze medals will be awarded to all riders who fulfil the conditions of the trial and make non-stop runs.

Leith M.C.

The above club held a reliability trial last Saturday over a distance of 110 miles. There were seven controls, including a secret control, and it was the latter that caused more than one rider to lose marks, as a standard of eighteen miles an hour was to be maintained, and every minute early or late was a mark lost. The following finished within time: Medal winners, Wm. Sorley (7 Peugeot) and A. B. Lindsay (3½ Triumph), no marks lost. Also finished: T. Turnbull (3½ Triumph), 1 mark lost; R. H. Mouat (3½ Griffon), 11 marks lost; Jas. M. Dobson (4 Indian), 11 marks lost; D. Shadden (3½ Midget Bicar), 17 marks lost.

Westmoreland M.C.C.

The above club held a most successful hill-climb on Saturday last on Sug's Vicarage Hill, near Staveley, a short but very steep hill, averaging about 1 in 6. The prizes were given by Dr. Dick, of Staveley, and were of a very substantial nature. There was a good number of competitors, and the results were: H. Harrison (1910 Bradbury), fastest time, 1st on A.C.U. formula; R. Hutchinson (1909 Bradbury), 2nd; W. Westwood (1909 Triumph), 3rd.

The secretary wishes to draw members' attention to the Greyhound Hill-climb on June 9th, at 5 p.m., when five prizes will be offered, given by Mr. V. G. Blackburn, of Windermere.

The A.C.U. (Metropolitan Centre).

Honorary secretaries of clubs forming the Metropolitan Centre of the A.C.U. are earnestly requested to send their entries for the preliminary contest for the inter-club championship as soon as possible. The eliminating trials will be held on June 25th in the neighbourhood of Beaconsfield, starting at 10 a.m. The last day for the receipt of entries is Saturday, 11th June. Entry forms should be addressed to Mr. H. B. Renner, hon. sec. A.C.U. Metropolitan Centre, 112, Piccadilly, W. Members are also reminded that on the day following the event, Sunday, June 26th, the river excursion will be held, when ladies will be specially welcome.

Pontefract M.C.

Inspired perhaps by the Tourist Trophy Race, the Pontefract M.C. held six motor cycle speed events on May 26th, in Bryam Park, Brotherton (by kind permission of Sir John W. Ramsden, Bart.) The length of the track was a measured mile, and racing took place over half the distance, a quarter of a mile being allowed in which to accelerate, and a quarter of a mile in which to pull up. Competitors making fastest time in each class were declared the winners of the various classes, but they had to ride over the course a second time, when the one who made the highest percentage of improvement (subject to a limit) became the winner.

RESULTS.

Class C.—1909 and 1910 Single-cylinder Machines.

Will Bentley (3½ h.p. Triumph) ... ... 35⅕s.
Ed. Lee (3½ h.p. Triumph) ... ... 39⅕s.

Class B.—1908 and previous models.

E. M. Dolan (Triumph) ... ... 40⅕s.

Class A.—Lightweights.

C. P. Finn (Royal Enfield).
R. F. Turner (Motosacoche).

Class D.—1908 Twin-cylinders.

Roslyn Holiday (Rex) ... ... 45⅖s.

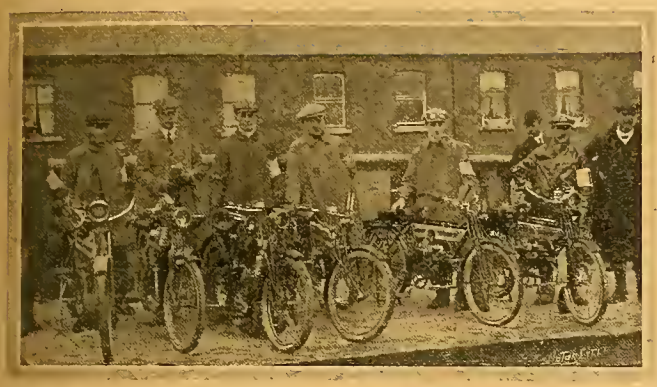
Class E.—1909 and 1910 Twin-cylinders.

Ed. Lee (Scott) ... ... 40s.

Final.—W. Bentley, 35⅗s.; E. M. Dolan, 38s.; R. F. Turner, 52⅗s.; R. Holiday, 39⅗s.; Ed. Lee, 38⅗s.

Holiday's percentage of improvement (12.77) disqualified him; Dolan (9.52) was declared the winner. Bentley 4.81, Lee 4, Turner 2.23.

Club News.—



Starters in the Dublin and District M.C.C. Reliability Run to Lisburn and back for the White Cup. The winner has not yet been announced.

Leeds M.C.C.

The competition for the Kelly Cup did not take place on the 22nd ult., as arranged, there being only eight entries up to Saturday noon. The event will take place at a later date.

M.C.U.I. (Dublin Centre).

The inter-centre contest for the Triumph Cup between the Dublin and Belfast Centres of the Union will take place on the first Saturday in July, starting from Talka Bridge, Dublin, and finishing at Belfast.

North-west London M.C.C.

The members' hill-climb will be held on Saturday, June 11th. A hill has been chosen of a moderate gradient, and lightweight and passenger classes will be included. It is hoped that a really good entry will be forthcoming, as two prizes will be offered in each class, provided there are sufficient entries. Entry forms and fees should be sent to Mr. Frank Thomas, 172, Belsize Road, N.W., not later than Monday next, the 6th inst. The gymkhana will be held on a private road on July 2nd.

Herts A.C. (Motor Cycle Section).

A strenuous competition for a cup to be presented by the Triumph Cycle Co. will be run off on July 30th and August 1st. The route will be to Kendal and back, *via* the Great North Road, Wetherby, Otley, Skipton, and Settle, returning by Penrith, Stainmore, and Scotch Corner. There will also be a cup offered for twin-cylinder machines. A hill-climb on Shap will be included on the return journey. To motor cyclists on the look out for an interesting event through some of the best English scenery this competition should strongly appeal, and they are reminded that early application for membership is necessary, as the committee for election only sits once a month. Enquiries should be addressed to Mr. C. C. Cooke, North Mimms, Hatfield, Herts.

York County M.C.C.

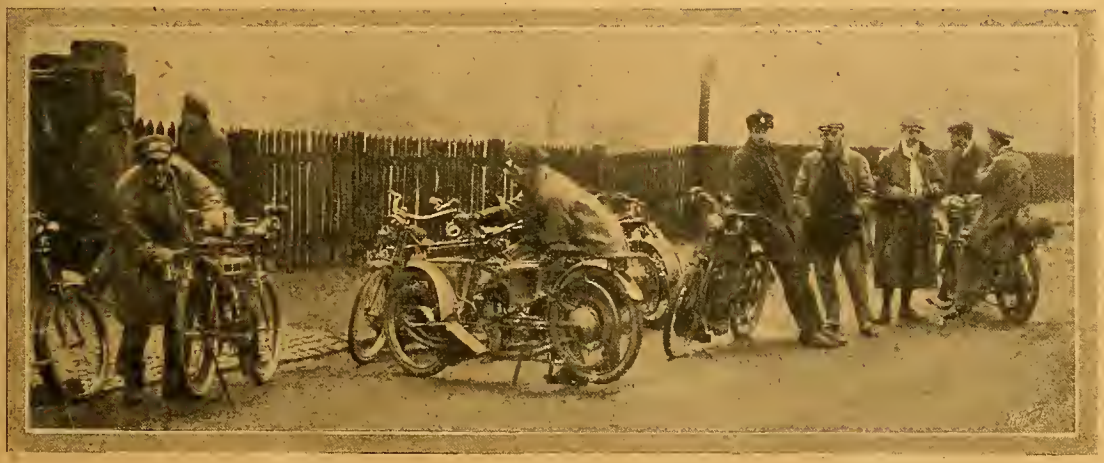
The results of the first quarterly trial, held on the 22nd ult., are as follows: Non-stops—H. Wilkinson (3½ h.p. Triumph), W. E. Asquith (3½ h.p. Triumph), J. C. Bennett-Mitchell (3½ h.p. T.T. Rex), R. W. Glenn (3½ h.p. Triumph), N. Miers (5 h.p. Rex), E. Clough (3½ h.p. Triumph), F. C. Speke (7 h.p. S. and R.), S. Graham (3½ h.p. Triumph), A. B. Bilbrough (3½ h.p. P. and M.), F. Scott (3½ h.p. Triumph), H. A. Ramsden (7 h.p. S. and R.) punctured, and C. H. Johnson (2¾ h.p. Lloyd) broke the petrol pipe.

Ayr and District M.C.

A slow hill-climb was held by the A.D.M.C. on Monday evening, May 23rd, at the Asylum Brae. Considerable amusement was caused by the majority of the competitors failing to go the length of the course through starting too slowly. The following were the results:

	Rider and machine.	Time.
1.	J. Meredith (3½ h.p. Triumph) ...	2m. 53.6s.
2.	Robert Dickie (3¼ h.p. Rex)	2m. 32s.
3.	A. McG. Morton (3½ h.p. Triumph)	2m. 10.4s.

George Brough, jun. (3½ h.p. Brough), who won the M.C.C. Challenge Cup in the London-Edinburgh and Back run with a total variation in time of 10m. 43s. only.



Birmingham M.C.C. Reliability Trial to Lincoln and back. Early dawn on the 17th ult. Competitors assembling at the starting point.

Belt Fastener Screws.

[4785.]—With reference to "D 3895's" letter in the last issue *re* "Belt Fastener Screws," the undernoted will be of interest, as your correspondent is only one of the many with this grievance. Being urged by some users of D'All fasteners for improvement in that line, and recognising the need for same, I have just made one or two alterations whereby the fitting to the belt is almost as easy as linking up the ends of the fastener. The pin is D-headed, and of sufficient length for the threaded end to project through the belt a quarter of an inch on top side, to take an ordinary hexagon nut of ample dimensions. No screwdriver is required, the procedure being: Push bolt through hole, run on nut, and tighten up with spanner or pliers; the nut will not come loose. The flat on head of bolt registers with the curved end of the U link, and keeps the pin from turning round when nut is being turned either way. J. B. DALL.

Slow Running.

[4786.]—Perhaps "One of the Heavy Brigade" may be interested to read the following:

I bought a new "single" of first-class make this year, and though everything was in tip-top order, I could not get the pace below 15 m.p.h. under any conditions of mixture without constant misfiring.

I eventually wrote to the makers, who advised me to separate my sparking plug points a trifle. This, much doubting, I did, and can now drive at "walking pace" with a fully advanced spark, and with the spark slightly retarded at a trifle under 5 m.p.h.

I might say that when a proud owner boasts of driving at "walking pace" he is naturally referring to the best quality of the article, say 7 m.p.h., and not to the untrained pedestrian's dilatory style of progression. AW 2.

Running Costs.

[4787.]—As it may be of interest to some of your readers I send you herewith a summary of the careful accounts I have kept of the cost of running my 2¾ h.p. F.N. motor cycle almost every day in all weathers for the last three years. I bought the machine in May, 1907, second-hand (it had, however, only run 500 miles), and the total capital expenditure was £23 3s. 6d.

After the machine had run 4,300 miles, including the 500 before I had it, the original Engelbert tyres were worn out, and I replaced them with Palmer Cords, which have now done over 7,000 miles, and look good for another 7,000. After 10,800 miles in all, the compression was very bad, and I had the cylinder rebored and a new piston and rings fitted.

Since I have had the machine I have been 11,137 miles on it, the cost being as follows:

		Per mile.
Petrol, 107 miles to the gallon ...	£5 19 9	.129d.
Oil	1 4 6	.026d.
Tyres, and repairs to same ...	5 11 9	.120d.
Transmission (belts, fasteners, and pulleys)	3 11 9	.077d.
Engine repairs	2 2 8	.044d.
Repairs to machine	1 11 10	.034d.
Sundries	1 6 5	.029d.
Licences and interest on capital ...	3 9 6	.075d.
Total		.534d.

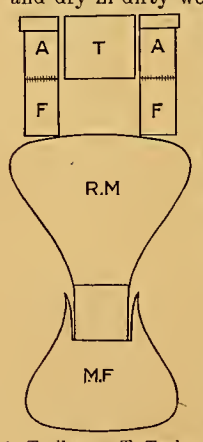
This includes nothing for depreciation. DI 51.

Hill Climbing.

[4788.]—May I enquire through your valuable paper whether any motor cyclist has succeeded in climbing "Sookham's Hill" or the Caterham Road? I ask this because on Whit-Monday I succeeded in making a clean ascent in the presence of Messrs. R. G. Nye and A. R. Hunter, both members of the Streatham and District M.C.C., and was informed by the occupier of the house at the bottom that no motor cycle or car had ever succeeded in getting to the top before. I do not know the gradient, but should imagine it to be about 1 in 6 average, with two very steep bits of about 1 in 4. The surface is awfully loose, stones abounding everywhere. My machine was a 1909 3½ h.p. Bradbury in full touring trim, minus pedalling gear, geared 4¾ to 1. Wishing you continued success, D. R. GREIS.

Cleanliness.

[4789.]—We are all interested in keeping our legs clean and dry in dirty weather while motor cycling. This has been carried out in several ways, all more or less unsightly. I venture to submit the following sketch of an arrangement I have carried out with fair success on my Triumph.



A. Toolbags. T. Tank. F. Flaps. RM. Top mud flap. MF. Bottom mud flap.

To begin with, I have mounted my toolbags one on each side of the tank, in similar fashion to the F.N. Below these on either side I have attached a neat japanned leather flap. On the front mudguard I have fitted one of the regulation mud flaps as fitted by the Triumph Co. to their magnetos, but with the broad part at the top. This coincides with the original magneto flap towards the bottom. You see, therefore, that, commencing with the toolbags and finishing with the magneto flap, there is a continuous overlapping protection from knee to ankle, which at the same time does not impede the cool draught of air so necessary for an air-cooled engine. FLAPPER.

An Extended Trial of a Scott.

[4790.]—I am a very enthusiastic rider of one of the 1910 3½ h.p. models of this make, and cannot understand how it is you find its petrol consumption so heavy. Since reading the article I have made careful tests with my machine, and find I can easily average 70 to 75 m.p.g. A friend and myself, both mounted on Scotts, recently did 155 miles on two gallons of spirit; this run was by no means a non-stop, neither was it over flat country (nor were we under 20 m.p.h. all the time), but when you take into consideration the fact of its being a two-stroke engine, I think the machine very economical, and can be very favourably compared with the average four-cycle twins. As regards the Scott being capable of holding its own with the best 3½ h.p. singles of orthodox type, there is no doubt about this, as my experiences so far lead me to believe that a goodly number of 5 h.p. twins will have their work cut out to keep up with them; leave them, the majority of the standard twins cannot. I rode a fast 3½ h.p. last year, but it was not a patch on the Scott in any respect. I have no fault to find with the machine; it is not perfect yet, we know, but it is, to say the least of it, five years ahead of anything else.

REKAB, JUN.

A Puzzle or a Poser.

[4791.]—I have a B. and B. carburetter on my 3½ h.p. ——, and certainly fifty per cent. of the petrol was blown back through the air port. I have now fitted a fresh cam for lifting the valves having a top about an inch long, or practically double the length of the old one. This holds the valves open longer and has completely cured the back-blow, besides increasing the effectiveness of the engine to a surprising extent, while I have been able to reduce the size of the jet. EDWARD W. FORWARD.

Jamming of Carburetter Pistons.

[4792.]—Has any motor cyclist experienced the same trouble as myself in connection with the carburetter fitted to a.o.i.v., the old pattern P. and M.? Every time I go out, after running about twenty miles, the extra air lever jams, owing to dust getting between the air piston and the sides of jet chamber and so fixing the said piston.

This means that I have to drive with fixed air and control by means of throttle only for the rest of the run, then at the first stoppage dismantle carburetter and clean it. I may mention that the air piston jams so much that nothing short of a hammer and punch will persuade it to move at all.

While writing I should like to mention that I have had exactly the same troubles with security bolts and spoke-head punctures as Mr. Briggs, and had to cover the bolts and fix spoke bands to obviate this nuisance.

TROUBLE.

Riding Conditions in County Donegal.

[4793.]—I should like to caution any motor cyclist who may be thinking of touring through Co. Donegal in the near future. Practically all the roads in the county are at present covered with loose stones, and as these have only recently been put down (why now, instead of last autumn—the proper time—probably only the County Surveyor and the contractors know!), some of the most beautiful scenery in the British Isles will only attract the motor cyclist to misery and trouble. Furthermore, until somebody armed with a shot-gun tours the county in a motor car and shoots all the big half-bred collie dogs he can find (and a busy month of it he will have), travelling for a motor cyclist in Donegal is absolutely dangerous. These big brutes are in swarms everywhere, and lie in wait behind corners, or rush out of open doors to the unsuspecting motorists' destruction at every turn. Why *did* Lloyd George not treble the tax on these useless curs and leave the poor motor cyclist alone?

I wonder when manufacturers, too, will realise the necessity of giving us really reliable and comfortable machines for Ireland? I at present, in common, I think, with most Irish riders, ride a Triumph, and the fact that I have ridden my machine several thousand miles during the past winter over the worst of our roads without a single mechanical breakdown speaks wonders for the Triumph engine. In wet weather, however, the rider is soon completely covered with mud, the belt starts slipping, and at the first sharp rise the unfortunate rider has to get off and push 200 lbs. of metal in his heavy sodden clothes. Protection for the rider and the transmission in mud and wet are ludicrously inadequate. I should much like to see some of the expert trade riders from England trying to climb, say, the hill at Creeslough, or Ballintoy, in wet weather, with a further run on to Doochary, and up the corkscrew hill to Dungloe. I think we should hear less then about the charm of the belt drive, or the superfluity of two-speed gears. Also, when the riders found their handle-bars to be only occasionally within their grasp, and their connection with their saddle decidedly of the make and break order, they could begin to feel less sure of the accuracy of the makers' catalogue description of the springing arrangements. Both are quite inadequate for Irish roads.

Let the Wilkinson Sword people bring over a few T.A.C. machines with their three-speed gears, worm drive, sprung frames, and better protection for the rider from mud, and if they can prove the ability of their machines to stand hard wear, and give no trouble over our Irish roads, I believe they will find many purchasers.

Ireland, with her few railways, and other slow methods of transit, offers a good field for the manufacturer who will cater for the real needs of would-be riders. There are many!

IMPROVEMENT.

Tyres for Irish Roads.

[4794.]—It may interest your correspondent, T. P. Henry, to learn that I have been using my 1908 Triumph, with a ROM tyre (26in. by 2¼in., rubber crossbar and steel stud pattern) on the rear wheel, and a Clincher Dreadnought tyre on the front wheel with entire satisfaction.

The country travelled is that between Killarney and the coast, but every rideable road is covered in addition to the main routes, and since I came here last September I have ridden 1,700 miles, my only tyre trouble being one horse-shoe nail puncture to the front wheel (Clincher) cover.

The steel studs of the ROM cover are intact, and the rubber bars show very little wear indeed, although the roads here, in addition to being made without steam rolling, are hilly, and in some cases rather bumpy.

I have not suffered a sideslip, although riding throughout the winter. J. F. O'CONNELL.

Chain Drive—An Appreciation.

[4795.]—I am sending you along a photograph of the 3½ h.p. 1910 Phelon and Moore with which I was able to score in the Streatham and District Hill-climb, gaining highest marks of merit against all comers in all classes. The combined weight of machine and sidecar with passengers was 641 lbs., and it climbed the hill with a good deal to spare in grand style.

A lot has been said lately *re* chain and belt, and after experience with the former as the method adopted by this excellent firm, I feel those who foster the latter cannot have had opportunities of investigating the merits of the chain drive in a practical form. I have ridden this identical machine 2,500 miles, mostly in winter and rainy weather, and the transmission has not given me one ounce of trouble. In fact, the chains might as well have been sealed in out of sight for the attention they required, or even that they appear to require in the future. I have not met the hill on the roads I frequent that the engine will not take sidecar and passenger up, and in this I include Bury Hill, Bognor Road. I have found it takes a good twin to hold it on give and take roads when it is going, and I can comfortably average twenty-five miles an hour, mile after mile. I have touched forty with sidecar and passenger—total weight twenty-four stones on level road.

H. P. White, the writer of the letter on chain transmission.

For ordinary touring purposes I cannot conceive that a more satisfactory and no trouble machine could be wished for than this 1910 model, and I can say that my experience extends over a number of years with most makes, including twins and four-cylinders.

The soul of the P. and M. is, of course, the two-speed gear and chain drive. In traffic the gear becomes almost human, and I believe I could run it at three miles an hour if need be. The extent to which the gear can be slipped without perceptible harm is remarkable.

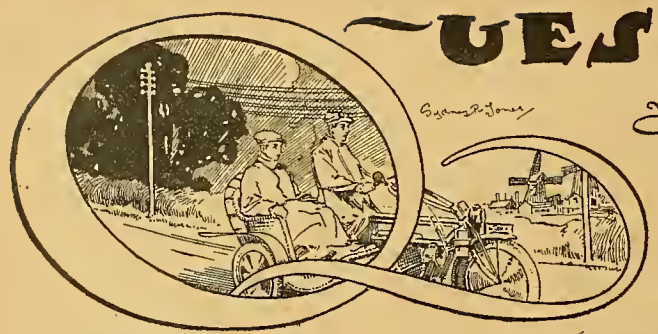
In conclusion, I should like to say that there is one thing about my P. and M. that was not possessed by any other machine I have had, and that is that I have always been sure it will start when I get it out of the garage, at a touch, and like most things that are good it gets little attention.

I shall be glad if you can insert these remarks as a guidance to others, as there must be many who are looking for a really reliable mount. H. P. WHITE.

EXPERIENCES WANTED.

"C. R." (Alderley Edge) would like readers' experiences of the P. and M. two-speed gear in use with a 7-8 h.p. twin engine and sidecar.

"R. C. S." would like readers' experiences with the Scott, particularly as regards compression (does it hold good for a long time?), wear of bearings, and consumption.



QUESTIONS AND REPLIES

A selection of questions of general interest received from our readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, **must be accompanied by a stamped addressed envelope for reply.**

Newmarket to Louth (Lincs.)

Might I trouble you to inform me the best route to take on my motor cycle from Newmarket to Louth, Lincolnshire?—M. L.

We think you will find that the best route is Cambridge, Huntingdon, Stamford, Grantham, Lincoln, Louth. There is an alternative route *viâ* Peterborough, Sleaford, Tattershall, and Horncastle, but it is very little nearer, and we recommend the former.

Bristol to Bournemouth.

Will you be so good as to tell me the best route to Bournemouth from Bristol?—B.H.J.

We should advise you to go as follows: Bristol, Bath, Warminster, Heytesbury, Wilton, Salisbury, Fordingbridge, Ringwood, Christchurch, and Bournemouth. There is an alternative route *via* Warminster, Shaftesbury, Blandford, Poole, and Bournemouth, which is shorter, but we recommend the first.

To Facilitate Starting.

I have a Scott motor bicycle and I find a certain amount of difficulty in starting easily from cold. Can you advise me if there is anything special to do to the Scott machine to enable it to start more readily? When once started and engine is warm there is no difficulty whatever, as it starts the first time the lever is pushed down, but from cold I find considerable trouble.—TWO STROKE, Stoke Newington.

We recommend you to ascertain that the holes in the jet are not partially stopped and sparking plugs quite clean with points adjusted close together. Of course, according to the makers' instruction book, petrol must be injected into the transfer ports through the spring valves at the side of each cylinder, and carburetter should be well flooded. Do not attempt to start engine when jacked up on the stand. The makers specially recommend engine to be started with back wheel resting on the ground. This may be due to the fact that when the machine is jacked up it slightly upsets the level of the spirit in the jet, as we find from personal experience that the engine starts better with the machine off the stand. Like other engines, it is, of course, necessary to see that there is no leakage of air between engine and carburetter, and also that the transfer port covers are firmly screwed down.

Of Interest to Club Secretaries.

I am on the trials committee of a new club, and not having had much experience of the work would be greatly obliged by your giving me some information regarding the following points: (1.) How are motor cycle hill-climbs conducted in the best and most satisfactory manner regarding classes, twins, singles, and lightweights, also old crocks—say previous to 1905 or 1906? What formulæ would you advise? (2.) Rules governing short reliability trials of, say, 100 to 180 miles? (3.) How do you define a standard touring machine—per maker's catalogue? (4.) What factors do you take into consideration in a consumption trial? (5.) What novelties would you suggest for a sporting event? (6.) Is the A.C.U. formula, $\frac{\text{capacity} \times \text{time}}{\text{weight}}$, fair to all twins up to 5-6 h.p.? (7.) How could I construct an electrical timing apparatus?—COMMITTEEMAN.

(1.) This question is best answered by referring you to the report of the A.C.U. hill-climb, held in the Isle of Man last week. You will then see how the classes are arranged. For a hill-climb divided into classes, results are usually on time. (2.) Write for the rules of the Quarterly Trials to the secretary of the A.C.U., 18, Down Street, Piccadilly, W. (3.) A standard touring machine is defined by the A.C.U. rules, which can be sent you on application. (4.) Weight of machine and rider and cubical capacity of engine. (5.) We must leave this to your own initiative. (6.) The A.C.U. formula is $\frac{\text{weight}}{\text{capacity} \times \text{time}}$. It is the fairest known at the present time. (7.) An electrical timing apparatus was described in *The Motor Cycle* for July 24th, 1907, and was used at Harrogate on July 25th, 1907. A back number can be obtained from our offices, 20, Tudor Street, E.C.

A group of T.T. competitors in racing attire. From the left the riders are P. Butler, H. Reed, H. H. Bowen, F. W. Dayrell, W. H. and J. T. Bashall, and G. E. Stanley.

Tuning up for Hill-climbs.

With reference to the tuning of a T.T. Triumph for hill-climbs, do you consider that the engine will take an extra large jet if I can get enough air at the same time, or does the power cease to increase after a certain volume of gas has entered the cylinder? Shall be pleased to hear from you to guide me in the matter, as I am not certain whether any advantage would be gained by enlarging the present jet on which the machine is very fast, but want to get as much out of it as possible.—CLUBMAN.

For hill-climbing purposes it is usual to fit a slightly larger jet and at the same time to increase the additional air openings. Some organisers of hill-climbing competitions might object to alterations being made to the machine; but we have heard of no objections raised to the removal of a portion of the carburetter chamber to allow more additional air to enter. You must bear in mind that when you cut the carburetter about in this way it renders the machine slightly less saleable, as for ordinary touring purposes there is certainly no advantage in increasing the size of the jet or the air holes over those of the standard make.

A Strange Experience.

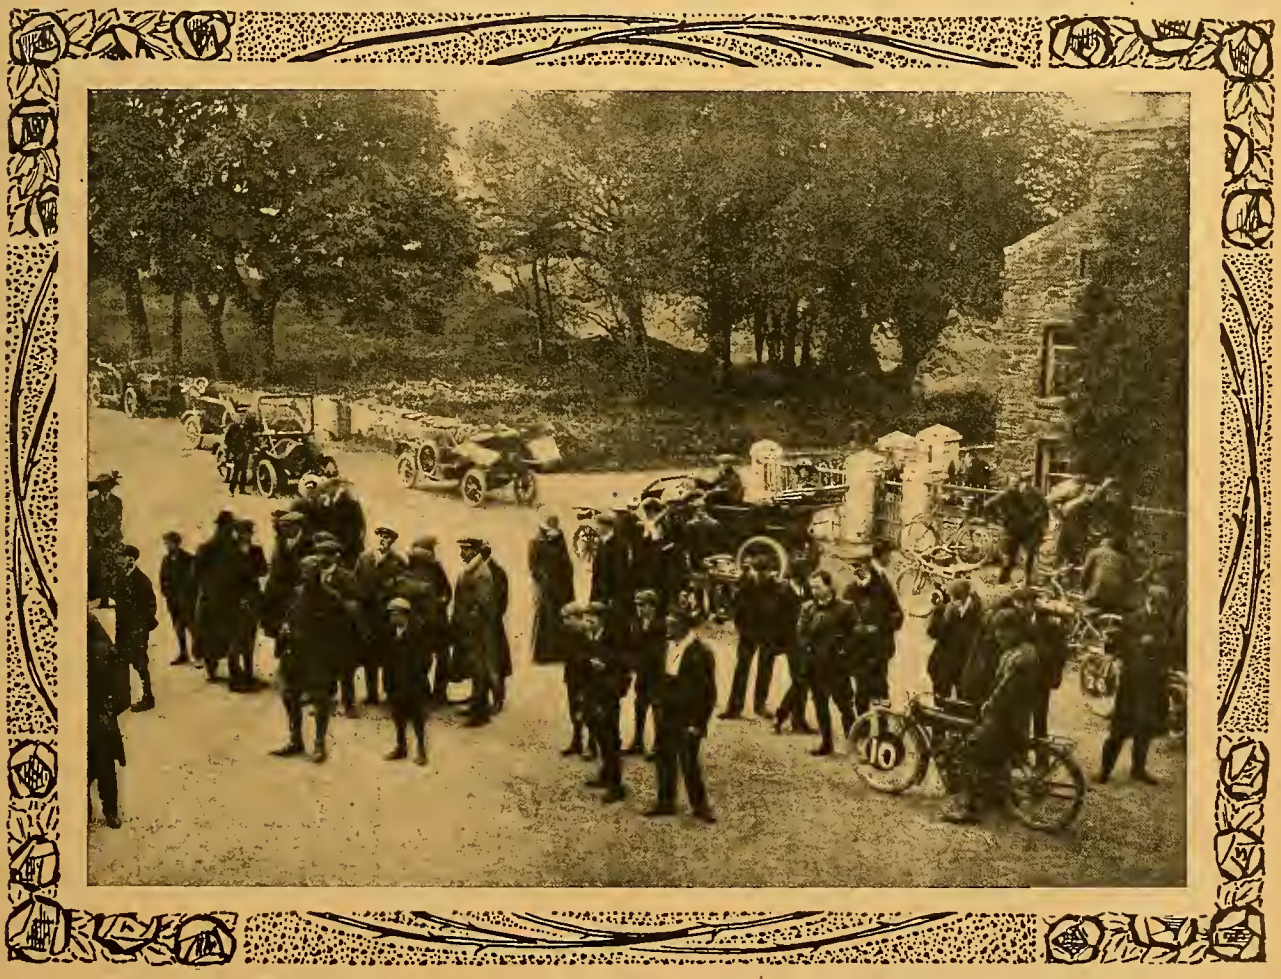
I had my spray carburetter to pieces a short time ago in order to clean the gauze intake, and since then I am unable to start the engine at all. Instead of a mixture a great deal of petrol is drawn into the combustion chamber; this soaks the plug and does not allow it to spark. The engine is in good order—compression and timing being correct. Ignition is good too, as the plug sparks well when off the machine. I put the carburetter together as I found it, still it seems to be the whole cause of the trouble. For any advice you can give me I shall be most grateful.—PUZZLED.

Your experience is a strange one. All we can think of is that the pistons in the carburetter are sticking, causing air holes to remain closed and perhaps throttle wide open, or the carburetter itself is flooding through the parts of float chamber and needle valve being in some way wrongly assembled. You do not say if the levers of handle-bar-controlled carburetter can be easily moved, but we should imagine one or other of the pistons has stuck. Our advice is to take the carburetter to pieces very carefully, to send to the makers for their book of instructions if you have not already got a copy, and then re-assemble the carburetter according to the instructions contained in the book.

Re-engining an Old Quadricycle.

(1.) What is the largest cylinder—water-cooled or with water-cooled head—which can be safely and easily adapted to fit the crankcase of an old pattern 2¼ h.p. De Dion engine, 70 mm. bore? (2.) Can the same connecting rod be used? (3.) Is there any larger engine with a crankcase of the same dimensions as the 2¼ h.p. De Dion which could be readily fitted in its place on a quad?—C. T.

(1.) The largest we have ever known fitted to the engine mentioned to give good results is the 74 mm. bore De Dion, which converts the engine to 2¾ h.p. (2.) The same connecting rod can be used. (3.) You could fit the following engines of larger dimensions: 2¾ h.p. De Dion, 3½ h.p. De Dion, M.M.C., or Aster. Ascertain if the axle is suitable for a more powerful engine. A firm which would be likely to supply you with articles such as you desire is Brown Bros., Ltd., Newman Street, Oxford Street, W.; Paris house, 31, Rue de la Folie Mericourt.

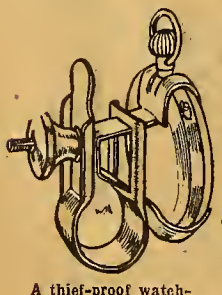


Competitors and spectators watching the practising for the T.T. Race at Ballacraine Corner.

Several new introductions have been recently added to the already long list of fitments designed for the comfort and convenience of motor cyclists, and made by Alfred Dunhill, Ltd., of Euston Road, London. As fast cars are getting quieter every day, a handle-bar mirror is becoming more and more a necessity, as by its aid following traffic can be observed. Even the fastest motor cycle is not *always* going "all out," so that it still needs a mirror when going at a moderate pace and perhaps with more reason, for it is then probably

Dunhill's Handle-bar Mirror.

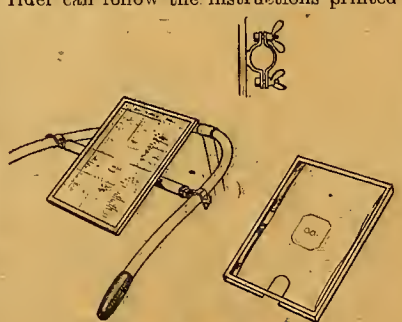
rather on the noisy side, and the rider is often prevented from hearing the warnings of overtaking cars. The accompanying sketch illustrates Messrs. Dunhill's new handle-bar mirror. Over all it measures about 8in., and weighs about ¾ lb. The clip with which it is fastened to the handle-bar is fitted with a rubber cushion. The bar on which the mirror is carried is attached to the clip through a simple locking device in which serrated faces are held together by a butterfly nut. No amount of vibration can cause the mirror to move when once fixed. The mirror itself has a convex surface, and this gives a very wide range of vision, not merely a section of the view behind, and is fixed to the bar with a screw clip, which permits it to be turned round the bar, and also to slide along it. Thus, in whatever position the handle-bar clip be placed the mirror can always be arranged to show the traffic behind. The whole is neatly and strongly made and is heavily nickel-plated.



A thief-proof watch-holder.

Those who carry a watch on their handle-bars know how convenient and useful it is, but not a few have also realised that most watch clips present a "dead easy proposition" for a casual thief. The one Dunhills have introduced for attaching a watch to the handle-bar has the great merit of being thief-proof. This fitting is shown in the illustration. The safety locking device is contained in the thumb-screw at the back, which cannot be unscrewed without a special key, which is of such a sort that it would be almost impossible to pick the lock with any instrument. The nut can, however, be freely screwed up without the use of a key. This useful little accessory is extremely cheap, and should meet with wide popularity. Two other accessories which will be sure to appeal to the motor cyclist who studies his own comfort are a padded saddle cover which can be attached by means of laces to any saddle, and a waterproof cap provided with "curtains" which encircle the turned-up collar of one's overcoat or mackintosh, and entirely prevent the rain from getting down one's neck. The cap complete folds up into an extremely small compass, and those who ride in all weathers should not fail to find a place for it in their permanent kit.

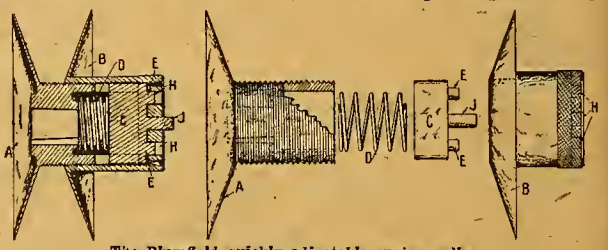
Mr. A. H. Hunt, 117, Cannon Street, E.C., recently got out a neat fitting which is sure to appeal to those motor cyclists who go in for long distance trials. It is a route card holder, which can be attached to the handle-bar by means of a cross piece, so that the rider can follow the instructions printed



A. H. Hunt's Route Card Holder.

on the route card without having to dismount. The construction is shown in the accompanying sketch, whence it will be seen that the route card and the piece of covering celluloid are simply slipped into the frame, which is so attached to the handle-bar as to be turned to any inclination desired.

The latest adjustable pulley which has been submitted to us is made by Messrs. Blumfield, Ltd., 70, Lower Essex Street, Birmingham, and consists of four parts only. The fixed flange A is screw-threaded to take the loose flange B, which has a long hollow boss capped at the end. The cap is provided internally with eight holes H (two only are shown). A driver C, on which are machined two short studs E and a long stud J, slides in a slot milled on the hollow boss of the fixed flange A. The short studs E engage with the holes H, and are kept in position by



The Blumfield quickly adjustable engine pulley.

the coil spring D. To adjust the pulley the long stud J, on driver C, which projects through the cap of the boss on loose flange B, is pushed inwards against the pressure of the coil spring D. This causes the short studs E to come out of engagement with the holes H, and the loose flange can be screwed in or out to the desired amount. Releasing the stud J allows the studs E to re-enter the holes H in the same or a fresh position, and the loose flange is again locked. The construction is simplicity itself, the action quite free, and a very fine adjustment can be obtained. A further advantage is that the movable parts are all covered by the hollow boss, and cannot be affected by dust and mud. The sample pulley we have examined is thoroughly well made and splendidly finished.

The makers of the Turco tyre repair outfit have sent us a much improved box containing inside repair plaster, lightning patches, French chalk, valve tubing, canvas-backed patching sheet, glass paper, a roll of insulating tape, and two sparking plug washers. A small tin of solution is fitted with a patent airtight lid, which is much better than the usual collapsable tube which sooner or later bursts with the result that the contents dry up. Further particulars can be obtained from the Union Rubber and Chemical Co., Ltd., Shaw Street, Ashton New Road, Manchester.

MOTOR BICYCLES FOR SALE.

1909 Two-speed Humber, latest Druid forks, studded tyres not done 500 miles; accept £32 10s.—Evans, furnisher, Sparkhill, Birmingham.

WOLF Lightweight, 1910, latest model, grand, magneto, spring forks, stand, tools, splendid hill-climber, quite new, one of the best lightweights; list price £55 10s., take 30 guineas; makers' guarantee.—54, Lozells Rd., Birmingham.

MOTOR BICYCLES FOR SALE.

NOBEL, 2¼h.p., h.b.c., low, good condition; £9.—10 Northview Rd., Hornsey.

4-CYL. F.N., 4½h.p., perfect, £24, worth £30.—7 Mill Lane, W. Hampstead.

4h.p. Twin, Chater-Lea, variable pulley; sound bargain £12.—27, Colonnade, Russell Square.

3½h.p. M.M.C., spring forks, new condition, £1 sidecar, £2 10s.—Guy, Buckhurst Hill.

7-9h.p. Peugeot, No. 6 Chater, B. and B. handle-b control; £19 10s.—234, High Rd., Lee.

BROWN, 2¼h.p., in good condition; £8 10s.—6 Colvestone Crescent, Dalston, London, N.E.

TRIUMPH, 3½h.p.; £20, or near; in perfect orde tyres excellent.—Roberts, 65, Peckham Rye, S.

WHITTLE'S.—F.N., 4½h.p., 4-cyl., magneto, sprin forks, nearly new, unscratched; bargain, £2

WHITTLE'S.—Bat-J.A.P., 6h.p., twin, spring fram and forks, excellent order; £22 10s.

WHITTLE'S.—F.N., 4½h.p., 4-cyl., magneto, sprin forks, fine order, extra cheap; £22 10s.

WHITTLE'S.—Rex de Luxe, 5-6h.p., twin, magnet Roe clutch, as new, unscratched; £26.

WHITTLE'S.—Bat, 3½h.p., spring frame, M.M.C engine, De Dion carburetter, practically new £18 10s.

WHITTLE'S.—Singer, 3½h.p., magneto, late mode sacrifice, £16 10s.—Whittle's Motor Exchang Earlsfield.

REX, 5h.p., twin, free engine clutch, replated an enamelled; £26.—Gardner, 6a, High St., Hamp stead.

3½h.p. Rex, accumulator, just overhauled and re-enam elled; £11.—30, Shakespeare Crescent, Manc Park, Essex.

BRADBURY, the touring machine; notice on record.—Agents, Gardner and Co., 6a, High St Hampstead.

MOTOSACOCHE, 1910, magneto, absolutely new must sell; £33, or offer.—4,816, *The Motor Cycl* Offices, Coventry.

2¾h.p. Kerry, fast, low, footboards, plating, tyre excellent condition; £9.—9, Park Rd., Collier Wood, Merton.

2½h.p. Humber, good tyres and condition, perfec order; £7.—Kingsmill, East Sheen, Loudon Rd. Sittingbourne.

BRADBURY, 3½h.p., hold a unique record in reli ability trials; £46.—Agents, Bright and Hayles Camberwell.

BRADBURY, 3½h.p.; exchanges arranged, Bright and Hayles, Camber Motor Wks., 73, Church St., Camberwell Green.

BRADBURY, 3½h.p., ball bearing engine, 87 by 87 mm.; £46.—Agents, Bright and Hayles, Camberwell.

BRADBURY, 3½h.p., brimful of good points; £46.— Agents, Bright and Hayles, Camberwell.

BRADBURY, 3½h.p., made by a firm of fifty years' experience in mechanism; £46.—Agents, Bright and Hayles, Camberwell.

BRADBURY, 3½h.p., the best hill-climber of today; £46.—Agents, Bright and Hayles, Camberwell.

BRADBURY, 3½h.p., are low built; £46.—Agents, Bright and Hayles, Camberwell.

BRADBURY, 3½h.p., built by British labour; £46.— Agents, Bright and Hayles, Camberwell.

FIRST-CLASS Twin, 6h.p., splendid condition; offers; every day after 6.—71, Grafton St., Tottenham Court Rd., London.

3h.p. Humber, in perfect condition, tyres as new; £13.—Hereford House, Somerville Gardens, Leigh-on-Sea.

ROYAL Enfield, 3h.p. Minerva, Longuemare, excellent condition, new tyres; £10.—House, 2, Lexington St., Piccadilly.

1¾h.p. Motor Bicycle, lightweight, spray carburetter, good running order; £4 10s.—34a, Melville Rd., Walthamstow.

4½h.p. Riley and Forecar, spare wheel, to convert will separate; exchange 2¾h.p. and cash.—Ross 1a, Cowick Rd., Tooting.

PHELON and Moore, 3½h.p., two-speed, 1908, 1909 fitments, new condition; best offer over £33.—41 Ashford Rd., Cricklewood.

MOTOSACOCHE, good condition, new accumulator belt and front tyre; £14, or near offer.—Howe Church St., Rickmansworth.

4h.p., Antoine engine, 85 by 85, low frame, long handle-bars, splendid order; £15.—L. Sarcin, 48 Sedlescombe Rd., Fulham, S.W.

2¾h.p. Phœnix Cob, two speeds, Bosch, B. and B. equal new, low, and comfortable, footboards; £20.—66, London Rd., Twickenham.

N.S.U., 1908, 3½h.p., magneto, perfect condition spring forks, new Wetawata belt all accessories £22.—"Homestead," Burnell Rd., Sutton.

PHELON and Moore, 3½h.p., two-speed, magneto Rom back, just overhauled by makers; £35.— Phelon and Moore, Ltd., 12, Mortimer St., London, W

The Future of the T.T. Race.

IT is gratifying to know that the prophecies frequently made in these columns seem likely to be fulfilled as early as 1911 by the division of the Tourist Trophy Race into two separate events—one for single cylinders and one for twins. Some writers have laid great emphasis on the fact that six of the first twelve machines were single cylinders. This is rather due to the even distribution of Fortune's favours than to any intrinsic equality. If no machines had trouble, and all the riders were equally skilful, the twins would have matters all their own way. To put this in another form: The fastest lap done by a twin was Bowen's third round—17.51; the fastest by a single was Creyton's sixth—19.14. Supposing these men, the two fastest representatives in the two classes, had been able to maintain top pace throughout, Bowen on the fastest twin would have beaten Creyton on the fastest single by over a quarter of an hour! It is obvious, therefore, that under the 1910 conditions the single is hopelessly outclassed for speed, and could only hope to snatch a win if the crack riders of twins all encountered serious trouble. Two alternatives therefore present themselves, viz.:

(i.) The capacity limit of the twins can be further reduced.

(ii.) Separate races can be organised for twins and singles.

There is now no doubt that the latter solution must commend itself. There is no great demand for small twin-cylinder engines of the dimensions used for the T.T. Such a demand may conceivably come in time. The standard 3½ h.p. touring mount may possibly in days to come be universally supplied with a twin-cylinder engine for the sake of smooth running; there are such engines on the market now, but their sales are limited. Nine times out of ten, the man who wants a twin, wants a big twin or a very small twin; and the makers of twin cylinders who excel in the T.T. Race sell very few duplicates of their T.T. engines—the engine they market is of considerably larger dimensions. Hence it may be taken as practically certain that next year the two types will compete in separate races, very possibly on separate days. The cubical capacity of the twin-cylinder engines can then be determined without any reference to the single cylinder at all, and will no doubt be largely increased.

The Course.

IN other respects the conditions require very little alteration. Competitors will no doubt take their own steps to guard against the conflagrations which occasioned so much alarm at the filling stations this year, and the A.C.U. will cancel the stupid rule which compelled the rider to pour in his own petrol, as his unsteady wrists must lead to spilling. There is much talk of a new course. A longer course is certainly desirable if the entries continue large, in order to reduce crowding, but the old course would serve admirably for two events, each with fifty entries. No Manx course can be free from perilous corners. The one real defect of the present course is its lack of a steep hill. Greg Willey is an easy climb, with only a few yards of 1 in 9 at its steepest point, and no one ever fails on it in the race unless his engine is seriously amiss or other riders impede him on a bend. If the race is to be seriously regarded as a "tourist" event a worse gradient would be of service. Quite a number of the machines entered were actually genuine tourist machines, and the sub-

stitution of ordinary forks, handle-bars, and saddles would have converted many of them into suitable mounts for the touring private owner. In other cases the machines were frankly of a racing design, drilled out wherever possible, with frames so low that the crank case only cleared the ground-line by a couple of inches. Every maker knows what strength he must put into the frame and detail fittings of a touring machine, and the race provides an admirable test for engines, carburetters, belts, tyres, magnetos, and so forth. Its touring value is not diminished by the use of racing frames, forks, bars, or saddles.

Preliminary Tests.

THE silencer test is a farce, and next year we hope to see good silencers insisted upon for the preliminary practice, and removed for the race itself. The brake test is unnecessary. No sane man would compete without good brakes, and if anyone enters with bad brakes the judges can discern in the practice spins that his machine is unsafe, and insist on its being fitted with better brakes. In conclusion, next year we hope to see two separate races, if possible on two consecutive days; an increased cylinder capacity for the twins; no brake test; no silencers in the race; the same course, unless entries increase very much, or a really difficult hill can be included; and the same set of painstaking, vigilant, and obliging officials in charge of affairs.

F. Philipp (5 h.p. two-stroke two-speed Scott), the ninth competitor in order of speed in the Tourist Trophy Race. His performance, coupled with that of Eric S. Myers, sets up a new record, as it is the first time a valveless engine has completed the T.T. course.

Incidentally, we wish those who had ill-luck the other week better fortune in 1911; we hope for a better contested race in each division, and a result in doubt up to the concluding lap.

AUSTRIAN MOTOR CLUB'S RELIABILITY TRIAL.

AN international reliability trial organised by the Austrian Motor Club took place recently in the neighbourhood of Purkersdorf, near Vienna. It was not so successful as those held in former years, as the weather on the day of the trials was dreadful—it poured with rain, and was bitterly cold. Owing to the bad weather it was decided to go over the course once, instead of the three times originally intended, so that it was only fifty-four kilometres in length. This was, however, a more difficult test than the original would have been in good weather. During the trial a speed test of three kilometres long was held. In judging the final results, the regularity of running during the whole course was taken into consideration, as well as the number of marks gained in the speed trial. Final classification: 1, A. Müllner (5½ h.p. Rössler and Jauernigg); 2, O. Wolf (2.9 h.p. Puch); 3, F. Ahlgrimm (6 h.p. Puch).

Grotsch (6-7 h.p. Twin-cylinder Puch and Sidecar) crossing the starting line.

W. Bliding (5½ h.p. Laurin and Klement). Note curious position of the passenger to lessen wind resistance.

The winners in the respective classes were: Class I. (lightweights), Alois Wutte (1¾ h.p. N.S.U.); Class II., Otto Wolf (2.9 h.p. Puch); Class III., Ottokar Mazanek (3½ h.p. Niesner); Class IV., Anton Müllner (5½ h.p. Rössler and Jauernigg); Class V., Fritz Ahlgrimm (6-7 h.p. Puch).

A Round of the T.T. Course at Speed.

NOBODY who has yet to visit the Isle of Man can conceive how exacting is the task which faces the racing man who would win a T.T. Race. Nobody who has not "blinded" round it in the early morning when the roads are free can understand what address and dash are required to register even a twenty minute lap, though this year Charlie Collier's *slowest* lap was reeled off in 19.34 minutes. Ask Hedstrom, the veteran designer of the Red Indians, what he thinks of the course. In case you don't know him, I will try to paint its difficulties. St. John's, the official starting point, is a hamlet on a broad road, less than a mile from the south-east corner of the triangle, and a broad, straight, pot-holey highway conducts you to the ill-famed right-angle of Ballacraine. Here a large, square, white-walled public-house shrouds the corner from you. You cannot estimate its severity; you cannot see whether Bowen, or some other daring rider, is recumbent in mid-track behind the wall with his machine pummelling him. You jam on your brakes, lift your valve, and twist round. Can you ever do it? The kindly wooden banking seems too far round the bend to help you—straight ahead is a cruel, gnarled wall, the bloodstains scarce washed off. By an effort you twist your front wheel, and with a bump you are up the banking a couple of feet. Lying well over, you swirl off it, and, hey presto! you find the deceptive road is strongly on the rise, and your engine knocks—it was here the Colliers' automatic A.M.A.C. carburetters came in very handy.

Ballig Bridge.

You jab your air lever back a notch or so, and with clanking piston gather pace up the ascent. Just as you rejoice to hear your exhausts merge again in indistinguishable roar, Ballig Bridge leaps up under you—loathly little hump set on the skew—it hurls you five yards forward and across the road, over paving stones set at the cottage doors, and now, as your jumping heart slows down a few r.p.m., you face a particularly nasty patch of going. The road is narrow, hemmed in with ruthless walls, and has lost all sense of rectitude. It is an elongated spiral. Arm Hackenschmidt and Sandow each with a huge pair of gas pliers, and let them pull out a giant exhaust valve spring till it has something of straightness—such is the road to Glen Helen. There are no genuine corners, but you are shaving stonewalled curves all the time. One or two wheel tracks in the race go within *four inches* of the low walls; were you squatted there to watch with dangling heels you would spill Collier and Jack Marshall and two or three more. So to Glen Helen, where the capricious road gives a sharp breathless twist to the left, then right again, then back left, then with the last and sharpest wrench to the right. Close on your back wheel thunder five or six more projectiles, breathing flame—take an inch more room than you can claim, and they will smash into you.

Then the grade straightens up, and a lower geared machine nips past you at 45; over the undulating plateau you bound, losing yards on him at every explosion, till the mad swoop down to Kirk Michael drops away beneath you—twenty-five feet wide, fenced by high hedges, curling down in long gentle wreaths. 50—you are pulling back the man who passed you on the hill—60—you have him—70—you leave him standing, but with a rush and a thunderous roar Charlie Collier's front wheel is up with you. Aha! the bottom—two tiny rises, which betoken that Kirk Michael is near you; you signal "Next lap" you will stop for petrol; Collier, with consummate nerve, delays slowing till the bend is almost under his wheel, and leaves you for ever; you slide cautiously round with several others in a crackling, spluttering string, as cramped wrists refuse wholly to lift the valve against its 40 lbs. spring. Steady here—this was where poor Alan Woodman met his terrible fall—then six miles of broad hedgerowed going, up and down in little undulating dips, with only one corner, and that the terrible Devil's Elbow, too dangerous to be dangerous at all, until after another three miles of winding road

The Very Nastiest Piece of the Whole Course

is reached, the wicked one, two, three corners in the streets of Peel—a regular beast one of them; across a street into another street a trifle out of register with the first; though the gutters are filled with hard-

P. Platt, the fastest rider in Class I. of the A.C.U. Snaefell hill-climb, riding a 1910 model 3½ h.p. Bradbury.

A Round of the T.T. Course at Speed.—

stamped metal, the slightest error means mounting the kerb, with a sickening jolt and long odds on a skid over the flags. Then a lovely mile—broad, dead straight, and not too bumpy—till you pass under the railway bridge, and strike two bunkers you would never have called bunkers till you tried to snatch seconds through them—the first another skew bridge with stiff stone parapets, the second a corner, heaven save the mark, up into St. John's. Why, the road looked straight here last night, so long and gentle is the bend, but as you tear up on full throttle you scrape the bank on the extreme right, and should you fall, that roar behind you means you will be knocked into mincemeat before you realise you are over. This is no sport for cowards or fools, gentlemen! IXION.

"IFS" OVERHEARD IN THE ISLE OF MAN.

If the island were only big enough to hold Bowen and his Bat!

If the Indians' tyres had stood up!

If the Colliers will ever make a mistake!

If Creyton had funked mounting his blazing machine at Kirk Michael!

If Oberländer's belt hadn't broken!

If young B. Jones had kept going!

If attendants were allowed to do the refilling!

If Wood hadn't come a purler in the rink race!

If J. R. Nisbet wasn't a champion clerk of the course!

If the roads had been greasy!

If the Scotts didn't hold the road like postage stamps!

If Bosch Bennett wasn't very much in evidence!

If Mackay had been two yards nearer Bowen when the latter's frame broke!

If poor Woodman's tyre hadn't burst!

If Marshall's tube wasn't in rags after his spill on Snaefell!

If the Rex connecting rods weren't "holy" terrors!

If Bowen ever funked a corner!

If Adamson's corner work isn't the real thing!

If Lister Cooper ain't a coming man!

If the police hadn't cleared the road when Bashall became a pillar of fire!

If *The Motor Cycle* "maritime office" wasn't great!

If "Pa" Applebee wasn't deaf, would he have used twenty-four belt fasteners!

If Chase didn't ride as neatly as ever!

If the Zenith didn't mop up the precipice from Sulby to the Bungalow!

If the Humber aeroplane engine isn't first cousin to a bullet!

If Slaughter hadn't got the fastest Ariel ever seen!

If Bentley wouldn't make a bucking broncho buster!

If nobody had trouble, who would win!

If there were Ballacraine bends on Brooklands!

If racing through Peel isn't the limit!

If seagulls know more about aviation than Paulhan!

If there were no barnacles on the Peel coast, how much more skin would a certain End-to-end record-breaker possess!

If Schulte was smiling on Thursday night!

If Hedstrom fancied the course!

If Wells holds the record for replenishing an oil tank!

If anybody can teach the Colliers anything!

If Mrs. Aston would not be a valuable asset at a bazaar!

If we are popular in the Isle of Man!

If there will be separate races for twins and singles next year!

If there will be a new course!

If a 40 h.p. car wanted any pushing out of the Sefton garage!

If the Rom car wasn't a naughty little projectile!

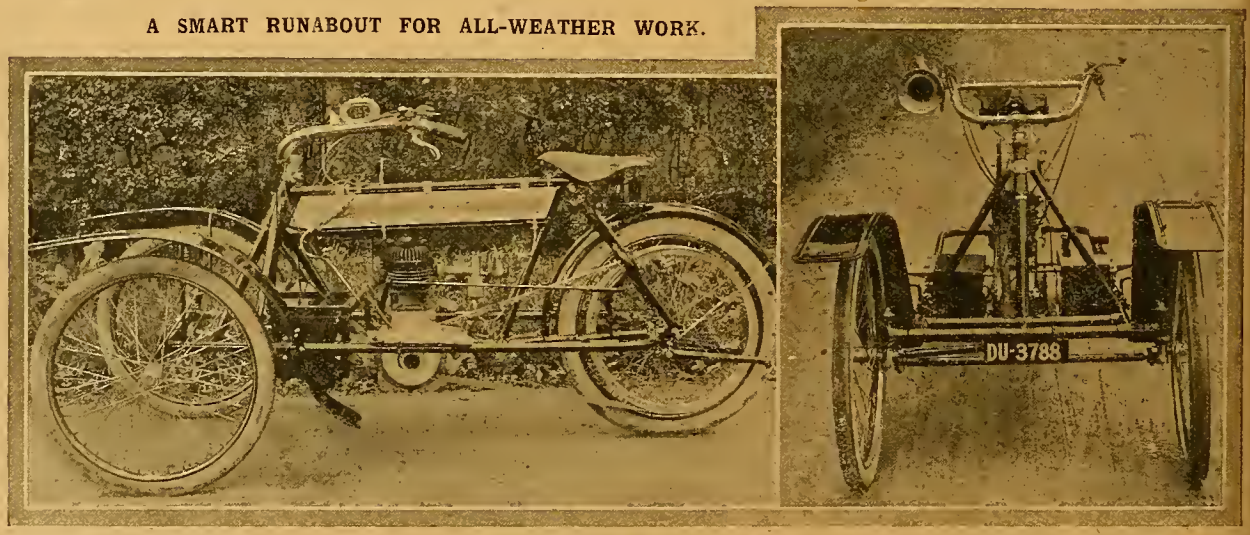
If Holroyd didn't bulk large against the sky line up Snaefell!

If some wag hadn't put blotting paper between the magneto contacts of Boileau's Indian and Brooker's Triumph!

If any visitors had to do some pushing out of Douglas towards the Bungalow!

If the lightweights ever needed more than "L.P.A." up some of the Manx precipices!

A SMART RUNABOUT FOR ALL-WEATHER WORK.



The handy three-wheeler illustrated has been designed and built to the order of Mr. J. G. Jelley, Coventry. The engine is a 3½ h.p. White and Poppe, provided with a cone clutch, and the machine complete weighs but 200 lbs. The tyres are 26in. × 2¼in. Three Spiras non-skids.

The Automobile Engineer is the title of a new sixpenny monthly which has just made its appearance, and is published at 19-21, Great Queen Street, W.C. Its aims and objects are to deal with all technical and scientific questions concerning the design and construction of self-propelled vehicles. Among the contents of the first number is an article on "Universal Joints," which will probably be of interest to motor cyclists, and particularly those engaged in the construction of motor cycles, universal joints being used on more than one make of motor bicycle. Carburation is an item which all are anxious to know more about, and carburetters are exhaustively treated in a special article, which points out where efforts for future improvement should be made

A New Automatic Carburetter.

A VARIABLE CHOKE TUBE.

ONE of the most interesting carburetters we have ever seen is that recently introduced by the F.N. Co., which embodies a number of novel and highly ingenious features. Fig. 1 gives a perspective view of the carburetter as a whole, and shows the position of the float chamber, throttle lever, and inlet pipe union. The mixing chamber is cylindrical and contains a rotating sleeve throttle, which in addition to the functions dealt with later on controls the admission of air to the mixture through two ports. The situation of these latter is more clearly shown in fig. 2. That on the left hand side admits cold air, whilst the right hand one is furnished with a gauze-covered funnel which abuts on the cylinder head and provides warm air.

The throttle sleeve is illustrated in fig. 3, which for the sake of clearness shows it the wrong way up. When in the position of full opening the heart-shaped hole in the sleeve coincides with the outlet port in the top of the mixing chamber, the sleeve passing between the cylinder wall and the small castellated-ended tube, the use of which will be described. For the control of the air a portion of the sleeve is cut away in such a manner that when the throttle valve is nearly shut all the air supply is drawn from the warm air port; then as the valve is gradually opened the cold air supply comes into use, until at full throttle only cold air is drawn in. It may be mentioned that the area of cold air port is considerably larger than that of the hot air port.

A variable choke tube practically makes a carburetter automatic. The F.N. Co. have set about achieving this laudable end in the following manner. Mounted to the cover plate through which the throttle valve spindle passes are a couple of cylindrical rollers which run the entire length of the mixing chamber, and butt up against its walls at either end. These rollers are geared together by means of teeth milled in them, and are cut away in a very peculiar manner, which may be described as a double compound helical groove. From a middle point along the roller's length a right-handed thread and a left-handed thread are marked off and pass some threequarters of the distance round the circumference of the roller. Between these two diverging lines a semi-circular groove is machined, which as the lines get further apart becomes not only wider but deeper. Fig. 4 shows the appearance of the two grooved rollers which are meshed with one another symmetrically, so that when they roll together the depth of the grooves immediately on either side of the line of contact is the same. Since each groove is semi-circular it will be seen that there is between the rollers a circular gap which can be increased or decreased by rolling the rollers one way or the other.

In the choke tube thus formed is placed the jet, which when the rollers are in one extreme position practically fills the gap.

One of the rollers is fixed to a spindle which runs loose in bearings at each end, whilst the other is attached by a

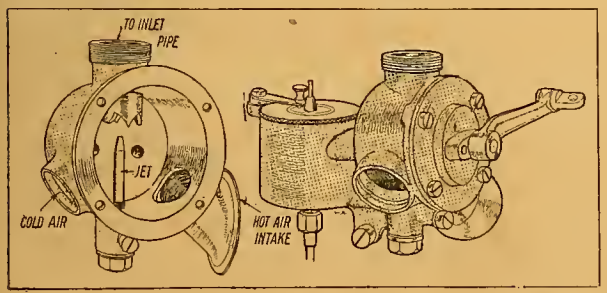


Fig. 2.—Interior of the mixing chamber with throttle sleeve removed

Fig. 1.—General view of the new F.N. automatic carburetter.

grub-screw to the spindle shown inside the throttle sleeve in fig. 3. This spindle carries at its rear end a small pinion which meshes with a similar-sized pinion mounted on the throttle sleeve spindle.

In this way the opening of the throttle is caused to actuate the rollers, with the result that as the throttle is opened the area of the choke tube is increased, and *vice versâ*. The amount of choke tube area compared to the throttle opening can be regulated to any desired degree by slipping the driving roller upon its shaft. The rear plate of the throttle sleeve is slotted to let the roller spindles pass through, as

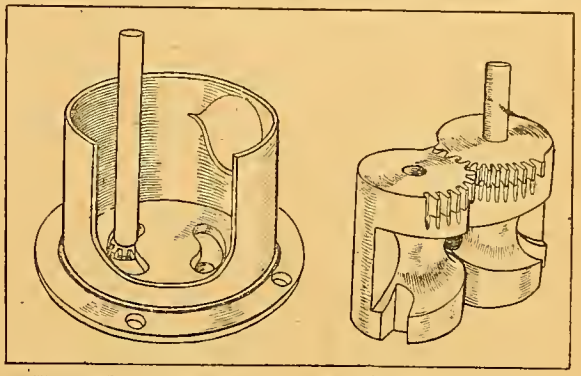

Fig. 3.—The throttle sleeve showing roller spindle and gear, also air and gas shutters.

Fig. 4.—The two peculiarly shaped geared rollers.

shown in fig. 3, and only a certain amount of motion in the rollers is therefore possible.

The rollers when placed side by side are a snug fit inside the throttle sleeve, and the cutting away is such that in any position there is a sufficiency of unbroken surface of the rollers in contact with the sleeve wall to provide a practically perfect air-tight joint.

To render the continuation of the choke tube above the rollers as symmetrical as possible, and thus prevent the mixture being obstructed by any sharp corners, the small castellated tube shown in fig. 2 is provided, and is secured to the end wall of the mixing chamber by means of a stud and set-pin. The castellations make as near a fit as is possible with the peculiar contour of the grooved rollers.

The lid of the float chamber is made extremely easy to detach, as is also the jet, and all parts of the instrument are readily accessible. Throughout it is of gun-metal, dull nickel-plated.

After Mr. Harry G. Bell had explained the working of the carburetter, he kindly placed at our disposal one of the latest four-cylinder machines for a short run in the London traffic. The machine started very easily, and on closing the throttle it was found that it would run extremely slowly with all four cylinders firing with absolute regularity. Driving the machine through Richmond Park, there was no difficulty whatever in keeping down to ten miles an hour, and, in fact, so slow a speed could be maintained that it required a good deal of handle-bar movement to balance the machine. In action and general principle the carburetter strongly resembles one which is very largely used on motor cars, and it has the same peculiarity, that very sudden opening of the throttle causes the engine to cease to fire through too much air being drawn in. This is merely mentioned as an interesting fact, as it in no way impairs the running of the engine or interferes with the working of the carburetter. All that is necessary, and, in fact, desirable, is to open the throttle fairly gradually. The new four-cylinder F.N. machine is a decided advance upon anything previously turned out by the firm.

One by one the large cycle manufacturers are taking an interest in the motor cycle question, the latest firm to succumb to the powerful influence of the petrol-propelled two-wheeler being the Rudge-Whitworth, Ltd., Coventry. They inform us they have not yet decided to market a motor bicycle, but they have been examining the subject from every point of view for some time past, and should they come to a definite decision as a result of such enquiries they will be in readiness for the 1911 season. The Olympia Show in November next will possibly see the first public appearance of the Rudge-Whitworth motor bicycle.

A Week in the Isle of Man.

THE year offers the keen motor cyclist few more pleasant and petrolly times than the T.T. week in the Isle of Man, and when I first sampled its savour last year I bound myself by a vow never again to be voluntarily absent. It is true that the getting there is not all top gear work. I could not ride to Liverpool from my obscure residence in half a day, and, time being short, I plead guilty to having trained it, trusty Triumph and all. Here come valuable tips—"Road Rider" please note! I did not know the "advance luggage" system worked across the water, so I posted my personal baggage; returning, I forgot to post it, and boarded the steamer at Douglas with two large brown paper parcels, which split, and strewed my belongings in the scuppers.

Secondly, I took my machine with me as luggage, for economy's sake—7s. 6d. By the time I had tipped six porters at railway stations, paid one hefty son of Anak to push it across Liverpool, two ditto to drop it into the hold at Prince's landing stage, three ditto to hoike it out at Douglas, I was running short of small change. On the return journey I took it to the parcels office, and for 12s. 6d. go it freighted to Northampton at company's risk without ever seeing it *en route*. If it hadn't been for those accursed brown paper parcels, "orl would have been peas."

Picturesque Peel.

Now to our motors. I put up at the Sefton in Douglas. Next year I shall find an hotel on the course. Peel, for instance, is a charming place, picturesque buildings, and about the bluest thing in bays. Douglas is too trippersome, and those ten bumpy miles which have to be traversed before the course is reached come amiss at 3.30 a.m., as one rushes hungrily out to see the wily Colliers get in their early practice before the course gets crowded. Not but what the scenery is magnificent, indeed at its best when sun and mountain struggle with mist and wind; but I am not of that poetic temperament which can appreciate scenery when the beard is unshaven, and ham and eggs are still distant possibilities. Timing the men round in the wee sma' hours is aggravating. Nearly all of them are lying dark. The cutest get their rounds done before the average journalist has had time to do more than abuse his alarum. Others stop and smoke a cigarette in some inaccessible corner half way round lest their form should be exposed; many more seem to have long *pannes* somewhere or other; and one or two are back again in such unbelievable haste that one wonders if they have discovered a short cut reducing a lap to seven miles or so. Most of the early birds take up their stand at Ballacraine Corner in an unholy thirst for gore; but, as a matter of fact, the rash rushes seldom come until a few delirious laps have warmed a man's blood—Ballacraine is very forbidding when one is fresh from bed, and most took it very gingerly.

Practice over, we made for some remote beauty spot where we breakfasted, much to the profit of the good host at the Sefton, whom we paid for many a meal we never ate. Never did breakfasts taste so good as those dished up at some seashore hotel or glen farmhouse, to vanish before an appetite quickened by thirty miles of open road and five hours mist and sun. Then the day was free for exploration. First of all, the main roads are traversed—low the speed, for every landscape clamours for admiration in the beautiful island, and the dust forbids scrapping when riding in company; the Manx dust is of a peculiarly fine floury consistency, and it hangs in a stifling pall over the road for quite a long period after two or three rapid riders have torn past; even so, it is a long way better than the Manx grease, which, happily, was not in evidence during this week of cloudless sun. The coast road alone totals up to some fifty miles, of which not a yard ought to be rushed, save where gradients and the want of a variable gear compel speed.

A Host of Byways.

Inland there are dozens of cunning little glens, gemmed with gorse and tender larch foliage, foiled by rugged, barren moor above. When these obvious routes have been covered there remain a devious host of byways, each with its own gorgeous glories. To these last I devoted much attention in the idea that they would afford a good imitation of colonial riding. Often such a road jumps up by abrupt steps from terrace to terrace. Of surface there is none, except that when a hole gets so deep that a pony might be lost in it they send along a cartload of boulders to level things up.

The Day of the Race.

Gentle experiences of this sort lead one calmly on to the great race itself. The course is a triangle, and there are very few paths inside the triangle. Last year I hung about the southern corner, where, with the help of a good motor cycle and a knowledge of byroads, one may wander along some six miles of the track and watch the riders at different points. This year, for variety's sake, I resolved to go to Kirk Michael corner. The attractions here are threefold: First, there is the terrible V corner—the worst on the whole lap; secondly, there is a replenishment depot, and no crowd to hamper one's observations; and thirdly, one can wander safely up the long slope towards the top of Creg Willey's, and see the human projectiles descending at speeds which certainly touch eighty miles an hour now and then. The depot was situated in a field with a house and garden adjacent, where an excellent lunch was provided for the handful of officials—so excellent that a well-known Coventry motorist presently wearying of the rattlesome procession outside, retired within, and shunted rabbit and

A Week in the Isle of Man.—

trifle and jelly by the cartload, totally oblivious to the strenuous happenings over the wall. Nisbet, on his French-grey Humber, was soon round to close the course, and ere long the crackling procession began, continuing without intermission for five mortal hours, though with a difference. One might say the current of riders retained its voltage, but with a vastly reduced ampèrage, as the day wore on and, many disappearing, the survivors became strung out.

In 1909 Lee Evans and Harry Collier fought a ding-dong battle almost up to the post, while for many laps Marshall was very, very dangerous, and one or two others were not done with for certain. This year the whole Indian team were early out of the running through no fault of machines or riders, and the Bats, on whom their mantle fell, did not last halfway.

The No-trouble Colliers.

After that it was evident that only serious trouble could oust the two Colliers, and we know that the Colliers simply do not have trouble. Nobody can beat them at corner work, nobody can beat them at tuning. Hence to ensure victory they have only to make a non-stop by one of the family a dead sure certainty, and this they can be relied upon to do. After six laps the only ghost of a chance possessed by anybody else lay in both the Colliers having a long stoppage—and that would have been a miracle, for they don't have accidents, and they eliminate luck by thorough and clever testing of every single detail on their machines. Hence before half time we awarded the race to the Matchless, and our subsequent interest depended merely on any exciting incidents with which the gods might favour us. Nor were the gods particularly kind. Poor Oberländer put up a great race till his belt pulled through just opposite us, and broke his stand clip—a mishap which involved lengthy difficulties, and destroyed his chances even if his engine had not failed him later. Altogether we were very glad when Nisbet's Humber car at last trickled slowly down the hill, and gave us the signal that such of us as had machines which could go might blind gleefully round into St. John's once more.

The final ride from St. John's back into Douglas is unpleasantly memorable. The constant stream of vehicles shrouded the entire road in a choking wreath of horrible white dust, and the driving of certain visitors was distinctly lurid. One sportsman on a powerful car took the tricky turn over Quarter Bridge at about 50 m.p.h. just as I negotiated it, and next time we meet he and I will have "wurruds."

The remaining happenings of a glorious week partook of the nature of an anti-climax. We went to the rink, and saw divers racing men reproduce their earlier corner work on roller skates, much to the terror of the regular *habitués*—saw, too, I am sorry to say, a few motor cyclists disgrace our whole body by extremely unseemly conduct. Then to the big dancing hall of the Palace, where a dense mass cheered everybody impartially, and drowned Collier's maiden speech.

The next day many visitors on touring machines found fresh arguments in favour of two-speed gears as they tried to climb Snaefell from the easy (or Douglas) side. I saw quite ten machines of class makes fail ignobly on this very trifling ascent. Up the long slope of the other side those who had lost reputation on the Thursday mostly regained somewhat on the Friday. Bentley, in particular, exhibited what the racing Indians can do when their tyres stand up, and Jack Marshall would almost certainly have recorded the very

TOURIST TROPHY RACE.

C. R. Collier passing the finishing post a winner in 3 hours 7 mins. 24 sec.—average speed 50·7 m.p.h.

Leaving Ballacraine, there is a gradual and steady rise which partly accounts for the competitors rounding the corner at a fast rate of speed.

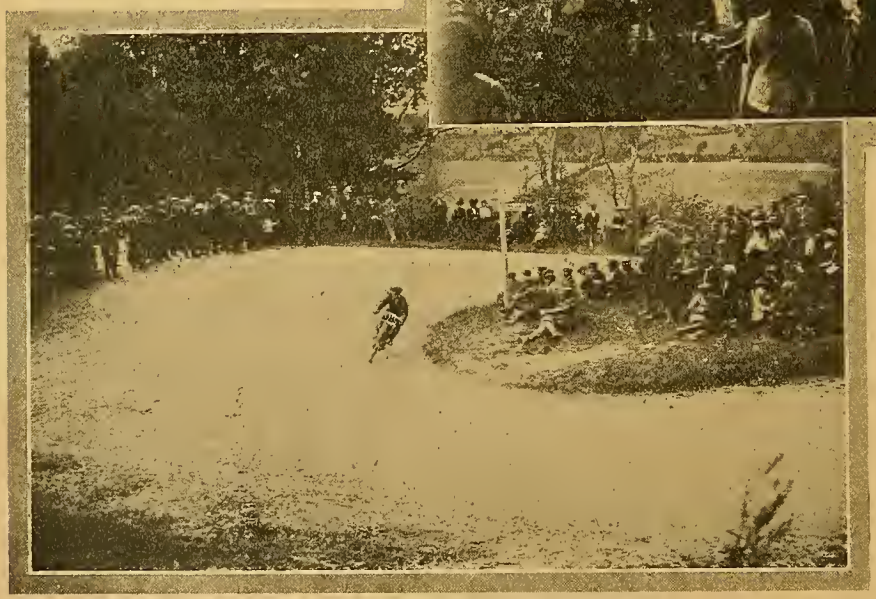
fastest time of the whole bunch if his inner tube had not chewed itself into sixteen little pieces. But for

THE SNAEFELL MOUNTAIN HILL-CLIMB IN THE ISLE OF MAN.
Three aspects of the hairpin bend—a popular point of vantage.

F. W. Barnes (3½ h.p. Zenith-Gradua), who derived much benefit from the use of his variable gear.

style in hill-climbing there is nothing to touch the Scott. It may be beaten for speed, but for *pretty* work on a tricky hill there is nothing to touch the two-stroke. The four-stroke can mop up twenty per cent.

R. Lord (3½ h.p. Rex) heading for the steep gradient leading to the Goose Neck.



Half way round the hairpin bend. It will be observed that this competitor has still to turn his front wheel at right angles to its present direction of travel.

grades as if they were level, but put it at a hairpin when five miles of previous climbing have hotted it up a bit, and it will clank a trifle as its head comes round into the straight again, and its valve is dropped once more. But the two-stroke—no rattle, no fuss, no "you-listen-to-me," no dexterous wrestling by an agile driver. Just a sweet silent swoop upwards, slowing down evenly and smoothly for the bend, no spitting or ceasing of the purr as the wicked twist in the white tape folds down towards it, no clank or rattle or labour as the guarding banks loom up straight against the horizon. Just a gentle curbing of the purr for fifty yards, then a modulated lowering of its note, then pf!—and she's up! The Scotts have now got what they have been looking for—a great public test of reliability with banners flying. We knew they were easily started, we knew they could climb anything, and now we hope they are going to sell like hot cakes.

About the return journey—I spare you there! There were ninety motor cycles on board, and ten cars. The boat got in at 1.40 p.m., our train left at two. We moored outside another steamer, instead of against the quay. He who must be obeyed sang out, "Land only passengers and mails." Under such circumstances blessed is the man who has sent his machine home on its own. Such was I.

B. H. DAVIES.

TOURIST TROPHY MODELS.

A SPECIAL SINGLE-CYLINDER HUMBER.

ALTHOUGH it did not figure very prominently in the actual race, there is little doubt that there was no machine in the Isle of Man which created more comment than the 3½ h.p. Tourist Trophy Humber—an entirely new model, constructed and designed upon highly original and instructive lines.

Starting with the engine, this is a single-cylinder with a bore and stroke of 85 mm. by 88 mm. Here, however, its resemblance to standard practice ends, for in scarcely any other particular does it follow the lines of any other motor bicycle engine. It is, in fact, made practically in accordance with aeronautical practice, and shares several original points with the Humber aero-motor. The cylinder is steel, and is provided with radiating fins, so thin that by drawing one's nail across them one can produce practically a complete octave scale. These fins are greater in diameter at the top than at the bottom of the cylinder.

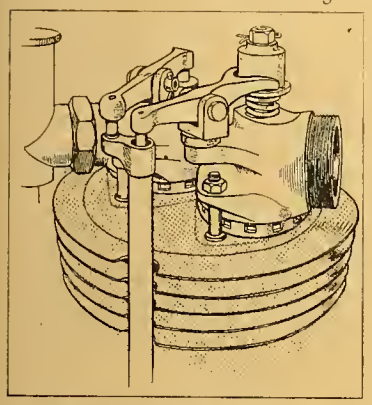


Fig. 1.—The combustion head fitted with overhead valves, and concentric tappet rods. The radiating fins decrease in diameter towards the base. The sparking plug is behind the exhaust valve casing.

Both inlet and exhaust valves are situated in the cylinder head, where they are carried in separate valve chests secured to the cylinder in a special manner. The valves are mechanically operated by overhead rockers, which are actuated by tappet rods, one of which is tubular and has the other working inside it (see fig. 1).

The above valve arrangement necessitates the cam construction shown in fig. 2. The cams are in one piece with the half-time pinion, the outer pair operating the inlet and the middle one the exhaust valve. The rocking arms are also shown in fig. 2, together with the exhaust valve lifting device. The exhaust rocking arm takes the form of a bell crank, the short arm of which can be engaged by a crank attached to the spindle upon which the rocking arms are pivoted. The timing gear is, of course, enclosed in an oil-tight aluminium case, and through this the spindle projects and terminates in a squared portion to which the exhaust valve-lifting lever is secured.

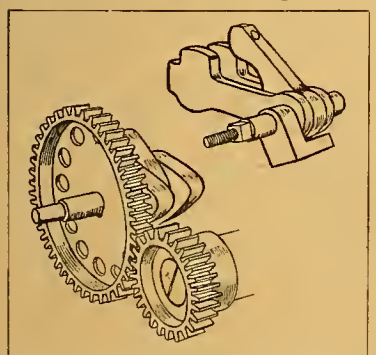

Fig. 2.—The arrangement of the timing gear, cams, rocking levers and exhaust valve lifter on the T.T. Humber.

The magneto is driven by a train of pinions, and is secured in a horizontal position to the back of the crank chamber behind the engine, whence it is not only extremely accessible and well protected from mud and dust, but is also very quickly removable, since it is held in position by a steel strap and buckle similar to that employed in car practice. Fig. 3 illustrates this and also the foot-rest bar and foot brake.

The lubrication system is carried out in a most thorough manner, and embodies several highly ingenious and effective devices. Fig. 4 shows how the crank chamber is provided with a large sump capable of holding sufficient oil for a run of several hundred miles. A small pump, consisting of a couple of pinions running in mesh with one another and connected to an extension of the spindle of the half-time wheel, draws oil from the sump and delivers it to a punt-shaped trough in which the flywheels dip and fling oil on to the piston, cylinder, big-end, and gudgeon pin. The trough is hinged at one end, whilst at the other it rests upon an eccentrically-mounted spindle, which can be turned and the trough raised or lowered. In this way the amount of oil splashed up by the flywheels may be regulated to any desired degree, so that very economical and efficient lubrication can be obtained. At its rear end the sump is furnished with a glass window, through which the level of the oil can be determined.

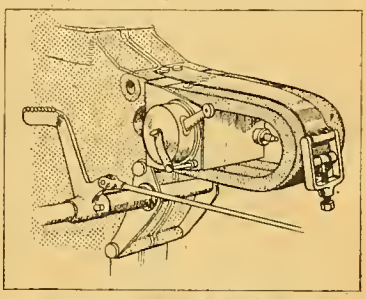

Fig. 3.—The magneto is fixed in a horizontal position behind the crank case and secured by a steel strap and buckle rendering it easily removable.

Fig. 5 shows the petrol and auxiliary oil tank and hand pump. The latter delivers oil to the sump *viâ* the timing gear box, and is used as occasion demands, when, for instance, very hilly country is being traversed. The petrol tank delivers fuel to a Brown and Barlow carburetter coupled close up to the inlet valve chest, as indicated in fig. 1.

Fig. 5 also illustrates the unique construction of the top frame member. This latter is composed of two D section tubes which are spread out and bent downwards at the rear of the tank to form the rear fork. The down tube forming the seat-pillar passes through a cross-piece which is brazed to these D tubes. This construction is at once light, extremely strong, and pleasing in appearance, and it will be a matter for some surprise if it does not cause other designers to realise that frame construction is a point which has been left undeveloped much too long.

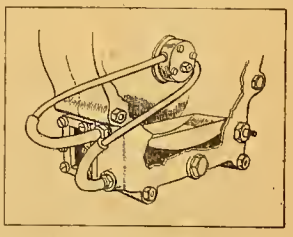

Fig. 4.—Lubrication is by means of a sump in the crank-case, an adjustable trough and a gear pump.

As might be expected, the reciprocating parts of the engine are remarkably light. We give a sketch (fig. 6) of the piston, which is cut out of a solid billet

Tourist Trophy Models.—

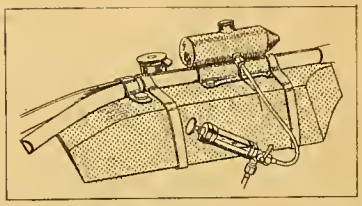

Fig. 5.—The divided top member constructed of D tubing, also showing the petrol and auxiliary lubricating oil tanks.

of steel, and is machined inside and out until in no place is there much more than one-sixteenth of an inch of metal. A single ring at the top is employed, and it will be noticed that the gudgeon pin, which is fastened to one side of the piston only, is provided with right and left-hand oil grooves.

Chain drive is employed, and for this purpose a ball-bearing countershaft is mounted upon the rear stays, and a chain from a pinion on the engine-shaft transmits the power to the counter-shaft, which in turn transmits the motion to the rear wheel. The counter-shaft is furnished with slip washers, which absorb a certain amount of the "kick" of the engine at low speeds, and so relieve the chain of a good deal of strain. These washers are adjustable to any extent.

The above description by no means exhausts the interesting features of the machine, but for the present space forbids a longer article. No doubt the machine will be subjected to slight modification, and as it will probably become a popular type, we may have an opportunity of dealing with it further in the near future.

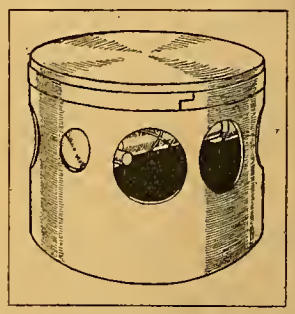

Fig. 6.—The T.T. Humber has a steel piston machined from a solid bar of metal.

BRADFORD M.C.C. OPEN HILL-CLIMB.

THE next important event in the North is the open hill-climbing competition promoted by the Bradford M.C.C., to be held on Saturday, the 25th inst., at Cockshoot Lane, Skipton, commencing at 2 p.m.

Eight classes have been included on the programme as follows:

Class 1.—For lightweight machines, not to exceed 120 lbs. in weight.

Class 2.—For single-cylinder motor cycles, not exceeding 517 c.c.

Class 3.—For machines with multi-cylinders, not exceeding 750 c.c.

Class 4.—Variable gear class for single-cylinders, not exceeding 517 c.c.

Class 5.—Variable gear class for multi-cylinders, not exceeding 750 c.c. In classes 4 and 5, competitors to start from a standing start on lowest gear, with the rider well seated in the saddle. To bring road wheels to rest anywhere between two indicated points fifteen yards apart, and restart as before. No assistance allowed.

The above classes are for standard pattern machines.

Class 6.—For single-cylinder racing machines, not exceeding 500 c.c.

Class 7.—For twin-cylinder racing machines, not exceeding 670 c.c.

Class 8.—Open to any motor bicycle, weight of machine unlimited, capacity of engine not to exceed 1,000 c.c.

Every machine must be fitted with an efficient silencer. The weight of every rider must not be below the minimum of 154 lbs. A competitor weighing more than the minimum fixed may not strip his machine in standard classes to compensate for the difference.

Stripped machines will be allowed in the racing classes.

The Awards.—A handsome trophy, generously presented by Mr. Eric S. Myers, and taking the form of a silver cup, to be won and held for twelve months by the rider making the fastest ascent of the day. A special gold medal to the value of two guineas to be presented along with the trophy. Should any one competitor win the trophy three times in succession the same shall become his private property.

Gold medals awarded to each class winner; silver and bronze medals will be awarded to second and third in any class having not less than ten entries.

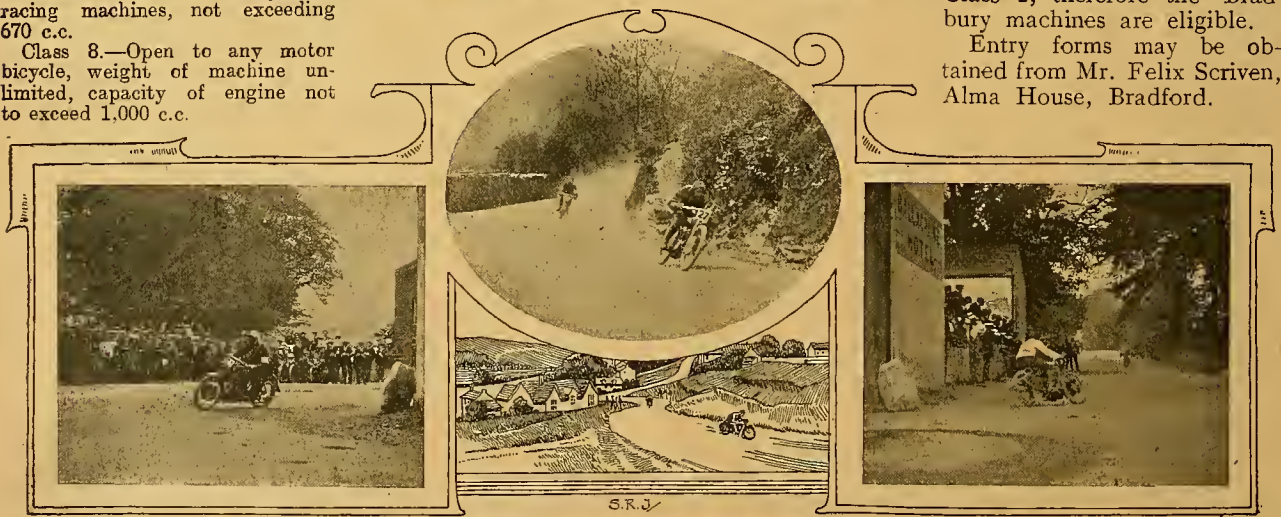
It is hoped to announce further special prizes at a later date.

Every machine entered in Classes 1, 2, 3, 4, and 5 must be in full touring trim, fitted with horn, toolbag, tools, efficient metal mudguards and silencer, and be absolutely standard in every respect. Tourist Trophy models must enter the racing classes. A committee of scrutineers will inspect and classify the machines before the commencement of the event.

It will be observed that single-cylinder machines up to 517 c.c. will be admitted in Class 2, therefore the Bradbury machines are eligible.

Entry forms may be obtained from Mr. Felix Scriven, Alma House, Bradford.

INTERNATIONAL TOURIST TROPHY RACE.



N. F. Holder (5 h.p. Blumfield) rounding the corner at Ballacraine.

J. R. Alexander (5 h.p. Indian) and H. Lister Cooper (3½ h.p. Triumph) at speed in Glen Helen.

HERTS COUNTY A.C. SELECTION TRIALS.

An eliminating competition and selection of teams for the M.C.C. Team Trials and the A.C.U. Inter-club Championship Trials was successfully run off on Saturday last over a course from the Red Lion, St. Albans, to Daventry *viâ* Dunstable and Weedon, and returning by the same route to the Bull at Redbourne. The distance is approximately 100 miles, and five hours were allowed. The starters were: E. A. Colliver (3½ h.p. Triumph), A. H. Colliver (3½ h.p. Triumph), P. H. Batchelor (3½ h.p. Triumph), Mrs. C. C. Cooke (3½ h.p. Triumph), C. C. Cooke (3½ h.p. Triumph), R. G. Goslett (3½ h.p. P. and M.), F. Mussell (3½ h.p. Rex), V. Wilberforce (5 h.p. Indian), E. Bennett (2½ h.p. Grandex-J.A.P.), Capt. M. Seymour (3½ h.p. Triumph), J. S. Seyfried (6 h.p. N.S.U.), G. S. Carter (3 h.p. Triumph), C. M. Down (5 h.p. Indian), and E. C. Jarvis (3½ h.p. Triumph). Each competitor was supplied with a printed card on which he had to enter any stops and particulars of same. E. A. Colliver was early in trouble, as he punctured immediately after starting. After repairing he continued, but finished inside schedule time at Redbourne. His brother, A. H. Colliver, had the bad luck to run over a dog, and later had to straighten his lamp clip. Batchelor made a non-stop, but was inside schedule. Goslett had carburetter troubles all the way, and finished outside time. Bennett was outside time at Daventry. Seyfried retired early with tyre troubles. G. S. Carter was unfortunate, as his front wheel bearing came adrift; he was unable to replace it and consequently retired. Mrs. C. C. Cooke, Hon. Secretary C. C. Cooke, F. Mussell, Wilberforce, Seymour, Down, and Jarvis made non-stops.

Herts County A.C. (motor cycle section) eliminating competition and selection of teams for the M.C.C. team competition and A.C.U. inter-club trials. Scenes at the starting point, the Red Lion, St. Alban's.

Entries for Next Saturday's Open Hill Climb.

List of entries for the Herts County A.C. (Motor Cycle Section) open hill-climb, to be run off at Aston Hill, Tring, Saturday, June 11th:

CLASS A.—For lightweights up to 130 lbs.

- H. D. Teage (2½ Hobart)
- L. M. Redding (2¾ Douglas)
- J. V. Robinson (2¾ Douglas)
- A. A. Chase (2 Chase)
- C. Patteson (2¾ Moto-Rêve)
- E. Clark (2¾ Douglas)
- J. Holroyd (1½ Motosacoche)
- A. A. Chase (2¾ Chase)
- E. Bennett (2½ Grandex)
- W. H. Islip (2¼ Royal Enfield)
- H. Greaves (2¼ Royal Enfield)
- F. E. Williams (1¼ Moto-Velo)

CLASS B.—Standard touring models up to 499 c.c.

- E. A. Burney (3½ de Haviland)
- P. Brewster (3½ Norton)
- R. Maxwell (3½ Triumph)
- E. A. Colliver (3½ Triumph)
- C. C. Cooke (3½ Triumph)
- B. Yates (3½ Humber)
- W. Keep (Midget Bicar)
- A. A. Chase (3½ Centaur)
- W. Cooper (3½ Brough)
- C. Cross (3½ L.M.C.)
- F. W. Applebee (3½ Centaur)

CLASS C.—For T.T. models up to 499 c.c.

- F. W. Barnes (3½ Zenith)
- P. Brewster (3½ Norton)
- H. Bevir (3½ L.M.C.)
- R. T. Wood (3½ Triumph)
- J. F. Crundall (3½ Humber)
- O. C. Godfrey (3½ Rex)
- C. C. Cooke (3½ Triumph)
- W. A. Jacobs (3½ Rex)
- A. R. Abbootl (3½ Rex)
- A. A. Chase (3½ Centaur)
- R. M. Brice (3½ Brown)
- E. Gwynne (3½ T.T. Triumph)
- A. Lister Cooper (3½ T.T. Triumph)
- W. G. McMinnies (3½ h.p. T.T. Triumph)
- Capt. Sir R. K. Arbuthnot, R.N. (3½ h.p. Triumph)
- C. A. Williams (3½ h.p. T.T. Triumph)

CLASS D.—Standard touring models up to 670 c.c.

- C. M. Down (5 Indian)
- C. E. Bennett (5 Indian)
- L. C. Munro (3½ N.S.U.)
- A. V. Deacock (3 Wanderer)
- M. Geiger (5 V.S.)
- D. R. Clarke (5 Indian)
- G. Lee Evans (5 Indian)
- W. O. Bentley (5 Indian)
- F. A. Hardy (5 V.S.)
- W. H. Bashall (5 Bat)
- J. T. Bashall (5 Bat)
- J. Thompson (5 Indian)
- J. Seyfried (6 N.S.U.)

CLASS E.—T.T. models up to 670 c.c

- C. E. Bennett (5 Indian)
- L. C. Munro (3½ N.S.U.)
- M. Geiger (5 V.S.)
- F. A. Applebee (4 Rex)
- D. R. Clarke (5 Indian)
- G. Lee Evans (5 Indian)
- W. O. Bentley (5 Indian)
- J. P. le Grand (5 Rex)
- F. C. Clement (5 Rex)
- W. H. Bashall (5 Bat)
- J. T. Bashall (5 Bat)
- J. Thomson (5 Indian)
- F. G. Baxenden (3½ N.S.U.)
- S. C. Perryman (5 Blumfield)

CLASS F.—For variable gears.

- F. W. Barnes (3½ Zenith Gradua)
- R. G. Goslett (3½ P. and M.)
- T. H. Tessier (5 Bat)
- F. Palmer (3½ P. and M.)
- F. J. Peard (3½ Scott)
- M. Geiger (7 V.S.)
- W. Keep (Midget Bicar)
- H. Karslake (4 Dreadnought)
- F. A. Hardy (5 V.S.)
- B. Marians (3½ P. and M.)
- B. Marians (2½ P. and M.)
- V. Underhill (3½ L.M.C.)
- W. G. Ayling (3½ Midget Bicar)
- J. Seyfried (6 N.S.U.)

CLASS G.—For any machine, fastest time to win.

- F. W. Barnes (3½ Zenith Gradua)
- A. Mackenzie Cott (3-10 King-J.A.P.)
- P. Brewster (3½ Norton)
- C. E. Bennett (5 Indian)
- W. Cooper (3½ Bradbury)
- W. A. Jacobs (3½ Rex)
- C. C. Cooke (3½ Triumph)
- D. R. Clarke (5 Indian)
- M. Geiger (5 V.S.)
- W. H. Bashall (7-8 Bat)
- G. Lee Evans (5 Indian)
- C. K. Wigram (6 Bat)
- E. D. Dickson (5 Indian)
- F. J. Peard (3½ Scott)
- W. O. Bentley (5 Indian)
- J. P. le Grand (5 Rex)
- W. H. Bashall (5 Bat)
- J. T. Bashall (5 Bat)
- C. M. Down (5 Indian)
- C. Perrens (7 Indian)
- F. White (4½ Rex)
- E. Gwynne (7 Indian)
- H. Lister Cooper (3½ T.T. Triumph)
- J. Thompson (5 Indian)
- R. M. Brice (3½ Brown)
- F. G. Baxenden (3½ N.S.U.)
- J. Seyfried (6 N.S.U.)
- F. P. Dickson (Zenith Gradua)

This climb should be worth going many miles to see, and Class G should produce a battle royal between Mackenzie Cott, E. Gwynne, and W. H. Bashall. Start at 3 p.m.

Police Traps.

We have received information that a police trap is working on the Ridgeway at Enfield, between Earlsdom and Spring Court. The trap is usually worked on Sundays in both directions.

There is a police trap at Lee Green on Lee Road in the direction of Eltham from Mottingham Lane to the bottom of Eltham Hill. The trap works both ways Saturdays and Sundays.

Comment Needless.

A comment in *The Bicycling World* of America, in the issue preceding the T.T. Race, reads rather funnily at this stage. It is as follows: "In fear of the further success of the American machine, which has made them sit up and take so much notice, it is understood that several of the British manufacturers have discarded belts and adapted their machines to chain transmission for the occasion." The paragraph reminds us very much of the adage, "Don't count your chickens before they are hatched." It may be added that the first eight machines to finish were belt driven.

C.T.C. Defends a Motor Cyclist.

The C.T.C. has been successful in getting a case dismissed against one of its motor cyclist members. The member in question was riding his motor cycle along Corporation Street, Manchester, at the rate of about five miles an hour, when a constable on point duty suddenly shot out his hand. The motor cyclist pulled up in five or six yards, and, the road being absolutely clear, the rider enquired with surprise why he had been stopped. He was informed that he would be summoned for riding in such a manner as to endanger life and limb! Several witnesses offered to give evidence in favour of the motor cyclist, and the C.T.C. took up the case, with the result that the constable's evidence entirely broke down, and the summons was dismissed.

SPECIAL FEATURES

A WEEK IN THE ISLE OF MAN (Illustrated).
THE FUTURE OF THE T.T. RACE.
A NEW AUTOMATIC CARBURETTER.
THE M.C.C. GYMKHANA AT BROOKLANDS.

M.C.C. Team Trial.

The next important event in the motor cycle world is the Motor Cycling Club's inter-club team trial for *The Motor Cycle* 50 guinea challenge trophy and M.C.C. medals. On the next page will be found a list of teams entered to date.

Police Tactics in Cheshire.

Cheshire is a county to be avoided by motorists. Returning from the Isle of Man, a party of motor cyclists were timed and numbers taken at different points. The officer informed the riders that should they be found to have exceeded the legal limit on comparing times the same evening, a summons would follow. Seeing that the roads were practically deserted, and it was raining at the time, such un-English methods will receive the strong disapproval of all sections of the motoring community.

Hundred Miles Road Race.

The annual road race of the Victorian M.C.C. was decided on April 24th, on the Sydney Road. The winner proved to be L. Benn, the scratch man, riding a 3½ h.p. Triumph, whose time for the first round (50 miles) was 1h. 8m. 50s. At the turn he was delayed ten minutes making some necessary adjustment, afterwards continuing and completing the course in 2h. 25m. 45s. Notwithstanding a strong wind that was blowing, Benn beat the previous record of a 2h. 26m. accomplished in the same event in 1907 by H. F. Hall on a 5 h.p. twin Peugeot.

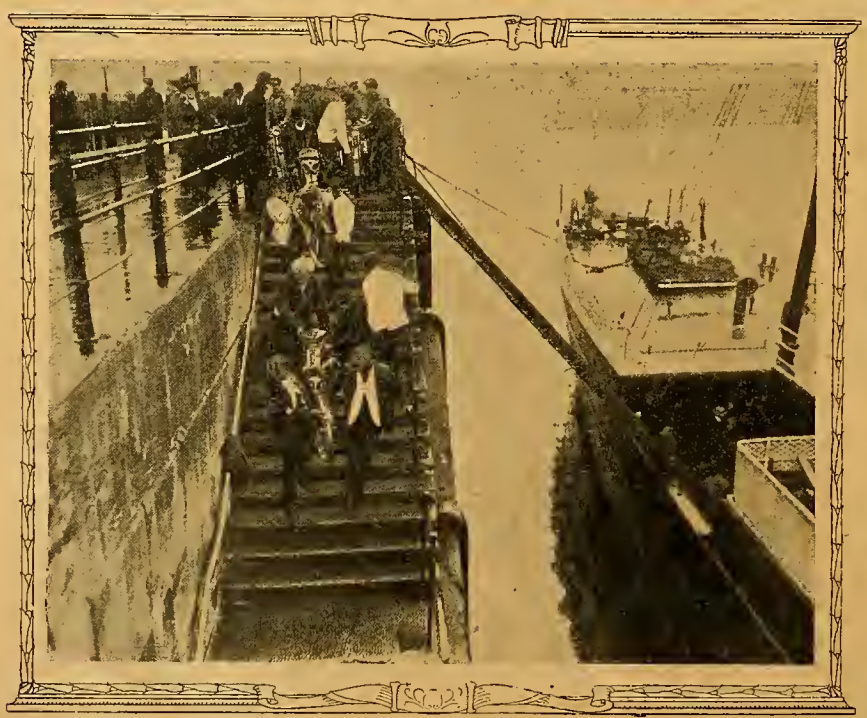
Dangers of Cattle on the Road at Night.

The question of drovers of cattle and sheep along the high roads carrying lights at night was discussed by the Canterbury Farmers' Club recently, a member considering the idea grandmotherly. He humorously suggested that bullocks might be fitted with dynamos to produce lights between their horns and on their tails! The club decided that in their opinion there was no ground of complaint.

A Disinterested View of the Situation.

A local paper's comment on the above decision is worthy of repetition:

"But it is not the motorist alone that finds the practice of driving herds at night dangerous. During the recent discussion on the question at the County Council meeting, Mr. W. F. Winch, himself not a motorist, described how he had just narrowly escaped a serious accident through driving a dog-cart into a flock of sheep on a dark night. It would be no great hardship to compel drovers to carry a lantern, and the light would prove useful to them in keeping an eye on their stock."



Carrying motor cycles down the Douglas quay steps on to the boat. This antiquated method of shipping machines at Liverpool and Douglas was the cause of much grumbling. Three and sometimes four labourers had to be chartered. We suggest that the Isle of Man Steam Packet Co. or the dockyard authorities adopt proper slings at an early date. A tarpaulin covering on deck would also be appreciated in case of wet.

G. W. Baker (3½ h.p. 1910 L.M.C.), who reduced H. A. Collier's Aston Track Record of 6 min. 51 secs. for five miles to 6 min. 40 secs.

The T.T. Race on the Bioscope.

The Tourist Trophy Race and the last race meeting at Brooklands are being shown on the bioscope this week at the Alhambra.

Midland Aviation Meeting.

Motor cycle clubs in the surrounding district of Wolverhampton are arranging a run to the Midland Aviation Meeting at Dunstall Park, Wolverhampton, from Monday, 27th inst., to Saturday, July 2nd.

Another Tourist Trophy for Twins.

We are happy to be able to announce that the Marquis de Mouzilly St. Mars is offering a second Tourist Trophy, similar to the magnificent statuette that he has already given, for the twin-cylinder machines in the next Tourist Trophy Race. Motor cyclists will welcome, we are sure, this sportsmanlike act with the heartiest approbation.

Unjust Prosecution of a Motor Cyclist.

The Motor Union has successfully defended a motor cyclist named Frank Bridgwater, who was summoned at Birmingham for driving a motor cycle to the danger of the public, and also for failing to stop his machine at the request of a police constable in uniform. The circumstances were of a curious nature, as on the day upon which the offences were alleged to have been committed at Birmingham the motor cyclist was away at Llandudno. The police were informed of this, but at first ridiculed the idea. Subsequently, however, they investigated the matter, but informed the Motor Union solicitor, Mr. M. Clive Blewitt, that no mistake had been made, and that they would proceed with the case. At the hearing of the summons, nine witnesses attended to prove that the defendant was not in Birmingham on the day in question. The magistrates held that the defence had clearly established that a mistake had been made, and in dismissing the summons allowed, on the application of the solicitor, £3 3s. costs against the police. The magistrates expressed their regret that the defendant should have been brought to the court on such charges. The pity is that the police cannot be made to pay the costs personally.

A Novel Engine.

We had the pleasure of riding a machine fitted with a new two-stroke engine one day last week. The design of the engine is simplicity itself, yet full of novelty. Further details will be forthcoming later. For the present we can only say that the engine is being tested by a large firm of manufacturers with a view to its adoption.

A T.T. Race at Brooklands.

On Wednesday, the 22nd inst., an important event is down for decision at the fourth monthly meeting of the B.M.C.R.C. A long distance race, amounting to 163 miles 103 yards, will be run under identical conditions with those governing the recent T.T. Race, and advantage will be taken of the opportunity to time riders at fifty miles, one hour, 100 miles, two hours, 150 miles, and three hours. Those T.T. competitors who experienced bad luck in the Isle of Man will now be able to show their paces on a flat track.

FUTURE EVENTS.

June 6-11—Scottish Six Days' Open Reliability Trial, organised by Edinburgh M.C.C.
" 18—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CHALLENGE CUP. Competing Teams: Motor Cycling Club (holders), Coventry and Warwickshire M.C., Bristol B. and M.C., Streatham and District M.C., Sutton Coldfield A.C., Edinburgh M.C.C., Southern M.C., Harrogate and District M.C.C., Great Yarmouth and District M.C.C., Herts. County A.C., Essex M.C., N.W. London M.C.C., Oxford M.C.C., Nottingham and District M.C.C., and Sheffield and Hallamshire M.C.
" 18—Brooklands A.R.C. Meeting, 2 p.m.
" 25—Bradford M.C.C. Open Hill-climb at Cockshoot Lane, Skipton, 2 p.m.
July 4-9—A.C.U. End-to-end Reliability Trial.
" 13—Open Irish End-to-end Reliability Trial, promoted by the Ulster Centre.
" 13 (Wed.) and 14 (Thurs.)—Brooklands A.R.C. Meeting, 2 p.m.
" 23—A.C.U. Quarterly Trial, Uxbridge to Banbury and Back.

End-to-end Lightweight Record.

A Birmingham motor cyclist, Harold J. Cox, has entered his 1¼ h.p. Singer Moto-Velo for the End-to-end six days trials, and after arriving at John-o'-Groat's he proposes to turn round and make an attempt to set up a lightweight record. From recent personal experience with the Singer Moto-Velo we have little doubt that Mr. Cox will be successful in his ambition, despite the severity of the course.

The Heavy Brigade.

The accompanying illustration shows yet another of the heavy brigade, Mr. Harry Warden, an old Birmingham racing cyclist, who has ridden everything in the bicycle line from an ancient velocipede to a modern motor cycle. He weighs 19 st. 3 lbs., and stands 6ft. 1½in. His mount is an L.M.C., on which he is able to climb all local hills and keep a little reserve power. It is some time since we published a photograph of a heavyweight motor cyclist, and although Mr. Warden does not hold the record he is very near it.

Motor Cycling in Russia.

Motor cyclists of St. Petersburg have banded together, the name of the club being the French Motor Cycle Club. On the 29th ult. the opening run took place to Tzarskoi-Selo. Machines ridden by the members were four Wanderers, two F.N.'s, one each Adler, Motosacoche, Peugeot, Triumph, Allright, and Mars. To-day (Thursday) a road race has been arranged, the result of which will be announced in due course.

Unauthorised Speed Limit Signs.

Among the reports presented on Thursday last to the R.A.C. General Committee by the Associated Clubs was one from the Manchester A.C., which contained a reference to the existence of unauthorised reduced-speed-limit signs at Ashton-under-Lyne, on which the club had had correspondence with the local authorities, but unfortunately without result. The General Committee agreed to ask the Legal Committee to consider what action could be taken with the view of securing the removal of these and other similar unauthorised signs.

The M.C.C. Team Trial.

Club secretaries should note that entries for the team trial at Daventry on the 18th inst. close first post on Saturday next to Mr. J. Van Hooydonk, the trials hon. sec., Spring Villa, High Road, Finchley, N. In addition to the clubs stated in our "Future Events" column, the Derby and Leicester clubs are probable starters.

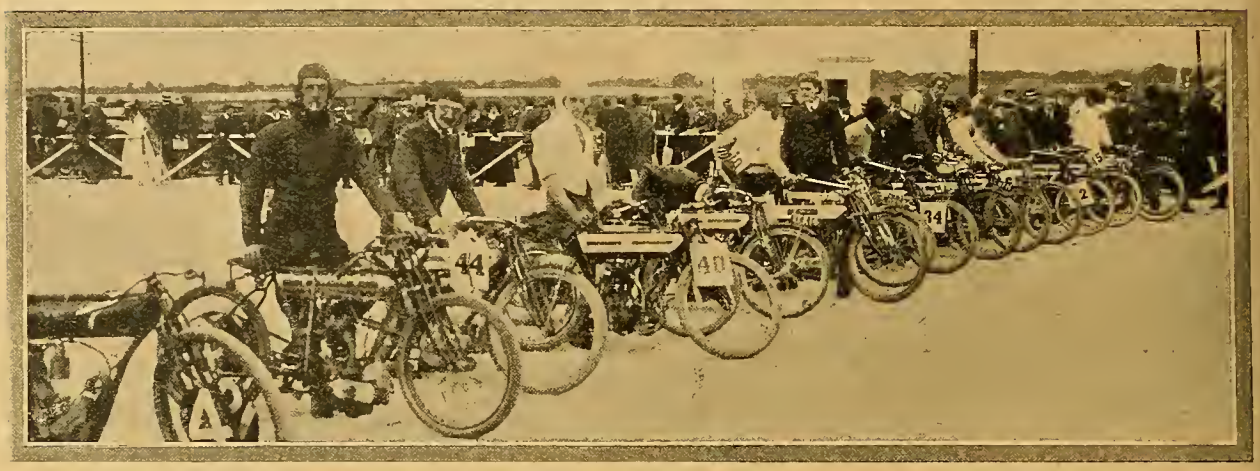
Non-stops Claimed in the T.T. Race.

It has been said that H. A. and C. R. Collier suffered trivial stops in the T.T. Race, and we ourselves distinctly remember the stand of C. R. Collier's machine trailing near the Devil's Elbow. Be that as it may, we have the assurance of the elder brother that neither of them "had any stoppages whatever except for filling up with petrol."

The actual winning Matchless is on view at the showrooms of Maude's Motor Mart, 136, Great Portland Street, W. The machine ridden by H. A. Collier may be inspected at the Service Co.'s premises, 292-3, High Holborn, W.C.

A Birmingham motor cyclist weighing 19st. 3lbs. (See paragraph on this page.)

The M.C.C. Race Meeting and Gymkhana.



Members of the M.C.C. ready to start in the handicap race for touring mounts with single-cylinder engines.

THE above event, which was held on Brooklands track last Saturday afternoon, was well attended. The weather was dull, but fortunately there was only one shower of rain. No less than eight motor cycle events figured in the programme. The first event, which took place shortly after 2 p.m., was a motor cycle race for ordinary single-cylinder touring mounts with engines not exceeding 550 c.c., for novices only; distance three laps. The following competitors started: W. Cooper (3½ h.p. Bradbury), scr.; H. L. Cooper (3½ h.p. Triumph), scr.; F. H. Mullett (3½ h.p. Triumph), 15s.; S. Webb (3½ h.p. Triumph), 15s.; C. B. Moss Blundell (3½ h.p. Triumph), 45s.; W. Price (3½ h.p. Rex), 1m.; H. E. Davison (3½ h.p. Rex), 1m.; A. V. Deacock (2½ h.p. Wanderer); A. T. Stanton (3½ h.p. Bradbury), 15s.; P. Janson (3½ h.p. Bat), 45s.; R. T. Wood (3½ h.p. Triumph), 25s.; A. L. Colyer (3½ h.p. Humber), 1m. 10s.; and L. A. Baddeley (3½ h.p. Brown), 25s.

First lap. Davison led the field, followed by Dr. Moss Blundell, Colyer, Price, and Lister Cooper.

Second lap. Moss Blundell took first place, followed by Lister Cooper, Mullett, Price, and Colyer. Wood retired with a broken belt.

Third lap. Dr. Moss Blundell (3½ h.p. Triumph) romped in an easy winner, H. Lister Cooper (3½ h.p. Triumph) second, and H. E. Davison (3½ h.p. Rex) third. Just before reaching the finishing line Price's machine struck a bump and wobbled violently: the rider could not recover, and fell heavily in full view of the spectators, fortunately without seriously damaging either himself or his machine. Winner's time, 9m. 17⅕s. Speed about 53.41 m.p.h.

Event 2.

Motor cycle race for ordinary touring mounts with multi-cylinder engines of a cubic capacity between 400 and 1,000 c.c., for novices only; distance three laps.

Starters: E. B. Dickson (5 h.p. Indian), 10s.; A. V. Deacock (2½ h.p. Wanderer), 30s.; C. M. Simpson (7 h.p. V.S.), scr.; C. Gibbons (5 h.p. Indian), 50s.; and W. A. Sale (5 h.p. Rex), 10s.

All got away in good style, but Gibbons's clutch was slipping badly at the start; it gripped, however, a moment later, and he set off at a smart pace.

First lap. Gibbons well to the front, followed by Dickson, Sale, Deacock, and Simpson.

Second lap. Gibbons still leading, but Dickson rapidly gaining ground, followed by Sale, Simpson, and Deacock trailing his stand on the track.

Third lap. E. B. Dickson (5 h.p. Indian) an easy winner; C. Gibbons (5 h.p. Indian), second; and W. A. Sale (5 h.p. Rex), third. Time, 9m. 19⅗s. Winner's speed about 53.39 m.p.h.

Event 4.

Motor cycle race for any type of motor bicycle with single-cylinder engine not exceeding 550 c.c., open to any member of the club; distance three laps.

Starters: E. Gwynne (3½ h.p. Triumph), 45s.; G. Lee Evans (4 h.p. Indian), scr.; Sir R. K. Arbuthnot, Bart. (3½ h.p. Triumph), 35s.; J. F. Crundall (3½ h.p. Humber), scr.; J. Cox (3½ h.p. McNab), 10s.; H. L. Cooper (3½ h.p. Triumph), 10s.; F. H. Mullett (3½ h.p. Triumph), 25s.; C. B. Moss Blundell (3½ h.p. Triumph), 55s.; A. T. Stanton (3½ h.p. Bradbury), 25s.; E. D. Colrick-Herne (3½ h.p. Triumph), scr.; W. A. Jacobs (3½ h.p. Rex), scr.; R. T. Wood (3½ h.p. Triumph), 35s.; L. A. Baddeley (3½ h.p. Brown), 35s.; F. W. Barnes (3½ h.p. Zenith), scr.; S. Grey (3½ h.p. Rex), 35s.; and S. May (3½ h.p. Triumph), 35s.

All got away well at the start, but Barnes's splendid acceleration, due to his Gradua gear, evoked much enthusiasm.

First lap. Captain Sir Robert Arbuthnot led the field, followed by Mullett and Grey (whose machine was missing fire at the time).

Second lap. Mullett assumed the lead, while Sir Robert Arbuthnot took second place and Barnes third.

Third lap. F. H. Mullett (3½ h.p. Triumph) romped in a winner, E. D. Colrick-Herne (3½ h.p. Triumph) was second, and G. Lee-Evans (4 h.p. Indian) third. Time, 8m. 59⅕s., winner's speed about 55.40 m.p.h. Some difficulty was experienced in this and other races in distinguishing the competitors' numbers, some curled up, others were placed in illegible positions, and others fell off.

Event 6.

Motor cycle race for any type of motor bicycle with multi-cylinder engine of a cubic capacity between 400 and 1,000 c.c., open to any member of the club; distance four laps. Starters: W. H. Wells (5 h.p. Indian), 20s.; G. Lee-Evans (7 h.p. Indian), scr.; E. B. Dickson (5 h.p. Indian), 1m. 5s.; V. Olsson (7-9 h.p. Oxted-J.A.P.), 1m. 5s.; E. Pond (4½ h.p. Premier), 1m. 40s.; C. M. Simpson (7 h.p. V.S.), 55s.; C. Gibbons (5 h.p. Indian), 1m. 45s.; J. [illegible] le Grand (5 h.p. Rex), 40s.; E. C. W. Fitzherbert (5-6 h.p. F.N.), 1m. 25s.; and W. A. Sale (5 h.p. Rex), 1m. 5s.

First lap. Gibbons led, followed by Olsson, Wells, Fitzherbert, Dickson, Pond, Le Grand, Evans, and Simpson. Evans was travelling at a great pace.

Second lap. Olsson assumed the lead, while Wells and Evans followed.

Third lap. Olsson maintained his place, while Evans ran second and Wells third.

Fourth lap. G. Lee-Evans (7 h.p. Indian), 1st; V. Olsson (7-9 h.p. Oxted-J.A.P.), 2nd; and W. H. Wells (5 h.p. Indian), 3rd. Time, 10m. 40s. Winner's speed, 62.22 m.p.h.

The M.C.C. Race Meeting and Gymkhana.—

Event 7.

Invitation scratch race for silver cup. Open to riders of standard machines "as issued to the public," fulfilling the requirements of a touring motor bicycle, in the opinion of the judges. Distance, five laps. Starters: A. T. Stanton (3½ h.p. Bradbury), L. A. Baddeley (3½ h.p. Brown), E. Gwynne (3½ h.p. Triumph), J. F. Crundall (3½ h.p. Humber), J. Cox (3½ h.p. McNab), W. Cooper (3½ h.p. Bradbury), C. B. Moss Blundell (3½ h.p. Triumph), F. H. Mullett (3½ h.p. Triumph), Capt. Sir R. K. Arbuthnot, Bart., R.N. (3½ h.p. Triumph), and H. L. Cooper (3½ h.p. Triumph).

All made an excellent start, though Stanton was a trifle behind the others.

First lap. Lister Cooper led the throng, followed by Mullett, Moss Blundell, Cox, W. Coooper, Crundall, Arbuthnot, Stanton, Baddeley, and Gwynne.

Second lap. Lister Cooper still held first place and Mullett the second, both well ahead of the third man, Moss Blundell.

Third lap. Mullett had now taken first place, and was well ahead of the second man, Lister Cooper, and Moss Blundell was still third.

Fourth lap. Mullett had increased his lead, while the first and second remained as before. Lister Cooper momentarily slowed at the fork.

Fifth lap. F. H. Mullett (3½ h.p. Triumph) first, H. Lister Cooper (3½ h.p. Triumph) second, and Moss Blundell (3½ h.p. Triumph) third. Time 14m. 39s. Winner's speed about 56.63 m.p.h.

As all the above races took place at the fork, the spectators were able to watch the progress of every lap with unfailing interest.

Event 9, the Hill Climb.

After tea the next motor cycle event (No. 9) was a hill-climb up the test hill, with its three gradients (1 in 8, 1 in 5, and 1 in 4). Award: Special prize given by Mr. E. B. Dickson, M.C.C. captain. The start was made just behind the timekeeper's box. Two runs were made up the hill, the first to decide the handicap. During the first attempt F. W. Barnes made the star performance, accomplishing the climb in 9s. Nearly everyone got up satisfactorily, but Gibbons opened his throttle too suddenly and failed quite low down. Simpson, Davison, Sale, and Pond also did not get up. Fletcher pedalled, and so did De Lissa, but his little Motosacoche really pulled splendidly.

In the hill-climb trial Dr. Moss Blundell (3½ h.p. Triumph), 4s. start, was first, 6⅗s.; A. T. Stanton (3½ h.p. Bradbury), 2⅗s. start, was second, 8⅕s.; L. A. Baddeley, ⅗s. start, 8⅘s., third. Barnes and Baddeley tied in making fastest time, actual time 9⅕s., ⅕s. slower than Barnes's fastest time in the preliminary ascent. After leaving the cement surface on the top of the hill the riders landed into soft loose gravel. Lister Cooper and Mullett fell through dry skidding in this the moment they applied their brakes. Both fell heavily, but, fortunately, without suffering much damage.

Details of the Hill-climbing Competition.

		H'cap time. secs.	Start. Secs.	Actual time. Secs.
1.	C. B. Moss Blundell (3½ Triumph)	6⅗	4	10⅗
2.	A. T. Stanton (3½ Bradbury) ...	8⅕	2⅖	11
3.	L. A. Baddeley (3½ Brown) ...	8⅘	⅗	9⅕
4.	H. Lister Cooper (3½ Triumph) ...	9	⅖	9⅖
	E. B. Dickson (5 Indian)	9	⅗	9⅗
	F. A. Hardy (5 V.S.)	9	4⅖	13⅖
	W. Cooper (3½ Bradbury)	9	2	11
8.	F. H. Mullett (3½ Triumph) ...	9⅕	1⅘	11
	F. W. Barnes (3½ Zenith)	9⅕	scr.	9⅕
	R. T. Wood (3½ Trinmph)	9⅕	⅘	10
	H. Bevir (3½ L.M.C.)	9⅕	5⅕	14⅖
12.	E. D. Colrick-Herne (3½ Triumph)	9⅖	1	10⅖

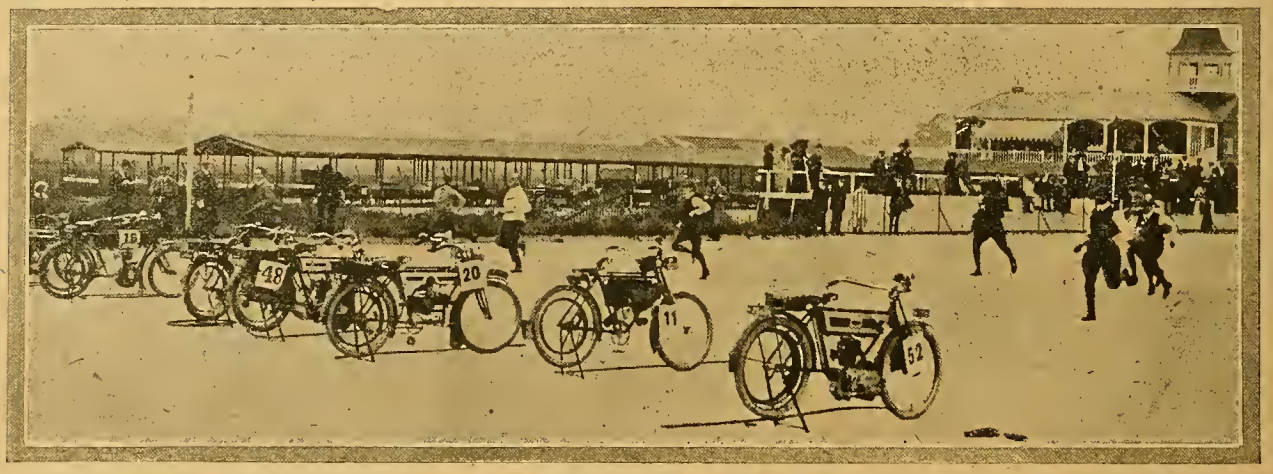
14.	S. Webb (3½ Triumph)	10	3	13
15.	Spenser Grey (3½ Rex)	10⅖	3⅕	13⅗
	W. A. Jacobs (3½ Rex)	10⅖	⅖	10⅘
17.	O. L. de Lissa (1½ Motosacoche) ...	10⅘	7	17⅘

Event 10.

was a most amusing affair—a life-belt race—probably so-called because the men had to remove their belt fasteners by *undoing a screw*, lay their belts on the ground, and sprint for their lives for a hundred yards to their machines, put on their belts, and ride to the line from which they had started on foot. Baddeley, De Lissa, J. V. Robinson, Peppercorn, Pond, Fowke, Arbuthnot, and Fletcher were in for this competition. A wild rush ensued, in which Fletcher reached his machine first, Baddeley got his belt on first, but forgot to slip it through one stay of the carrier, Sir Robert Arbuthnot had trouble in fixing up his stand, and Fletcher, who was first away, could not raise his exhaust valve for some yards. Result: De Lissa first, Fletcher second, Sir R. K. Arbuthnot third.



Competitors sprinting towards their machines in the "Life Belt" Race. The camera has caught one or two riders in decidedly energetic attitudes.

Event 12.

Skilful driving competition for Mrs. Jarrott's prize. The competitors had first to ride on a narrow black line on the track and then thread their way over a complicated course with numerous terribly sharp bends round various posts and finish. A marshal stood at each post to direct the men which way to take the turn.

Robinson did not keep the line very well, but finished satisfactorily.

Barnes left the line almost altogether, but covered the tricky course most skilfully.

De Lissa deviated slightly from the line near the top, but otherwise executed a skilful performance.

Fletcher kept the line fairly well, and finished satisfactorily.

Fowke failed at turn near the top of the course.

Colyer did not keep the line very well, but managed the course satisfactorily, thanks to his low gear.

The M.C C. Race Meeting and Gymkhana.—

Karslake finished satisfactorily.

Stanton kept the line well, but went the wrong side of two posts.

Colrick-Herne's single-geared T.T. Triumph kept the line absolutely—a most skilful performance.

Marian's two-speed P. and M. kept the line well, but made rather wide sweeps at bends.

Wood failed at last post but one.

Baddeley managed satisfactorily; rode with compression tap half open.

Bell's new four-cylinder F.N. made an excellent performance.

Mullett failed at last post but two.

Winner, Colrick-Herne.

Event 13.

Tortoise race. Distance, about 100 yards, slowest to win. The men were handicapped according to their gears. Presuming it is more difficult to drive slowly with a high gear than with a low one, the highest geared machine had to cover the greatest distance. Starters: H. G. Bell (four-cylinder F.N.), gear 5¼ to 1, start 48 paces; A. T. Stanton (3½ h.p. Bradbury), 5 to 1, 52 paces; F. W. Barnes (3½ h.p. Zenith), 7 to 1, 30 paces; Colrick-Herne (3½ h.p. Triumph), 4¼ to 1, 32 paces; F. H. Mullett (3½ h.p. Triumph), 6½ to 1, 35 paces; O. de Lissa (1¼ h.p. Motosacoche), 6⅞ to 1, 30 paces; J. V. Robinson (2¾ h.p. Douglas), 5¾ to 1, 40 paces; G. L. Fletcher (2¾ h.p. Douglas), scratch.

Bell and Robinson were the first to stop their engines, Barnes alone crawling home a winner; De Lissa was second.

At the conclusion of the meeting, Mrs. R. H. Head distributed the prizes. The judges were Mr. Chas. Jarrott (president) and Mr. R. H. Head. The hard-working chief marshal was Mr. L. Vedy, and the starter Mr. V. Hart. The hon. sec. to the gymkhana committee was Mr. S. H. Fry.

Mrs. Charles Jarrott presented a prize for a skilful driving competition. O. L. de Lissa (1¼ h.p. Motosacoche) is seen competing for this prize.

ENTRIES FOR THE A.C.U. SIX DAYS' END-TO-END TRIALS.

The following are the entries for the Land's End to John-o'-Groat's trial, July 4th to 9th:

P. H. Allen (2⅜ Douglas)
Jack Haslam (2⅜ Douglas)
Philip Grout (2¾ Douglas)
C. Patteson (2¾ Moto-Rêve)
H. H. Bowen (6-7 Bat)
J. D. A. Munro (6-7 Bat)
J. R. Haswell (3½ Triumph)
G. H. Lake (3½ P. and M.)
W. W. Douglas (2¾ Douglas)
P. Phillips (2¾ Douglas)
E. Clark (2¾ Douglas)
F. Dover (3½ Triumph)
F. G. Boddington (4 J.A.P.)
H. J. Cox (1¼ Motosacoche)
J. A. Stacey (3½ Triumph)
W. H. Bashall (5 Bat)
J. T. Bashall (5 Bat)
W. H. Wells (two Indians)
W. O. Bentley (5 Indian)
E. Nelson (one ———)
Phelon and Moore (two P. and M.)
Bat Motor Mfg. Co. (one Bat)
G. Brough (one Brough)
J. Gibson (5 Indian)
S. A. M. Witham (6 Bat)

AVERAGE SPEEDS IN THE TOURIST TROPHY RACE.

Position	Rider and Machine.	No. of Cyls.	Total Net Time.	Miles per Hour.	
			h. m. s.		A.C.U. Awards.
1	C. R. Collier, 5 h.p. Matchless-J.A.P.	2	3 7 24	50.627	Winner of Trophy and £40.

BRITISH MOTOR CYCLE RACING CLUB.

OPEN RACE MEETING.

On Wednesday, the 22nd inst., the following event will be held at Brooklands open to members and non-members.

THE BROOKLANDS TOURIST RACE.—A long-distance motor cycle race at Brooklands, under identical conditions with those governing the T.T. Race. The distance to be covered will be fifty-nine laps, amounting to 163 miles 103 yards. The race will be for (1) single-cylinder motor cycles not exceeding 500 c.c., and multi-cylinder motor cycles not exceeding 670 c.c. The timing and awards will be kept quite separately for each class.

Awards.

First and second prizes for multi-cylinder machines, Brooklands Silver Cups, presented by Major Lindsay Lloyd.

Third prize, the B.M.C.R.C. gold medal.

First and second prizes for single-cylinder machines, Brooklands Silver Cups, presented by the B.M.C.R.C.

Third prize, the B.M.C.R.C. gold medal.

B.M.C.R.C. silver medals will be awarded to all other than the first three in each class completing the distance in less than three hours.

First private owner, multi-cylinder machines, Brooklands Silver Cup, presented by Mr. A. G. Reynolds.

First private owner, single-cylinder machines, Brooklands Silver Cup, presented by Mr. W. Pratt.

Entry fee, £1 1s.; reduced entry fee to members of the B.M.C.R.C., 10s. 6d. Entries close noon June 18th.

NORTHERN LEAGUE MEETING AT YORK.

Military Sunday at York, on the 5th inst., was this year a record. The number of motor cyclists in the historic city would number many hundreds. Over seventy attended the luncheon at the Royal Station Hotel, organised by the Northern League. This function proved a great success. Riders hailing from Selby, Hull, Leeds, Middlesbrough, Bishop Auckland, Harrogate, and Sheffield attended, and nearly all the Northern clubs were represented, Bishop Auckland and Scarborough having the largest attendance. Dr. W. H. Coates, of the Army Motor Reserve, presided, and afterwards the riders made for Garrowby Hill, Pocklington, where under the guidance of the Pocklington club, a survey was made of the hill, which is proposed as the venue of the first contest. A meeting of the council will be held on Saturday, June 18th.

Suggested design of badge for the Northern League of Motor Cyclists.

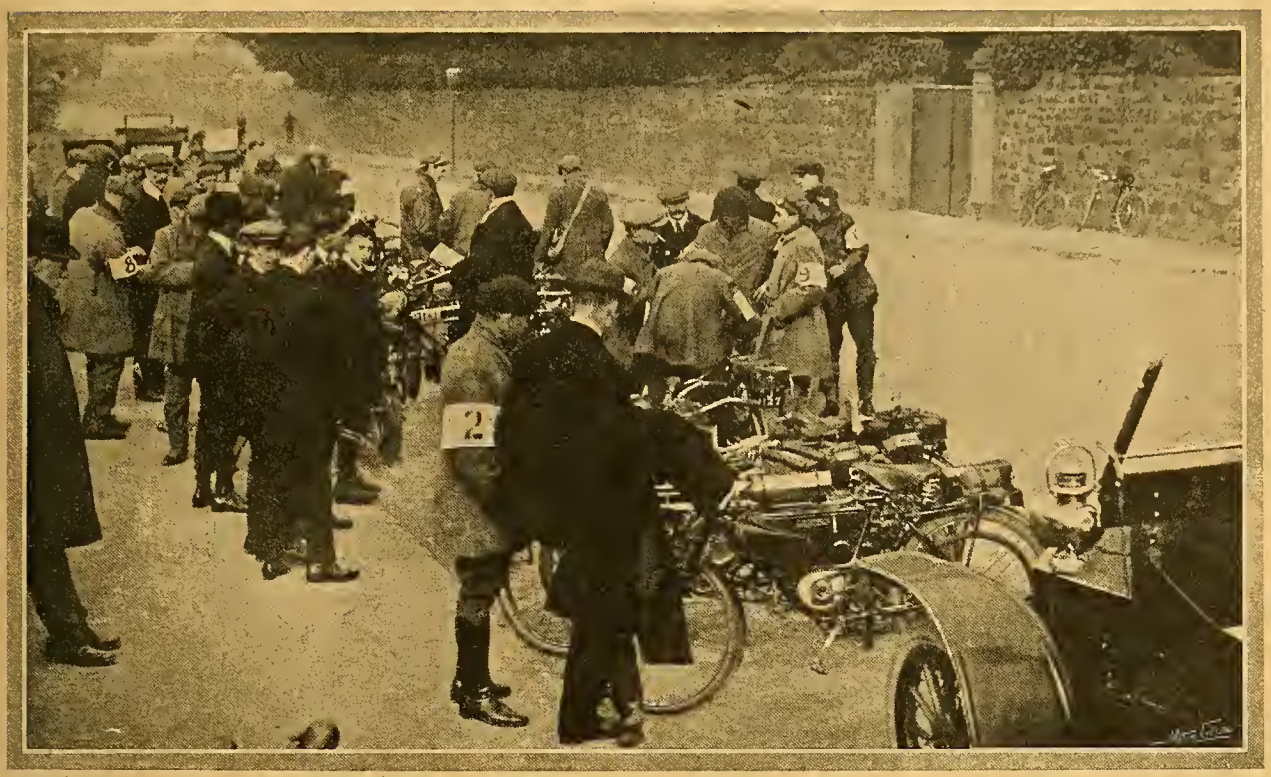
MOTOR CYCLE EVENTS
Baxter pluckily passes Grant in last lap, Grant in an endeavour to retain inside position almost brings a splendid race to a tragical conclusion.
H.A. Collier has the speed but is outridden by Alexander in a Sporting final
J.R. Alexander – 5 H.P. 'Indian'
Winner of Three Miles Handicap
F.A. Bennett 1910

NORWICH CHARITY SPORTS.

At the Norwich Sports on Saturday last two motor cycle scratch races were held of three and five miles. Also time trials for track record over the flying mile. Harry Martin, on a Martin-A.S.L., won both the three and five mile events, and made fastest time for the flying mile of 1m. 22s., beating Colver by $\frac{4}{5}$s. Martin also accomplished a remarkable flying mile of 73s. in the five miles race, said to be the fastest mile ever ridden on a three-lap dirt track in the U.K.

A group of members of the Northern League of Motor Cyclists assembled at York on Sunday last. The members had ridden from various parts of the North to witness the military parade.

The Scottish Six Days' Trials.



The Scottish Six Days' Reliability Trials promoted by the Edinburgh M.C.C. A general view of the start from Murray Field, Edinburgh.

Bright sun and a following wind favoured the competitors in the above trials when they started from Edinburgh on Monday morning last. The whole of the nineteen entries materialised, namely:

S. J. K. Thompson (7-8 Bat and sidecar)
W. W. Douglas, G. L. Fletcher, and P. Phillips (2¾ Douglas)
J. S. Holroyd (Motosacoche)
P. W. Bischoff (1909 Triumph)
W. Pattullo (1908 Triumph)
J. T. Wood (3½ Zenith-Gradua)
J. Donaldson (3½ Bat)
W. Pratt (3½ P. and M.)
H. S. Bilbe and B. Yates (3½ two-speed Humbers)
A. F., A. N. Downie, and J. Slaughter (3½ Ariels)
B. Macmillan (5 Bat)
A. H. Hay (3½ Matchless)
W. Houghton (3½ Bradbury)
G. A. Alexander (Bat)

Immediately after lunch at Arrochar a rough road commences the six miles ascent of Glencoe up to the ill-famed bend at "Rest and be Thankful." The riders' performances were frankly disappointing in spite of the strong wind blowing up the pass. Seven machines possessed variable gears, but with the exception of Bert Yates's 3½ h.p. Humber two-speed, which made a magnificent ascent, they all overheated. From below the summit of the single-geared machines, Bischoff and Pattulla (1909 and 1908 Triumphs respectively), went up excellently, as did Fletcher (2¾ h.p. Douglas). The Douglas machines have a dog clutch variable gear. Thompson provided the star turn of the day on his single-geared 8 h.p. Bat and sidecar, as after stopping lower down to adjust a slipping belt he roared up to the hairpin and skidded round with his passenger lying across the back of his mudguard. A tube of the sidecar afterwards collapsed from the strain, but it was temporarily repaired to enable it to proceed by lashing on a stake from the hedge. Holroyd's Motosacoche went up in two stages, and Donaldson (3½ h.p. Bat) unfortunately came a nasty cropper on the hairpin.

Later on the road degenerated into a mere moorland track with a very loose and stony surface and atrocious corners; there were also many short steep pitches. The riders have had a perfect glut of loch and mountain scenery, and all were quite enthusiastic about the route.

Aberfeldy was the destination, and thirteen competitors had come in up to the dinner hour—Bilbe, Houghton, Alexander, Thompson, Donaldson, and Hay being late.

Full marks were gained on Monday by Douglas, Phillips, Holroyd, Bischoff, Wood, Yates, F. Downie, and probably Pratt. Pattullo lost 5 marks, Macmillan 7, Fletcher 13, N. Downie and Slaughter 38 each, Bilbe, Alexander, and Donaldson 60 each. Houghton retired collided with a cart. Hay arrived at midnight.

The starters on Tuesday numbered eighteen, and it was raining hard.

END-TO-END SIDECAR RECORD BEATEN.

At 1.40 a.m. on Monday last, Hugh Gibson (driver) and G. Wray (passenger) left John-o'-Groat's on a 1910 standard single-geared 3½ h.p. Triumph and Mills-Fulford rigid sidecar on a plucky attempt to capture M. Geiger and W. Lamm's End-to-end record of 51 hrs. 45 mins., accomplished last October with a 7 h.p. two-speed V.S. Messages received by *The Motor Cycle* recording Gibson's progress are as under:

"Gibson and Wray arrived Beauly 7.25 a.m. and left at 7.45 a.m.—Morison."

"Arrived Perth 12.35, left 1.16."

"Arrived Lockerbie at 6.15 p.m., left at 6.37 p.m,"

Tuesday.

"Had wonderful run. Arrived Wigan 1 a.m., 4 hours ahead of schedule. Machine pulls marvellously. Two punctures, one valve and belt broken. Failed on Berriedale. Averaged twenty-five to Bridgnorth.—Hugh Gibson."

"Arrived Gloucester 7.17 a.m., left 7.52 a.m."

"Arrived Exeter 12.35 p.m., left 1.25 p.m."

The last wire received from Gibson on Tuesday evening announcing his success reads as follows:

"Arrived Land's End 6.27. Time, 40 hrs. 47 mins."

Further details of the ride will appear next week.

CLUB NEWS

Newport (Mon.) and District M.C.C.

To-day (Thursday), also on Saturday next, there is a run to the Wye Valley *via* Chepstow, leaving headquarters at three o'clock.

Leeds M.C.C.

The annual invitation run to London and back is to be held on the 18th and 19th June. Three members from all surrounding clubs are invited. This event promises to be a successful one, as already entries are flowing in. For particulars apply to Mr. F. O. Langton, hon. trials sec., The Calls, Leeds.

Aberdeen and District M.C.C.

The club held a hill-climb at Learney Hill, Torphins, on Saturday, 28th May. The principal prize, value £1 1s., presented by Mr. J. M. Henderson, was won by A. Stewart (6 h.p. J.A.P.), and the club prizes were won by: 1, G. Cumming (5 h.p. F.N.), .076; 2, G. F. Davie (5 h.p. Vindec), .057. The timekeepers were Messrs. Fred Turnbull and J. C. Ogilvie Will.

Bradford M.C.C.

The annual climb for the Dyson Shield was held last Saturday at Tong. There were twenty-two entries, which were run in pairs on handicap lines, starts being given in number of yards on a basis of weight and make of machine, etc. Some clever climbing was witnessed, H. Shaw (7 h.p. Indian) ascending the hill at sixty miles per hour, Jack Scriven (5 h.p. Speed King Rex), T. Hargreaves (5 h.p. T.T. Scott), and F. Phillip (5 h.p. T.T. Scott) being very little slower. Felix Scriven (3½ h.p. Rex) and A. Davey (2¾ Moto-Rêve) ran a very close heat, Davey, taking 200 yards start, being beaten by a few lengths. In the final heat, C. Bedford, the holder, having six stones advantage in rider's weight, conceded 270 yards to T. Bullus, the latter winning by 100 yards. Final:

T. Bullus (3½ h.p. Phelon-Moore), shield and gold medal.
C. Bedford (3½ h.p. T.T. Triumph), silver medal.
F. Pitney (3½ h.p. S.K. Rex), bronze medal.
The hill was 1,000 yards in length.

Surrey M.C.C.

The annual twelve hours' reliability competition was held on Wednesday, June 1st, from Guildford to Lyme Regis and back. The start was made at 6 a.m., and competitors were despatched at two minute intervals. There were control stations at Winchester and Dorchester, in addition to the two terminal controls on each journey, and a number of secret controls at which a margin of a few minutes was allowed. In spite of the trying nature of the course, two of the riders succeeded in completing the trial without losing any marks, consequently the first prize (a silver cup, presented by Mr. McNab) has not yet been definitely awarded. The second and third prizes were gold and silver medals respectively.

The weather for the first part of the trial was unfavourable, heavy rain being experienced until after the New Forest had been passed; afterwards better conditions prevailed, and the return was made in real June sunshine. The results were as follows:

		Marks.
1.	H. Mitchell (3½ h.p. Triumph) ...	500
	J. A. Manners-Smith (3½ Triumph) ...	500
3.	J. H. Sparks (3½ Triumph)	480
4.	C. J. Feeny (3½ Triumph)	430
5.	G. Pine (3½ Triumph)	370
6.	H. R. Owtram (3½ Triumph)	0

Also ran: A. G. Fenn (Indian), missed secret control by taking the wrong road; P. Mitchell (2¼ h.p. F.N.), did not return to Guildford; L. Kennard (5 h.p. Vindec), retired at Dorchester on the return through engine trouble; C. Gammon (3¼ h.p. Rex) and W. C. Wiltshire (3½ h.p. Kerry-Abingdon), did not reach Lyme Regis; E. March (3½ h.p. Chater-J.A.P.), retired through a burst tyre.

A petrol consumption competition will be held on Wednesday, June 22nd.

Derby and District M.C.C.

A hill-climbing competition will be held on Hazlewood Hill on Saturday, meet at Market Place 2 o'clock prompt.

Harrogate and District M.C.C.

On July 3rd a reliability trial over the following course will be held: Skipton, Settle, Kirkby Lonsdale, Kendal, up Shap to Penrith, from there up Hartside to Alston, Middleton-in-Teesdale, Barnard Castle, Scotch Corner, Boroughbridge, and Harrogate—approximate distance 200 miles.

Southern M.C.

All competitors who started in the Blandford and back 190 miles reliability trials qualified for gold medals, none losing more than ten points. Deductions were made at the rate of one point per minute variation from schedule. The three competitors with the least variation from schedule are: (1.) T. E. Goodley (3½ h.p. Triumph), winner of Triumph Cup, variation nil. (2.) J. H. Wheeler (3½ h.p. Triumph), ½ minute. (3.) A. W. Holt (5 h.p. J.A.P.), 1½ m. Winner of cup (1909) T. E. Goodley.

Manchester M.C.

On Saturday last a 100 miles reliability trial for the motor cycle members was held to decide which riders shall represent the club at the forthcoming M.C.C. Team Trial. Fourteen riders started.

The competition was started from the Nag's Head Hotel, Bucklow Hill, at 2 p.m., the 100 miles non-stop run being approximately four times round a more or less circular route of twenty-five miles.

The result was very close:

Manchester M.C. Reliability Trial. A competitor at the starting point.

Single machines.—W. T. Munroe (3½ h.p. Rex), H. L. Cunliffe (3½ h.p. Rex), 100 marks each; F. Sirett (3½ h.p. N.S.U.), J. E. Leigh (3½ h.p. Triumph), 99 marks each; G. S. Stevens (5 h.p. Dot twin), H. J. Scales (3½ h.p. J.A.P.), 98 marks each.

Passenger motor cycles.—J. P. Scott and H. Turner (3½ h.p. chain-driven Rex, with sidecar), 97 marks; J. E. Tytler on a sidecar Dot had belt trouble after riding consistently for threequarters or more of the distance.

Club News.—

Coventry and Warwickshire M.C.

On Saturday last a most enjoyable ten hours' run was held to North Wales. The outward journey had to be covered at an average of nineteen miles per hour, the total time not to exceed ten hours. Secret checks were arranged at different points to decide the prize winners for the most regular running. The stopping place for the night was Bangor, 155¾ miles from Coventry. Reliability was the keynote of the run throughout the whole journey. Very few incidents occurred, punctures during the first fifty miles being the only untoward occurrences. Of the twenty-three motor cycles and sidecars entered, all started except one. It is a notable fact that all completed the journey without serious trouble. Lunch on the outward journey was partaken of at the Old Royal Hotel, Llangollen, and tea at Pen-y-Gwrhyd, near the top of Llanberis Pass, which unfortunately was somewhat obscured by the heavy mist. The homeward journey was a go-as-you-please affair, members of the party returning by whichever route they pleased at their own pace The following members competed :

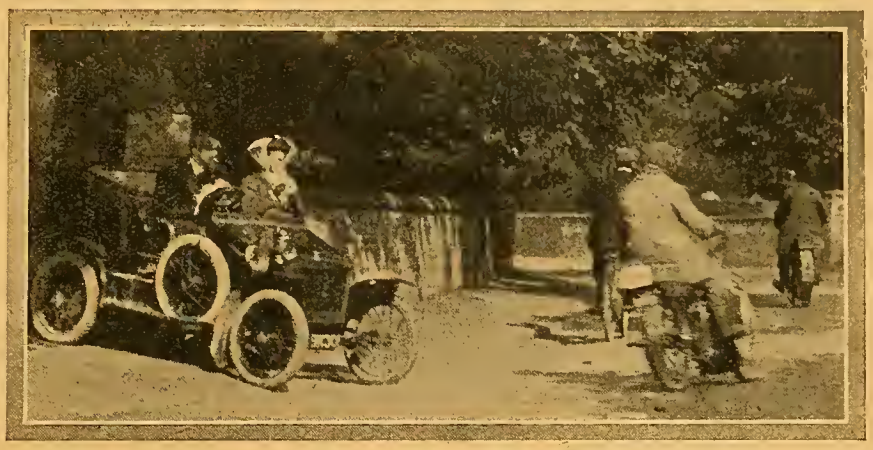
MOTOR CYCLES.

C. S. Burney (3½ de Havilland)	V. A. Holroyd (3½ Triumph)
G. T. Mills (3½ Triumph)	F. Pountney (4 Indian)
A. B. Jepson (3½ Triumph)	C. J. Hobson (3½ Triumph)
J. V. Pugh (3½ Triumph)	*E. W. Harris (3½ Excelsior)
M. Sampson (3½ Rex)	A. Elson (3½ Triumph)
J. F. Spencer (3½ Triumph)	T. C. Pearson (3½ Triumph)
S. H. Davis (3½ Rex)	A. L. Ommanney (3½ Triumph)
E. A. Gorton (5 Rex)	G. H. Spicer (3½ Triumph)
W. Hewitt, jun. (3½ Excelsior)	E. A. Isherwood (3½ Triumph)
*J. R. Haswell (3½ Triumph)	A. Wright (3½ Triumph)
C. S. Brown (3½ Triumph)	C. Moulder (3½ Triumph)

PASSENGER MOTOR CYCLES.

H. Williamson (5 h.p. Rex Sidette)	W. Montgomery (motor cycle and sidecar)

*Denotes that the journey was completed nearest to schedule time, ten hours, including luncheon and tea stops.



Coventry and Warwickshire M.C. run to North Wales. Competitors passing the surprise check (timekeeper: R. W. Duke) at Castle Bromwich.

Nottingham and District M.C.C.

A hundred miles non-stop reliability trial, starting and finishing at Normanton, took place on Saturday last. First prize is the Henry Bircumshaw gold medal, and the trial was also to select a team for the M.C.C. Team Trial on June 18th. The result was as follows: 1, W. H. Hadfield (3½ h.p. Triumph); 2, Claude H. Johnson (3½ h.p. Triumph); 3, J. Richards (3½ h.p. Brough); 4, B. W. Maltby (3½ h.p. Rex); 5, F. Birley Johnson (5 h.p. Matchless); 6, J. Fairburn (3½ h.p. Triumph); 7, G. Chudleigh Holmes (5-6 h.p. Roc); 8, J. D. Mitchell (3½ h.p. Triumph); 9, C. R. Smith (3½ h.p. C.C.R., Smith); 10, A. E. Lole (5-6 h.p. F.N.). George Brough (3½ h.p. Brough), punctured; F. Percy Johnson (7 h.p. Matchless), punctured; Arthur J. Pounder (3½ h.p. Triumph), skid, somersaulted; W. Reilly (3½ h.p. Triumph), skid, hedge bottom; R. George Toplis (3½ h.p. Triumph), stopped; J. King (2¾ h.p. twin Douglas), belt slipping, stopped on hill.

Sunderland and District M.C.C.

This club will hold its annual reliability trial for the Vaux Challenge Cup on Saturday next. The course is between Sunderland and Brough (Westmoreland) and back *viâ* Barnard Castle. It is being run in conjunction with the N.E.A.A. competition for their twelve guinea challenge cup.

Scene at the start from Broadgate, Coventry, of the Coventry and Warwickshire 10 hours run to North Wales. Every competitor completed the run.

Club News.—

Sutton Coldfield A.C.

The above club held a reliability trial of eighty-eight miles on Saturday last in order to choose a team of six riders to represent it in the M.C.C. Team Trial for *The Motor Cycle* cup. Ten members turned out, and the results were as follows:

H. C. Newman (3½ h.p. Ivy), non-stop.
P. Mosedale (3½ h.p. Centaur), non-stop.
Howard Smith (3½ h.p. Triumph), non-stop.
S. C. Perryman (3½ h.p. Ariel), filled up with petrol half a mile from finish.
J. St. John (3½ h.p. Centaur), mudguard stay broken.
W. D. South (5 h.p. Indian), tyre troubles.
R. N. Corah (3½ h.p. Corah), tyre troubles.
Seymour Smith (5 h.p. Norton), tyre troubles.
F. P. Mayell (3½ h.p. Triumph), magneto trouble.
S. Jones (Ivy), retired.

All the team, excepting the sidecar combination, will be picked from the above riders, and the club has decided to award silver commemoration medals to those who ride in the competition on June 18th.

York County M.C.C.

A hill-climb at Norwood Edge on the 28th ult., divided into three classes, resulted as follows:

CLASS I., FOR STANDARD TOURING SINGLES.

T. Clough (3½ h.p. Triumph) X
C. H. Benn (3½ h.p. Triumph) ... ... 1⅗s. more.
A. B. Bilbrough (3½ h.p. P. and M.) ... 5⅖s. ,,
R. W. Glenn (3½ h.p. Triumph) ... 7⅗s. ,,

CLASS II., FOR STANDARD TOURING TWINS.

F. C. Speke (7 h.p. S. and R.) X
N. Miers (5 h.p. Rex) ... ... 1⅕s. more.
A. Waterman (6 h.p. J.A.P.) ... ... 3⅖s. ,,

CLASS III., FOR T.T. AND SPECIAL MACHINES.

P. H. Cockroft (3½ h.p. T.T. Triumph) X
F. Scott (3½ h.p. Triumph) ... ... 6⅖s. more.
J. C. Bennett-Mitchell (3½ h.p. T.T. Rex) 7⅖s. ,,

The winner in each heat had to ride in the final, allowing any difference in his class time as a handicap.

FINAL.

F. C. Speke improved his previous time 3s.
T. Clough improved his previous time 1⅘s.
P. H. Cockroft lost ⅘s. on previous time.

Fastest time was made by P. H. Cockroft.

Dublin and District M.C.C.

On Saturday afternoon the first hill-climb of the season was held on the Long Hill leading over the shoulder of the Sugarloaf Mountain in Co. Wicklow. The prizes for the event were presented by C. B. Franklin, who consequently did not compete, but after the trial was over he made a successful attempt to lower his own record for the hill. Mounted on his 5 h.p. T.T. Indian, he covered the mile and a half over which the competitions are usually run in 2m. 10⅕s., as against 2m. 15⅕s., which he did on a 3½ h.p. Triumph last year. Result:

		Net Time. m. s.	Fig of Merit.
1.	J. Browne (3½ h.p. two-stroke Scott) ...	2 51⅘	... 218
2.	J. Langley (3½ h.p. Rex)	3 12⅕	... 249
3.	G. Tyson (3½ h.p. Triumph)	3 0⅗	... 255
4.	J. Healy (3½ h.p. Rex)	3 17⅖	... 271
5.	J. "Villecar" (2¾ h.p. Douglas) ...	3 35⅗	... 272
6.	A. E. Moran (3½ h.p. Triumph) ...	3 45	... 310
7.	J. Doleman (2¾ h.p. Douglas)	4 10⅖	... 323

Pembrokeshire A.C.

The result of the hill-climb at Arnold's Hill, near Haverfordwest, on May 26th, has just been announced as follows:

	Order on time.	Order on formula.
Eric Green (3½ h.p. T.T. Triumph) ...	1 ...	1
Ralph Green (3½ h.p. Rex Speed-King)	2 ...	2
D. Pantall (3½ h.p. Triumph)	7 ...	3
G. Carrow (3½ h.p. T.T. Triumph) ...	5 ...	4
Albert Thomas (3½ h.p. T.T. Triumph)	3 ...	5
Geo. Owen (3½ h.p. Triumph)	6 ...	6
Stanley Williams (3½ h.p. Rex Speed-King)	4 ...	7
Owain Thomas (3½ h.p. Triumph) ...	9 ...	8
R. Grant (3½ h.p. Triumph)	12 ...	9
G. James (A. Thomas) (3½ h.p. Triumph)	8 ...	10
Jones Parry (3½ h.p. Triumph)	10 ...	11
Howard Palmer (3½ h.p. Triumph) ...	11 ...	12
Francis Phillips (3½ h.p. Triumph) ...	15 ...	13
Owain Thomas (D.E. 174) (3½ h.p. Triumph)	14 ...	14
S. Davies (Jones Parry) (3½ h.p. Triumph)	13 ...	15

P. L. Lipscombe (3½ h.p. Triumph) fell; did not finish.

Oxford M.C.C.

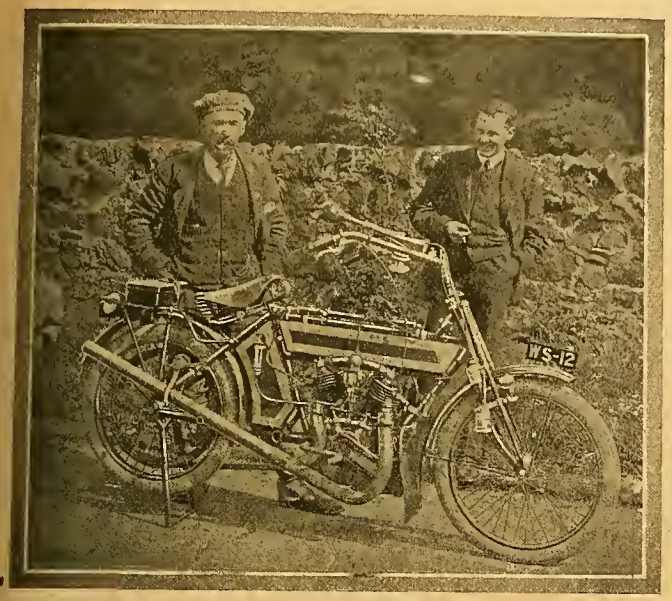
The inter-club contest with the Birmingham M.C.C. arranged for Saturday last was cancelled by Birmingham, because the latter club could not get a twin-cylinder team together. Consequently the Oxford Club held a sweepstake handicap among themselves. The handicap was based on the time of the first ascent, any competitor on the second attempt improving his time by more than two seconds to be disqualified. Result:

	First ascent. secs.	Second ascent. secs.
R. A. Bishop (5 h.p. Indian) ...	43 ...	41
W. A. Mathews (3½ h.p. Triumph)	43 ...	46
J. A. Betteridge (3½ h.p. Triumph)	44⅘ ...	42⅘
W. H. Wakefield (3½ h.p. Triumph)	45⅕ ...	48
E. Parker (8 h.p. Matchless) ...	54 ...	45
H. G. Hill (3½ h.p. Bradbury) ...	62 ...	43

R. A. Bishop and J. A. Betteridge therefore qualified for the final, the former eventually winning by 3 secs. H. G. Hill, having put right a magneto trouble, made a very fine ascent in 37⅖s.

Members of the Oxford M.C.C. at the foot of Irondown Hill on Saturday last prior to an impromptu hill climbing competition.

Club News.—



Something new in silencing arrangements on a 7 h.p. Pengeot. The exhaust pipes are large enough for a good-sized car engine. W. Sorley (vice-president of the Leith Motor Club) left, and J. T. Young (hon. sec.) on right.

Leith M.C.

The above club held a hill-climb, open to its members only, on Flotterstone Hill. T. E. B. Chalmers, riding a 5 h.p. Bat, made fastest time of the day. There were seven classes. Below are the results:

Class I.—Single-cylinder (handicap): Winner, J. Donaldson (3½ h.p. Bat).

Class II.—Twin-cylinder (handicap): Winner, T. E. B. Chalmers (5 h.p. Bat).

Class III.—"Old crock" class: Winner, D. Snadden (3½ h.p. Midget Bicar).

Class IV.—Single-cylinder (open): Winner, J. Donaldson (3½ h.p. Bat).

Class V.—Twin-cylinder (open): Winner, T. E. Chalmers (5 h.p. Bat).

Class VI.—Single-cylinder, novice (handicap): Winner, D. R. Kelly (3½ h.p. Triumph).

Class VII.—Multi-cylinder, novice (handicap): Winner, T. E. B. Chalmers (5 h.p. Bat).

Grimsby Marlborough M.C.C.

The above club was recently formed and members will be gladly enrolled. The subscription is 6s. per annum, and includes full use of the club premises, and affiliation to the Motor Union. The opening run will take place this (Thursday) evening, starting from headquarters, Marlborough Social Club, at seven o'clock. A run is also arranged for the 12th inst. to Skegness, starting from headquarters at 10.30 a.m.

Edinburgh M.C.C.

The Edinburgh Motor Cycling Club held an open reliability trial of 150 miles on Tuesday, the 24th ult. The first competitor was despatched from Fairmilehead at 9 a.m., the others following at one minute intervals. The route was by Leadburn, Tweedsmuir, and Moffat to Dumfries and back by Thornhill, Menock Pass, Crawford, and Biggar. One hour was allowed for lunch at Dumfries, and during that period competing machines were not allowed to be touched. The day was very fine, and the roads, except on the hills, were in good condition. A strong wind was blowing down the Menock Pass, and with the heavy gradient proved a good test for the very best machines. Five competitors received full marks:

N. Macmillan (3½ h.p. Scott)	100
R. A. Macmillan (5 h.p. Bat)	100
A. W. Moncrieff (4-cyl. F.N.)	100
J. D. Morrison (3½ h.p. Bat)	100
P. E. Tolfree (3½ h.p. Matchless)	100
R. White, jun. (3½ h.p. Triumph)	98
P. E. Phillips (3½ h.p. Bat)	70
W. Gerard (2¼ h.p. Enfield)	36
J. Gerard (3½ h.p. N.S.U.)	36

Three failed to finish.

Hertfordshire County A.C.

The speed-judging competition at Brickendonbury resulted as follows: 1st, A. H. Colliver (3½ h.p. Triumph); 2nd, Mrs. M. C. Cooke (3½ h.p. Triumph); 3rd, C. C. Cooke (3½ h.p. Triumph).

Sutton Coldfield A.C.

It has been decided to hold the mile speed trials on Monday morning, July 18th. Permission has been obtained to use a private road for the purpose, and it is therefore hoped that all members will turn out to support the events. There will most likely be five classes, and lightweight, touring, and T.T. machines will all be catered for. The event will be a "closed" one, therefore motor cyclists wishing to compete will have to become members of the club. Further particulars may be obtained from the hon. secretary, Mr. Howard Smith, the Dingle, Four Oaks.

Northern Inter-club Meet.

The Newcastle Motor Club arranged a run to Northallerton, on the 29th ult., when the opportunity was taken to make an inter-club meet.

The Bishop Auckland and District Motor Club, Middlesbrough Motor Cycle Club, Scarborough Motor Cycle Club, and the Newcastle Motor Club were represented.

Luncheon was partaken of at the Golden Lion Hotel, Northallerton.

After luncheon an informal conference was held at the Golden Lion Hotel, presided over by Mr. Parkin, of the Bishop Auckland and District Motor Club.

Mr. G. W. Liddle, of the Middlesbrough Motor Cycle Club, laid before the conference full details and the aims and objects of the Northern League of Motor Cyclists which is now being organised. Mr. Liddle pointed out that Northern motor cyclists had not been well catered for by the Auto Cycle Union, which body does not extend its usefulness in any energetic or business-like fashion to the Northern Counties, and the Northern motor cyclists have long felt the want of some large association or league to protect their interests. An invitation is extended to all clubs from York northwards to affiliate with the league, and motor cycle clubs in Scotland are asked to throw in their lot with the new body.

The first arrivals in the 150 Miles Reliability Trial of the Edinburgh M.C.C., the results of which are given on this page.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

The London-Edinburgh Run.

[4796.]—With the manager's permission, and on my promising to pay a switch man for sitting up, I was able to have the electric arc lamps burning during the early hours the men came through Stamford, which no doubt they appreciated when encountering the three awkward turns in the town. Several of us sat up to guide the competitors, who were going great guns. J. FANCOURT.

Cure for Stretching of Leather Belts.

[4797.]—Regarding a cure for stretching of leather belts in a recent issue, by fixing a cycle chain on the outside of the belt, the same result can be attained in a neater way by riveting an ordinary American eight-day clock spring, about §in. wide, on the outside centre of the belt. Copper rivets should be used, and spaced about every six inches. This effectually cured a belt which was continually jumping off the pulley. W. HEMSWORTH.

Increase of Speed on Partially Raising the Exhaust Valve.

[4798.]—With reference to "Try Again's" letter on his increase of speed on raising his exhaust valve, might I suggest that if he replaced the present tappet lifting the valve with one which would give a longer lift, his difficulty would be overcome. I believe it is a recognised fact that the best speed results are given when the exhaust valve is raised to the fullest possible extent on the occasion of each exhaust being expelled, thereby giving the easiest and quickest access to the air of the spent gases. The above suggestion gave satisfactory results with a 1906 Triumph belonging to a friend of mine. A BARROVIAN.

Hill-climbing.

[4799.]—Referring to Mr. D. R. Greis's letter *re* Socombe Hill, on the Caterham Road, I know this very steep hill, and, therefore, must congratulate him on his climbing it on a single-geared single cylinder pedalless machine.

Some months ago I rode up it on my 1910 Phelon and Moore, but what cannot a P. and M. climb? I think it is the stiffest hill I have been up so far, being a good deal worse than Cudham.

Shortly afterwards I read in one of the testimonials in an old 1908 Triumph catalogue that a 1907 Triumph had got up with pedalling, and a 1908 without, so we are both too late to be the first. C. A. CROW.

Inter-club Meets.

[4800.]—I think that it would be a splendid idea if a meeting of the motor cyclists in the Southern districts could be arranged at a near date. We hear of motor cyclists meeting in the Northern counties of England, and of having a very enjoyable time. I think it would be a grand opportunity for motor cyclists in general to meet and discuss matters concerning their welfare and things in general and possibly it might be arranged to hold a competition.

Should you think it worth while bringing it before your readers, I should be very pleased to discuss the matter further with any clubs desirous of participating.

R. S. H.

P.S.—When I mention Southern counties, I refer to those lying south of the Thames, *i.e.*, Kent, Sussex, Surrey, Hampshire, etc. There are a number of clubs in this part of the world who would doubtless be glad to arrange such a meeting.

Portable Sheds and County Council Regulations.

[4801.]—*Re* query in a recent issue of housing a motor cycle, I thought it would be interesting to your readers to hear of my trouble with the L.C.C. over a portable shed.

Last June I erected a portable shed in my back garden, against the back fence, which is over 26ft. from any building. In October I heard from the district surveyor, telling me I must obtain a licence for erection of shed from the L.C.C. I sent in my application for same and received from them a copy of the Council's regulations, stating I must have three plans made out, sending two with fee of 5s. to them on application, and the third plan with a further fee of 5s. if my application were accepted.

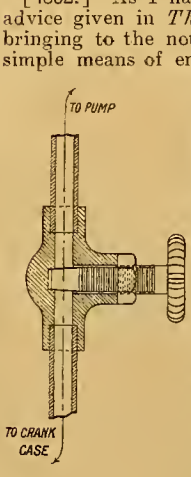
I conformed to the regulations, and on 30th November received a letter stating the plans must be amended to show corrugated iron sides and roofing, and floor of solid substance, and that this if done must be passed by the district surveyor. On receipt of this I told them that as my tenancy was likely to expire in June I should be glad if they would licence the shed as it stood or with the alteration of a corrugated iron roof only, as it was lit by electricity and no petrol was kept on the premises.

Last February I heard from the Council that the committee would grant me a licence for the wooden building for six months, but would not grant it for any further period. From that date until the evening of May 26th I had heard nothing; by the last post that day I received a letter from the Council's solicitor stating I must do as they require or remove the shed.

I might say that the shed is 8ft. by 6ft., which means that it is over 18ft. from the house. SHED.

To Ensure Regular Lubrication.

[4802.]—As I have profited so frequently by the tips and advice given in *The Motor Cycle*, I have much pleasure in bringing to the notice of other motor cyclists the following simple means of ensuring a gradual and sure lubrication of the engine, which I have tried and found quite successful. I had previously fitted a sight feed lubricator, but did not find it easy to obtain a sure rate of feed, which varied according to circumstances (quality of oil, etc.), since the drops cannot be seen while running. I therefore tried a compromise by fitting a small screw stop cock in the oil pipe between pump and crank case, as per sketch herewith. This cock can be adjusted (and fixed by check nut) to allow a given quantity of oil to pass to the crank case in a given time; mine is adjusted to pass rather less than half a pumpful in about ten miles. The pump (a tapless Peugeot) is raised to fill the barrel with the desired quantity, the usual tap handle then turned to shut off oil from the tank, and the engine gradually takes what is in the barrel according to the amount of opening of the stop cock. An occasional glance at the (glass) pump barrel shows at once whether oil is passing to the crank case too quickly or otherwise. The diameter of the hole through the stop cock is equal to the inside diameter of the oil pipe, so that by unscrewing the plug the pump can be used full bore if desired. E. RYE.



[A very similar device used on 1910 pattern Norton motor cycles was described on page 457, May 19th.—ED.]

Motor Cycles for Sidecar Work.

[4803.]—As there has been considerable correspondence in your columns as to what different motor cycles are capable of doing when put to sidecar work, and the best cycle for this work, I thought it would be of interest to some of your many readers to hear my own experience. Both my wife and myself are very fond of travelling in this way, but our enjoyment was always more or less spoilt by having to dismount on some very bad hills around Nottingham and Derby (the machine I owned at that time being a fixed single gear), but some weeks ago I purchased a 1910 two-speed Humber, attached it to the same sidecar, and we made up our minds for a tour in the South of England during the Whitsuntide holidays.

We commenced our tour on the Thursday before Whitsuntide, and arrived home the following Thursday, after doing over 800 miles, going through Loughborough, Leicester, Coventry, Tewkesbury, Gloucester, Bristol, Exeter, Plymouth, Bodmin, Truro, Penzance, Torquay, Dawlish, Teignmouth, Salisbury, Banbury, and Oxford, and home through Leicester. The trip was the most enjoyable we ever experienced, having no trouble whatever the whole of the way, and what is more, mounting the whole of the hills with comfort.

It will perhaps be of interest to some of your married readers to know that our little baby girl of eight months did the entire journey in my wife's arms, and fared none the worse for the trip.

Our total weight was: Self twelve stones, wife and baby ten and a half stones, luggage about two stones. The roads from Bristol to Exeter were in a wretched condition owing to the recent heavy rains, but the machine never faltered even on the worst hills. The amount of petrol used averaged just over eighty miles to the gallon. I am sure that if any of your readers are thinking of purchasing a cycle for sidecar work they will do well to choose one with free engine and two-speed gear, as I consider it the most essential feature both for ease of starting and hill-climbing; in fact, I did not know the pleasure of motor cycling until I purchased the present machine. Wishing your valuable paper every success,

AR. DOCKING.

A Three-wheeled Runabout.

[4804.]—As you have published particulars from time to time of several tricars and runabouts made by amateur readers of *The Motor Cycle*, perhaps photographs [Reproduced below.—ED.] of my 3 h.p. tricar runabout would be of interest. It has an engine with water-cooled head, belt drive, Mabon clutch, weight about 250 lbs., made by my brother and self from parts bought through the miscellaneous advertisement columns of your paper. I may add we were nearly two years collecting parts, as it was all put together in spare time. The machine was designed by Mr. H. D. Boultbee (for some time in the Wolseley-Siddeley Motor Co.'s works) just two years ago. It is single-geared, 5 to 1, and will do 20 m.p.h., but of course will not climb many hills with the present gear. The machine would of course be much improved by the addition of a variable gear.

ARTHUR C. CLAXTON.

A Strange Experience.

[4805.]—I recently noticed that, after passing over several miles of freshly tarred roads, there was a heavy deposit of tar between the points of my plugs. I at first thought it was simply black oil, but on closer inspection found it to be composed almost wholly of tar. I am using automatic lubrication, so that there is little or no chance of over lubrication. I should be interested to hear whether any other readers have suffered from the same complaint.

E. P. T.

[Our correspondent does not state the condition of the exterior of his engine, or his clothes, after the above experience.—ED.]

Change of Ownership.

[4806.]—We wish to impress upon your readers the importance of notifying the police of change of ownership when disposing of their machines. We purchased a machine last December, and for inadvertently neglecting to comply with certain requirements, we—along with our client—were summoned by the police, and in consequence had to hand over a part of our hard-earned savings. We understand more prosecutions are pending, so beware. Even if you sold your machine months ago, take the necessary steps to have number cancelled at once, and profit by our experience.

BOOTH'S MOTORIES.

Delay in Execution of Orders.

[4807.]—I feel it to be only fair to a firm that has treated me most splendidly to write to your columns pointing out that your correspondent 4756 must have fallen into evil hands. I did not see letter 4730, but gather that he, too, has received the scant—or rather total lack of—civility sometimes found with manufacturers of motor cycles. It is by no means so with the firm I have recently dealt with. I have an Arno motor cycle, and a short time ago I had a slight accident about fifty miles from the Arno Co.'s offices. I telephoned the firm, and within a few hours I not only had the required part but one of the company's men to put me right on my journey again. This is a typical instance of the way in which the Arno Co. treats its customers. C.W.I.

EXPERIENCES WANTED.

"G.L.N." (Arbroath) would be glad of readers' experiences with the single-cylinder Moto-Rêve, particularly with respect to hill climbing and reliability.

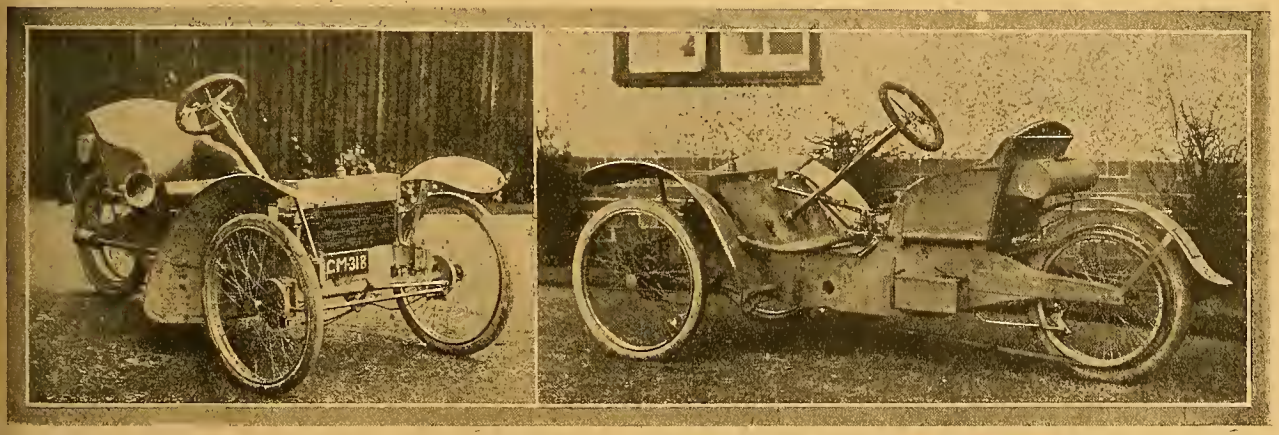
"J.A.H." (Muswell Hill) would like to have readers' experiences of the P. and M. motor cycle using J.A.P. drip feed lubricator. Is it a success?

"W." (Poole) would be pleased to hear of any users' experiences of the Griffin-Simplex gear with sidecar.

"W. S. J." would like to hear of users' experiences of the Griffin-Simplex two-speed gear.

SUMMARY OF CORRESPONDENCE.

"G.W." (Haywards Heath) would be glad to hear from another motor cyclist, preferably a rider of a lightweight, respecting a ten days' tour in Scotland in June or July.



A light three-wheeled runabout described in a letter from Arthur C. Claxton, which appears on this page.

OCCASIONAL COMMENTS.

By "IXION."

The End-to-end Sidecar Record.

While I write, a well-known rider is having a dash at the End-to-end record with a single-geared 3½ h.p. motor bicycle, a sidecar, and an eight-stone passenger. I do not know how he has progressed at the moment, but here's luck to him, though I shall regard his performance as little short of phenomenal if he succeeds. I only wish to emphasise the advance betokened by the mere idea of attempting such a feat. Five years ago we thought it a magnificent performance to cover the same distance in a longer time with a solo motor bicycle of the same power.

To-day there is probably no gradient up which a well-tuned 3½ h.p. machine cannot carry a thirteen-stone rider if its adjustable pulley be screwed right out. My own machine, temporarily geared down to 6½ to 1, will take fifteen stones of dead weight up 1 in 4 very comfortably indeed with a slow start. A very few years ago no sidecar had ever got through the London-Edinburgh ride, though the road is practically flat throughout its entire distance, and machines of high power with variable gears had essayed the task.

The rider mentioned is quite confident, though a little doubtful as to how long the southern bank of Berriedale may take him, if his passenger has to walk the whole of it; some Scotsman comforted him with the information that half-way up, a switch road has been constructed to accommodate cars if their brakes fail on the headlong descent, so that if his engine dies away after the cornersome foothills, he can get a magnificent start again by pushing a little way up the switch road.

Hard Luck, Bashall!

There was nobody I felt so sorry for in the T.T. as W. H. Bashall. In the past he has gained a reputation rather for dash than for that added spice of steadiness which ensures a finish, but this year he was out to finish and to finish first. He had trained like a pugilist, and in his first four laps he exhibited all his old devil and daring, with just that correct ingredient of restraint which hallmarks a man as a first-class racer. He left the extra risks to Bowen, and in spite of that was only fractionally behind him when evil luck destroyed his machine, and he himself narrowly escaped serious injury by burning. Next year I hope all makers may be trusted to make a conflagration impossible, especially if the A.C.U. allow attendants to fill the tanks. I should say some mechanical device rendering overfilling impossible is almost as necessary as a pair of steady hands.

Why the Colliers Win.

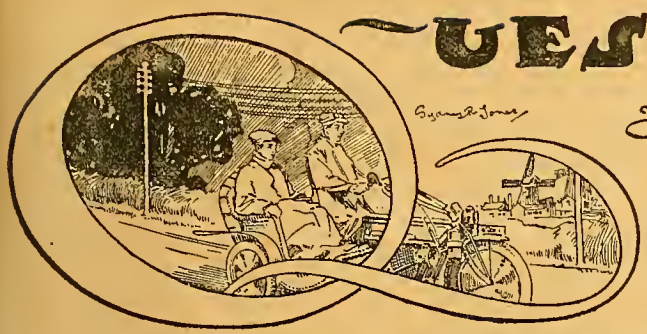
First of all, they ride as a team. Charlie goes sufficiently near all out to keep in the very first flight. He aims at being within two minutes of the leader at half the distance whatever happens. If the race produces a dark horse who can go faster than Charlie wants to, Charlie will accelerate at half time, and cut out the work as was never done before. A few minutes behind him looms brother Harry, riding a half and half race, if circumstances allow, fast, of course, but with a bit more in reserve, a few risks postponed, a notch or so of throttle in reserve; if Charlie falls out, as, thanks to a faulty belt link, was the case last year, Harry moves up one in the team and takes all the risks. Behind the pair rides Colver, less of the born speed merchant, no doubt, but genuine hot stuff none the less. He takes the slowest machine of the bunch (if the engines vary a trifle), and rides a finishing race, stepping up in the take-all-risks place only if both the famous brothers drop out, which has never happened yet. Something precedes all this; every single detail is put through the most gruelling tests imaginable. If a suitable fitting cannot be bought from stock it is made, and made early enough for tests; and every conceivable contingency guarded against. For instance, no machines were so totally weatherproof as the Matchless with rain-proofed magnetos, sparking plug covers, and belt guards. Last, but not least, nobody can beat this trio at tuning an engine. Everybody expects them to win the twin-cylinder class next year, and their rivals will have to get up early if they hope merely to hunt the Colliers home.

W. F. Newsome, who, riding a 3½ h.p Triumph, surprised everyone by making fastest time in the Snaefell hill climb, beating all the multi-cylinder machines.

Pace in the T.T.

A study of the lap times will show the careful reader how finely a rider must cut things to obtain a high place in the race.

There is only a slight difference between each pair of lap times, yet Collier was first and Fowler fifteenth, thirty-eight minutes behind the Matchless crack. Fowler's times are fast all through, his worst lap being his fifth, in which he evidently changed a belt or a valve, or something of the sort, and even in this his gross time for the 15m. 1f. works out at considerably better than 30 m.p.h. Very few riders, if they were given the closed course to themselves and Bowen's Bat to ride, could manage one lap in nineteen minutes within their first day's practice. Yet to win they must ride faster than this, including waiting for a chance to pass rivals, and two stoppages to replenish.



QUESTIONS AND REPLIES

A selection of questions of general interest received from our readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, **must be accompanied by a stamped addressed envelope for reply.**

Gear Ratio.

I have just purchased a second-hand motor bicycle (3 h.p. Bradbury) with a gear of 4⅝ to 1. I find it is not so good as my last 2¾ h.p. for towing a passenger on slight hills. It has a good speed on the level, and is fast on hills alone. Could you let me know a more satisfactory gear for this work, and perhaps occasional sidecar work?—S. H.

A gear of 5¼ or 5½ to 1 would be more suitable for your purpose. The best plan would be to fit an adjustable pulley (or change speed gear, if you can afford it), so that you may vary the gear and determine the most suitable ratio. At the same time, we may point out that 3 h.p. is insufficient for passenger work, and will never be a success on hills.

Calculating Gear Ratio.

I should be much obliged if you could tell me the method which is used to calculate the gear ratio between pulley and road wheel. Also, supposing the gear is of the chain variety, whether the top diameter or pitch diameter is considered?—S. A.

The method of calculating the gear ratio when machine is fitted with chain drive and counter-shaft is as follows: Multiply the number of teeth on the driving wheels together and the number of teeth on the driven wheels. Divide the smaller figure into the larger, and the result is the gear ratio. Pitch line and top diameter are not taken into account, only the number of teeth.

Adjustment of Two-speed Gear Control.

I shall be much obliged by your advice on the following points. My machine is a 1909 Humber, with Roc clutch and two-speed gear. I find the clutch has a tendency to slip, so that I have to keep the high speed pedal pressed down with my foot while running. Is it possible to take this up, and how? (2.) It is very difficult to force grease into the back hub; will it do any harm to warm the grease before pumping it in? (3.) Should I oil or otherwise treat the band brake on the rear hub? I see the hub is wearing bright under the band. (4.) I use a sidecar with the machine and can get up Wrotham Hill with an eleven stone passenger. Can you tell me any means of testing whether the sidecar is in correct alignment with the machine? I may add that I bought the machine new three weeks ago through an advertisement in your columns. I had never before ridden or even handled a motor cycle, and I think it speaks well for the machine that I have had no trouble of any kind, and not a single involuntary stop.—G.P.

(1.) Certainly it is possible to adjust the brake bands. A correspondent named Macintyre on February 21st (page 155) advised readers to fit a powerful coil spring midway along the rod which operates the high gear; this may improve the adjustment. (2.) No harm will be done by warming the grease if you allow time for it to solidify after pumping it in. Why not write to Humber, Ltd., Coventry, and ask them to supply you with a grease squirt with wooden plunger as illustrated in *The Motor Cycle* of April 28th, page 382? (3.) Instructions *re* oiling band brake were given in *The Motor Cycle* of February 21st, page 155. (4.) To test whether the sidecar is in correct alignment with the bicycle, measure the distance from centre of tread of back wheel tyre to centre of tread of sidecar wheel tyre at the rear, and from centre of tread of front wheel of bicycle to centre of tyre of sidecar wheel in the front. Use a straight edge made out of a long piece of wood planed true or a tape measure.

Starting a Twin-cylinder Machine and Sidecar.

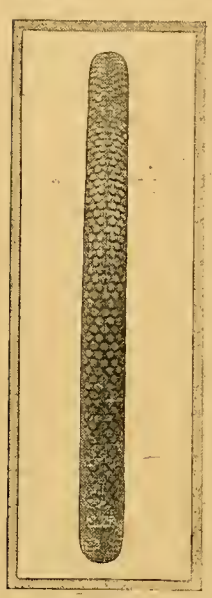
My 5 h.p. twin with 4½ to 1 single gear picks up speed with jumps and jerks, which is very uncomfortable, and it sometimes stops if I do not pedal it into a quicker speed. It only does this with sidecar. When I get up speed it will take sidecar and twenty stones up hills that some singles will not look at. The specification is B. and B. carburetter, Bosch magneto. Everything seems in perfect condition. Compression good.—B. A. R.

You do not say if your engine has automatic or mechanically operated inlet valves. If the former, the difficulty may be due to the inlet valve springs being slightly too strong. If the latter, carburation is most likely at fault; that is to say, the carburetter does not provide a strong enough mixture at very slow speeds. This is always more apparent with a sidecar or other passenger attachment, because the speed is not so fast at starting as it is with a single-seated bicycle. If your engine has mechanically operated valves and everything is in perfect order elsewhere we should advise you to try a slightly smaller adapter in the carburetter. The 1910 B. and B. has a detachable adapter, and smaller ones can be supplied by the makers, Brown and Barlow, Holt Street, Birmingham.

The T.T. week. General view of the start of the six miles climb up Snaefell, which is a most strenuous test.

The Latest Goodrich Tyre.

The accompanying illustration is that of the latest Goodrich tyre for motor cycles, which we have just been testing on one of our machines. The tyre is well made with closely grouped rows of rubber studs which secure a very good grip on a slippery surface without materially reducing the speed of the tyre; in fact, the Goodrich is one of the fastest motor cycle tyres we have tried. The cover, like most good tyres, is moulded and vulcanised with the fabric bedded well into the rubber, hand-made tyres being unsuitable for motor work.



With regard to the question of speed, most riders know that there is a great difference in the speed of the same make machines fitted with various makes and qualities of tyres. There is no question, however, about the speed of the Goodrich. It is lively and fast, and our experience of it so far is that it wears well. The makers will be pleased to send full particulars of all their motor cycle tyres to anyone applying for same to the B. F. Goodrich Co., Ltd., 7, Snow Hill, E.C., and will also give advice as to the various rims which their tyre will fit.

T.T. Notes.

The fastest lap time in the T.T. Race (17m. 51s.) was made by Bowen on a Bat shod with ROM tyres. The first eight single-cylinder machines to finish the T.T. Race (all Triumphs) were shod with Dunlop tyres. Thirty out of seventy-two starters used Continentals.

In Class 5 of the A.C.U. Snaefell climb, J. Scriven was second, riding a 4 h.p. twin m.o.i.v. Rex, shod with Continental tyres. He used a Lyso belt.

The first to the fourth and the sixth and tenth competitors to finish used Shamrock Gloria belts, as also did H. H. Bowen. It is worthy of note that S.G. belts were fitted to the winning machines in 1908, 1909, and 1910.

Price's oils were used by twenty-five out of the twenty-nine competitors that finished in the above contest. Price's Patent Candle Co., Ltd., Battersea, S.W., attribute their success very largely to the fact that they have made a careful study of the lubrication of motor cycles, used for various purposes, so that they were in a position to offer lubricants specially adapted for the different makes. Their heaviest grade of oil was used on the J.A.P. engines, whilst the Triumph engines, on the other hand, were lubricated with a very light, but highly super-fatted compound, specially prepared for the purpose.

The Hutchinson tyres used by the Bros. Collier came through the race with flying colours. One day last week we visited the offices of the Hutchinson Tyre Co., Basinghall Street, E.C., and there saw the actual pairs of covers used by the winner and his brother. Both rear covers have the corrugations completely worn off, and are slightly more worn on the inside than on the outside, but there is not a cut to be seen on their surfaces. Both front covers are in perfect condition, and show absolutely no signs of wear. The tyres used have a number of fine corrugations on the tread, and are known as the Brooklands type Tourist Trophy pattern.

SPARKLETS

Importance of Good Tyres.

Kempshall tyres have figured prominently in most of the important trials which have been held so far this year.

The P. and M. machine fitted with Kempshalls depicted in the accompanying illustration with its driver, Mr. W. Pratt, scored in the January and Spring Quarterly Trials, the same machine and tyres being used in the run from London to Harrogate, when the same rider won a silver cup.

In the London to Edinburgh run Kempshall tyres were fitted to four of the successful machines. These machines went through from London to Edinburgh without a puncture and with absolutely no trouble whatsoever. One of the four completed the return from Edinburgh with no puncture or tyre trouble.

Change of Address.

Expansion of business has necessitated an increase in the size of the premises of the Roc Motor Works. Enquiries should in future be addressed to A. W. Wall, Ltd., Roc Motor Works, Tyseley, Birmingham.

Electric Lamps.

We may remind those motor cyclists who depend on an electric lamp alone that J. W. Greenwood and Co., Portland Place Works, Halifax, make a special lamp for motor cyclists called the Glare. It was used by several riders in the London-Edinburgh, who we are informed, had not the slightest trouble the whole time.

A New Lubricating Oil.

Messrs. Wakefield are now specially catering for motor cyclists, having introduced their lubricating oils in half-gallon and one gallon cans at very moderate prices. These can be obtained from any local agent. The quality of this oil is illustrated by the fact that Harry Martin used it when he broke the five miles flying start record at Canning Town.

A British Success.

Geo. Brough used a Simms British-made magneto when he won the M.C.C. challenge cup in the London-Edinburgh and back trial. A photograph of the rider and his machine (a 3½ h.p. Brough) appeared in last week's issue, page 515.

The Largest Indiarubber Manufacturers in the British Empire.

Amongst the exhibitors in the British Section at the Brussels International Exhibition will be found the North British Rubber Co., Ltd., of Castle Mills, Edinburgh, who claim to be the largest indiarubber manufacturers in the British Empire. This firm, who are manufacturers of the Clincher tyres, have a very representative exhibit.

Riding Equipment.

The Express Rubber Co., Great Eastern Street, E.C., have lately placed on the market a very sensible set of leg overalls. It will be seen from the accompanying illustration that they are provided with a strap, which fastens them round the lower part of the body, and they have an extension which fastens round the neck completely protecting the rider's chest. In summer weather the extension may be folded up and tucked inside. It will be seen that these overalls adequately protect the rider from wet. The other illustration shows a complete outfit. The price is not much in excess of the ordinary leg overalls.

Overalls and complete suiting made by the Express Rubber Co.

THE

LODGE

SPARKING PLUG,

DESIGNED FOR MAXIMUM POWER.

Barnack, Stamford,
May 25th, 1910.

Messrs. Lodge Bros. & Co., Birmingham.

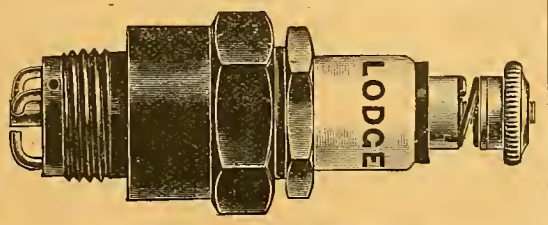
Dear Sirs,—The Lodge plug fitted to my lightweight Motor Cycle in the recent London-Edinboro' and back run gave perfect satisfaction.

This plug was fitted the day previous to the run and never touched until I arrived home on the Tuesday following, after having covered over 1,000 miles without a misfire.

Other lightweight riders could not have used your plugs, as they had their pockets full, and were continually changing them.

Make what use of this you like, as I know of no other plug to equal the Lodge, and it may help other riders out of trouble.

Yours faithfully,
(Signed) A. WEBSTER.



PRICE **4/-** EACH.

LODGE BROS. & CO., Dept. E., 14, New St., **Birmingham.**

Flying

THE WHY AND WHEREFORE.

¶ Motor Cyclists who follow the subject of aeronautics should read "Flying," a breezy non-technical book for amateurs dealing with the first principles of human flight by means of aeroplanes.

¶ Clearly illustrated with photographs and drawings.

On Sale at all Booksellers,

Price 1/- net,

or post paid 1/2, from

ILIFFE & SONS Ltd., 20, Tudor St., E.C.

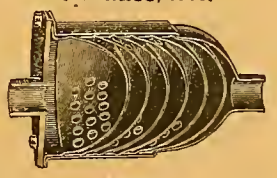
SILENCE IS GOLDEN.

THE "CLAIR" SILENCER.

The Silencer and Brake Tests.
The silencer and brake tests took place on Wednesday ..... the men must fit efficient brakes if they value their necks and their chance of winning, while the less said about some of the silencers (?) the better.

Vide Press Reports, T.T. Race, 1910.

No need for this result.



When you can have this result.

Silence.

I can corroborate all previous letters *re* the Clair silencer. Some three months ago I fitted one of these to my 4 h.p. Bat, and as in Mr. C. Lake's case, my machine is ninety per cent. quieter than formerly. That awful, nerve-destroying, Gatling gun effect is entirely eliminated, and one can now distinctly hear the valves closing. To prove its efficacy one has only to open the cut-out.

I scarcely need add I have no interest in the makers beyond being a SATISFIED PURCHASER.

Sole Manufacturers— 1¼ to 150 h.p. (Patent).

J. C. LYELL & CO., LTD., 53, Victoria St., LONDON.

Telephone—2469 Gerrard. Telegrams—"Electrinus, London."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

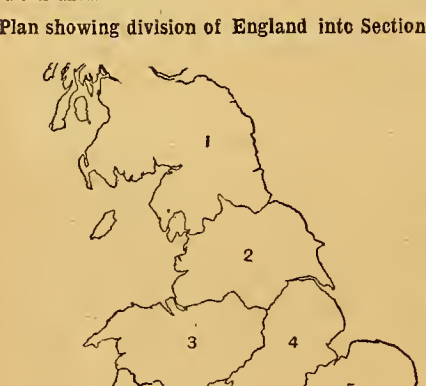
All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.



SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.

1¾h.p. F.N., magneto and spring forks; £15.

5h.p. Twin Rex, with Roc free engine clutch; £25, or offer.

ALL the above to be seen at Mylam and Co., 354, High Rd., Streatham, S.W.

EAGLES.—Indian, 5h.p., 1910 twin, Bosch magneto. Indian red finish; £42, as new.

EAGLES.—N.S.U. 2¼h.p. Twin Lightweight, 1909. Bosch magneto, M.O. valves, under-geared pulley, only ridden 100 miles; £29 10s.

EAGLES.—3½h.p. N.S.U., magneto, adjustable pulley, 26 by 2¼ Continental tyres, excellent condition; £15 10s.

EAGLES.—3½h.p. Peugeot, Truffault, spring forks, Palmer tyres; £14 10s.

EAGLES.—Rex, 2h.p., vertical engine, long handle-bars, low saddle, Dunlop tyres; £6 15s.

EAGLES.—Any of the above can be had on approval, deposit.

EAGLES.—We have a few brand new N.S.U.'s just delivered, finished in latest style; 3h.p., £25; 3½h.p., £31; 6h.p. twins, £40; two-speed gears, £5 15s. extra; exchanges entertained; deferred payments; inspection invited.

EAGLES and Co., High St., Acton.—N.S.U. West London District Agency. 1910 model from stock; liberal allowances for machines in part payment. Tel.: 556 Chiswick.

3h.p. J.A.P., just overhauled; what offers?—Brady, 36, Morseby Rd., Clapton.

VINDEC, 5h.p., Truffaults, Bosch, good tyres; bargain, £25.—84, Greenside Rd., Croydon.

The Mechanics of Riding Round a Corner.

By ARCHIBALD SHARP, B.Sc., A.M.I.C.E.

Some of our readers may have heard something about what has been erroneously styled a "new method of taking corners," in which the rider inclines his body outward and allows the machine to lean inward. Far from being new, this method was adopted by some well-known riders as far back as 1903 or even earlier. We do not recollect reading or hearing of any definite authoritative statement as to whether any benefit is derived from adopting this method of taking corners; we therefore asked Professor Archibald Sharp to contribute a short article on the subject and give his opinion, which is as follows:

The Editor has asked me to contribute a short rticle pointing out if it is of any assistance to the der to lean his machine inwards and his body out- ards when taking a corner. Subject to the proviso iscussed below, I do not believe any advantage is ined by the procedure. In practical pedi-cycling nd motor cycling I have never experienced any ldditional security—rather the reverse—from leaning utwards. Nor from the theoretical point of view an I find any justification for the practice.

Starting from Newton's first law of motion, "Every ody continues in its state of rest or of uniform motion *n a straight line* unless compelled by an impressed orce to change that state," the fundamental prin- ples involved can be simply discussed. When a otor cycle is running steadily in a straight line, the ertical forces acting on the system formed by the achine and rider are balanced, viz., the total weight ting downwards, and the reactions of the ground at ie tyres acting upwards. Similarly, the horizontal orces are balanced, viz., the wind resistance and olling resistance of the tyres opposing the motion, nd the tangential reaction from the road surface on ie tyre of the driving wheel in the direction of notion. (The internal friction of the engine and echanism of the machine does not directly affect the roblem.) The resultant force on the system is zero, and the velocity remains constant in magnitude and direction.

The Centrifugal Force.

If the velocity of the body alters either in magnitude or direction some applied force is necessary. If the magnitude of the velocity remains constant, but the direction of the motion gradually changes, as in rounding a corner, the applied force is at every instant at right angles to the direction of motion, and is provided by the side reaction of the ground at the tyres, directed towards the inside of the curve. The equal opposite force (exerted sideways by the tyre on the ground) is called the "centrifugal force." The centrifugal force is proportional to the mass W of the machine and rider; inversely proportional to r, the radius of curvature of the curve described; and proportional to the *square* of the speed v. If W is expressed in pounds, r in feet, and v in feet per second, the centrifugal force F is given by the formula—

$$F = \frac{W v^2}{g r}, \text{ or } \frac{F}{W} = \frac{v^2}{g r},$$

g having the value 32.2.

Fig. 1 shows the conditions of a motor cyclist rounding a corner when the rider does not move side-

The Mechanics of Riding Round a Corner.—

ways on his seat, but both machine and rider lean inwards. G is the centre of gravity of machine and rider; the weight W is balanced by the equal opposite vertical reaction W from the ground, and the centrifugal force F is supplied by the horizontal reaction from the ground. The two forces W and F have a resultant R, as shown in the figure. The rider auto-

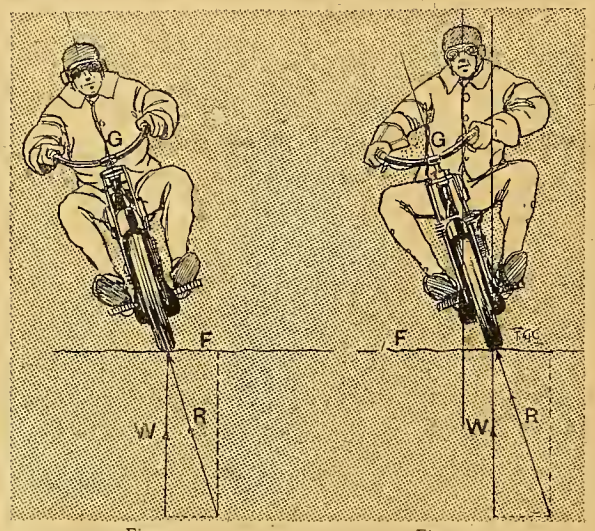

Fig. 1. Fig. 2.

Diagrammatical sketches showing a motor cyclist leaning machine and body inward (fig. 1) and machine inward and body outward (fig. 2).

matically leans inwards until the central plane of the bicycle coincides with the direction of R. The resultant R is transmitted to G, its vertical component balancing the downward weight W, and its horizontal component supplying the necessary radial *centripetal* force to keep G moving in the curve.

Fig. 2 shows the conditions when the rider leans outwards, the machine inwards. If the speed v and radius r of the curve be the same as in fig. 1, the relative positions of the centre of gravity G, and of the forces W, F, and R are exactly the same as in fig. 1. The only difference between the two figures is that the angle the machine makes with the vertical is greater in fig. 2 than in fig. 1.

When the machine is just on the verge of skidding the centrifugal force F is equal to the greatest frictional resistance that can be exerted. The ratio F/W is then just equal to the coefficient of friction between the tyre and the ground. The condition of the road and tyre surfaces therefore determines the biggest value of F/W. Figs. 1 and 2 are identical in this respect, the slope of the wheel not affecting the problem.

The Contact of the Tyre at the Ground.

The only possible modification is that probably with the flatter slope of the wheel in fig. 2, in some cases the ridge at the side of the tyre may get a better grip of the road surface than the smoother central part of the tread. Figs. 3 and 4 are enlarged views, showing the contact of the tyre at the ground. In fig. 3 the point of contact is on the middle part of the tread. In fig. 4 the point of contact is at the corner of a ridge, and it is possible that the grip is better than in fig. 3. However, I don't think there is much in this distinction.

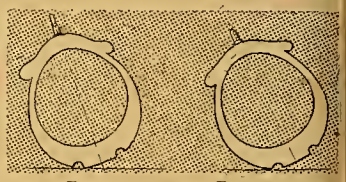

Fig. 3. Fig. 4.

The tyre contact at the ground.

Incidentally, the fact that F varies as the square of the speed, shows how careful a rider should be in slowing down at a corner. A certain corner may possibly be taken with safety at twenty miles an hour, which would necessitate a certain angle of heel. To take the same corner at twice the speed the angle of heel would have to be increased four times, and the friction may not be sufficient to give the necessary grip. Hence the necessity for banking, the ideal being to make the track or road surface at right angles to the direction of the force R.

ANOTHER TYPE OF BACKREST.

A NEW patent backrest, embodying desirable features, has been brought to our notice by Messrs. Samuel Hall and Sons, Ltd., 18-20, Swinton Row, Edinburgh, well-known as the makers of the F.R.S. lamp. The rest is illustrated on this page. Its advantages are: Absolutely automatic action, great strength and comfort, smallest space, quickly fitted, and sensitive adjustability. When fitted, the backrest is part of the saddle, consequently it moves with the rider. After mounting the machine, the rider simply puts one hand behind him and pulls up the rest, when it will "click" into position. When dismounting, the backrest looks after itself, and the reason is that immediately the rider's weight is off the saddle, the support instantly falls down, as shown in the right-hand illustration. Rough roads will not cause the rest to fall, because every particle of weight must be off the saddle before it is released, and then its action is instant.

A new backrest, with an automatic action. Immediately the rider's weight is off the saddle, the backrest falls down.

OCCASIONAL COMMENTS.

By "IXION."

Automatic Carburetters.

Support of my advocacy of automatic carburetters for certain purposes has just come to hand from an unexpected quarter. The A.M.A.C. Co., who make the carburetter used on the Matchless machines in the T.T. Race inform me that the Colliers and Colver adjusted and used it so as to be entirely automatic. It is designed to retain an extra air lever, the automatic valve being intended to look after the more sensitive variations at moments when the rider's attention is occupied by steering or lubrication; but the three Matchless experts preferred to rely exclusively on the automatic air, and, according to the patentee of the device, raced from start to finish on single lever control.

Drilled Pulleys.

Some pulleys had been liberally drilled with holes for the T.T. Race with an eye to reducing weight, and they repaid the experimenters in many instances by bursting. The Triumph pulleys had apparently been drilled with very different intent. A ring of comparatively small holes encircled the flanges at such a depth as to come midway down the side of the belt; the wedging action of the drive would therefore have the effect of forcing small pimples of belt, as it were, into each orifice, and so intensify the grip. It would be interesting to know how many riders used 28° belts in 28° pulleys. One belt manufacturer confided to me that he had scrapped all his moulds at considerable expense, and now supplies 30° belts and 28° pulleys. He points out that the upper part of the sides of a new belt keeps quite clean until the belt has covered a certain distance, and asserts that the wedging action distorts a 28° belt in actual use. The old adage, that belt and pulley should be of equal angularity (viz., 28°), may yet be true of leather belts, but the more compressible rubber and canvas type is very susceptible to distortion, and he obtains a better grip by making his belts at 30° section.

Valve Springs.

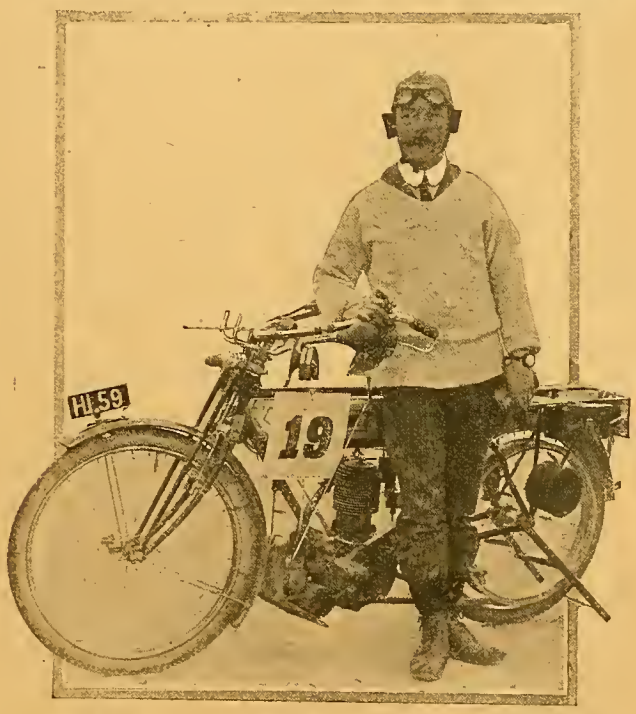
Many riders have experimented with different strengths of valve springs, and few points better repay experiment, as some makers are rather careless about the strength of their springs, and in any case the springs slowly lose temper in running. I dare say many readers have not realised that the inlet and exhaust valve springs need testing separately and in combination. One machine, for instance, which a member of our staff was tuning, ran no better with any exhaust spring other than the standard, but the fitting of a much stiffer spring to the inlet valve speeded it up several miles an hour. Hence a thorough experiment with valve springs implies testing three or four different springs on each valve both separately and in combination, but care must be taken not to use too strong a spring, or broken valves will result.

Belt Fasteners and Low Gear Ratios.

Many belt fasteners, particularly those of the adjustable pattern, are totally unsuited either to expanding pulley gears or to the lowest ratio of ordinary variable pulley. When a motor bicycle engine driving a 26in. wheel is geared down as low as 6½ to 1, as is quite practicable with many pulleys, a very small arc of belt can at the best get a grip on the tiny engine pulley. Some fasteners measure 3in. from the tip of one end plate to the other, and even if their link is perfectly flexible, the end plates stiffen the extremities of the belt and cause them to "lift" out of the pulley groove. As a result the gripping area of the belt is cut down to an infinitesimal number of square inches, and slipping or fastener trouble is certain to occur almost immediately. As a general rule, when a very small engine pulley is being used, the fastener should be as short and flexible as possible.

Bravo, the Triumph Team!

Quite the best achievement in the annals of the T.T. Race was registered by the Triumph machine, which got all its starters through, including five private owners, and obtained the third, fourth, sixth, seventh, eighth, eleventh, thirteenth, and fifteenth places. This spells magnificent construction, thorough practical foresight, and fine riding. Creyton, Marshall, and Newsome, we all know (condolences to Marshall, by the way, on his tyre troubles; next year his luck may be in again). The amateurs are indeed a team of cracks. Adamson hails from Perth, and can take corners better than any rider I have seen. Cooper was one of the first Triumph enthusiasts, and has as much experience as anyone. Murphy trains in Ireland, and after the bumps of the Green Isle regards the Manx course as a billiard table. Howard Smith will be a lot faster next year, and McMinnies is acquainted with speed of old, and probably rode more cautiously because he was out to report the race from a competitor's standpoint.



Dr. C. B. Moss-Blundell, a prominent M.C.C. member and successful competition rider, who was instrumental, through the columns of *The Motor Cycle*, in forming the Leicester and District Motor Cycle Club. His mount is a 3½ h.p. Triumph.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

The Tourist Trophy—A Suggestion.

[4808.]—As it may be of interest to some of your readers, how would it be to run a race similar to above for private owners only, so as to give them a chance, as seemingly the last three or four T.T. races have been won by a trade rider? GALBROOK.

Increase of Speed on Partially Raising the Exhaust Valve.

[4809.]—With reference to Mr. Forward's letter [4791], it would be very interesting to have further details. For instance, does the alteration to the cam affect the inlet or exhaust valve, or both, and is the increased profile of cam set to give earlier opening, or later closing, or both?

Doubtless there are many readers who would be extremely interested to know exactly how the valves are timed by the alteration carried out by Mr. Forward.

BACKWARD.

Carbonised Deposit in Engines.

[4810.]—I was much interested in "Ixion's" notes regarding deposit in engines, and shall be glad if any readers can inform me and others if they have tried the following tip, and with what success: The rider of a J.A.P. twin informs me he always kept a $\frac{3}{16}$in. ball in each of the cylinder heads, and this prevented carborisation, no matter how much he lubricated. He found cylinder head and top of piston always in a bright and polished condition whenever he removed his cylinder. Perhaps some other reader would give his experience. Personally, I think the idea quite feasible, and shall try it when next taking down engine.

LN 3980.

Hill-climbing.

[4811.]—Your correspondent, Mr. D. R. Greis, refers, I expect, to Succombe Hill in his letter [No. 4788]. This hill is a turning to the left soon after passing Warlingham Station, on the Purley to Caterham Road. It is certainly a wonderful performance for any single-geared "single" to make a clean ascent, but Mr. Greis is not the first to do so. I noticed some weeks ago, in a Triumph 1909 list, that a Cambridge motor cyclist, on a 1908 Triumph, had made two ascents minus pedals. My brother recently rode up Succombe Hill on his 1910 P. and M. (his weight is 14 stones), and I know a motor cyclist who went up on a two-speed Warwick machine. I also know another gentleman who has driven his 10 h.p. Darracq car up this hill.

I know of no other hill so difficult to take on a single-geared motor cycle, and Mr. Greis's climb is a great credit to his machine and him. S. H. CROW.

Jamming of Carburetter Piston.

[4812.]—With reference to letter 4792, "Trouble" should try slackening the nut below the extra air lever and above the jet chamber. I think he will find this is the cause of the jamming and not the dust getting behind the piston.

C.E.D.

[4813.]—In reply to "Trouble" [letter 4792], I had the same bother with my carburetter in really muddy weather only, and several times broke the pin through the collar of the choke tube trying to force it round. I partially cured it by filing a little off the point of the screw which travels in the spiral slot of the choke tube, as I found most of the trouble was caused by grit getting in this groove. Trusting this will help "Trouble," E. S. 186.

Road Dangers.

[4814.]—On Saturday afternoon, June 4th, on the main road between Lancaster and Carnforth, a small patch of very sharp granite stones, newly laid, very deep and loose, was left the *full width* of the road.

If common "horse sense" had been used, either the men would have been kept on overtime to roll the stones in, or the laying of so short a stretch held over till the work was resumed on Monday, or a quantity of soft earth thrown over it, or only half the width of the road laid.

I presume the men would finish on Saturday morning, and therefore these sharp-cutting stones were left one and a half days on one of the main roads of the country, over which at the week-end thousands of pedal cycles, motor cycles, motor cars, rubber-tyred traps, and other vehicles would pass, and consequently many pounds worth of damage done.

I was driving a brand new Ford motor car home from London and up to this stretch nothing had occurred, when one tyre was cut on this short stretch, although I passed over it at walking pace. C. W. BARRETT.

P.S.—If the police, and especially in these parts, would attend to matters like the above, and waste less time in trapping motorists, they would be doing a public service.

[4815.]—I wish to caution motor cyclists travelling over Douglas Moor, N.B. The road has a splendid surface, but has been sprinkled here and there with small sharp stones, with edges sharp as a razor, which play havoc with the tyres. The other day when taking my 6 h.p. N.S.U. over this road I experienced ten punctures in the rear wheel in about three miles, cutting large rents in cover and tube which have not yet been 200 miles. Reaching Lesmahagow I found cover and tube completely ruined and totally unfit for my return journey of 150 miles. Thinking Glasgow a sure place to purchase a new 24in. × 2½in. cover and tube I took the train and found, to my great dismay, such a size in the heavy tread was not procurable or even stocked. The following day found me again in Lesmahagow ready to take the train home. Here Robert Park and Sons, although I was an absolute stranger, very kindly lent me free of cost a good cover and tube. J. M. E.

The Glasgow Clarion Sports.

[4816.]—A regrettable feature of the three miles motor cycle handicap at the above meeting on June 4th was the inability of the competitors to pass each other on the banking of the Celtic F.C. track, which is rather narrow for this class of racing. In the third heat, Baxter failed to pass the undersigned on the banking in the earlier laps, and only succeeded in doing so in one of the later laps by passing so close as to cause my front wheel to rub for several seconds against the inside of his back wheel, instead of observing the Brooklands rule to get a clear three lengths ahead before crossing.

As you are aware, in the T.T. Race competitors were strongly urged by Mr. Nisbet to avoid attempting to pass each other on corners. Immediately on completion of my heat I lodged a protest, but was informed by one of the judges that there was no occasion to do so, as I had won the heat, and my half-guinea was forthwith returned. Judge of my astonishment when, on taking my place for the final, I was informed *by the handicapper* that I had been disqualified, and would not be allowed to start. The reason vouchsafed was that Baxter had failed to get past me on the banking!

Collier failed to pass his opponent, and, in fact, every competitor who valued his life and that of his rival failed. Only

one competitor was disqualified for preventing the passage of his opponent on the banking, and this, moreover, was done on the report of an umpire who probably held such a position in a motor cycle race for the first time. The opinion of many of those present, including Mr. H. A. Collier, was that the decision was, to put it mildly, most unjust.

If motor cycle racing in Scotland is to be put on a sound footing, it must surely be organised and controlled by practical motor cyclists, who should now take the matter into their own hands. JAMES S. GRANT.

[The trouble arises apparently from the fact that the track is unsuitable for high speed motor cycle racing.—ED.]

Why Wait till Next Year for Another Road Race?

[4817.]—Why wait till next year for another road race? Everyone who saw the T.T. agreed that it was a sporting event of the very first class—in fact to anyone, such as myself, deeply interested in motor bicycles, it was absolutely the most interesting competition that could possibly be witnessed. Granted that the race is not only interesting but instructive, that it is not only popular with spectators and officials, but that the competitors also are absorbingly eager to meet again, then why be bound by a hard and fast annual period?

Why wait till next year? Could not a similar event be arranged in September this year, possibly not for the Tourist Trophy, nor by the name of Tourist Trophy, but under similar conditions and for similar objects. There could not be any excessive difficulty either in making arrangements or in raising the help and the funds. Another race this year will also provide an opportunity for a special competition restricted to lightweights, a class of machine which is increasingly popular, and of which the speed and power could be surprisingly demonstrated.

The lightweight event would be greatly welcomed by many of the public who fancy that class of mount, and would like a lead as to the respective qualities of the varying makes, and it would also be welcomed by those manufacturers of lightweights who have confidence in their productions. FRANK S. WHITWORTH.

A Successful Conversion.

[4818.]—Herewith I enclose you three photographs which I think may be of interest to your readers.

No. 1 shows an old 4½ h.p. tricar bought by me in 1909 with the usual forecarriage.

You will notice the position of the radiator and petrol tank, also the handle-bar, steering, and diamond shape framework, to carry the forecarriage, the drive being taken on the back wheel alone. I found the wear and tear on the back tyre and the vibration so great that I set to work and converted it into the vehicle shown in photographs 2 and 3.

In order to do this I bought up a lot of odds and ends at a local auction sale very cheap, out of which I provided the machine with a couple of back wheels, and fitted them with a differential axle and small carriage springs, the new wheels taking the place of the old single driving wheel.

Over this I built a seat for two.

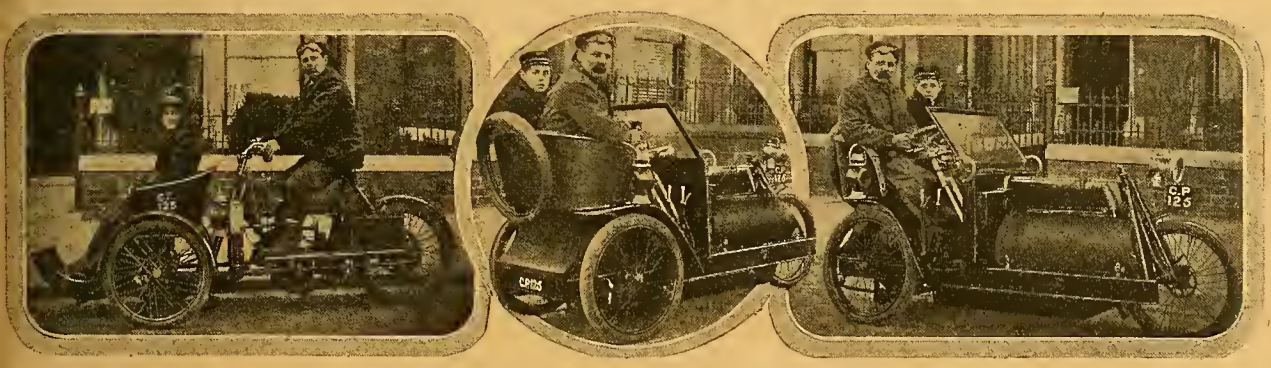
I used one of the old front wheels as a new front steering wheel, and as it was already fitted with a rim for band brake, I fitted it up with a band brake operated by a Bowden wire, controlled from the steering wheel, and in addition to this with a pedal brake. The two brakes together will now hold it on any hill.

In putting in the two wheels in the place of the old driving wheel, and a single steering wheel in the place of the old forecarriage wheels, I had to cut off the handle-bars level with the petrol tank, converting it to wheel steering, fitting the front steering wheel into a pair of old cycle forks operated through the old steering head. The socket through which the steering wheel now operates was built up out of the head of an old cycle as shown in the photograph, the old diamond shape framework to carry the tricar being done away with. The radiator now forms the lower part of the screen, and you will notice I have now fitted the car with complete undershield and covered the engine, etc., with a long bonnet. The petrol tank still retains its original position.

The box at the back provides ample room for spares, and plenty of room under seat for luggage. The long side pieces and framework are made of wood and used for appearance.

The alterations have not only reduced the original weight by 106 lbs., and made it 16in. shorter, but I have now got a steady running vehicle in place of a machine which, to say the least, took a great deal of jockeying to keep one's seat at anything over fourteen or fifteen miles per hour on rough roads.

The machine runs fifty miles to the gallon.



An old pattern tricar altered almost beyond recognition. See accompanying letter signed CP 125.

(1.) The tricar in its original form. (2.) Rear view of the converted vehicle with side by side seats. (3.) Three-quarter view of the altered machine which the owner much prefers.

I might perhaps point out that I have made the whole of the above alterations and fittings entirely myself, though by trade I am a builder, and have had no mechanical training, and I think these photographs may be the means of inciting others to make similar improvements.

I see no reason why an up-to-date small tricar should not be built on these lines. CP 125.

Delay in Execution of Orders.

[4819.]—I noticed in your paper a short time ago a complaint about the unbusinesslike manner in which some firms replied to repair orders. I may say in fairness to the F.N. depot I always receive most prompt attention for every small order. E F 216.

SUMMARY OF CORRESPONDENCE.

Will Cyril Morgan kindly send his address, not necessarily for publication, but as a guarantee of good faith?

Messrs. H. Taylor and Company write in appreciation of the Car and General Insurance Co., who settled their claim for burglary in full promptly and without any deductions.

EXPERIENCES WANTED.

"G.H., K.C." (Southbourne) would be glad of owners' experiences of electric lamps lighted by a dynamo driven off the rim of front wheel. Are such dynamos suitable for motor bicycles driven at speeds up to twenty-five miles per hour?

"G. L. A." (Ealing) would be glad of readers' experiences as to cost of touring in France.

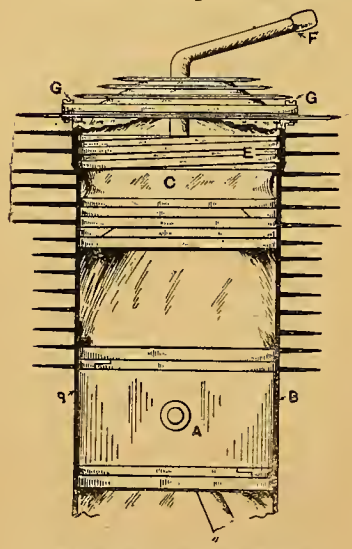
A NOVEL CAP.

WE have just been shown a patent cap produced with a special eye to motoring, which strikes us as rather a good thing for motor cyclists. Except for one patented detail, it is an ordinary waterproof cap of smart cut, provided with button-over ear flaps. The special feature is to be found in the peak, which is duplex and formed of celluloid. The lower flap of the peak is hinged to the front edge of the peak proper, and is provided with a recess to fit the nose, while it is edged with soft material. When the conditions are such as to make goggles advisable, *i.e.*, in wind, dust, or rain, the lower peak is pulled down the face, and it then encloses the physiognomy from the upper lip to the brow in a transparent shield of celluloid. The cap, known as the Phillips, is comfortable, and no goggles are required. It is obtainable from the majority of hosiers and outfitters.

Phillips's patent cap for motor cyclists.
A. Lower flap. C. Peak.
B. Hinge. D. Ventilators.

A SUGGESTED DEVICE FOR VARYING THE COMPRESSION.

"D. P." sends us the following description and sketch of a device for varying the compression, and says: "It is surprising to see no firm making attempts to devise a variable compression device for use on motor cycles. So much has been said and written of the advantages both of high and low compression engines, and there has been so much argument as to which is the better, that it naturally sets one trying to think of some idea to alter the compression whilst riding. An engine if fitted with variable compression should never overheat, as for ordinary running a moderately low compression could be used; but when an exceptionally steep hill was encountered and full power was required all that would be necessary would be to raise the compression, and immediately have the power of a T.T. machine. Appended is a sketch of an idea. A is the ordinary working piston, B the cylinder (somewhat higher than in present day engines), and C a small piston fitted to a screw thread E, so that if the handle F were turned it would turn the screw thread E, which would raise or lower the piston C, so altering the ratio of compression in the cylinder.



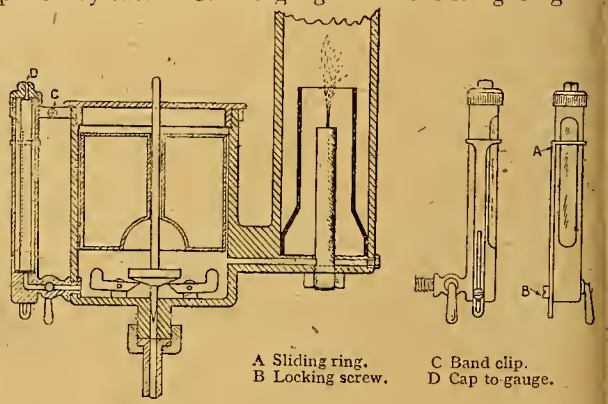
A suggested device for varying the ratio of compression in motor cycle cylinders.
A. The working piston. B. Cylinder.
C. Auxiliary piston. E. Screw thread.
F. Handle. G.G. Detachable head.

"With this engine one would also have all the advantages of a detachable combustion head without its disadvantages, as by simply removing the head G G the piston C could be unscrewed out of the cylinder and all carbon deposit cleaned off the piston and head. There would be no fear of loss of compression, as the piston C is fitted with two rings, which would prevent gas reaching the screw thread, or, in fact, leaking by at all, there would be no wear on the rings, and the slots would not widen."

A CARBURETTER PETROL GAUGE.

WE have pleasure in reproducing a drawing of a petrol gauge for carburetters, which has been sent us by Mr. J. L. Aldridge, 108, Brighton Road, Surbiton, S.W. It has been designed to save trouble in dismantling the carburetter to ascertain the petrol level.

When the gauge is fitted either to the spray or float chamber it is possible to ascertain the level of the petrol by means of the gauge. The sliding ring A should be set to the correct level and locked by the screw B. Once it is set correctly one only needs to turn on the tap to ascertain if the petrol level has altered, and if found incorrect the cover of the float chamber can be removed and the weight on the needle valve adjusted without dismantling the carburetter.



A Sliding ring. C Band clip.
B Locking screw. D Cap to gauge.

The device is provisionally protected, and the patentee is open to entertain offers for its manufacture.

COLOURED MAGNETO DIAGRAMS.

THE Bosch Magneto Co., Ltd., 40-42, Newman Street, Oxford Street, W., have produced a series of charts dealing with the DA2 magneto, similar to those issued with reference to the car magnetos. The book of charts should be in the possession of every motor cyclist, as with its aid the rider can get to know his magneto machine thoroughly at the expenditure of the least possible amount of trouble. Every material used in the construction of the magneto machine is shown in its correct colour, so that it may at once be recognised on referring to the actual article. In addition to the above, there is a diagram of wiring and a description of the working of the apparatus. No less than seven end views of the machine are given and a longitudinal section, full size, showing every detail in its correct colour. The price is 1s.

SCOTTISH SIX DAYS RELIABILITY TRIALS.

Scene at the start from Murrayfield, Edinburgh.

By Our Special Correspondent.

MONDAY, JUNE 6th.

THE Scottish Trials earned in 1909 the reputation of being the sternest test to which touring motor cycles have ever been submitted, and they will not surrender their fame in 1910. But they fail to secure as many entries as they deserve, partly owing to the fearlessness of the test they provide, partly to the expense of competing, and partly to the T.T. coming so soon before them. Only nineteen riders faced the starter at the Murrayfield car terminus outside Edinburgh on June 6th. The names and mounts of the stalwarts were given in my reference to the start in last week's issue, but I repeat the list for reference.

CLASS I. Allowed 10m. extra for each section.

S. J. K. Thomson (8 h.p. Bat, single-geared, and rigid sidecar).
*W. W. Douglas (2¾ h.p. Douglas with two speeds).
*G. L. Fletcher (2¾ h.p. Douglas with two speeds).
*P. Phillips (2¾ h.p. Douglas with two speeds).
*J. S. Holroyd (1¼ h.p. Motosacoche).

CLASS II.

P. W. Bischoff (3½ 1909 Triumph).
W. Pattullo (3½ 1908 Triumph).
J. T. Wood (3½ Zenith).
*W. Pratt (3½ Phelon and Moore).
J. Donaldson (3½ Bat).
*Bert Yates (3½ two-speeded Humber).
A. F. Downie (3½ Ariel).
*J. Slaughter (3½ Ariel).
R. A. Macmillan (5 Bat).
H. S. Bilbe (3½ two-speeded Humber).
A. V. Downie (3½ Ariel).
A. A. Hay (3½ Matchless).
W. Houghton (3½ Bradbury).
G. A. Alexander (3½ Excelsior).

*Trade rider.

Several of the machines deserve a line of special description. The Douglas trio, as I stated briefly last week, appeared for the first time in public with a two-speed gear, a miniature duplicate of the old Humber tricar, the gear box being bolted to the bottom tube of the frame under the front cylinder, and driven by chain off the engine, the drive from gear box to road wheel being by belt. The front shaft of the gear box is duplex and concentric, sprocket and pulley being within an inch of each other. The gears have ratios of 6 and 9 to 1.—Pratt's Phelon and Moore has sidecar ratios of 5 and 9⅓ to 1 in view of the bad hills. Thomson is up against the toughest proposition of the Trial in attempting to get through on a single-geared machine with a sidecar, but he has actually succeeded in driving the combination up Amulree in practice. To prevent punctures he has roped an old cover minus its beads over the back tyre.

The First Stage Easy.

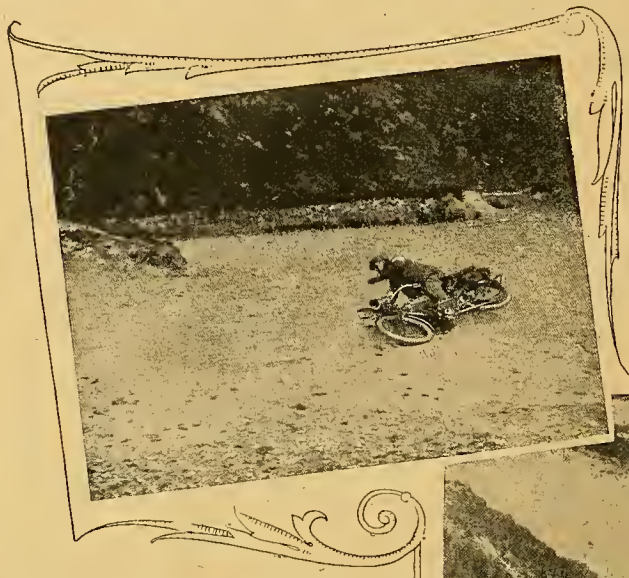
Just to put us in good spirits the trial opened with a very easy stage of eighty-two miles to Arrochar on the shore of Loch Long. The first sixty-three miles consisted of flat, broad turnpike, until near Balloch we ran into view of Loch Leven. Thence to Aberfeldy the scenery absolutely baffled description, and many of the most *blasé* riders declared they had never seen anything so magnificent. For close on a hundred miles the road threaded its way through superb pine forests close to the beach of tremendous lochs. Under a brilliant sun and cloudless sky these vast lochs shimmered a deep ultramarine in their craggy prisons. Sheer from their very brims towered the great Bens, mountain after mountain 3,000 feet high, clad in pine towards the foot, rising higher and higher in shades of roan and violet, and maroon and sage, with here and there a patch of white snow or black rock, till the eye reached their gnarled peaks, clearly silhouetted against a golden haze. Unfortunately, rough going, dangerous corners, and numerous steep little pitches compelled the riders to devote the best part of their attention to the track.

No troubles were heard of until after lunch, when the riders, after skirting the northern end of Loch Long, struck up into Glen Croe, a six-mile zigzag climb, ending in the terrible elbow turn just below the "Rest and be Thankful" stone. The two-speeded brigade were completely routed here, and the average of the performances was mediocre to a degree, for if the sun was hot, a strong wind was blowing up the pass. Overheating was rife, and I especially noticed that the machines which paused for various purposes halfway up had a good deal more ginger in them at the summit than those which came up practically in one run. Three fine climbs were registered. Yates's Humber took the corner close in where the gradient is worst. Bischoff, to whom the hill was strange, looked like muffing the bend and charging the bank, but made a splendid recovery and got up well. Pattullo rode up neatly with pedal assistance. Slaughter and Wood took heavy tumbles, and Donaldson, coming up impossibly fast, ran into the deep ditch and stuck there. All the rest stuck a quarter of a mile or more lower down, but several of them took the corner smartly after cooling their engines.

P. Phillips two-speed Douglas) climbing the precipitous Allargue Hill on the second day.

The Scottish Trials.—

notably G. L. Fletcher. The climb proves that a two-speed gear is of very limited assistance in really mountainous districts unless used in combination with an engine that can keep cool. Quite the finest achievement goes to Thomson's credit. His belt started slipping about halfway up. He adjusted a Whittle belt to a low ratio, and came roaring up on his powerful Bat. Just on the knuckle of the bend he skidded his combination violently, and, while his passenger hung out across his back carrier, swung round and shot up. The wrench, however, proved his undoing later on, for the saddle-pillar stay of the sidecar buckled.



J. Slaughter 3½ h.p. Ariel) suffers a fall at the hairpin bend on Rest and be Thankful.

However, he made a temporary repair with a strap and a stout ashstake purloined from the hedgerow, and when last sighted was going strong.

Scotland is the land of cheap motor spirit, and several competitors are running on fuels seldom heard of south of the Tweed. Several riders got hold of a patent spirit selling at 7d. a gallon, which produces a very pungent exhaust. Its smell made Yates quite ill. Pratt put a match to some more, and it burnt with murky fumes. Fletcher poured some more in a gutter, and reports finding it still there half an hour later. Several others filled their tanks with it, and, taking their machines into the basement of their hotel, were presently requested to leave owing to the stench. Quite a number of the riders are using a fuel known as Ross spirit, having rather a heavy density, and they say they can obtain extraordinary power from it after enlarging their air intakes.

The Official Cars.

Three cars are accompanying the trial—a 20 h.p. Rothwell, carrying officials of the Edinburgh Club, among others R. J. Good, who, with B. H. Davies, is acting as judge: Davies is driving a 20 h.p. Ford, a light-looking American runabout, which climbs most things on top gear; the third car is a 14-16 h.p. Pelsize, driven by W. Hall, of the Vacuum Oil Co.

At 10 p.m. the following are still missing: Two of the three official cars; Houghton's Bradbury (retired owing to collision with cart); Thomson's sidecar (reported ditched near Dalmally); Bilbe's Humber (cause unknown); and Hay's Matchless.

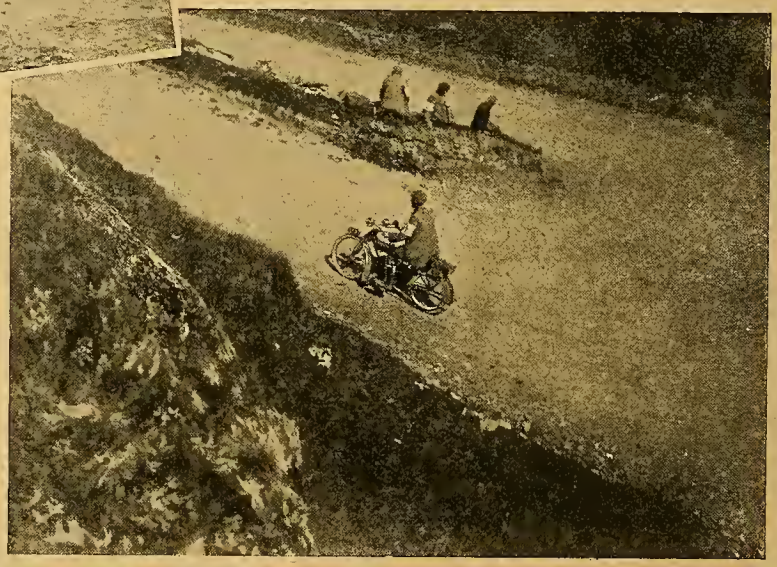
TUESDAY, JUNE 7th.

"Roads and the men I sing!" As was expected, to-day's journey of only 136 miles in length has proved by far the most severe day's ride to which motor cycles have ever been subjected in any competition. From last night's sleeping place, Aberfeldy, we ran into Pitlochry and, crossing the End-to-end route, climbed over Carn Dubh, through Kirk Michael up to the Spittal of Glenshee. There we faced the stiffish climb round the ill-famed Devil's Elbow over Cairnwell Summit, 2,200 feet high, which is the highest road in Great Britain. Coasting down into Braemar for lunch, we ran along a broad slippery turnpike as far as Balmoral Castle, where we took an unspeakably vile cross cut over the shoulders of the moors down to the Cockbridge Hotel.

The Worst Main Road Hill in Britain.

Past this house rises the worst main road hill in Britain, known as Allargue Hill, variously described by the competitors as two Suttons or three Porlocks rolled into one. A rough and dangerous descent, containing one pitch of 1 in 3, ending in a hump-backed bridge, goes down into Tomintoul, whence the moorland route into Grantown is again rough and perilous.

From Grantown to Inverness the roads ought to have been good, as the rain had cleared off soon after breakfast, but fifteen miles out of Inverness we ran into a cold, white mist, and found on the roads a liberal coating of the terrible



A competitor on a two-speed Douglas taking a wide sweep round the same bend.

skid porridge which had made the soft stretches of the mountain roads so treacherous. Out of the 136 miles, only about twenty miles were either dry or smooth. The whole of the remainder were either steep, stony, or slippery, and not infrequently all three at one and the same time.

The veteran trade riders regard the day's journey as equal in severity to any 500 miles of the stiffest A.C.U. trial ever held. The hill off the Balmoral road, for instance, contained many patches of single figure gradient, and was very greasy. Reefs of rock projected up through it, watercourses a foot deep ran across it; it was scarred with deep ruts and strewn with lumps of granite. Two of the descents (from Allargue Summit and down to Bridge of Brown) were positively hair-raising at intervals, and as for climbing, Allargue Hill, two miles in length, averaging 1 in 7, with four wicked turns near the bottom, easily surpasses any English ascent in severity.

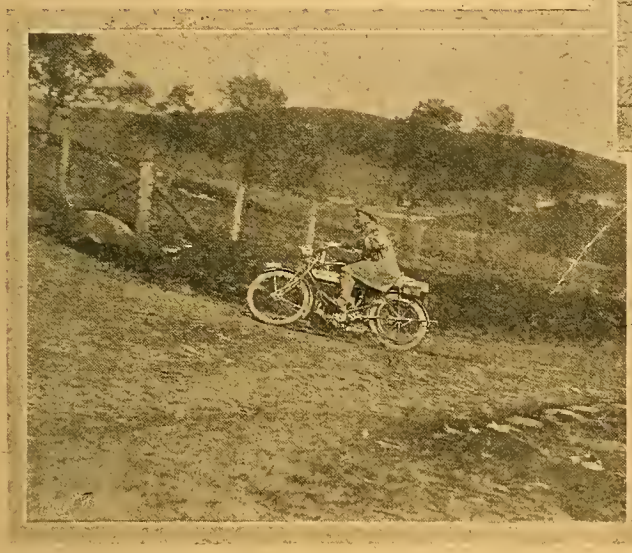
Our little 20 h.p. Ford car only weighs 10 cwt., and is about equal to a 3½ h.p. two-speeder bicycle, climbing all

The Scottish Trials.—

ordinary slopes on top gear. It romped out to the Spittal of Glenshee in fast time, and though anxious to reach the far worse ascent at Allargue we waited to see the leading men slither round the Devil's Elbow on the climb of 2,200 feet up to Cairnwell Summit.

Wood's Zenith-Gradua was the first machine up; the sodden surface made him slow and careful, but he never faltered. Bischoff's Triumph was very perceptibly faster, the rider's previous acquaintance with the hill standing him in good stead. A. F. Downie charged the bank at the top kink of the Elbow, but restarted a few yards higher up. As no other riders came along, we slid and bucketed down into Braemar, and after a hasty lunch tackled the cross cut to the Cockbridge Hotel—easily the vilest road ever traversed by any trial.

Reaching Allargue Hill, which begins just below the inn, we drove the car up and returned to witness the competitors' struggles, providing drinks for the failures low down. The landlord did not recommend whisky. "It's a slow poison, man! I grew tired of life forty-five years ago, and I've drunk whisky ever since, but it hasna taken the smallest effect!" It was impossible for us to watch the riders up the whole of the hill owing to its great length and many bends, and no competitor can be certified officially to have made a clean ascent.



P. W. Bischoff (3½ h.p. Triumph) about to strike a steep section of Allargue Hill

The Worst Turns at the Foot.

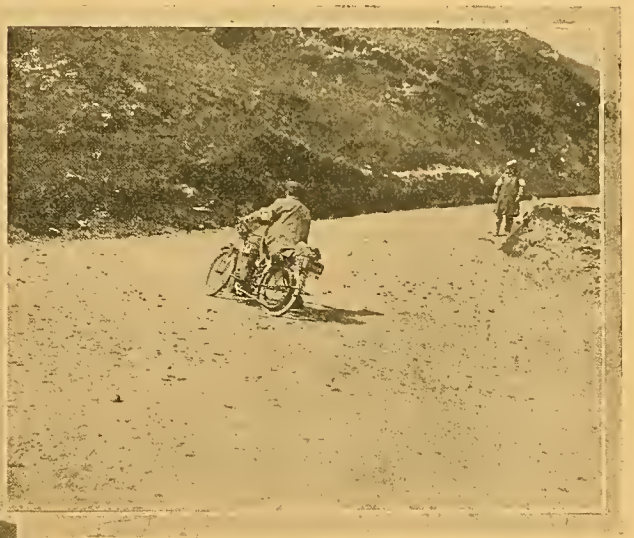
The severity may be guessed from the fact that a two-speeded 7-9 h.p. machine, owned by a spectator, failed completely in its first two essays. The worst gradients and the sharpest turns come right at the bottom. Wood's Zenith rounded the first bend well, but when it disappeared into the wood overhead, the rider was running alongside. Pratt's Phelon and Moore and Yates's Humber passed us going strongly, and are believed to have made clean ascents. A. F. Downie went up a bit at a time. Fletcher and Douglas seemed by the beat of their engines to take the climb in serial numbers. Holroyd was still in the saddle of the Motosacoche when last seen, but was looking as if he could not pedal much longer.

Slaughter's fate is "wrop in mistry," but his engine had a reluctant beat. Bischoff was the only rider who knew the hill of old, but his engine "konked" itself to a standstill just above the first bend, and as he dismounted his belt broke. After a wait of half an hour he tried again, and this time went right up with hard pedalling. Phillips's Douglas, thanks to strong pedal assistance, got up more than halfway, and might have finished if the near pedal, damaged in a previous fall, had not come adrift. The other eight starters were still missing when we had waited two hours on the hill, and finally we walked up to the car and started for Tomintoul.

Patches of Snow.

Just as we noticed great patches of snow far below us, we saw a machine prone on the moor near the road a few hundred yards ahead. Wood had burst a tyre at speed, and his Zenith, charging off the road, had buckled both wheels and its front forks down the rough mountain side.

We helped him to straighten the machine out enough to permit of its being wheeled, and directed him to the nearest railway station, fifteen miles away. On the way home we



A. F. Downie (3½ h.p. Ariel) rounding one of the bad bends on Allargue.

only encountered Bischoff, who is a really clever rider with a good machine, but has been up against cruel luck with frequent punctures and belt breakages.

A few miles of decent going near Grantown put fresh heart into the riders but on the mountains south of Inverness we ran into a death-cold white mist, and a renewal of skid porridge made the travelling rather dangerous. Ten of the eighteen starters got in fairly early, all very tired, their machines mostly very dirty, and the wheels showing the marks of rough usage.

A Marvellous Performance.

Thomson registered perhaps the most heroic performance in the annals of motor cycling by getting his damaged side-car in by 10 p.m. He is reported to have made a splendid ascent of the Devil's Elbow, and to have made a non-stop ascent of Allargue after shedding his passenger at the foot. The two facts that the Bat is single-geared and that Allargue is regarded as too severe for inclusion in the Car Trials bring the merit of this performance into due relief.

Marks Lost on Tuesday.

W. W. Douglas (2¾ two-speed Douglas), 0
G. L. Fletcher (2¾ two-speed Douglas), 18
P. Phillips (2¾ two-speed Douglas), 0
J. S. Holroyd (1¼ Motosacoche), 0
P. W. Bischoff (1909 Triumph), 2
W. Pattullo (1908 Triumph), 26
W. Pratt (3½ two-speed P. and M.), 0
J. Donaldson (3½ Bat), 28
B. Yates (3½ two-speed Humber), 0
A. F. Downie (3½ Ariel), 0
J. Slaughter (3½ Ariel), 0
B. Macmillan (5 Bat), retired
G. A. Alexander (Bat), 60
S. J. K. Thomson (7-8 Bat and sidecar), 60
A. V. Downie (3½ Ariel), 60
H. S. Bilbe (3½ two-speed Humber), missing at midnight
A. H. Hay (3½ Matchless), missing at midnight.

Important Decision.

The judges have decided that owing to the fearful severity of the Braemar-Grantown section and its inadequate road-marking, no competitor shall be debited with any loss of marks over that section. Further, as J. S. Holroyd (1¼ h.p. Motosacoche) was the only man to check into Grantown inside maximum time (he had 2m. to spare), they have awarded him a special prize for his magnificent performance.

The Scottish Trials.—

WEDNESDAY, JUNE 8th.

The third day's journey followed the classic record route up to John-o'-Groat's, and, continuing *viâ* Huna into Thurso, was 174 miles long, or twenty-one miles longer than the sixth day of the 1908 A.C.U. run. In spite of this, the

J. T. Wood busy at work on his Zenith-Gradua at the top of Allargue Hill. This competitor was unfortunate, as, whilst travelling fast, his front tyre burst, causing a fall which buckled both wheels.

competitors regarded it in the light of a picnic after the strenuous work of the first two days, and their Scotch practice has made them so astute at hairpin bends that Berriedale troubled nobody.

There is good news of yesterday's absentees, except poor Bilbe, who is reported to have collided with a lorry on the Spittal of Glenshee. That lion-hearted sportsman, Allan Hay, crackled into Inverness on his 3½ h.p. Matchless at 1 a.m. He has passed his fiftieth birthday, yet he lives on the roads, though he is always in trouble, and cannot start without the help of pushers except downhill. His normal hour of arrival at the night stop is well on towards daybreak, and yesterday, after several tumbles, he walked the last seven miles into Inverness; yet he was up at 6 a.m., as fresh as a lark, and more than a match for anybody who tried to chaff him.

Wood sent word that he was repairing his bent forks at the Cockbridge Inn, and intending to push on at daybreak. He actually reached Inverness at 10.30 a.m. on Wednesday—two and a half hours after we had left. Thomson arrived at 10 p.m., the forcing of a single-geared sidecar outfit over yesterday's route being a feat of unparalleled merit. He fitted two new covers this morning—his 8 h.p. engine rips at the tyres whenever he opens the throttle. Thus Bilbe, Houghton, Macmillan, and Wood were absentees at 8 a.m. to-day.

I saw very little of the riders during the day, and when I attempted to manœuvre the car out of the garage, I made the alarming discovery that turning the steering wheel to the right deflected the road wheels to the left, and *vice versa*; this was due to an impact with a collie on Tuesday, and took an hour to remedy, so we were late in starting.

Baffled Experts.

Overtaking the field by Brora, we were presently in difficulties with the carburetter of the Ford. The three *soi-disant* experts in our crew, A. D. Draper, J. W. Rutter, and B. H. Davies, spent two hours on it to no effect, till at last some inspired genius started the engine up for the hundredth time, and the car ran better than it had ever done before. No one knows what was wrong, nor how it was remedied. Our photographer went on to Berriedale with the Rothwell car, and was marooned there by his heartless driver minus any lunch. He reports that all the men took this tricky ascent cleverly.

We found Hay mending his belt in Berriedale, and presently Wood overtook us on his Zenith, having ridden 180 miles since sunrise, and having still fifty more to cover. Presently we repassed him, busy with tyre troubles. Bischoff is also experiencing cruel luck with his tyres. By truly Herculean labours he managed to take out both wheels in the adjustment hour this morning and to change his covers over, but he has had four more punctures during the day.

At Wick, Mr. Robertson, who has despatched so many aspirants for record honours upon their arduous journey, gave us the news of Hugh Gibson's glorious sidecar record, which reminded us of the equally meritorious achievement Thomson is even now engaged upon. He has straightened his buckled stay, cut it down, and re-attached it at a different angle, and his corner work on the 1 in 5 hill elbows is enough to make a marble statue's hair stand on end. This is by compulsion, as if he ever let his single-geared engine slow down seriously on such grades, it could never pick up.

Did he Lean Inward or Outward?

We ran into John-o'-Groat's for tea, and as we left the veteran Hay crackled up—he is not an advocate of silence. We pushed him off again, and following him closely down the Thurso Road saw him approach one of the right-angle corners near Huna at 40 m.p.h., leaning over at an inclination of something like 30°. There was a cloud of dust, a crash and a thud, and when we got up nothing was to be seen of the Matchless, while its rider was lying through the bottom gap of a barbed wire fence, wagging his head ruefully. We extricated him, not a whit dismayed, and got assistance to haul his machine out of a deep ditch, in which it had disappeared from view.

Hay regards it as his *métier* to provide the comic relief of the trials, but though he never takes himself seriously, he is quite the toughest sportsman of the whole crowd.

We then drove into Thurso without further incident after a glorious day's run of 174 miles under a burning sun. Entrants for the A.C.U. End-to-end trials will be relieved to hear that excepting a very few miles immediately south and north of Inverness, and a short patch near Dalwhinnie, the road they will traverse is in exceptionally good condition this year. The Scottish car trials, which usually cut up portions of the route rather severely, have been abandoned, and unless severe weather is encountered the going next month should be good.

A Clever Temporary Repair.

A. F. Downie has managed a clever piece of riding. His drain tap came adrift from his petrol tank; he managed to plug it with a lump of soap, and using his handkerchief as a lashing rode for many miles. Finally the lashings came adrift when time was precious, and he held the soap plug in position by hand, changing hands from time to time, as either hand was required for lubrication purposes, etc.

A competitor at the bad bend on Berriedale hill, travelling northwards. The gradient at this point is 1 in 5½.

Thomson's repair to his sidecar stay turns out to be a clever piece of amateur mechanics, for arriving in Inverness very late at night he pushed his machine into the hotel porch, straightened the bent tube at the fire in the lounge, and cut it with an ordinary hand file. Yates's machine is keep-

The Scottish Trials.—

ing exceedingly clean, and the Motosacoche has run most consistently.

The following is a statement of marks lost up to date:

	First two days.	Wed.		First two days.	Wed.
Thomson ...	120	0	Yates ...	0	0
Douglas ...	0	0	A. F. Downie	0	*
Fletcher ...	31	0	Slaughter ...	38	0
Phillips ...	0	0	Macmillan ...	Retired	—
Holroyd ...	0	0	Bilbe ...	Retired	—
Bischoff ...	12	0	A. V. Downie	60	*
Pattullo ...	31	0	Houghton ...	Retired	—
Wood ...	60	60	Alexander ...	120	27
Pratt ...	0	0	Hay ...	120	60
Donaldson ...	88	0			

* Denotes lost time card.

Note.—The maximum number of marks which can be lost on one day is 60.

THURSDAY, JUNE 9th.

The fourth day's route began with the Betty Hill section, along which most riders lost their chance of a gold medal last year, but the weather conditions were a pleasant contrast. Last year we had pouring rain and boisterous winds, to-day there was scarcely a breath of air and the sun was grilling, while the surface was at any rate no less atrocious. Fletcher, however, had a nasty smash, seriously damaging his front forks. Thomson wired yesterday for two Kempshall covers, hoping to break a long sequence of tyre troubles, but they did not fit his rims, and further punctures and bursts delayed him. Phillips was also missing at lunch, and up to the time of writing W. W. Douglas is the sole representative of his trio. After lunch at Bonar, the men took the picturesque cut over Aultramein Hill into Dingwall, and following the record route to past Beauly, turned off at Glen Urquhart, and entered upon the most picturesque stretch of the entire route. The glen is narrow and exceedingly lovely, with a little brook trickling beside a passable road. The drop from the summit into Drumnadrochit struck the writer as about the worst hill he has ever seen. Passing Drumnadrochit we reached the shores of Loch Ness. For twenty miles a narrow terrace of red road clings desperately to the sheer scarp overhanging the loch, the finest freshwater lake in Britain. The six-foot lane winding through balmy forest of larch and pine was not an ideal place in which to catch up time, and must have troubled five riders whom we saw littered along three miles of road near Beauly: Holroyd and A. F. Downie with tyres, and Bischoff, Wood, and A. N. Downie with broken valves—a common trouble on this baking day. They have all arrived, and have ridden pluckily round corners where many a car would have to reverse. Pratt, Douglas, Slaughter, Yates, and Pattullo complete the ten who have arrived up to 9 p.m. The latter have all had an easy day.

Three competitors in the trials ascending one of the steep Scottish passes in company. The rider in the foreground is J. Slaughter (3½ h.p. Ariel), who was awarded a silver medal. W. W. Douglas (2¾ h.p. Douglas), who won a gold medal, is on the right, and Bert Yates (3½ h.p. Humber), a gold medal winner, in the background. Observe the group of canine spectators.

The veteran competitor in the Scottish Trials, Alan H. Hay (3½ h.p. Matchless), who, despite one or two falls and a difficulty in starting, pluckily stuck to his task until Friday, when he was forced to retire through another fall.

The competitors are looking forward with some trepidation to the climb out of Fort Augustus to-morrow, a straight road rising for 1,000 yards, average gradient 1 in 5, reputed to contain a patch as near 1 in 3 as possible. Owing to the heat and numerous hills, the consumption of oil has been phenomenal, some using half a gallon per diem. The engines are now somewhat carbonised, and it is not likely there will be many entries for the special time prizes to-morrow. Fletcher has just arrived with his frame six inches askew. It is miraculous how he can steer it at all. He rode off the road into a ditch, and later rammed a cow, cannoning off into another ditch. Alexander is also in, and Bilbe, who retired on Tuesday, has ridden his Humber across to greet us. He took a bank at Kirk Michael to avoid two carts, and found it prudent to retire.

The following is the marks register for Thursday: Losses—Fletcher, 15 (collision); Phillips, 46 (tyres); Wood, 22; Donaldson, 60; A. F. Downie, 10; Alexander, 60; Hay, 60; and Thomson, 60. Holroyd, Douglas, Bischoff, Pattullo, Pratt, Yates, Slaughter, and A. V. Downie lost no marks.

FRIDAY, JUNE 10th.

Fort Augustus to Aberfeldy *via* Errogie, the Grampians, and Ballinluig, 122 miles.

The timed hill-climb at Glendoe was the *pièce de résistance* of to-day, and as the hill commenced one mile from the hotel most of the competitors walked out last night to inspect it. As is usually the case, the gradient has been vastly exaggerated, though a hill including five separate pitches of 1 in 5 must always command respect. Entry was optional, and Hay, Pattullo, Holroyd, and the younger Downie preferred to surmount the hill unofficially. The Ford was the only car present capable of climbing the severe grade, and it was kept pretty busy laying telephone wires, conveying flag-waggers, etc. It was decided to time the men up to the danger board, the length thus being increased to 1,200 yards, a dip some twenty yards in length giving engines a chance to pick up after 980 yards. Just before we all started out Hay and Donaldson got in after spending the night on the road, with a whole Odyssey of adventures to relate. Hay, after his usual pack of trouble, had waited for daybreak, regarding the Loch Ness road as too dangerous for night driving, while Donaldson had been busy at work on his tyres. The general level of the performances on the hill was excellent, in view of the fact that the machines have undergone a tremendous gruelling, and that the hill is unquestionably formidable.

The Scottish Trials.—

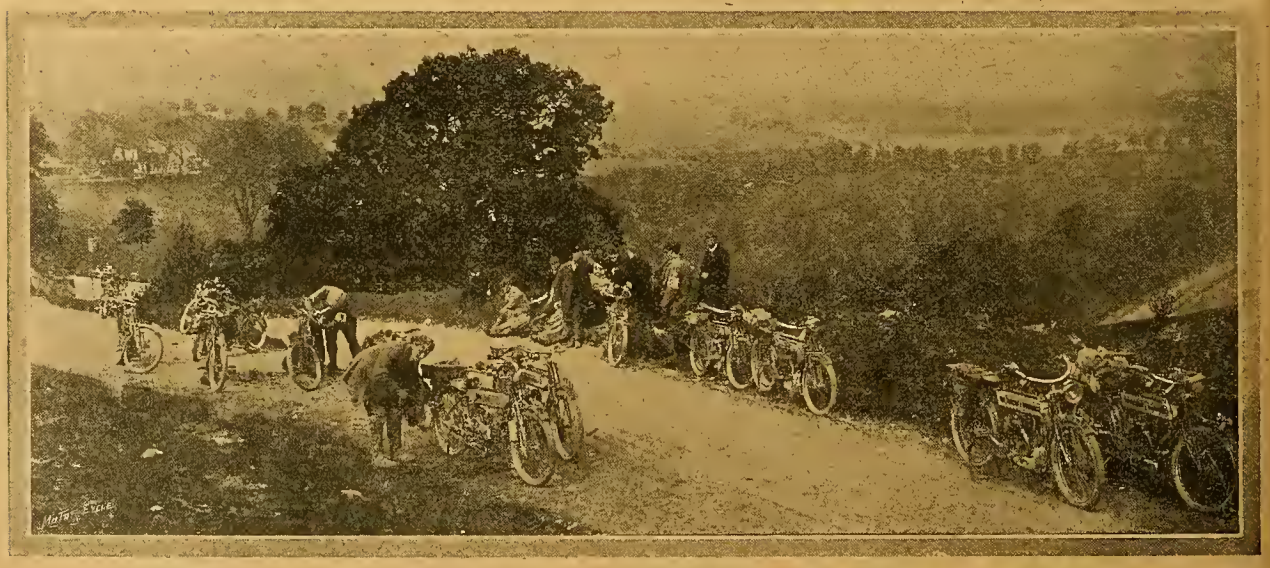
Competitor and Machine.	Time.
S. Thomson (8 h.p. Bat, single-geared sidecar, heavy passenger) ... ... The 8 h.p. J.A.P. engine scarcely slowed a tick on a 5 to 1 gear. Both men assisted the machine by jerking their bodies forward. The writer never thought there was anything in this trick, but it seemed to help them on the worst 1 in 5 bit. Second fastest time.	1m. 54⅕s.
W. W. Douglas (2¾ h.p. two-speed Douglas) ... Slow. Pedalled hard the whole way up.	3m. 8s.
G. L. Fletcher (2¾ h.p. two-speed Douglas) ... Very good indeed. Gave a few strokes with the pedals now and again. His first ascent, faster still, was missed by the time-keepers.	2m. 13⅕s.
P. Phillips (2¾ h.p. two-speed Douglas) ... ... Fair.	2m. 55⅖s.
P. W. Bischoff (1909 Triumph) ... ... Had under-estimated the hill, and, gearing too high, failed low down. Afterwards climbed the hill fast unofficially in 1m. 42s. on a lower gear.	———
J. T. Wood (3½ h.p. Zenith-Gradua) ... ... Made a driving error on first steep pitch, but after running alongside over the knuckle, picked his engine up and finished very fast.	2m. 18⅖s.
W. Pratt (3½ h.p. P. and M.) ... ... Sailed up quite easily, using his low gear all the way.	2m. 18⅖s.
J. Donaldson (3½ h.p. Bat-J.A.P.). Fastest time... Magnificent climb. Some consolation for his night on the road. Had to use his brakes hard on one of the top bends.	1m. 31s.
B. Yates (3½ h.p. Humber two-speed) ... ... The Humber engine licked up the grade easily.	2m. 22⅖s.
A. F. Downie (3½ h.p. Ariel) ... ... Failed.	———
J. Slaughter (3½ h.p. Ariel) ... ... Went up easily and fast.	1m. 59⅕s.
G. A. Alexander (3½ h.p. Excelsior) ... ... A neat climb. Slow, but sure.	2m. 8⅖s.

Of those who did not enter for the special hill-climb prizes Hay (3½ h.p. Matchless) failed close to the bottom and hired men to push him up. The same applies to A. V. Downie. Dr. Pattullo went up quite fast and ought to have entered for the timed sprint. Holroyd's Motosacoche took itself up at about five miles per hour with its owner walking comfortably alongside. This is Holroyd's usual method of ascending severe hills.

A good impression of a winding Scottish hill. The rider is P. W. Bischoff (1909 Triumph) ascending Glendoe.

Rain began to fall soon after the last man had passed the summit, and continued as far as Pitlochry, the going being mostly rather rough, but not greasy. The authorities are doing their best to convert the Grampian Road into a first-class highway. We passed several gangs of roadmenders, who spend weeks up in the pass, sleeping in a caravan at night, and constantly supervised by the surveyor, who uses a De Dion car. The road is being widened, bends eased, and grades toned down, but neither the foundation nor the surface is hard as yet, and a little bad weather still makes the road very unpleasant.

Passing Thomson's sidecar we noticed that the frame was again strained, and the machine was tilted towards the sidecar in dangerous fashion, while the fore end of the wicker chair was evidently fouling any bumps in the road. Having lost his front mudguard on the first day, he was greatly troubled by mud-flinging, which stuck up his carburetter slides. Ere long this plucky pair, Thomson and his passen-



Scottish Trials. Competitors and their machines assembled at the foot of Glendoe between Loch Ness and Whitebridge.

The Scottish Trials.—

ger Somerville, had to uncouple the sidecar and carry it on their heads over a river, the bridge being broken down by floods. At Ballinluig the men turned off the End-to-end route to follow the north bank of the River Tay, cross at Grantully Bridge, and so into Aberfeldy.

To-day's marks list is as follows: Lost 0, Douglas, Fletcher, Phillips, Holroyd, Bischoff, Wood, Pratt, Yates, A. F. Downie, Slaughter, and A. V. Downie; Donaldson, 46 (tyres); Alexander, 60 (tyres); Thomson, 60 (various); Hay, 66 (not arrived yet).

Formula Results in Glendoe Hill Climb.

CLASS I.—Single-cylinder Handicap.

1.	Donaldson ...	665.9	5.	Yates	406.1
2.	Slaughter ...	515.9	6.	Alexander ...	390.01
3.	Wood	450.9		Bischoff and A. F. Downie	
4.	Pratt	412.8		failed.	

CLASS II.—Twin-cylinder Handicap (Formula).

1.	S. Thomson ...	652.1	3.	P. Phillips ...	327.4
2.	G. L. Fletcher ...	436.6	4.	W. W. Douglas...	296.9

CLASS III.—Open Scratch.

1.	Donaldson ...	1.31	3.	Slaughter ...	1.59⅕
2.	Thomson ...	1.54⅕			

SATURDAY, JUNE 11th.

Aberfeldy to Edinburgh, *via* Amulree, 109 miles. The close of to-day's run was the ascent of the terrible Amulree Hill from the Sma' Glen side, and after the cloudburst of Friday everyone was anxious about the surface of the steep and twisty road up Glen Quaich. Fortunately for the competitors the storm had not reached so far, as we soon discovered when we drove our trusty little Ford car out along the Killin Road and put it at the Kenmore side of the hill. This is the incline which the A.C.U. men are being taken out of their road to face. Frankly, we consider it unlikely that many of them will get up. Bischoff was the first man up. He took the bottom bend badly, and stopped his engine, but jumping off restarted very cleverly, and by dint of hard pedalling reached the summit in the saddle. Other riders afterwards took the bends better, but nobody else made quite so easy an ascent. Douglas failed at the lower bend, his engine having had quite enough of it. Yates hugged the bottom bend too closely for success, rounded the second, when his engine being nearly done he freed it, and aided by a push from the spectators, got off again, and all but reached the top.

Wood, A. F. Downie, Pattullo, and Pratt all stuck at the beginning of the elbow, the latter charging the bank with considerable force. Pattullo on restarting finished the 1 in 6.2 portion above the elbow better than anybody else except Fletcher.

Slaughter had been seen running alongside on one of the lower 1 in 5 stretches, and we expected nothing startling from him in consequence. However, he electrified us all by

Spectators on the banks of Amulree watching P. Phillips (2¾h.p. Douglas) rounding the first bad bend.

taking the elbow in brilliant style, though his engine failed again 100 yards higher up. The little Motosacoche took the lower pitches in its usual leisurely fashion, Holroyd slacking the jockey pulley to permit a little belt slip, and walking alongside at four or five miles an hour, while the machine took itself up "and a bit of him," as he puts it.

Phillips next appeared and negotiated the corner quite nicely, only to fail above it. Fletcher puffed up to within 100 yards of the elbow, stopped his engine with the utmost *sang froid*, and asked McGregor for a route card. After a short cool he restarted, and climbed to the very summit in neat style on his low gear. A. V. Downie and Alexander failed down on the foothills. Everybody was eagerly wait

The judges, Messrs. B. H. Davies and R. J. Good, examining the machines at Murrayfield, Edinburgh, at the conclusion of the trials.

The Scottish Trials.

ing for Thomson and Somerville with their 8 h.p. Bat one-gear sidecar. At last the combination swung round the final bend below the elbow, and though both men were jerking their bodies in unison, it was plain from the beat of the engine that the 8 h.p. Bat was a trifle weary. With wonderful precision they altered their policy. Dismounting earlier than they had intended, they ran the machine round the lower bend, hauling it straight, pushing it up, and pressing it down as it leapt off the rough surface, with marvellous judgment and agility. Bucking like a broncho, it pounded quickly round the upper bend, both men wrenching, shoving, and leaning on it as they galloped alongside up the 1 in 6 slope, amid loud plaudits; but flesh and blood could not stand such a strain for long, and eighty yards higher up Thomson sadly stopped the engine, but many willing hands helped them off ten minutes later.

Saturday's Results.

Full marks were gained by W. W. Douglas, G. L. Fletcher, P. Phillips, J. S. Holroyd, P. W. Bischoff, W. Pattullo, J. T. Wood, W. Pratt, B. Yates, and J. Slaughter.

J. Donaldson, V. Downie, S. J. K. Thomson, and G. A. Alexander lost sixty each. F. Downie lost three. A. Allan Hay retired owing to an accident on the Friday afternoon.

The provisional results are as follow:

SPECIAL PRIZES.

J. S. Holroyd (1¼ h.p. Motosacoche), best performance on a lightweight; also medal for best performance on Braemar-Grantown section.

P. W. Bischoff (3½ h.p. Triumph), best performance using Ross spirit.

The three Douglas riders have been awarded the team prize.

GOLD MEDALS—FULL RELIABILITY MARKS.

W. W. Douglas (2¾ h.p. Douglas), J. S. Holroyd (1¼ h.p. Motosacoche), W. Pratt (3½ h.p. P. and M.), and Bert Yates (3½ h.p. Humber).

SILVER MEDALS.

G. L. Fletcher (2¾ h.p. Douglas), lost 28 marks; P. Phillips (2¾ h.p. Douglas), 46 marks; P. W. Bischoff (1909 Triumph), 12 marks; W. Pattullo (1908 Triumph), 31 marks; F. Downie (3½ h.p. Ariel), 13 marks; and J. Slaughter (3½ h.p. Ariel), 38 marks.

BRONZE MEDALS.

J. T. Wood (3½ h.p. Zenith-Gradua), lost 142 marks; J. Donaldson (3½ h.p. Bat), 254 marks; G. A. Alexander (3½ h.p. Excelsior), 308 marks; S. J. K. Thomson (7-8 h.p. Bat and sidecar), 241 marks; and V. Downie (3½ h.p. Ariel), 120.

HERTS COUNTY A.C. OPEN HILL-CLIMB.

Aston Hill-climb. A general view at the starting point of the Herts. County open Hill-climb at Aston Hill, Tring, on Saturday last.

THE annual open hill-climb for motor cycles, promoted by the Motor Cycle Section of the Herts County A.C., was originally fixed for Saturday, 7th May, but owing to the lamentable death of His Majesty King Edward the event was postponed until Saturday last. The greatest difficulty with which the committee of the club had to contend was to fix upon a date which did not clash with any other important motor cycle fixture, and in this they succeeded, although by holding it on Saturday they unfortunately clashed with an important fixture of their own Car Section, who were holding a motor gymkhana near Watford, thus dividing the interest of their own members. A splendid entry, totalling 111 machines, had been received, but as was to be expected, as a result of the postponement, a number of these were unable to put in an appearance on this occasion, only sixty-one answering to their names when called upon. This was, however, sufficient to afford a most interesting afternoon's sport. The Rose and Crown Hotel, Tring, was the club headquarters for the day, and here the weighing arrangements were carried out under the direction of Messrs. F. G. Carter, A. F. Petch, H. O'Hagan, and Dr. Upcott Gill. As usual, one or two of the competitors arrived late, quite expecting to be weighed in, and they were able to tell such pitiful tales of mishaps and delays on the road that the officials felt compelled to relent and allow them to be weighed. Whilst the weighing was in progress, the judge, Mr. J. W. G. Brooker, was very busy examining every detail of the machines, to see that they conformed to the necessary requirements. These formalities over, competitors and officials made their way to Aston Hill, which is about three miles from Tring on the road to Wendover, and is the same hill upon which the previous hill-climbs have been held. It is about 1,320 yards in length, and has a total rise of about 440 feet.

Disfiguring the Countryside.

On arriving at the hill one would have imagined that some enterprising advertising agent had hired the place, for the railings near the starting point had been disfigured by advertisements of rival vendors of motor spirit—a practice which is much to be deprecated, and which the committee, in the interests of the club, would do well to consider the advisability of putting a stop to in future. Prior to the start of the competition a number of non-competitors amused themselves by riding up and down the hill, but the majority of them made very sorry exhibitions, several having to make two or three attempts before they were able to reach the top, whilst others failed hopelessly to get to the summit. The surface of the hill was in a very loose state as a result of the recent heavy rains in the district, two patches at the top being particularly dangerous, one about fifty yards before

Herts. County A.C. Open Hill-climb.—

the riders reached the finishing timekeeper and the other about thirty yards beyond. It was the fast division who were particularly affected by these patches, as owing to the speed at which they were travelling they had to take the slight bend near the finish fairly wide. This took them on to the loose patch and appeared to affect their steering, consequently before they were able to get themselves straight again they were upon the second patch, and had the utmost difficulty in keeping upright. Both F. A. Applebee and A. Mackenzie Cott fell through this, fortunately without any serious damage to themselves, whilst H. Lister Cooper had a very narrow escape at the same spot. A large number of spectators were at the various points of vantage along the course, whilst a number of machines and cars carried the Cambridge identification plates, having apparently brought over a number of 'Varsity men to see their crack, A. Mackenzie Cott, perform.

The following are the results:

CLASS A.—For lightweights, weighing not more than 130 lbs. in touring equipment. Pedalling allowed.

		Figure of merit.
1.	E. Clark (2¾ h.p. Douglas)	.961
2.	W. H. Islip (2¼ h.p. Royal Enfield)	.945
3.	F. E. Williams (1¼ h.p. Moto Velo)	.843
4.	O. L. De Lissa (1½ h.p. Motosococche)	.817
5.	J. V. Robinson (2¾ h.p. Douglas)	.799
6.	E. Bennett (2½ h.p. Grandex)	.796
7.	L. M. Redding (2¾ h.p. Douglas)	.730

Ten started. Clark made a splendid climb, as also did Islip.

CLASS B.—For single cylinders, standard touring models. Cylinder capacity not to exceed 499 c.c.

		Figure of merit.
1.	E. A. Burney (3½ h.p. De Haviland)	1.101
2.	E. H. Colliver (3½ h.p. Triumph)	1.094
3.	Capt. Sir R. K. Arbuthnot, Bart. (3½ h.p. Triumph)	.997
4.	R. M. S. Maxwell (3½ h.p. Triumph)	.993
5.	F. W. Applebee (3½ h.p. Centaur)	.919
6.	C. C. Cooke (3½ h.p. Triumph)	.895
7.	C. Cross (3½ L.M.C.)	.885
8.	F. W. Chase (3½ h.p. Centaur)	.735
9.	G. S. Carter (3½ h.p. Triumph)	.684

Ten started. Capt. Sir R. K. Arbuthnot apparently tried to start with his exhaust lifter down—a mistake which he soon rectified. Colliver appeared to be the fastest in this class, and came up in good style, whilst Burney, Applebee, and Capt. Arbuthnot were only a trifle slower.

CLASS C.—For single-cylinders. T. T. models. Cylinder capacity not exceeding 499 c.c.

		Figure of merit.
1.	H. Lister Cooper (3½ h.p. Triumph)	1.228
2.	W. G. McMinnies (3½ h.p. Triumph)	1.043
3.	C. A. Williams (3½ h.p. Triumph)	1.010
4.	O. C. Godfrey (3½ h.p. Rex)	1.009
5.	R. T. Wood (3½ h.p. Triumph)	.978
6.	C. C. Cooke (3½ h.p. Triumph)	.962
7.	W. A. Jacobs (3½ h.p. Rex)	.914
8.	F. W. Applebee (3½ h.p. Centaur)	.907
9.	F. W. Chase (3½ h.p. Centaur)	.739
10.	H. Bevir (3½ h.p. L.M.C.)	.722

R. M. Brice also started in this class, but in mounting he appeared to knock the spring off his contact breaker cover, thus allowing the cover to come adrift.

H. Lister Cooper was undoubtedly the fastest in this class, the next best being apparently Godfrey, McMinnies, and Wood.

Cooke started with his clutch, but in doing so stopped his engine. He then returned and made a running start.

CLASS D.—Multi-cylinders. Standard touring models. Cylinder capacity not to exceed 670 c.c.

		Figure of merit
1.	C. M. Down (5 h.p. Indian)	.84
2.	J. Thompson (5 h.p. Indian)	.754
3.	F. A. Hardy (5 h.p. V.S.)	.738
4.	M. Geiger (5 h.p. V.S.)	.702

J. Seyfried (6 h.p. N.S.U.), figure of merit .74, was third, but was disallowed owing to c.c. being too large, therefore F. A. Hardy was placed third and M. Geiger fourth.

W. O. Bentley (5 h.p. Indian) started in this class, but as he had not been weighed, was disqualified. His figure of merit, 1.015, was best.

CLASS E.—Multi-cylinders. T.T. models. Cylinder capacity not to exceed 670 c.c.

		Figure of merit.
1.	S. C. Perryman (5 h.p. Blumfield)	.883
2.	J. Thompson (5 h.p. Indian)	.851
3.	J. P. Le Grand (4 h.p. Rex)	.774
4.	M. Geiger (5 h.p. V.S.)	.747
5.	F. A. Applebee (4 h.p. Rex)	.555

Applebee just after crossing the finish lost control of his machine, ran into a wooden fence with great force, but fortunately escaped with a slight injury to his wrist and damaged clothing.

CLASS F.—Variable gears, single or multi-cylinders. Machine to be stopped and restarted on the hill within a distance of 15 yards.

		Figure of merit.
1.	B. Marians (3½ h.p. P. and M.)	.764
2.	F. A. Hardy (5 h.p. V.S.)	.683
3.	R. G. Goslett (3½ h.p. P. and M.)	.592
4.	J. Seyfried (6 h.p. N.S.U.)	.577
5.	V. Underhill (3½ h.p. L.M.C.)	.522
6.	W. G. Ayling (3½ h.p. Midget)	.38

Geiger failed to restart after the compulsory stop. Hardy restarted in remarkably smart style, and was much applauded; by far the best performance, but only second on formula. Goslett stopped his engine, and remounted by running alongside.

CLASS G.—Single or multi-cylinder. Fastest time to win.

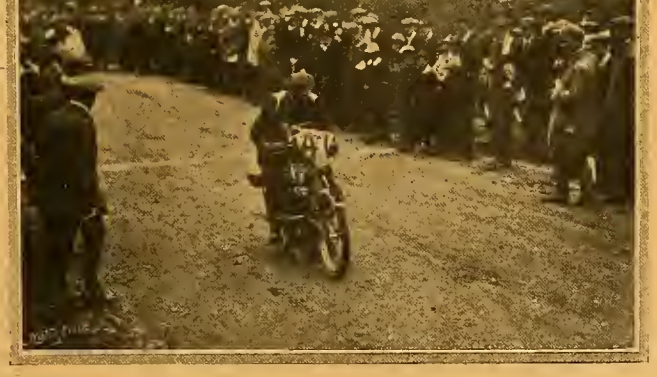
1.	H. Lister Cooper (3½ h.p. Triumph)	X
2.	A. Mackenzie Cott (8-10 h.p. King)	X + ⅘s.
3.	E. D. Dickson (7 h.p. Indian)	X + 2s.
4.	E. Gwynne (7 h.p. Indian)	X + 4⅕s.
5.	R. M. Brice (3½ h.p. Brown)	X + 6⅕s.
	C. M. Down (5 h.p. Indian)	X + 6⅕s.
6.	F. P. Dickson (3½ h.p. Zenith-Gradua)	X + 10s.
7.	J. Thompson (5 h.p. Indian)	X + 10⅘s.
	J. Seyfried (6 h.p. N.S.U.)	X + 10⅘s.
8.	F. C. Clements (5 h.p. Rex)	X + 12⅕s.
9.	C. K. Wigram (6 h.p. Bat)	X + 12⅖s.
10.	C. C. Cooke (3½ h.p. Triumph)	X + 14⅘s.
11.	M. Geiger (5 h.p. V.S.)	X + 20⅗s.

Lister Cooper made a splendid ascent, as also did Mackenzie Cott; the latter, however, after passing the timekeeper and when travelling at a great speed, came a heavy cropper, fortunately without doing any damage to himself.

The timekeepers were Messrs. F. Straight and D. K. Hall.

Signalling on the hill was carried out by a staff of signallers from the Watford Territorials.

The classes were run through very expeditiously, and Mr. C. C. Cooke, the hon. secretary, and his assistants are to be congratulated upon the general excellence of the arrangements.



F. A. Hardy (5 h.p. V.S.) restarting in the Variable Gear Class.

THE END TO END SIDECAR RECORD.

THE HOLDER, HUGH GIBSON

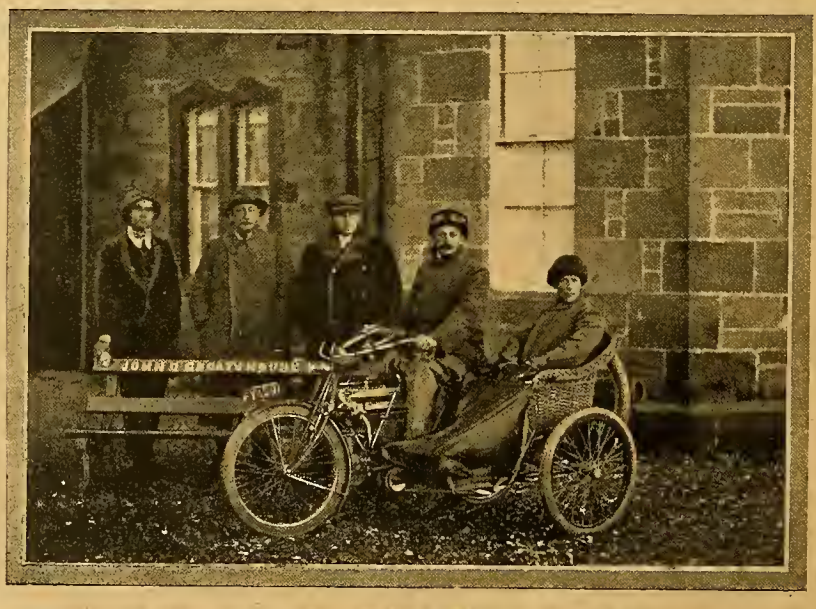
"THE finest ride on record" is the general opinion of Hugh Gibson's new sidecar record from Land's End to John-o'-Groat's. Just think! 886 miles of up hill and down dale in 40h. 47m. on a 3½ h.p. single-cylinder, single-geared machine, with sidecar and passenger. It really makes one wonder if the Auto Cycle Union can properly call its six days' event over the same course a "trial." Two years ago, Arthur W. Bentley's ride was considered a wonderful feat, yet Gibson's time is less, despite his handicap of a sidecar and passenger.

In our last issue we gave Gibson's time of passing through certain important centres, but we may again refer to his time-table. He left John-o'-Groat's on a 3½ h.p. 1910 Triumph with Mills-Fulford rigid sidecar attachment, accompanied by George Wray as passenger, at 1.40 a.m. on Monday last week, timed by J. J. Robertson, of Wick. Prior to the start, a member of *The Motor Cycle* staff sealed the vital parts of the machine. Gibson's time-table was as follows:

		Monday.
Left John-o'-Groat's	...	1.40 a.m.
Arr. Beauly (134 miles)	...	7.25 a.m.
Dep. ,,	...	7.45 a.m.
Arr. Perth (266½ miles)	...	12.35 p.m.
Dep. ,,	...	1.16 p.m.
Arr. Lockerbie (388 miles)	...	6.13 p.m.
Dep. ,,	...	6.37 p.m.
		Tuesday.
Arr. Wigan (520 miles)	...	12.50 a.m.
Dep. ,,	...	1.35 a.m.
Arr. Gloucester (654 miles)	...	7.17 a.m.
Dep. ,,	...	7.52 a.m.
Arr. Exeter (764 miles)	...	12.35 p.m.
Dep. ,,	...	1.25 p.m.
Land's End (886 miles)	...	6.27 p.m.
Total time	...	40h. 47m.

The previous record was 51h. 45m., accomplished by M. Geiger and W. Lamm last October, under much more unfavourable conditions and without proper organisation or followers, on a 7 h.p. two-speed V.S. and sidecar.

The above is a brief itinerary of the record, and we took the first opportunity of interviewing Mr. Gibson and gleaning some of his experiences. After congratulating him upon the achievement, Gibson assured us that even in his most sanguine moments he did not anticipate beating the record by more than an hour or two, and on arrival at Wick on the Saturday had quite "a fit of the blues," believing for once his many critics who had said that it was impossible for so small an engine with a single gear to tackle the journey. Next morning, however, he arose in better spirits, and looked forward to a successful run if luck favoured him. The schedule was made out for a start at 2 a.m., but in the far North it is sometimes possible to read a newspaper without artificial light at 1 a.m. The morning luckily proving lighter than usual, the word to go was given by Timekeeper Robertson at 1.40 a.m.



The start from John-o'-Groat's House. This photograph was taken at 1.30 a.m. by natural light.
Photograph by J. G. Humphrey.

Gibson's Own Story of the Ride.

The record-breaker has written his own impressions of the ride specially for *The Motor Cycle:*

"After a restless night, I arose at midnight, feeling quite fit, and was cheered by Robertson's report that there was a following wind, and the glass high. Accordingly I raised the gear to 4¾ to 1, determined to make a good start. A cold wait to obey the photographer, and Robertson and two friends pushed us off with a cheer. One last glance at Groat's, and then eyes on the road. With the engine pulling well, we made a good ascent of the first hill, and then settled down to a brisk speed somewhat over legal. Dunheath proved a regular miniature Sutton Bank, but with a dangerous right-hand turn near the top. I rushed the hill, skidded round the corner, and with light pedal assistance reached the top. Berriedale was approached with a 6 to 1 gear. The first view took our breath away. I crawled round the fearful top corner, my patient victim making some inarticulate expressions as we got round. The descent safely made left me unprepared for the rush necessary to climb the south side. We struggled up a good halfway, and Wray's agility in jumping out was remarkable. We made another start, and I actually got up another 200 yards before our faithful 3 and a bit warned us. Wray was left behind to admire Berriedale, whilst I took the empty sidecar up to the summit. We afterwards raised the gear to 5 to 1. Three miles farther south we found the road closed. Mr. Robertson had warned us of this, and we made a *détour* of one mile *viâ* Ousedale Farm, and had a struggle to reach the main road again, the byroad having a severe gradient, which again called for 'light pedal assistance.'

"We passed two herds of red deer and hundreds of mountain hares, snipe, grouse, rabbits, etc., and I mean to bring my gun with me in the Six Days' Trials.

"The Ord is most distressingly barren country, and for the next ten miles I had some fine practice in corner work. A quick right-hand turn followed by a V left, generally on an up-grade, tested the engine severely, yet the Triumph picked up wonderfully well every time, my sole concern being to keep out of the gutter when swinging round to the left. On through Brora and Golspie, and we now began to pick up time. At Clashmore we were careful not to lose our way, and soon Bonar Bridge appeared in view, the scenery hereabouts (though somewhat blurred) being particularly fine.

"We had now reached another unknown stretch, viz.,

The End-to-end Sidecar Record.—

the mountain road over the Aultnam to Alner, Strurie Hill. This road cuts off eight miles from the Tain road. We geared down to 6 to 1, and climbed the first mile in good style. At the corner we stopped to cool down, driver and engine being overheated. The rest of the hill was climbed with ease. Good time was made to Daginal, where we were alarmed to find that our petrol tank was practically empty. Luckily, it was 7 a.m., and a garage was open. We arrived at Beauly, our first depot for food, etc., at 7.25, having averaged close upon 24 m.p.h. Mr. R. Morien had an excellent repast ready, and the hot porridge was wonderfully invigorating.

"Nearing Inverness, we struck a rather unfriendly wind. We got through the town with only one wrong turn, and then tackled the long drag from Inverness to Carrbridge. The engine pulled finely, and although we were slowed considerably we never had occasion to stop. Nearing Aviemore, we were considerably cheered by meeting J. W. Adamson, of T.T. fame, who had come out from Perth, and over one hundred miles of bad going, to pace us. This is the kind of sportsmanship! Adamson took us a fine pace through Kingussie over the Grampians to Pitlochry. Here we deemed it advisable to take in petrol. Perth was reached at 12.30. My back tyre had suffered most cruelly over the fearfully loose surface on the Grampians, and it was deemed advisable to change the cover. We were hungry and happy.

"David Adamson, another fine rider, now kindly showed us the way through Stirling to Lanark. From Stirling we struck an unmistakably strong head wind, which continued to beyond Lanark. At Lanark we said good-bye to Adamson, and then had our second tyre trouble, the back cover having crept and pulled out the valve at the seating. Ten minutes saw us on the move again, and in a few miles we met a friend on an N.S.U., who had been sent out from Lockerbie by Messrs. Hetherington and Son. We continued at a good speed to within four miles of Lockerbie, where we again ran out of petrol. Two bulbfuls from our unnamed friend just saw us in to Lockerbie. Messrs. Hetherington and Son had everything ready for us at the Blue Bell Hotel.

The Only Engine Trouble.

"Between Lockerbie and Ecclefechan we broke an exhaust valve, this being the first and only engine trouble that we experienced on the ride. When one thinks of the revolutions per minute made, when driving with a 5½ to 1 gear at thirty to thirty-five miles per hour, it is extraordinary that we did not go through many more valves. We reached Shap at 9.15, and stopped to see that lamps and generator were in order. On this section I reclined in the sidecar, and Wray brought us over from Shap to Kendal in some thirty-six minutes. High Borrow was simply eaten up by the Triumph. Steady going at 20 m.p.h. eventually saw us in Wigan at 12.50 a.m., still gaining on schedule. The Royal Hotel had a most sumptuous repast. Messrs. Leigh and Holford Jones rendered great assistance at Wigan, and also accompanied us for some distance. Hart-Davies, who had punctured near Whitchurch, was making the sleepy birds stare in amazement at the charm of his voice! When I passed him, however, I had another great henchman at my command in the person of Rupert May, whose knowledge of this bewildering stretch of road is second to none. May soon had me (despite unhappy memories) going 'all out,' and my engine seemed to improve every mile. The hills that abound near Bridgnorth were taken in fine style, and Hart-Davies from the rear was astonished at the way we got along. May, whose help had again been of immense value, had magneto trouble at Bridgnorth, and was reluctantly compelled to say good-bye, which he did in his own quaint way by nearly hitting me in the eye with a piece of belting or insulating tape. I freely forgive him.

"Hart-Davies now took me in hand, and accompanied us right through to Land's End. Near Tewkesbury we ran into a heavy thunderstorm, and lost ten minutes putting on our overalls. Belt slip was now prevalent, and we ran for a few miles on a leather Watawata belt which, fortunately, I carried.

"At Gloucester our arrangements were in the hands of A. Hart-Davies at the Bell Hotel, and this depot was most efficiently managed. Outside Gloucester I changed belts three times before I got the right gear, and then we made a very fast journey to Bristol. Davies knew the road through Bristol, and after innumerable twistings and turnings at length reached Bedminster Bridge. Further on the long hill proved too much for our high gear, the roads being very heavy and greasy. Just at this point Davies found a 2in. nail through his back cover, and we hurried away out of earshot. Within five miles he had caught us up, having effected a marvellous repair within five minutes. For the next few miles we found the hills particularly trying. The surface was greasy and heavy, and much 'light' pedal assistance was required, whilst on one or two occasions my passenger had to go through his celebrated acrobatic performances to enable me to take the sidecar up solus. We reached Exeter safely at 12.35—in my opinion the most strenuous section of the whole ride. Thunderstorm, rain, and severe gradients had made this section a very trying one.

The Record Safe Barring Mishaps.

"We had a long stop at Exeter (fifty minutes), for we had tons of time to spare, and felt that the record was safe, barring a serious breakdown. In view of the long and severe climb from Exeter to Okehampton, I decided to change the valves. The carburetter was also cleaned, and a new back cover fitted for safety's sake. We meant to leave nothing to chance. Our gear was 6 to 1. Two friendly motor cyclists, one of whom, Mr. Saunders, came right through to Land's End, caused us some amusement. They confessed that they had come to see the fun on the hills, and as we disposed of one pimple after another their astonishment knew no bounds. First they concluded that we had a secret two-speed gear concealed somewhere up my arm (by the way, my wrist and arm did feel like an operating rod); then after this theory had been exploded they wanted to know 'what the engine really is.' Hart-Davies had been tantalising me all the way by just keeping in view. Over Bodmin Moor we could see nothing beyond twenty yards on account of the mist, yet we climbed Bodmin without pedalling, Mr. Saunders hanging on to our back wheel to see how it was done. At Bodmin Davies was waiting with petrol can in hand, and we were soon on our last stage of the long ride. After Redruth the roads were appalling, and I had a nightmare, thinking that either the sidecar axle or frame would break. We soared up the few hills between Hayle and Penzance, and reached Penzance just at six o'clock. I had become possessed of the idea that I had to finish at 6.30. Why, I do not know, and when we found the road up, the surface atrocious and heavy with rain, I swore inwardly; the climax was reached when I stuck on the steep hill out of Penzance owing to the belt slipping. The last four miles were comparatively good going, and letting it all out the wonderful little engine pulled like a demon up to the last yard of the 886 miles. My first hand shake was for my partner, Wray, who had shared in my triumph.

"To all who helped me on this memorable ride, I wish to say the arrangements throughout could not have been better, and I tender my sincere thanks."

Interesting Data.

Specification of the machine: 3½ h.p., 1910 pattern, 85 by 88 mm. Triumph, Mills-Fulford sidecar, Shamrock-Excelsior tyres, S.G. belt, Bosch magneto and plug, Lucas lamp, Shell spirit, Price's oil. Driver's weight, 9½ stones; passenger, 8½ stones. Machine loaded, 200 lbs.; sidecar loaded, 100 lbs.

or London Office: 336, Goswell Road, E.C.

In answering this advertisement it is desirable to mention "The Motor Cycle."

Saturday's Team Trials for "The Motor Cycle" Cup.

A COMPLETE LIST OF THE ENTRIES.

THE list of entries for the Motor Cycling Club's annual team competition for *The Motor Cycle* fifty guinea challenge trophy, closed with a total of eighteen teams. By the kindness of Mr. J. Van Hooydonk we are enabled to give the names of the riders composing the teams and the machines they will ride. The competition starts from the outskirts of Daventry at 1 p.m. on Saturday next.

Anticipating a tie now that machines are so near perfect, and the difficulty of running off a tie, the M.C.C. Committee has decided to add to Rule 6: "The team scoring the highest mileage thus arrived at, and the times occupied over each twenty-five miles circuit by the riders of the team individually and collectively shall be the winner."

Rule 12 will be deleted. The above will enable the winning team to be determined on the day, and the best team will win.

BIRMINGHAM MOTOR CYCLE CLUB.

R. W. Duke (3½ Triumph)
S. K. Jones (3½ L.M.C.)
Reg. Samson (3½ Reg. Samson)
J. Slaughter (3½ Ariel)
F. H. Southam (3½ Triumph)
C. Winwood (5 Garrard tricar)

Reserves: J. Troman (3½ Triumph) and E. C. F. Evans (5 Rex and sidecar).

BRISTOL B. AND M.C.

E. Clark (2¾ Douglas)
W. W. Douglas (2¾ Douglas)
E. Kickham (2¾ Douglas)
F. C. Wasley (2¾ Douglas)
P. Grout (2¾ Douglas)
F. Bevan (5½ Rex and sidecar)

Reserves: P. Phillips (2¾ Douglas), G. B. Fry (3½ Rex), and E. Moon (4 N.S.U. and sidecar).

COVENTRY AND WARWICKSHIRE M.C. (2ND IN 1909).

W. Williamson (3½ Rex)
G. E. Roberts (3½ Rex)
J. Marshall (3½ Triumph)
G. E. Stanley (3½ Premier)
G. Smith (3½ Rex)
H. Williamson (5 Rex sidette)

Reserves: W. F. Newsome (3½ Triumph) and Sam Wright (3½ Humber).

DERBY AND DISTRICT M.C.C.

A. Ainsworth (5 Peugeot)
A. Mitham (3½ Rex)
F. G. Ford (3½ Triumph)
V. Clarke (3½ Bradbury)
W. Mendon (3½ Rex)
A. L. Boissier (3½ Triumph and sidecar)

Reserves: H. Baker (3½ Triumph) and W. McEwan (3½ Rex).

GREAT YARMOUTH AND DISTRICT M.C.C.

A. Wyatt (3½ Ariel)
F. C. North (3½ Ariel)
S. G. Allen (3½ Triumph)
H. Lock (3½ Triumph)
R. O. Clark (2¼ F.N.)
H. Collins (5-6 Roc and sidecar)

Reserves: C. Duberley (3½ Ariel). Dr. V. H. Blake (2¾ Anglian), and F. Worts (4½ F.N. and sidecar)

HERTS COUNTY A.C. (MOTOR CYCLE SECTION).

C. C. Cooke (3½ Triumph)
E. A. Colliver (3½ Triumph)
A. H. Colliver (3½ Triumph)
J. S. Harwood (2½ P. and M.)
F. Mussell (3½ Rex)
W. Pratt (3½ P. and M. and sidecar)

Reserves: Mrs. C. C. Cooke (3½ Triumph) and E. C. Jarvis (3½ Triumph).

ISLINGTON CONSERVATIVE AND UNIONIST M.C.

W. Price (3½ Rex)
H. E. Davison (3½ Rex)
C. Wilson (3½ Rex)
F. Brown (3½ Rex)
T. Campbell (3½ Rex)
W. Woodward (5 Rex de Luxe and sidecar)

Reserves: C. H. Price (3½ Rex) and H. Halfpenny (mount not known).

LEICESTER AND DISTRICT M.C.C.

Dr. C. B. Moss-Blundell (3½ Triumph)
E. G. Fowler (5 Indian)
T. Nedham (4 Clyde)
S. Briggs (3½ Triumph)
F. C. Barker (Clyde)
J. Finlay (3½ P. and M. and sidecar)

Reserves: W. Carrington (3½ P. and M.) and E. Laurance (3½ Bradbury).

MANCHESTER M.C.

H. L. Cunliffe (3½ Rex)
W. T. Munro (3½ Rex)
H. Reed (3½ Dot)
F. Sirette (3½ N.S.U.)
A. J. Moorhouse (5 Indian)
J. P. Scott (3½ Rex and sidecar)

Reserves: H. J. Scale (3½ Scale-J.A.P.) and J. E. Tytler (5 Dot and sidecar).

THE M.C.C. (HOLDERS OF THE CUP).

R. M. Brice (3½ Brown)
L. A. Baddeley (3½ Yelledab)
R. C. Davis (4 Griffon)
S. G. Frost (4 Minerva)
E. Pond (5 Vindec)
W. Chater Lea (5 C.L. and sidecar)

Reserves: H. G. Bell (2¾ F.N.) and W. H. Wells (5 Indian and sidecar).

NORTHAMPTONSHIRE M.C.C.

W. Duke (1910 Triumph)
A. E. Catt (1910 Triumph)
W. Barratt (1910 Rex and sidecar)
Chas. Jolley (1906 Triumph)
A. Osborne (1908 Triumph)
Wm. Lees (1910 Triumph)

Reserves: C. H. Leadbeater (1909 Triumph) and S. E. Temple (1909 Triumph).

NORWICH AND DISTRICT M.C.C.

A. A. Everard (3½ Triumph)
A. W. Lincoln (3½ Nondescript)
C. Cleary (3½ Bradbury)
H. Brown (3½ Triumph)
H. Chapman (3½ Triumph)
J. Boddy and H. E. Duge (5-6 Bat and sidecar)

Reserves: A. Bagshaw (3½ T.T. Triumph) and S. Hatch (3 Triumph).

NORTH-WEST LONDON M.C.C.

H. J. Pooley (Premier)
E. G. Westacott (Triumph)
W. Cooper (Bradbury)
A. C. Robbins (Humber)
H. G. Cove (Matchless)
E. W. Ashworth (V.S. and sidecar)

Reserves: G. Rowden (Bat) and G. H. Hollis (Triumph).

NOTTINGHAM AND DISTRICT M.C.C.

John King (F.N.)
Wm. Reilly (3½ Triumph)
C. R. Smith (3½ C.C.R.-Smith)
F. Burley Johnson (5-6 Matchless)
J. Richards (3½ Brough)
Geo. Brough (5-6 Brough and sidecar)

Reserves: J. Dutton Mitchell (3½ Triumph) and Chas. H. Sewell (3½ Triumph).

OXFORD M.C.C. (3RD IN 1909).

John Aldworth (3½ Kerry-Ahingdon)
R. A. Bishop (3½ Bradbury and sidecar)
H. G. Hill (3½ Bradbury)
W. A. Mathews (3½ Triumph)
J. F. Salter (3½ Triumph)

Reserves: A. H. Pearson (3½ Triumph) and G. F. Cooper (5 Vindec or Douglas).

SHEFFIELD AND HALLAMSHIRE M.C.C.

T. Durant (3½ Durant-J.A.P.)
F. Dover (3½ Triumph)
J. Haslam (2¾ Douglas)
S. Sawer (3½ Premier)
W. Hill (3½ Triumph)
A. Tarr (5½ Rex and sidecar)

Reserves: J. Stacey (3½ Triumph) and A. T. Smith (5½ Rex and sidecar).

SUTTON COLDFIELD A.C.

P. Mosedale (3½ Centaur)
H. C. Newman (3½ Ivy)
Howard Smith (3½ Triumph)
S. C. Perryman (3½ Ariel)
James St. John (3½ Centaur)
W. Mist (5 Mist and sidecar)

Reserves: F. P. Mayell (3½ Triumph) and Seymour Smith (5 Norton).

ESSEX MOTOR CLUB.

A. P. Howard (3½ Triumph)
H. Horswill (3½ Triumph)
G. Peppercorn (3½ Triumph)
L. W. Bellinger (5 Indian)
B. A. Hill (3½ Kerry Ahingdon)
W. Garrod (5 V.S. and sidecar)

Reserves: S. Sweet (3½ Triumph) and F. E. Smith (3½ Triumph).

We hear on going to press that last year's course will be used.

CLUB NEWS.

Leicester and District M.C.C.

The club held a very enjoyable speed-judging competition on the 9th inst., on the road from Oadby to Market Harborough. Seventeen members competed. W. Carrington on a Phelon and Moore was nearest his time, G. H. Upton being second.

Harrogate and District M.C.C.

The above club held a flexibility hill-climb on Thursday evening, June 9th. The following is the result:

	Entrant and Machine.	Difference.
1.	J. E. Brooke (3½ h.p. Triumph)	108⅕s.
2.	F. Strafford (3½ h.p. Triumph)	102⅖s.
3.	T. C. Atkinson (3½ h.p. T.T. Triumph)...	81⅖s.

Leeds M.C.C.

In connection with the annual Leeds to London and back reliability trial, which takes place next week end, and for which numerous entries have been received (including last year's winner, T. G. Bullus), a passenger machine class has been formed, with a special prize of a gold medal if machine is otherwise unplaced.

Bolton and District M.C.C.

The postponed hill-climb at Rivington resulted as follows:

	Touring Class.	M. S.	A.C.U. formula.
1.	Stanley Groom (3½ h.p. J.A.P.) ...	1 21⅘	... .0180
2.	J. H. Green (3½ h.p. Pecision) ...	1 21⅗	... .0166
3.	J. Fishwick (3½ h.p. Triumph) ...	1 20⅖	... .0158
	Racing Class.		M. S.
1.	F. W. Sixsmith (3½ Triumph T.T.) ...		50
2.	J. Fishwick (3½ h.p. Triumph T.T.) ...		1 6⅘
3.	L. R. Hardman (3½ h.p. Triumph T.T.) ...		1 19⅘

Sheffield and Hallamshire M.C.C.

A flying kilometre competition was held on the 11th inst. on a private road near Castleton, Derbyshire. The fastest time of the day was made by D. Bradbury on his 3½ h.p. Norton. Results:

Class I.—Capacity up to 350 c.c.

		Time Taken.
1.	P. Allen (2¾ h.p. Douglas)	59⅕s.
2.	J. L. Hall (2¼ h.p. Royal Enfield) ...	62⅕s.
3.	H. Dakin (2¾ h.p. Douglas)	60⅕s.

Class II.—Engines up to 500 c.c.

		Time Taken.
1.	D. Bradbury (3½ h.p. Norton)	41s.
2.	T. Durant (3½ h.p. J.A.P.)	45⅕s.
3.	B. Shaw (3½ h.p. Norton)	47⅖s.

Class III.—Engines of any capacity.

		Time Taken
1.	D. Bradbury (3½ h.p. Norton)	41⅗s.
2.	T. Durant (3½ h.p. J.A.P.)	44⅗s.
3.	J. Ardern (3½ h.p. Bradbury)	49s.

Nottingham and District M.C.C.

At the Notts A.C. Clipstone speed trials last Saturday, a mile handicap motor cycle race was included. Twelve competed. The final resulted in a win for A. E. Lole (5-6 h.p. F.N.); 2nd, W. H. Hadfield (3½ h.p. Triumph). F. Percy Johnson (7 h.p. Matchless) made fastest time, 1 min. 6 secs.

Derby and District M.C.C.

The first hill-climbing contest in connection with the Derby and District M.C.C. took place on Saturday at Hazelwood. The preliminary heats left four men in the contest, and the first three positions, for which gold, silver, and bronze medals were awarded respectively, were secured by: (1) O. Parker (3½ h.p. Humber), (2) V. Jobson (3½ h.p. Bradbury), (3) V. Clarke (3½ h.p. Bradbury).

Westmorland M.C.C.

On Thursday last the above club held a hill-climb on Greyhound Hill, near Kendal. The course was 1 mile 90 yards, and the gradient averaged about 1 in 8. There were twenty-one competitors. Result:

		Time.	Formula.
1.	H. Harrison (Bradbury)	2m. 0s.	... 178
2.	K. Hutchinson (Bradbury) ...	2m. 19s.	... 184
3.	W. Westwood (Triumph)	2m. 6s.	... 185

Ayr and District M.C.

A petrol consumption test was decided on the 8th inst. over a give-and-take course of 22¼ miles, starting and finishing at the club's headquarters, Dalblair road. Results:

	Single-cylinder Class.	Petrol. ozs.	Fig. of merit.	m.p.g.
1.	J. Robertson (3½ Triumph, 1909)	21.5	39.02	160.4
2.	Q. Clark (3½ Rex, 1909) ...	24	34.95	147
3.	H. Andrew (3½ Triumph, 1910)	26.75	31.13	131
	Twin-cylinder Class.			
1.	E. Hall (5 Rex, 1907)	40	26.9	88
2.	A. Sommerville (5 Rex de Luxe, 1909)	48.5	22.96	73
3.	F. Ferguson (5 Peugeot) ...	53.25	17.12	66

Manchester M.C.

On Saturday last, on the usual hill on the borders of Yorkshire, near Woodhead, the above club held its first big hill-climb of 1910.

The result was an easy win for A. J. Moorhouse, on a 5 h.p. Indian, who climbed the hill in the record time of 2m. 25⅗s. The next nearest, C. Meanock (7 h.p. Dot), took 2m. 43⅕s., and P. Platt (Bradbury), 2m. 50⅕s. Results:

1. A. J. Moorhouse (5 h.p. Indian).
2. F. W. Sixsmith (3½ h.p. Triumph).
3. P. Platt (3½ h.p. Bradbury).
4. H. J. Scale (3½ h.p. Scale-J.A.P.).

Novices' prize, H. Gibson (3½ h.p. Bradbury).

North-west London M.C.C. Hill-climb last Saturday.

Competitors and officials at the starting point.

(See next page.)

Club News.—

Worcestershire M.C.C.

There was a very good attendance at the club's first all-day run to Warwick. Lunch was partaken of at the Crown Hotel, and the afternoon was spent in sight seeing. A speed-judging competition is being held to-day (Thursday).

Coventry and Warwickshire M.C.

The prize winners in the ten hours' run to North Wales have now been announced. The timing at the secret checking stations revealed the fact that E. A. Gorton (5 h.p. Rex) and G. H. Spicer (3½ h.p. Triumph) rode most consistently, and they have been declared joint winners.

Streatham and District M.C.C.

The above club's reliability trial was held on the 4th inst., over a four-lap course totalling seventy-six miles, starting from the club's headquarters at Godstone. The medal winners were as follows:

1. G. D. Nelson (4 h.p. J.A.P.), 108 marks.
2. J. Campwell (four-cylinder F.N.), 97 marks.
3. C. J. Feeny (3½ h.p. Triumph), 96 marks.

North-west London M.C.C.

The results of the Coventry and back reliability trial are as follows:

Winners of silver cups.—Messrs. E. W. Ashworth, H. C. Bean, E. W. Brighten, E. A. Colliver, W. Cooper, H. Hill, G. H. Hollis, H. J. Pooley, G. E. Purchase, A. C. Robbins, E. G. Westacott, C. Williams, and E. Gwynne.

Winners of silver medals.—Messrs. W. J. Doe, C. H. Crole-Rees, and G. B. Owen.

A hill-climbing competition was held on Saturday last at Lippett's Hill, near Potters Bar. Competitors were weighed in at Goff's Oak Railway Station, G.N.R. The single-cylinder class was won by W. Cooper (3½ h.p. 1910 Bradbury), who also accomplished fastest time of the day. H. G. Cove headed the list of twin-cylinder machines, riding a 6 h.p. Matchless-J.A.P.

South Devon M.C.C.

An inaugural meet took place recently at the "Rock," Yelverton, near Plymouth, and although the weather proved wet, many members continued the run to Two Bridges, where an excellent lunch was partaken at Mr. Trinnerman's, Two Bridges Hotel, followed by an enjoyable run across Dartmoor to Torquay. A hill-climb is to be held on Saturday. Motor cyclists desirous of joining should write the hon. sec., Mr. Reg. Birkett, 10, Bedford Terrace, Plymouth.

Redditch and District M.C.C.

The results of the slow race held on Wednesday, the 8th inst., on the Ridgeway, are as follows:

LIGHTWEIGHTS.

1.	J. Cocker (2¼ Enfield)	3m. 13s.
2	Frank Smith (2¼ Enfield)	3m. 8s.
3.	E. J. Webb (2½ Clément)	1m. 40s.

HEAVYWEIGHTS.

1.	G. W. Horton (3 Humber)	3m. 3s.
2.	J. Fisher (5 twin Rex)	2m. 38s.
3.	W. E. Smith (3 Humber)	1m. 50s.
4.	S. Sheppard (3 Quadrant)	1m. 0s.

The next competition is a speed-judging competition, on Wednesday, June 22nd. The course will be from the Neville Arms, along the Ridgeway, down Arrow Lane, up Kingley Hill, round Dunnington Corner, up Weethby Bank, and back to the Neville Arms. The rates of speed will be drawn for at the start, which is at six o'clock. Competitors will not be allowed to carry watches, nor speedometers, but must rely upon judgment only.

A Motor Cycle Club for Gateshead-on-Tyne.

A number of motor cyclists in Gateshead-on-Tyne are about to form a motor cycle club. Readers in the district who are interested in the question should communicate with Mr. W. Stephen, 100, Whitehall Road, Gateshead-on-Tyne.

Motor Cycle Union of Ireland (Dublin Centre).

On the 25th inst. a reliability trial to Dundalk and back has been arranged.

July 2nd is the date of the inter-centre cup contest between Dublin and Belfast for the Triumph Cup.

Eldorado Cycle and Motor Club.

Readers in the locality of City Road, E.C., should note that a motor cycle section is attached to the above club. The town headquarters are 28-30, East Road, City Road, E.C., and country headquarters, "King's Oak Hotel," High Beech.

Motor Cycling Club.

A petrol consumption trial is to be held on Saturday, June 25th, starting at 5 p.m. Meet at the hotel, "True Lovers' Knot," Northwood, between Pinner and Rickmansworth. There are three classes: (1) Single-cylinder bicycles, (2) multi-cylinder bicycles, (3) passenger machines and cars (but not trailers). The awards in each class are: First, gold medal; second, silver medal; third, bronze medal.

"Shell" motor spirit at the rate of 1 pint for 300 lbs. total weight, increasing to 1½ pints for 600 lbs. and to 2¼ pints for 1,200 lbs. in the passenger class, irrespective of size or type of engine, due allowance being made for all intermediate weights, will be supplied to the competitors.

Multi-cylinder machines in Class 2, over 150 lbs. in weight, will be allowed 30 per cent. extra spirit.

Entries must be sent to the trials hon. sec., F. J. Jenkins, 35, Loveday Road, Ealing, by the 20th inst.

Sunderland and District M.C.

The annual reliability trial for the Vaux Challenge Cup took place on Saturday last over a 120-mile course from Sunderland to Brough (Westmoreland) and back *viâ* Chester-le-Street, Framwellgate Moore, Neville's Cross, Spennymoor, South Church, West Auckland, Staindrop, Barnard Castle, and Bowes. Twenty competitors, riding machines of from 1¾ h.p. to 8 h.p., took part as follow: Messrs. I. Baty, L. Forster, S. Wilson, A. P. R. Robson, J. P. Robson, J. Adams, F. Holzapfel, F. Turvey, jun., W. M. Duguid, A. Clarke, H. Mason, H. F. Inkson, H. M. Wood, F. Rowntree, E. J. Tiffin, T. Jack, T. Wood, H. N. Hull, C. W. Hughes, and G. W. Raper.

The Vaux Cup was given by the president of the club (Major E. Vaux), and by his request the result of this competition will decide the ownership of the trophy. In addition, the Motor Cycling Board of the North-Eastern Automobile Association have presented a shield and three prizes for competitions of which each affiliated club was to arrange one, and for which all the members of the board are eligible. The above trial was the first of this year's competitions, and the marks obtained are to be taken into consideration in awarding the N.E.A.A. shield. The Vaux Trophy competition was restricted to members of the Sunderland Club, and the results, when worked out, will be published in these columns.

A few members of the Bolton and District M.C.C.

CURRENT CHAT

TIME TO LIGHT LAMPS

,, 18	... ...	9.18 ,,
,, 20	... ...	9.18 ,,
,, 22	... ...	9.19 ,,

The A.C.U. End-to-end Trials.

The following additional entries have been received for the above trials, which commence on July 4th and terminate on July 9th: Humber, Ltd., two 3½ h.p. two-speed Humbers; C. J. Fox, one 8 h.p. Bat.

Open Hill-climb in Yorkshire.

Entries for the Bradford Motor Cycle Club's second annual open hill-climb on Saturday week must be in the hands of the hon. sec., Mr. Felix Scriven, Alma House, Bradford, by Monday morning next. The venue is Cockshoot Lane, near Skipton.

An Energetic Secretary.

A. J. Moorhouse, who was a competitor in the recent T.T. Race, is secretary of the Manchester Motor Club, and he managed to get the members of his club to subscribe between them the sum of £5 11s. to the T.T. Fund.

An Impudent Theft.

On the 7th inst., between 6.30 and 8 p.m., a 1910 pattern Triumph, No. 152,942, engine No. 9,009, was stolen from the premises of the Darlington Golf Club at High Coniscliffe, near Darlington. Information concerning it should be given to the police or to the owner, Alfred Harrison, 97, Stanhope Road, Darlington.

Motor Cyclists in the Army Manœuvres

The War Office has invited the motor cycle section of the Motor Union to furnish a contingent of motor cyclist members to do duty during the period of the forthcoming army manœuvres, which take place from September 18th to 24th. Railway fares for cyclists and their machines and cost of messing whilst in camp (or payment for food and lodging in the event of cyclists having to put up at hotels) will be defrayed by the War Office. In addition to this the motor cyclists are to receive an allowance of 6s. 6d. per day to cover cost of petrol and upkeep of machine, including damage, for every day the machine is in use. Motor cyclist members of the M.U. desiring to enter their names for service during the above-mentioned dates are requested to communicate with the secretary, Caxton House, Westminster, S.W., as early as possible.

SPECIAL FEATURES

THE SCOTTISH SIX DAYS' RELIABILITY TRIALS.

By our Special Correspondent.

THE MECHANICS OF RIDING ROUND A CORNER.

THE END-TO-END SIDECAR RECORD.

Saturday's Team Trial.

With eighteen teams of six riders, two reserves to each team, dozens of officials and clerks of the course, Daventry (Northants) will be alive with motor cyclists on Saturday. It is rumoured that last year's course will be used, and a really sporting one it is. Although either the Motor Cycling Club or the Coventry and Warwickshire M.C. has won the trophy ever since the trial was inaugurated, there is a general feeling that some outside club will capture the cup this year. In the event of a tie, an addition has been made to Rule 6 and the times occupied over each twenty-five miles circuit will be taken into consideration.

FUTURE EVENTS.

June 18—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CHALLENGE CUP. Competing Teams: Motor Cycling Club (holders), Coventry and Warwickshire M.C., Bristol B. and M.C., Norwich and District M.C.C., Sutton Coldfield A.C., Birmingham M.C.C., Manchester M.C., Derby and District M.C.C., Great Yarmouth and District M.C.C., Herts. County A.C., Essex M.C., N.W. London M.C.C., Oxford M.C.C., Nottingham and District M.C.C., Sheffield and Hallamshire M.C., Leicester M.C.C., North Islington C. and U. M.C., and Northamptonshire M.C.C.
,, 18—Brooklands A.R.C. Meeting, 2 p.m.
,, 25—Bradford M.C.C. Open Hill-climb at Cockshoot Lane, Skipton, 2 p.m.
July 4-9—A.C.U. LAND'S END TO JOHN-O'-GROAT'S RELIABILITY TRIAL.
,, 13—Open Irish End-to-end Reliability Trial, promoted by the Ulster Centre.
,, 13 (Wed.) and 14 (Thurs.)—Brooklands A.R.C. Meeting, 2 p.m.
,, 23—A.C.U. Quarterly Trial, Uxbridge to Banbury and Back.

Donation to the Douglas Hospital.

We are advised by Mr. Alec S. Ross that a sum of £60 has been handed over to the Manx Highway Board for the Douglas Hospital. This amount has been subscribed by the motor cyclists visiting the Isle of Man for the Tourist Trophy Race; £54 8s. 6d. was collected by Mr. Ross, and £5 11s. 6d. by Mrs. Aston and others on the *King Orry*.

A Ten Miles Hill-climb.

An important hill-climb promoted by the Unione Sportiva Florentina was held at Pontassieve-Consuma (Italy) on the 29th ult., over a distance of 10 miles 440 yards. In Class A for engines not exceeding 250 c.c. Bartolini (1½ h.p. Motosacoche) was first in 20m. 13⅕s. Class B for engines up to 333⅓ c.c. (one-third litre) was won by Squilla (2 h.p. Buchet) in 21m. 35s. Class C for engines not exceeding 500 c.c. was won by Borgo (3½ h.p. Borgo) in 16m. 3s.

Manchester M.C. Hill-climb on the borders of Yorkshire, near Woodhead. A. J. Moorhouse (5 hp. Indian) who made fastest time and won the Palmer Cup.

Next Year's T.T. Race Regulations.

Last week we suggested a separate event for twin-cylinder machines in the next Tourist Trophy Race. Mr. Archibald Sharp suggests three events, one for twins up to 750 c.c., one for singles up to 500 c.c., and one for lightweights, say 350 or 400 c.c.

Imports of Motor Cycles and Parts.

Though the May imports of foreign motor cycles and parts show a slight advance, the value of British exports exceeded the imports by £1,000. The import figures for May compared with previous years were:

	1908.	1909.	1910.
	£	£	£
Motor cycles ...	3,776	5,948	4,916
Parts thereof...	2,724	2,315	3,581
Total ...	£6,500	£8,263	£8,497

The imports for the five complete months of this year show a great increase over the corresponding period of 1909 and 1908. The figures were:

	1908.	1909.	1910.
	£	£	£
Motor cycles ...	21,136	18,211	20,585
Parts thereof...	8,647	9,785	23,729
Total ...	£29,783	£27,996	£44,314

British Exports.

The value of our exports of motor cycles during May, culled from Board of Trade returns.

	1908.	1909.	1910.
	£	£	£
Motor cycles ...	2,396	3,054	7,138
Parts thereof...	1,463	2,947	2,357
Total ...	£3,859	£6,001	£9,495

The rapid increase in British exports will be realised from the figures below for the five months ended May 31st:

	1908.	1909.	1910.
	£	£	£
Motor cycles ...	11,410	16,521	36,160
Parts thereof...	10,236	14,264	15,437
Total ...	£21,646	£30,785	£51,597

Cubical Capacity Tables.

Some time ago we issued a table giving the cubical capacities of all motor cycle engines. The first issue has been entirely absorbed, and owing to renewed applications for copies we have reprinted a number, and these can be obtained from our Coventry offices at 6d. per copy, post free.

Police Traps.

Readers are warned of a police trap on the Kew Road, between Kew Bridge and Richmond (Surrey), consisting of a measured furlong, worked by two policemen in plain clothes (one of them in a straw hat), and another policeman in uniform who stops motorists on receiving a signal from his *confrères*.

The London-Edinburgh Run.

In last week's issue we were asked to state that the 3½ h.p. Brough on which Mr. George Brough won the Motor Cycling Club Challenge Cup in the London-Edinburgh and back run was fitted with a Simms magneto. We have since been advised that this is incorrect, as the machine was fitted with a Bosch magneto supplied by the Bosch Magneto Co., 40-42, Newman Street, Oxford Street, W.

Motor Cycle Insurance.

"LD 1889" writes that he has been studying the special motor cycle prespectuses of insurance companies, and has come to the conclusion that the persons responsible for the prospectus knew nothing about motor cycles. In the opinion of certain companies, converting a motor bicycle into a three-wheeler by the addition of a sidecar or forecar increases its liability to be stolen by fifty per cent.; also the risk of machine being damaged by fire or explosion is increased fifty per cent. Finally, he points out that to insure against accidental death, sustained in direct connection with the insured motor cycle for £250, a premium of £1 10s. is demanded, but this he contends is altogether absurd, as he has an insurance policy for £250 covering *any* accident at an annual premium of 18s. 9d. This sounds too good to be true, and we should advise "LD 1889" to make certain that his policy really does cover *any* accident. Personally, we doubt it.

A Regrettable Accident.

We learn with regret that F. W. Barnes, of Zenith Motors, Ltd., has had a bad fall at Brooklands. Whilst testing a new machine fitted with an 8 h.p. twin J.A.P. engine and Gradua gear, specially built for a Cambridge motor cyclist, the valve blew out of the front tyre, rendering the machine unmanageable at speed. Barnes was badly cut on the head, hands, and knee, and will be incapacitated for some weeks. Though seriously knocked about, his principal grievance was that he would not be able to compete on Saturday in the Herts County hill-climb, which he had every hope of winning. It will be remembered that Mr. Barnes won two first prizes in this event last year.

Inter-club Meet in the South.

Cyril J. Feeny, hon. secretary of the Surrey Motor Cycle Club, writes: "Adverting to 'R.S.H.'s' letter [No. 4800] in your issue of June 9th, I beg to say that this club would be very glad to take part in an inter-club meet of the character to which your correspondent refers. The question of arranging such a fixture has already been raised in committee of this club, and the project has been provisionally approved. The success of a meeting of this nature depends very largely upon the convenience of the venue selected, and I would suggest that the centre of gravity of the southern clubs will be found here in Guildford. This town is within an easy day's return journey of practically any part of the South of England. I shall be very happy to hear further from your correspondent, and to join in arranging some of the details of the proposed meet."

Oxford M.C.C. impromptu hill-climbing competition on Irondown Hill, near Deddington (Oxfordshire). (1) R. A. Bishop (5 h.p. Indian) who made the fastest ascent and won the sweepstake, leading the hon. sec., W. A. Matthews (3½ h.p. Triumph). (2) E. Parker (8 h.p. Matchless) and H. G. Hill (2¾ h.p. Bradbury) competing in one of the heats.

AUTO CYCLE UNION NOTES.

The Lewes M.C.C. recently affiliated to the governing body.

Tourist Trophy Race.

At a recent committee meeting all the awards were confirmed, and votes of thanks were passed to His Excellency Lord Raglan, Lieutenant-Governor of the Isle of Man, the Highway Board, Colonel Freeth (Chief Constable), and the officials whose valuable assistance rendered the race the success it was.

It has been allotted to the Competitions Sub-committee to consider the conditions of the 1911 Tourist Trophy Race.

Permits.

In consequence of the agreement between the A.C.U. and the N.C.U., it was decided only to grant permits to motor cycle races and events in which the pedal cycle races were held under N.C.U. rules. Permits were granted for the following events: Bradford M.C.C. Open Hill-climb, June 25th, and the New Chesterton Sports for a motor cycle race to be held on July 7th. Also for a motor cycle race to be held during the Harrow Sports on June 25th, provided the pedal cycle races are ridden under N.C.U. rules.

A permit was granted to the B.M.C.R.C. to hold at Brooklands a sixty-lap track race for touring motor bicycles which conform to the A.C.U. definition of a touring machine on Wednesday, June 22nd, starting at 4 p.m.

Judges for the Six Days' Trials.

Messrs. A. G. Reynolds and H. G. Cove have been appointed judges for the Six Days' Trials, July 4th to 9th, and will follow these trials from Land's End to John-o'-Groat's.

Marshals and Checkers for the Six Days' Trials.

It will naturally be understood that the organisation of so big an affair as the Land's End to John-o'-Groat's Trials will require a good deal of outside assistance. The secretary, Mr. F. Straight, 18, Down Street, Piccadilly, W., will therefore be anxious to hear from riders who could officiate as marshals or checkers at the following points: Land's End, Camborne, Highbridge, Cross, Axbridge, Miner's Arms Inn, Whitchurch, Gloucester, Gretna Green, Kirkpatrick, Ecclefechan, Beattock Bridge, Abington, Douglas Mill, Newmains, Denny, Thornhill, Pitlochry, Dalnaspidal, Laggan Bridge, Loch Laggan Hotel, Spean Bridge, Invergarrie, Fort Augustus, Invermoriston, Drumnadrochit, Invercannich, Struy Bridge, Inverness, Beauly, Conan, Evanton, Alness, Invergordon, Tain, Clashmore, Dornoch, The Mound, Helmsdale, Thrumster, and Keiss. Riders who offer their services at the above points will not only be assisting the motor cycle movement, but will also obtain a magnificent view of the competition.

A COSMOPOLITAN GATHERING.

In last week's "Chat" we referred to a run organised by motor cyclists resident in St. Petersburg. The riders depicted above are those who took part. It may be added that the military looking uniform denotes that the wearers are students, and is not, as one might think, the regulation costume for motor cyclists in Russia. The riders in the group are of English, French, German, and Russian nationality.

BROOKLANDS AUTOMOBILE RACING CLUB.

The following entries have been received for the motor cycle races at the B.A.R.C. June meeting next Saturday:

2.20 p.m.—THE JUNE HANDICAP.

Entrant.	Machine.	Bore and stroke.	c.c.
V. O. Beuttler (Bat)	... ...	85 × 85 ...	964
D. R. Clarke (Indian)	... ...	71½ × 82½ ...	662
G. Lee Evans (Indian)	... ...	82½ × 93 ...	994
A. V. Deacock (Wanderer)	...	74 × 77½ ...	666
F. W. Dayrell (Martin-J.A.P.)	...	85 × 85 ...	964
H. G. Partridge (N.S.U.)	...	75 × 90 ...	808
H. V. Colver (Matchless)	...	85½ × 58 ...	666
C. R. Collier (Matchless)	...	85½ × 85 ...	976
H. A. Collier (Matchless)	...	85½ × 58 ...	666
G. Schink (N.S.U.)	... ...	80 × 99 ...	995
G. Schink (N.S.U.)	... ...	80 × 99 ...	995
J. P. Le Grand (Rex)	... ...	77½ × 70 ...	670
F. A. Applebee (Rex)	... ...	77½ × 70 ...	670
W. Lamm (V.S.)	... ...	75 × 75 ...	662
D. F. Steeves (N.S.U.)			

All the above are twin-cylinders.

4.20 p.m.—THE SUMMER HANDICAP.

Entrant.	Machine.	Bore and stroke.	c.c.
F. W. Applebee (Centaur)	...	85 × 87 ...	493
A. Brunton (New Century)	...	76 × 76 ...	349
E. D. Colrak-Hearne (Triumph)	...	85 × 88 ...	499
W. Dewar (Triumph)	... ...	85 × 88 ...	499
H. Hunter (Triumph)	... ...	85 × 88 ...	499
G. F. Hunter (Triumph)	... ...	85 × 88 ...	499
Capt. Sir R. K. Arbuthnot, Bart., R.N. (Triumph)	...	84 × 86 ...	477
H. Shanks, jun. (Kingfisher)	...	85 × 60 ...	340
*D. R. Clarke (Indian)	... ...	71½ × 82½ ...	662
*G. Lee Evans (Indian)	... ...	70 × 83 ...	639
A. C. Maitland (Trump-J.A.P.)		85½ × 85 ...	488
*T. Wilberforce (Indian)	...	70 × 83 ...	639
John Gibson (Trump-J.A.P.)	...	85½ × 85 ...	488
W. A. Jacobs (Rex)	... ...	84½ × 89 ...	499
*H. V. Colver (Matchless)	...	85½ × 58 ...	666
*C. R. Collier (Matchless)	...	85½ × 58 ...	666
*G. Schink (N.S.U.)	... ...	52 × 74 ...	314
*G. Schink (N.S.U.)	... ...	75 × 75 ...	663
A. Webb (Minerva)	... ...	76 × 76 ...	349
R. T. Exshaw (N.L.G.)	... ...	85 × 85 ...	482
C. E. Peach (Minerva)	... ...	76 × 76 ...	349
*J. P. Le Grand (Rex)	... ...	77½ × 70 ...	670
O. C. Godfrey (Rex)	... ...	83 × 89 ...	481
*F. A. Applebee (Rex)	... ...	77½ × 70 ...	670
A. G. Tapley (Calthorpe)	...	85 × 86 ...	488
*W. Lamm (V.S.)	... ...	75 × 75 ...	663

E. Williams (Frays)	... ...	85 × 85 ...	482
V. Yates (Rex)	... ...	84½ × 89 ...	499

*Denotes twin-cylinders.

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

Chain or Belt.

(1.) Would you prefer chain or belt drive on an 8 h.p. J.A.P. engine for touring purposes? Does a chain drive run as smoothly as a belt? Does it require more looking after? Why is the belt more popular than the chain? (2.) What should be the average life of a steel-studded 2½in. tyre on an 8 h.p. machine?—C. T.

(1.) If the machine is to be used for passenger work use a chain, if for single work use a belt. Chain drive with a proper slipping device is almost as smooth as a belt. A rubber belt is cleaner, easily repaired or replaced in case of breakage, and unlikely to do damage should the engine seize or jam. (2.) The average life of a 2½in. tyre on an 8 h.p. would be about 2,000 miles.

Knocking or Labouring of Engine.

What exactly is meant by the term "knocking"? I have ridden a Triumph machine for six months, and have noticed a metallic clank, which sounds as if it might be caused by a slack bearing of the connecting rod, but as this noise is noticeable at all times, and especially when going down an incline, when the engine misfires every alternate firing stroke, I do not attempt to check it by retarding the spark. Am I wrong? When the engine slows down on a steep upgrade and labours just before stopping there is a loud screech accompanied by a pounding noise at each firing stroke, which stops immediately the spark is retarded. This I suppose is the "knock" which one is warned against, and which does harm, but does the other knock do any injury, and is the misfiring I have spoken about a bad thing for the engine?—J. C. K.

Knocking is caused by the explosion taking place too early; that is to say, before the piston has reached the top of the compression stroke. The piston therefore ascends against the full force of the explosion, which tends to drive it downward, and this naturally causes the knocking noise. The sound you get when running down hill is probably simply the click of the valves, as it is unlikely that in six months the connecting rod bearing would be so worn as to cause the noise. The only way to verify this would be to take the engine down. In descending hills it is advisable to raise the exhaust valve and coast down. The noise you get on hills is genuine knocking, which should not be allowed to continue longer than can possibly be helped.

Size and Weight of Flywheels.

In the case of an engine with, say, 15in. diameter flywheels, would better results be obtained by using an engine pulley of 3in. or one of 5in. diameter, assuming the gear ratio to be unaltered, and the weight of the two pulleys to be equal? Of course, there is no question as to the relative gripping powers of large and small pulleys.—R. O.

It all depends on the weight and design of the flywheels. If they are accurately designed to suit the engine there would be no gain in fitting an extra large engine pulley which would act in the same way as increasing the weight of the flywheels. If the flywheels are too light there would be a gain by using a large diameter engine pulley, but not otherwise. There is a critical diameter and weight of flywheels according to the bore and stroke and speed of the engine, beyond which no increase of weight or diameter is effective.

Various Queries of Interest.

(1.) I have a 3½ h.p. Peugeot, a.o.i.v., Brown and Barlow carburetter. I find that when the engine is running a very distinct spray appears to come from the carburetter. What is the cause of this, and does it take any power from the engine? The carburetter is about 1½in. away from engine. (2.) Do you recommend driving on magneto switch or on throttle for city work? Does raising exhaust lift to slow in traffic help to pit valves? (3.) How often would you oil this engine?—N. P. W.

(1.) It means (1) that the spray is slightly on the large side, (2) that the inlet valve is opening to an excessive amount, or (3) the valve spring is rather weak. (2.) As regards driving, it would be better to control on the throttle, when possible, or exhaust lifter. For slow speeds, if you drive with the exhaust valve partially lifted it certainly helps to pit the valves. (3.) As regards lubrication, we should recommend you to give a pumpful of oil every twelve miles, or half a pumpful every six miles.

Refusal to Answer to Throttle Lever.

Please say the probable cause of my 1¾ h.p. Motosacoche motor bicycle having taken to run at one speed (a racing speed) only. Previously it was very sensitive, and answered to the least movement of the levers, but I cannot now get it to run slowly at all.—CA 421.

Without actually seeing the machine it is difficult to say what is the matter with it, but the symptoms point to the carburetter. You had better examine the working of the throttle and the wire controlling it, and see that the opening corresponds exactly with the position of the control lever. A hole or leakage admitting air to the induction pipe would account for the engine refusing to run slowly. Also overhaul the machine thoroughly and see that the magneto and carburetter are in order.

Fuel Consumption. Spring Footboards.

My machine is a 1908 standard tourist. (1.) I often see in *The Motor Cycle* particulars of fuel consumption tests with 3½ h.p. machines with a mileage of 100 and more miles per gallon. How is it done, and can I do likewise? 80-90 is about my average. (2.) Are spring footboard rests to be obtained anywhere which could be easily and comfortably fitted to my machine? A local man has tried to make a pair as an experiment, and has not succeeded very well. With a Brooks saddle seat and Hartford grips I have got rid of a lot of vibration.—B. W.

(1.) As regards economy, machines vary to a very large extent. Apart from a well-tuned engine, economy in running depends upon two things—(1) the adjustment of the carburetter, (2) the method of driving, and also upon the amount of air used. If you use a very small jet the consumption will be reduced at the expense probably of the power. If you use a very small jet a device to cut off the main air would be necessary. The most economical way of driving is to advance the spark as far as the road and other conditions will allow, and drive with as attenuated a mixture and as little of it as possible, to average about fifteen or twenty miles an hour, and to coast down hill as much as possible. This, however, is not the

way one would drive under ordinary circumstances. Your consumption at the present time is about what it should be. (2.) We do not know of any spring foot-boards on the market at the present time. Spring foot-rests, however, which are more or less similar to what you require, are made by Messrs. Templeton Bros., Sauchiehall Street, Glasgow, and by Messrs. J. Bradbury, Braintree, Essex.

A Double-purpose Accumulator.

Q. I should be obliged if you would answer the following: I use a 4-volt electric lamp for short runs, when it is not worth while to light up my acetylene lamp. I have two accumulators—one for the lamp and the other for ignition. Could I use one of these for both purposes at the same time, whilst the other is being recharged? Or would the current required for the lamp interfere with proper ignition, or, on the other hand, that used for ignition cause unsteady lighting of the lamp?—C. G.

It would not be advisable to use the accumulator for lighting and ignition at the same tme, as this would take a great deal out of the accumulator. It might, however, be done in cases of emergency for very short runs.

Licence for Motor Bicycle and Coupler.

Q. Will you kindly inform me whether it is necessary to take out an additional licence if I attach a Unito Coupler and an ordinary push bicycle to my motor cycle? The makers say no extra licence is necessary, but I should be glad if you would give me your opinion, as I am somewhat doubtful on the point. If you consider a licence is necessary for the coupler, can you advise (in view of the Budget regulations) where to take it out?—G. H. H.

The Board of Inland Revenue has decided that an extra licence is necessary, the conversion causing the machine to be a four-wheeler subject to a tax of £2 2s. In some districts it is possible to get off with an additional 15s. licence, the push bicycle being treated as a trailer. We should advise you to take out a 15s. licence for the coupler, and in making application for it treat it as a trailer. It will make no difference where it is taken out.

Synchronising Firing. Reducing Consumption.

Q. (1.) I have a 5 h.p. twin-cylinder Rex, which will only fire on one cylinder when starting, but the other fires when machine has got up speed. Could you please tell me how to cure this? (2.) My machine uses a large amount of petrol. I am only able to do about forty miles or so to the gallon. Could you give me any reason for this? My machine is 1907 pattern, Longuemare carburetter, accumulator ignition.—REXITE.

(1.) Probably the inlet valves are not properly adjusted, and the spring in one cylinder is a good deal stronger than in the other. Or the adjustment of the contact-breaker or carburetter may be at fault. A rich mixture is required for starting. (2.) Restrict the opening of your inlet valves to $\frac{5}{32}$in., fit fairly strong springs, and see that both have an equal tension. This will reduce your consumption, prolong the life of your inlet valves, and cause the machine to pull regularly.

READERS' REPLIES.

Belt Jumping Off Pulleys.

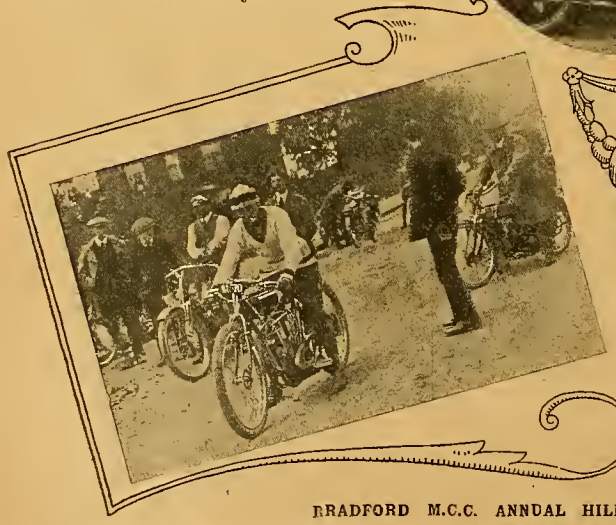
I cured a Watawata of jumping off proclivities by only leaving enough room, and no more, for the fastener hook to engage with its eye. When the whole, or a large portion of the slot in the eye is left outside end of belt, the hook disengages when running slowly, picking up, or starting on a high or even moderate gear. Each explosion causes a jerk of belt with consequent temporary stretch, the reaction causing hook to disengage from eye unless a neat and close fit.—OILE.

To Facilitate Starting.

I have had starting trouble with my 3½ h.p. Scott, and my experience might interest "Two Stroke" and possibly other Scott users. The cause of it was this: The airholes in the throttle casing admitted a good deal of air at all positions of throttle, and consequently when starting from cold the mixture was much too weak. Two strips of strong plaster over these holes stopped my trouble and improved the running of the engine when throttled down.—SHORT GRASS.

A Beginner's Mount.

Some time ago I asked your advice about a second-hand 2½ h.p. Kerry. I took the advice, and purchased the machine for £8 10s., and I would like to relate my experiences with it. In a little over three weeks I rode it 680 miles, and I am greatly pleased with it. I had practically no trouble with the machine, as when I bought it I overhauled and replaced any nuts or small parts that were shaky. My running expenses, including everything for the 680 miles, were 17s. 6d., which works out about a halfpenny a mile. The machine climbs splendidly, and will go up Brockley Hill without pedalling. I am only 15, and am writing this to tell those people who cannot afford an expensive mount that with a little care they will be able to derive a great deal of amusement and pleasure from a really cheap machine.—BK 169.



BRADFORD M.C.C. ANNUAL HILL-CLIMB FOR THE DYSON SHIELD.

(1) T. Bullus (3½ P. & M.), the winner. The club secretary, Felix Scriven, is in the centre of the group.

(2.) H. Shaw (7 h.p. Indian), who accomplished fastest time.

(3.) Some prominent competitors. From left to right: Bedford, Philipp, Bagshawe, Shaw, and J. Scriven.

GOLD MEDAL. GOLD MEDAL.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

We are glad to serve you honestly and very fairly at

WAUCHOPE'S,

THE MOTOR MAN,

9, Shoe Lane, E.C.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20 Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days, and if no sale is effected, each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

LOOK up Tamplin for reliable bargains.—3½h.p. 1909 magneto Rex and Millford castor sidecar, complete with spares, improved spring forks, Amac, Whittle, ready to ride away; £30, perfect.

5½h.p. Twin Kerry, two-speed gear, clutch, handle starting, Amac, footboards, silent, with Montgomery spring wheel sidecar quick detachable, re-enamelled, plated low, handsome combination; nearest to £37.—12, King St., Twickenham.

5h.p. Twin and sidecar, h.b. control, free engine, spares, tools, everything perfect; lowest, 25 guineas, no exchange.—F. Whittingham, 60, Chatsworth Rd., Clapton, N.E.

3½h.p. M.M.C., fast, powerful, Chater-Lea frame, no pedals, spring footboards, low built, long bars, sidecar built to suit; good condition; complete £16 10s.—Smith, 78, Olney St., Walworth, S.E.

4h.p. Chater-Lea-Kelecom, spring forks, detachable sidecar, good condition, Palmers, Michelin, almost new, adjustable pulley, accessories; trial by appointment; £22.—S.T.S., 139, Bathurst Gardens, Willesden Junction.

THE ROADS ARE DRY.

Let's get away on one of

HITCHEN'S MOTOR BIKES.

Please note the above is "Poetry." Lest you forget, these Machines can be purchased at

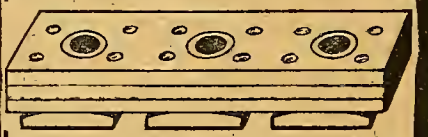
HITCHEN'S

163, EUSTON ROAD, MORECAMBE,

Telephone: 112.
Telegrams: "Motor, Morecambe."

on terms to suit all. Any accumulator machine with £3 down and 5/- per week. Any magneto model on best cash terms, with full allowance on old machine.

By-the-by, how does this suit for Belting? Cheaper and better than the best of Rubber.



⅝in. 1/-, ¾in. 1/2, ⅞in. 1/4, 1in. 1/6 per foot; just right for your summer visit to Morecambe Bay and the Lakes.

Summer Holidays by the Sea.

I shall be glad to arrange daily trips from Morecambe to those garaging with me. A fortnight can be spent enjoyably in this district.

Machines Cleaned, Garaged supplied with petrol, oil, and kept up to the mark. What more can man want except fine weather? This in Morecambe has so far been grand this year.

Sidecars are lent to steady drivers. Come and spend your holidays with me. I can arrange for plenty of variety and an enjoyable time.

Morecambe Sidecars.

Easiest to ride, easiest to detach; mudguards; best value, **£4 17s. 6d. & £5 5s.**, ready for the road, fitted in three minutes.

1910 Models in Stock.

F.N., P. & M., Scott, Bradbury, Enfield, Moto-Reve, Motosacoche, Indian, Premier, N.S.U., Zenith Gradua, two-stroke Rex, Speed King, Humber, Omega, Moto Velo. Best of terms. Cash or Exchange.

Magneto Machines.

Of these I have best Stock in the country. Speed Machines, Sidecar Machine Models, Lightweights, at right prices for cash.

State your Wants.

I buy what you want to sell, and sell what you want to buy. This is trade, and I am wanting that little order. Send for lists, boys, at once. The Garage Canary is doing fine; but one death in the family. Got worried by a Pom. Wish I had caught him on the job. However, "Goodbye," while next week. Don't forget MORECAMBE when fixing up your holidays.

Note Address as above

SIDECAR COMBINATIONS.

6h.p. Twin J.A.P., Chater-Lea, and sidecar, splendid condition; offers.—W., Burlington Studio, The Mall, Ealing.

1909 Phelon and Moore, 3½h.p., two-speed and free engine, with Millford 12 guinea castor wheel sidecar, all as new, will fire at walking pace, Clincher studded tyres, spare brand new studded tyre, Lucas King searchlight and generator, large horn, many extras; cost over £70, accept £46.—John Webber, Cranfurdrise, Maidenhead.

BROWN, 3½h.p., purchased new May, 1909, Mabon free engine, Fulford rigid sidecar (new tyre), powerful, driven 1,400 miles, Brown-Barlow, h.b. control, Palmers, excellent condition throughout, stand, carrier, accessories; trial; appointment; sacrifice £25, lowest, or separate.—Willmott, 53, Graces Rd., Camberwell, S.E.

1910 5h.p. Rex Sidette, Roe two-speed gear, only ridden 50 miles, in absolutely perfect condition butt-ended tubes, and one spare, special box under sidecar (cost 25s.), storm apron (cost 30s.), Cowey speedometer; total cost £83 4s. in May; will sacrifice for £73 4s.—M. Meta, 2, Sydney Rd., Richmond, Surrey.

MOTOR TRICYCLES AND RUNABOUTS.

DE DION Tricycle, water-cooled; £14, or offer.—138, Duke St. Park, Sheffield.

DE DION-PROGRESS Tricycle, 3½h.p., Dunlops, in perfect condition, two hand brakes, Longuemare carburetter, coil ignition, grand going order; great bargain, £8, or nearest offer.—W., 41, Church St., Lee, S.E.

QUADCARS.

8h.p. Phœnix Quadcar, 2-cyl. Fafoir, two speeds, reverse, splendid condition, every refinement, faultless, very smart; £40.—128, High Rd., Tottenham.

CARS FOR SALE.

ECLIPSE.—18-22h.p. Darracq, 1908, dual ignition, long chassis; sacrifice £145.

ECLIPSE.—18-22h.p. Clement, side entrance, magneto, long chassis, hood; £125.

ECLIPSE.—18h.p. Siddeley, side entrance, hood, screen two ignitions, perfect; £115.

ECLIPSE.—16h.p. Chenard-Walcker, 1907, side entrance, magneto, hood; £115.

ECLIPSE.—14h.p. Forman, side entrance, very smart steel frame; £85.

ECLIPSE.—14h.p. Mutel, 4-cyl., steel frame, in excellent order; £65.

ECLIPSE.—12h.p. J.P., 2-cyl., long chassis, hood, perfect order; £78.

ECLIPSE.—12h.p. Gnome, landaulet, very good order; £75.

ECLIPSE.—16h.p. Panhard Chassis, Krebs, steel frame; £55.

ECLIPSE.—12h.p. Star box van, good order; £48.

ECLIPSE.—6h.p., De Dion engine, 2-seater, hood; £35.

ECLIPSE.—6½h.p. Gladiator, very smart, four seats; £31.

ECLIPSE.—28-36h.p. Daimler, side entrance, dual ignition, screen; a bargain, £175.

ECLIPSE.—20-32h.p. Darracq, side entrance, magneto, canopy, fine order; £135.

ECLIPSE.—20-32h.p. Darracq, side entrance, hood, splendid condition; £140.

ECLIPSE.—6h.p. Siddeley, 2-seater, excellent order; £36.

ECLIPSE Engineering and Motor Co., 255, Earlsfield Rd., Waudsworth. 'Phone, 1135 Putney. Station, Earlsfield, L.S.W.R., 15 minutes from Waterloo.

6½h.p. Smart Peugeot 2-seater Car, good tyres, lamps, accessories; £36.—Below.

10-12h.p. Darracq Car, 2 cyls., complete with lamps, accessories, fine car; £58.—20, Potternewton Lane, Leeds.

6h.p. De Dion Car, in very good order; trial; £55.—Fowler, Womersley, Pontefract.

12-14h.p. M.M.C., 2-cyl., 4-seater, three speeds and reverse; £47 10s.—Below.

12-16h.p. Denuis, twin-cyl., 2-seater, three and reverse, h.t. magneto, shaft drive, just done up, smart car; £65.—Below.

7-9h.p. Brown, 2-seater, racy type, racked steering, three and reverse, fast and reliable, just repainted, bargain, £50; 7-9h.p. Star, 4-seater, three and reverse, excellent condition, many refinements, £47 10s.—Below.

8h.p. De Dion, one cylinder, two speeds and reverse, 4-seater, excellent condition, useful little car; £48 10s., cash or easy terms, exchanges entertained.—Stamford Hill Motor Co., 128, High Rd., Tottenham. 'Phone, 1982.

5½h.p. O.T.A.V. Voiturette, new Dunlops, magneto, hood.—Home, Electricity Works, York.

5½h.p. Peugeot, three speeds and reverse, in good order; £35.—E. C. Porter, 54, St. John's Rd., Clapham Junction.

Tests on Road and Track.

BY the time this issue is in the hands of our readers the Fifty-nine Lap Race at Brooklands for the Tourist Trophy machines will have taken place and the results be known. The race, as most of our readers know, was arranged to represent as far as possible the distance ridden in the Tourist Trophy Race in the Isle of Man, but the riding conditions were different in every respect. Instead of a series of short dashes, with continual and sudden slowing down and rapid accelerating at sharp corners, the ascent and descent of moderate, and in some cases rather severe, gradients, yesterday's race was held on a flat and comparatively smooth track. The conditions raise rather an interesting point as to which event provides the more severe test for a motor cycle engine, and opinion differs greatly. Let us consider the two sets of conditions, eliminating for the moment the personal equation. In the case of the T.T. Race the engine is called upon to exert its maximum power for short distances, with rapid decrease and acceleration of speed at corners. Occasional hill-climbing and high speed over rough roads render the conditions more severe. On the track the engine is called upon to turn round at its fastest rate, and the strain may be said to remain practically constant. The gear ratio may be higher, as there are no gradients to account for. The query arises, Which series of conditions are of the greatest service in the evolution of the perfect motor cycle engine? Other things being equal, which is the better engine for all-round conditions, one which will survive a trial at full speed under full load for several hours without variation, or one that will climb hills, run at high speed on the level, and rapidly accelerate when required after slowing down to turn corners? Some riders are of the opinion that the ascents and descents of the Manx course equalise the strain on the engine, because, although the utmost power that it is possible to obtain from a given cubical capacity is used for hill-climbing, the engine obtains a certain amount of relief when descending hills on reduced throttle and occasional switching off for corners. On a racing track like Brooklands there is no relief or idle moment for the engine from the start to the finish of the contest. Every part of the engine undergoes a continuous effort equivalent to, if not more exacting than, a bench test under full brake load for the same period of time.

It is no secret that several competitors in the Tourist Trophy Race profited greatly by continual practice on Brooklands, and were able to make adjustments and improvements that proved of the greatest benefit in the island. At the conclusion of yesterday's race of 163 miles 103 yards, more would be known of the subject from actual experience, and it would be interesting to hear the views of competitors as to whether the continuous grind of the flat race or the undulating and winding course in the Isle of Man proved the more exacting.

Still another feature which will be looked for with the greatest interest is the comparative speed performances of single and twin-cylinder machines and the positions in which they finish relative to one another. For example, in the T.T. there was a margin of 1om. 34s. only between the winning twin and the first single-cylinder machine. It was, however, generally considered that in yesterday's straightaway event the gap in the time would be much more pronounced. Before the race it was expected in all quarters that higher speeds would be accomplished by both types on the track, presuming that the same riders took part.

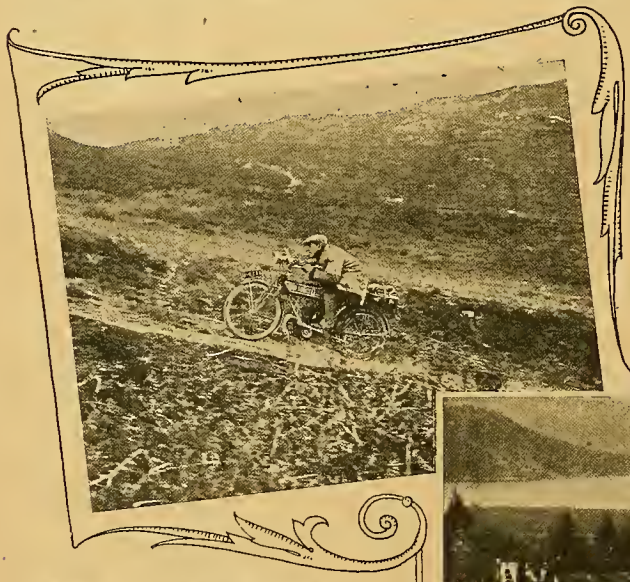
THE SCOTTISH TRIALS.

A RETROSPECT.

By B. H. Davies.

"THE severest test motor cycles were ever put to." Such was the verdict passed on the Scottish Trials of 1909. The organisers were severely criticised, first for adding to the list of trials, secondly for making their tests so exacting. They have replied to their critics by repeating the trials again in 1910, and by selecting a course even more severe. Let us examine the foundations of their obstinacy.

There are lots of hard riders and business men in Scotland who would use motor bicycles for business purposes if they thought the machines could stand



J. Slaughter (3½ h.p. Ariel) making light work o Glendoe Hill.

the racket and climb the hills. The Scottish railway service is limited in area, and where its tracks go the service is generally very poor—limited to two or three trains a day in many places. There is a tremendous market for motor bicycles in Scotland, which up to the present has scarcely been tapped; and it is among men who are neither able nor willing to confine their roadwork to the comparatively few broad highways which intersect the country. To such men as these the English trials are of little meaning. The A.C.U. riders last year complained about the surface of one road near Festiniog. If they had been through the Scottish Trials they would think it excellent. If this new market is to be tapped the Scottish Trials are necessary, the severity of their route is necessary, their value is enormous. Such is the conviction which inspires the work of the Edinburgh M.C.C.

The Trials as an Advertisement.

When all timid critics were decrying their course as impracticable, and only nineteen riders had the pluck to enter, it is distinctly encouraging to find fifteen machines finishing, and to note that three of the retirements were due to accidents for which the riders concerned were responsible, and the fourth to delaying the preparation of a machine to the last minute. Further, four machines, and two of them lightweights, scored full marks, and the next six divided a total delay of less than three hours between them during the six days. The machines concerned should reap a gorgeous advertisement north of the Tweed.

The Conduct of the Trials.

The trials were efficiently and courteously conducted. The sole breakdown in the organisation lay

P. W. Bischoff (1909 Triumph) passing an observer on Aultremain Hill.

The Scottish Trials.—

in the marking of the route at a few points, and here the competitors were indulgent, for the sections were miles away from towns, where it was very difficult to get the necessary marking properly done.

Were the Hills Too Steep?

Some of the Scottish journalists and a few of the less fortunate riders complained that the severity of the hill-climbs passed all reason. Personally, I am all for the inclusion of the severest hills which can be found, so long as too much trick riding is not demanded. Few private users need to set their machines at hills quite as trying as Glencroe, or Allargue, or Amulree. But if a specially tuned machine ridden by a lightweight mechanic could climb those hills (which was not the case in most instances this year), it by no means follows that machines in average condition ridden by unskilled and ponderous amateurs can climb them. The hill tests in trials should be far more severe than the tests to which the amateur is likely to subject his mount, for if all trials organisers set the trade a severe hill-climbing test we should get more rapid improvement in climbing capability. But in its attention to this point I think the E.M.C. made one mistake, viz., it was scarcely necessary to compel the riders to cover miles of villainous road either to get at these hills or to get off them. I see no objection to bringing the men to a steep hill along the best road that exists, and when they have climbed it allowing them to descend in a body and go home by a good road again.

G. L. Fletcher (Douglas) rounding the second bend, another view of which is seen in the lowest illustration.

ASCENDING AMULREE IN THE SCOTTISH TRIALS.

J. T. Wood (Zenith-Gradua) at the first bend. The beginning of the second curve is seen in the top left-hand corner.

A competitor dismounted at the second bad corner until his machine picked up speed again.

Few Mechanical Troubles.

Quite the most delightful aspect of the trials was the almost complete absence of mechanical troubles. No trial was ever so severe, yet from none has the motor bicycle emerged with its escutcheon so unblemished. The few mechanical troubles recorded were the result of spills, and the spills were not caused by the road conditions, let me say. Apart from collisions, I heard of but two mechanical troubles, two or three broken valves, and a loose drain tap.

Tyres.

Tyres gave some trouble, as they invariably do, and had it not been so there would have been quite a glut of gold medals; but punctures were as cheap as blackberries in September. Nor were the roads to blame. As a general rule, the stones on Scottish roads are not sharp. In proof of this, I may evidence the tyres of the little Ford car which I drove round the route, which were scarcely worn at all; we had one puncture, and the tyres showed two or three very small cuts. Any car driver will know these facts are a testimonial to the roads. On the other hand, it is no exaggeration to say that the nineteen entrants between them suffered more tyre stops than they should have done. The only qualification this statement demands is the fact that several riders were rank duffers at tyre repairs, and for some of their troubles they had chiefly got themselves to blame.

Good Belts but Bad Bags.

Belts behaved remarkably well, though rain—the belt's worst enemy, scarcely put in an appearance. Belt fasteners—of which in general I have a poor opinion—gave very little trouble indeed. Engines, carburetters, ignition, brakes, saddles, stands, carriers, levers, and detail fittings all proved more than equal to the severe strains encountered; but I noticed that few riders possessed proper toolbags. A cheap bag dissolves; an inconvenient bag is hurriedly packed and fastened when time is precious.

Hill Climbing.

The hill-climbing was rather disappointing. The published reports show in detail which machines behaved best. It was impossible to observe the riders on many of the minor ascents, though these were so severe that most English clubs would be glad to transport dozens of them to their own locality for test purposes.

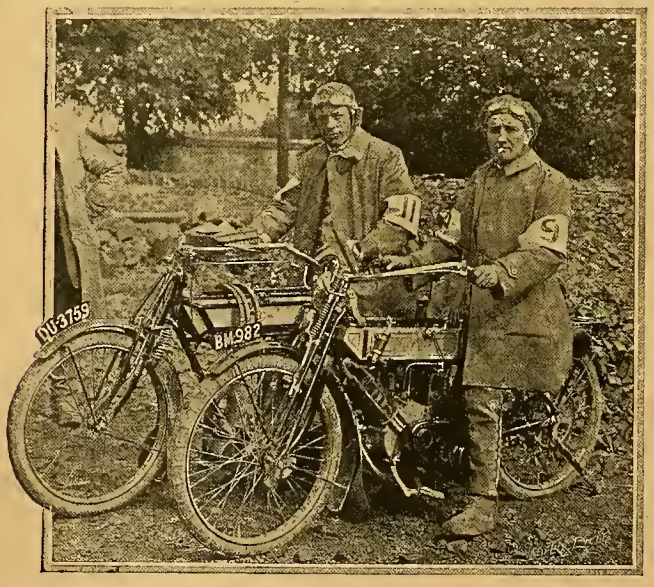
Of the half dozen crucial ascents Glendoe was the

The Scottish Trials.—

S. J. K. Thompson and his passenger coaxing the single-geared Bat and sidecar round the first bad bend of Amulree. It requires considerable audacity to start in a competition like the Scottish Trials with a single-geared passenger machine.

only hill on which a good average was obtained. It is a very severe hill, but it is open and straight, and the men were allowed an hour for tuning purposes; they all did well. On the long ascent up Glencroe most of the two-speeded machines failed as badly as the single gears, showing that the cooling problem is not yet solved, and even holding out a pointer in the direction of water-cooling for extremely hilly countries. On the other bad hills, *e.g.*, Cairnwell ("Devil's Elbow"), Allargue, and Amulree, the responsibility of failure rests partly on the riders, who slowed their engines so much on the wicked bends that they refused to pick up again farther on; or, in the case of variably geared machines, put in the low gear so soon that the engine ran hot before the climb was finished. In reality such failures are an indictment of machines rather than of riders. Remember that the gears were seldom higher than 6½ to 1 on these ascents. Had it been simply a matter of corner work, the trade riders at any rate would have come down after a look at the corner and tried again. Those who failed did not think a second attempt worth making. They knew the engines were unequal to the task, so they pedalled or ran alongside. There is no harm done, so long as we take the lesson to heart. From a hill-climbing point of view, we may say there is already no hill with a rideable surface in Great Britain which an expert on a freshly tuned machine cannot climb, if he is allowed to adjust the gear to the gradient, enjoy a little practice, and choose a dry windless day. We must not stop here. Motor cycles will have attained perfection only when the rank duffer can climb these same hills comfortably in spite of contrary winds and surfaces. These Scottish hill tests have proved that we need engines which can keep cool longer, engines that can pick up better on bad gradients, and good two-speed gears as options. Now that genuine reliability has been attained by nearly every maker, absolute certainty of hill-climbing is the point that most of all demands attention.

The winning Douglas team in the Scottish Trials. Left to right: G. L. Fletcher, W. W. Douglas, and P. Phillips. The machines illustrated are fitted with a two-speed gear specially designed for the trials.



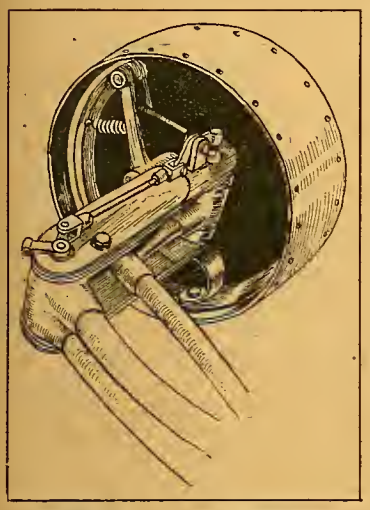
Full reliability marks in the Scottish Trials. Bert Yates (3½ h.p. two-speed Humber) and W. Pratt (3½ two-speed P. and M.), two of the four gold medal winners. The other two were W. W. Douglas (2¾ Douglas) and J. S. Holroyd (1¾ Motosacoche).

From a tourist's aspect the trials were truly delightful. The gorgeous scenery baffles description, and far surpassed anything that I had previously seen in the British Isles. The hotels were good, cheap, and not overcrowded as they usually are in the English trials, and a spirit of jovial goodfellowship reigned among riders and officials in spite of the hard work. I hope that next year a goodly band of our hard-riding English amateurs will enter—they will long look back to it as the finest week they ever had.

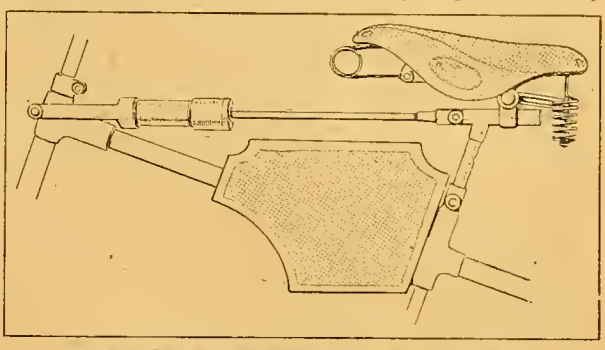
A club prize will be offered in 1911 for the best performance between teams of three riders representing clubs, and we should have fine sport if the prominent clubs send a trio apiece. The thanks and congratulations of the motor cycle world are due to the Edinburgh M.C.C. for organising so strenuous a test. We have plenty of easy ones, and a little work of a more exacting nature will do good.

THE 1910 JAMES MOTOR BICYCLE.

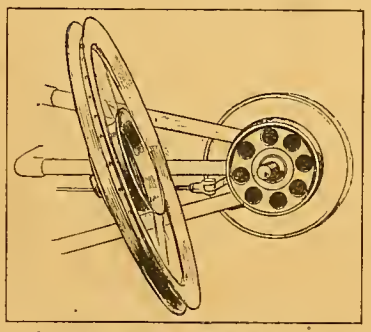
THE designers of the James motor bicycle are to be congratulated on their originality, as there is not a machine on the market which departs more from standard lines than the 3½ h.p. in question. On the occasion of a recent visit to the James Cycle Co.'s works at Birmingham, we were enabled, by the courtesy of Mr. A. D. Arter, to go round the well-equipped factory in which James motor bicycles are constructed. Here two of the latest models were to be seen being made ready for the road, one of which had lately successfully come through the last Quarterly Trials. Not the least interesting point about the machine is the frame, which, even from a casual glance, may be seen to be a striking departure from standard lines. The wheels are mounted on live axles, and are entirely open on one side, so that tyres and tubes can be changed without difficulty. Inside the outer shells of the hub are internal-expanding brakes, of which the front brake is hand-applied and the rear brake worked by means of a pedal. The fitting of a luggage-carrier has prevented the rear wheel being entirely open on one side, as it is necessary for the supports to have two points of suspension, but to remove an air tube it is only necessary to undo one nut, and there is then room to spring aside the carrier stay and pass it through the opening. The engine has a bore and stroke of 86 × 96 mm., and is provided with special staggered radiators, while the main shaft runs on ball bearings. The Bosch high-tension magneto is carried behind the engine, and is, in consequence, protected from mud and wet. It is driven by means of a train of gear wheels enclosed in a casing, but opposite the magneto pinion is a large cap, which may be unscrewed, totally exposing the pinion and allowing the magneto to be timed without disturbing the gear case cover. The saddle is suspended on a spiral buffer spring and an anti-vibratory check spring. The latest addition to the James motor bicycle is a friction clutch, which follows car practice, being of the cone leather-to-metal self-contained type, which is rendered possible by the employment of a live axle. It will be seen, therefore, that the idea throughout has been to employ car practice where possible, and the absence of front forks and the employment of pivot steering, the suspension of the wheels, and the free engine clutch just described, go to confirm this. The machine is full of interesting points, and, in consequence, an ever-increasing number should be seen on the road.



The front wheel hub, internal expanding brake and steering gear.



The spring seating arrangement on the James motor bicycle.



The leather-faced cone clutch on the driving wheel, also showing belt pulley.

CHECKING IN RELIABILITY TRIALS.

By F. H. M.

VARIOUS and numerous appear to be the systems adopted by clubs in order to decide winners in reliability trials. Can any of the methods be called perfect when stops are not taken into account? Even if a large number of checkers are arranged for *en route*, it is quite possible for a competitor to have several short stops and make trivial adjustments, and still arrive at the different checks (including secret checks) on schedule time. He may possibly be awarded a cup or medal, while another competitor, who has not had a single stop, may not (either through bad luck, a bad watch, or bad management—it matters little which, as the trial is presumably a test of machines) have adhered quite so closely to schedule time, and possibly loses the prize.

A method which does take all stops into account is that adopted by the Western District M.C. (London). The system works exceedingly well, and has met with great approval by the members. The committee had experienced all the usual difficulties when finding winners—re-running long events, speed-judging, secret controls, hiding in hedges, checkers' watches differing from competitors' watches, etc. At the beginning of last year the committee was faced with the following question at numerous meetings, until it became quite a joke: "Method of deciding winners in reliability trials?" The subject was discussed and argued vigorously for hours, but no decision could be arrived at, and in despair the matter was finally left to a sub-committee of three to come to some decision. Being two to one, it was thought they would arrive at some settlement of the vexed question. After long consideration, the method now adopted was planned out, and subsequently referred to and approved by the committee.

Checking in Reliability Trials.—

The system is as follows:

1. Competitors ride in pairs, each pair leaving at intervals of two minutes. Each competitor checks his partner, and those following behind must also note stops.

2. Times are taken at the start and on arriving back. A checker is also stationed at the destination, to prevent scorching, any competitor failing to arrive within five minutes either way of his schedule time being deducted 1 mark for each minute. Competitors are started on the return journey one hour after arrival.

3. No stops, other than traffic stops, are allowed outside controls. In long runs an intermediate control may be arranged, where petrol and oil tanks may be replenished. No adjustments allowed in controls.

4. Each competitor is allotted 60 marks, and for each stop of a minute, or part thereof, a mark is deducted, the time being recorded by his partner. Should a competitor be delayed more than 60 minutes he is disqualified, and his partner continues the journey in company with another pair following, or alone if the last pair. The number of minutes occupied during all stops are added to the time each competitor is due at the destination and to arrive back.

5. On the return journey, partners separate about four miles from the finish, one rider being due back one minute after his partner, the schedule time being worked out at twenty miles an hour, plus the hour at the destination. Competitors are thus due to arrive back at regular intervals of one minute.

6. In the event of several making non-stops and losing no marks, the winners are decided in accordance with their arriving back the nearest to their respective schedule time.

No Need for a String of Checkers.

Each competitor has attached to his handle-bar a coloured card worded as follows:

Competitor's name
Machine
Started at
Due back at
Arrived back at
Due.....(destination) at
Arrived.....(destination) at
Leave.....(destination) at

STOPS.

Mins.	Cause of Stops.

The method avoids the necessity of arranging for a large number of checkers; is not arduous or monotonous; eliminates the best machines and riders; and the winners can be ascertained in a few minutes after the termination of the competition. The fly in the ointment is the watch of the timekeeper at the start and finish may stop. This happened once (due, no doubt, to the owner not having wound it up the previous evening), but two watches are synchronised at the start, and in the event of the "official" one stopping the time is taken by the "spare."

In my opinion, the method is ideal, but possibly some of your numerous trials hon. secretary readers may wish to criticise it. At all events, all is calm and peace in the ranks of the Western District M.C. (London).

KENMORE HILL AND THE END-TO-END TRIALS.

IT is common knowledge that the A.C.U. has altered the Scottish portion of the End-to-end Trials route so as to include a hill-climb up the Kenmore side of Amulree Hill. We are in hearty sympathy with the policy of including more severe ascents than figured in the 1906 and 1908 events, but our representative in Scotland is strongly of opinion that the Kenmore climb should be cut out in favour of an easier and less freakish venue. We understand Kenmore has been selected for two reasons: (1) that to use the Sma' Glen side might seem like poaching on the preserves of the Edinburgh M.C.C.; (2) a private member of the A.C.U. reports having climbed the hill on a T.T. Triumph without difficulty. The first reason falls to the ground in view of the fact that the Scottish car trials have used the Sma' Glen side for several years past, and of the openly expressed wish of the Edinburgh clubmen to see how the A.C.U. riders can shape up it. The second reason is unsound, because there is a vast difference between attempts by a 10 stone rider on a stripped 150 lbs. machine, specially tuned, and, say, a 13 stone man on a fully equipped and rather road-worn steed, scaling over 200 lbs. all on, which is about the average weight of a 3½ h.p. roadster loaded with kit and luggage in an End-to-end trial.

If the hill is practically unclimbable, its inclusion in the A.C.U. trial will have the following effects:

(*a*) It will rob men of gold medals which they deserve.

(*b*) It will give a very unfair and unfavourable impression of motor cycling to the general public.

(*c*) It will deter riders from entering these trials.

(*d*) Especially it will discourage amateurs from entering (and the present desire is to see a large amateur entry in all the chief trials).

Now the Kenmore side is not unrideable. Adamson has climbed it several times, and, magnificent steersman and mechanic that he is, he has even taken up a passenger on his carrier to a point well above the fourth of the five bad bends. But the following facts and opinions are of weight:

(*a*) Nobody has ever climbed even the Sma' Glen side in the course of a reliability trial, all clean ascents having been recorded in timed sprints.

(*b*) The Kenmore side is nearly twice as difficult as the Sma' Glen side. According to the contour book, Sma' Glen side averages 1 in 8 as against 1 in 7 for the Kenmore side.

(*c*) The road is so narrow that any competitors who fail will seriously obstruct subsequent attempts, and with an expected entry of at least seventy-five the hill-climb alone may occupy half a day, owing to delays for clearing the road.

(*d*) The opinions of trade riders and others who have seen the hill should carry some weight, and they are almost unanimous that practically no one can climb Kenmore under touring conditions.

In view of these facts and opinions we respectfully invite the A.C.U. to consider whether it would not be in the best interests of its trials to substitute some other Scottish ascent. We should like to press the claims of Glendoe Hill at Fort Augustus, which is a straight and very formidable ascent, admirably adapted for the purpose.

A Remarkable Performance.

INTERVIEW WITH J. S. HOLROYD.

IF any rider had a good excuse for losing all possible marks in the Scottish Trials, it was J. S. Holroyd, who rode the 1¼ h.p. Motosacoche. It was not to be expected that so lilliputian an engine could climb half the hills embodied in so formidable a route, nor could it hope to make up the time lost on hills by fast travelling down the rough mountain passes farther on. Yet the plucky rider with his little machine was one of the only four who lost not a single mark. In one respect the Motosacoche surpassed all the rest. The Braemar-Grantown section was so terribly severe that the only official who was able to force his car over it recommended the judges to award full marks to every competitor who covered it. The judges decided to adopt this recommendation, and lo! it was discovered the same evening that everyone had been late in at Grantown except Holroyd! It is true that a breakdown in the marking of the route was partly to blame, but under the circumstances the Edinburgh M.C.C. awarded him a special medal for his marvellous performance over this section, of which we append a contour, reproduced from the "Contour Road Book of Scotland" (Gall and Inglis).

J. S. Holroyd (1¼ h.p. Motosacoche), the hero of the Scottish Six Days Reliability Trials. He was the only rider of a single-geared machine to obtain full marks.

Meeting Holroyd as he left the examination yard after the finish of the trial, we thought his experiences might be interesting to our readers. This rider weighs about 11 stones in riding kit, and was with the Rover Co. before joining Motosacoche, Ltd., two years ago. He looked perfectly fresh and fit, deeply tanned by the grilling sunshine, and was perfectly ready to discuss his experiences.

"You have a lot of experience in trials, Mr. Holroyd?"

"Well, scarcely so much as most of the trade riders. For years I worked wholly in the shops, but I have driven a Motosacoche through three Quarterly Trials, twice to Edinburgh and back in the M.C.C. trial, and I also gained a gold medal in the A.C.U. Six Days Reliability Trials last year, getting full marks for hill-climbing and condition at the end of the trial, and climbing Dinas Mawddwy and Birdlip without dismounting."

"And how do the Scottish trials compare with the other events?"

Our victim smiled meaningly. "Any other trial ever held was a mere picnic compared with them. Quite apart from the frightful hills we have had to get up, the amount of severe gradient thrown in in the ordinary way has been appalling, and when you are up the hills the surface has been so bad and the corners so sharp and so numerous that it has been the hardest thing in the world to catch up schedule time again."

"How did the Motosacoche fare on the hills?"

"Oh, I got up most of the ordinary hills in good style, mostly without pedalling, but you could not expect 1¼ h.p. to climb places where two-speeded 3½ h.p. machines, ridden by men lighter than myself, were sticking every day. As you saw, I make a rule to get up as far as I comfortably can in the saddle. Then, when I am tired of pedalling, I get off and slack back my jockey pulley a trifle, so that the belt slips a little. Then if I start the engine again it takes up the machine and a bit of me. I walk alongside at three or four miles an hour, and the machine helps me a little. Even thus I got up a good deal faster than some of the others. One or two men have pushed heavy machines for miles; they fell off at the bad corners, and their machines are so heavy they could not get going again."

"That must have been pretty severe on your belt, Mr. Holroyd?"

"Well, look here; these two §in. Whittle belts have brought me through nicely, turn and turn about, and they were not new when I started. A bit glazed, perhaps, but after a good scrape they ought to see me through the rest of this season. Probably I shall use them again in the End-to-end. I shall want a new pulley, though; the outside flange has got a groove worn in it."

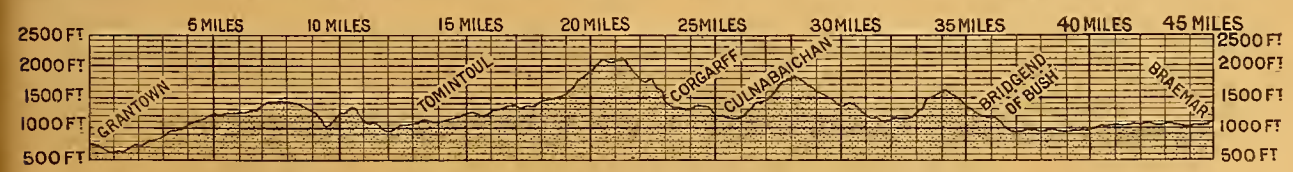
"You cannot have experienced much trouble or delay anyway, seeing you have averaged 20 m.p.h. over 900 miles of the worst roads in Scotland?"

"No, I have come off with a clean sheet in that respect, and, of course, the weather has been all in our favour. If it had been wet and windy, there would not have been any gold medals at all probably. I think I score by having a slow machine. I can pick my track carefully."

"Slow? I have been hearing how you passed that big car of Morrison's along the straight stretch into Blair Atholl."

"Oh, my engine can turn over all right when I put her to it, but, of course, I go steadily over the mountains."

So wishing Mr. Holroyd and his staunch little mount good fortune in the End-to-end, we left him to catch his train to London, taking with him three well-earned prizes—one of the four gold medals awarded for a perfect score, another medal for the best performance by any lightweight, and a third for the absolute best performance over the Grantown-Braemar section. Truly a field day for the Motosacoche!



Contour section of the road between Braemar and Grantown, the severest stretch in the Scottish Trials.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Cure for Stretching of Leather Belts.

[4820.]—Regarding letter 4797 in *The Motor Cycle* of June 9th in which your correspondent recommends using a large clock spring, we would like to say that the method of using a tempered steel band in this way, also in co-operation with a belt itself, has been patented by us.

JOHN A. MILLER, LTD.

The Storage of Accumulators.

[4821.]—Since the publicity given in *The Motor Cycle* to our hints regarding the care and storage of accumulators we have been inundated with queries as to why we recommend keeping them in a dark place. As no doubt there are a large number of your readers who are interested in this question who have not troubled to write us, we may state—for their particular benefit—that our reason for suggesting a dark place for storage is because continual exposure to the light seems to set up a chemical action which very quickly causes the celluloid cases to lose their transparency, hence our suggestion that they should be stored in a dark place or wrapped up in such a manner as to keep the light away from them.

C. A. VANDERVELL AND CO.

To Ensure Regular Lubrication.

[4822.]—In the issue of June 9th, Mr. E. Rye calls attention to the advantage of drip feed lubrication, and recommends the adoption of a screw regulating valve. As you state in your footnote, this device has already been adopted, and we should like to add *patented*.

This regulating valve, exactly as described in Mr. Rye's letter, is the leading feature of the "Best" drip feed lubricator, Patent No. 15,481, 1909, for which we have the sole patent rights, and of which we are the manufacturers. It is, in fact, the identical pump adopted by the Norton Manufacturing Co. for their Tourist Trophy models, and which is now in use on many motor cycles of various makes.

BEST AND LLOYD, LTD.

Experiences with a Lightweight.

[4823.]—Having ridden over a thousand miles on my two-cylinder Enfield, I should like to give my experience for the benefit of those who require a lightweight motor cycle.

As a medical man, with a practice which averages more than twenty miles a day through the streets of a busy town, I have had ample opportunity for testing the machine. I find it absolutely reliable, quieter than any machine I ever meet, and most economical in petrol consumption. One of its greatest charms is the ease with which it starts. Some days I call at over fifty houses; this, of course, necessitates starting it more than fifty times. I have used it every day, wet or fine, and there has been no suspicion of side-slip. I take it that is due to the low centre of gravity. In short, it is an ideal bicycle for a doctor. Two medical friends of mine have recently purchased one with the same happy results. I am not surprised to hear that the machine is doing so well in the reliability trials. Last week I had a run of 143 miles during the day, had no trouble, and took every hill without pedal assistance. I have no interest in the manufacturers, and I am writing this simply because I feel that I should like to give others who are in the position of myself some weeks ago, when I was hesitating which machine to buy, the benefit of my experience.

M.R.C.S., L.R.C.P.

Opinions of Motor Bicycling Wanted.

[4824.]—I have read "India's" letter under the above heading a few weeks ago, and should like to mention that I have ridden both horse and motor cycle.

The latter I am still riding, and have done so for the last three years. In my opinion the horse is by far the greater "liver stirrer." As to the motor cycle being bad for the spine and nerves—well, I don't see it. In fact, my brother when he has got neuralgia or toothache always goes a ride on his motor cycle, and says it always cures him, and that's not stretching it.

AN ENTHUSIAST.

Hill-climbing.

[4825.]—With regard to Mr. D. R. Greis's enquiry *re* Succombe Hill, I beg to inform him that I climbed this redoubtable hill in 1907—about May, I think. I used a 3½ h.p. Triumph, 82 by 86 mm., with a fixed pulley giving about 4½ to 1 gear, so my 1907 apparently did as well as your correspondent's 1909 engine, although it was at a disadvantage as regards gear and capacity.

I always understood my ascent was the first verified one, though I have heard rumours of others, which I may say I have not been able to confirm. Be that as it may, there is not much doubt to my mind that mine was the first single-cylinder single speed ascent.

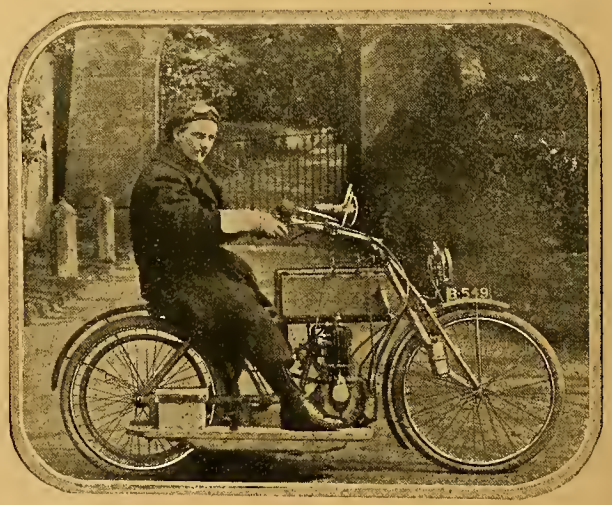
E. M. OLIVER.

Altering Old Pattern Machines.

[4826.]—I have been a reader of your paper for over three years, and would like first of all to express my appreciation and tender my thanks for the great help it has been, more especially when I first started motor cycling.

Some little time ago you illustrated a machine which had been cut down, and which I at once copied. I send you a photograph, which may be of use to some other readers. A point of interest may be the long footboards, which are very comfortable. Shallow boxes are fitted under the footboards, in which I carry tools and spares.

A. C. M. LILLIE.



An altered and improved frame mentioned in A. C. MLillie's letter on this page.

Portable Sheds and County Council Regulations.

[4827.]—Unless the writer of letter 4801 in the issue of the 9th inst. wishes to store petrol in large quantities, this has nothing whatever to do with the case he states. The question of the erection of a building of any character (portable, permanent, or temporary) within the London County area, is governed mainly by the London Buildings Act of 1894, whilst the storage of petrol is regulated by the Petroleum Act of 1871, and orders issued by the Home Secretary. The wording of the former Act is so closely drawn as to include practically all buildings of any nature whatsoever, if erected within 30 feet of any existing building or structure; the only exceptions to this are:

(a.) Not exceeding 5 feet in height, with a maximum of 50 square feet in area, and placed more than 5 feet from any existing building or structure.

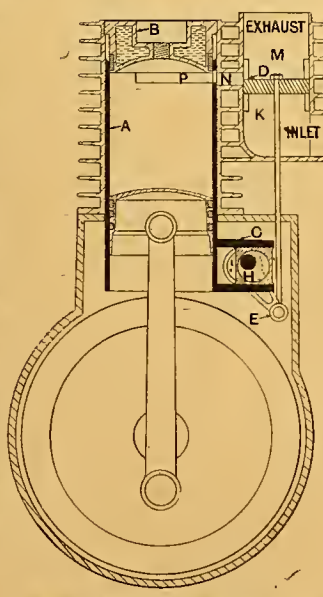
(b.) Contractors' or builders' offices, workshops, or sheds erected to enable them to carry out work of constructions or repairs, and removed as soon as the same is completed.

The provisions of this Act do not concern themselves with the use to which an erection of the kind your correspondent refers to is put, and as he admits it was only 18 feet away from a dwelling house, also that the garden fence is only 26 feet distant from same, he had no other alternative but to comply with the L.C.C.'s request to construct according to their requirements, or remove what was certainly an illegal construction, unless he wished to incur the risk of a summons, followed by a magistrate's order for its removal, with the addition of a fine. The issue cannot be evaded by the addition of wheels making it possible to move the shed from place to place.

The subject appears to be of interest to London motor cyclists. Enquiries which I made from my solicitor beforehand led me to abandon the idea of following your correspondent "Shed's" example. GARAGE.

A Slide Valve Motor Cycle Engine.

[4828.]—I beg to enclose a sketch of a new slide valve engine which I have just patented. I think it is the only design which is suitable for an air-cooled or partly air-cooled engine. In the sketch a water-cooled head is shown, but that might be dispensed with. The essential parts of this new valve gear are the single sleeve A and the small piston D. The sleeve has a cross-head C, by which means the eccentric H moves it up and down. The other eccentric gives motion to the small piston D. The action of the gear is as follows: On the explosion stroke the sleeve A commences to move down until its port P registers with the passage N, then the exhaust gases rush along that passage, and when the main piston moves up on the exhaust stroke, it forces the spent gases before it. During the exhaust stroke, the small piston D also rises, and on the commencement of the induction stroke it closes the passage M and opens the passage K. This allows the new gas to enter the cylinder, until the end of the induction stroke, when the upward movement of the sleeve A cuts off the supply of gas. During the compression stroke the sleeve A still travels upwards until the beginning of the explosion stroke, when it starts to move downwards. Owing to the size of the port P, this design gives the same quick release to the exhaust gases as the double sleeve type, and as there is only one sleeve instead of two, there is not the same chance of overheating. The weight of the moving parts of this gear is nearly fifty per cent. lighter, and it has fifty per cent. less frictional surface than the double sleeve gear. I think this engine should prove very suitable for motor cycles, for there are no loose parts to go wrong or need constant attention, and it should be very silent in working.



Single sleeve valve engine referred to in the accompanying letter.

With regard to the compression, it should be noticed that this is taken entirely by the sleeve A; the small piston D only opens and closes the exhaust and inlet passages. There should be little chance of overheating being experienced by piston D, as it is not exposed to any great heat, for the exhaust gases are nearly cooled before they reach it. J.M.

A Reader's Ideal Motor Cycle.

[4829.]—I consider the ideal motor cycle is not on the market as far as I know, though there are some cycles which have some of the desirable features. It would be according to the following specification:

1. Lightweight, not above 120 lbs.
2. Springs on both wheels, *i.e.*, back and front.
3. Engine to be of "balanced" type—(a) two-cylinder horizontal opposed as in Douglas, (b) three-cylinder vertical, (c) four-cylinder vertical as in T.A.C., and be of about 2½-3 h.p., preferably water-cooled.
4. All main bearings of engine to have automatic pressure pump lubrication (as in car engines).
5. Provided with two or three-speed gear capable of driving machine at, say, 40 m.p.h. on level and taking machine comfortably up hill, say, 1 in 4. Gear to be part of engine or rear hub.
6. Weather-proof transmission chain or shaft drive.
7. Flexible transmission, *i.e.*, some form of spring drive (slipping clutches barred).
8. Free engine clutch (governed engine).
9. Mud-proof. Persons riding even on fearful roads should be spotless. Ditto machine.
10. Accessibility of wheels and tyres, four nuts at most to take out wheel.
11. Pedals to be fitted for engine starting purposes.
12. Magneto ignition, etc.

The cycle which approaches this is the T.A.C., but I do not consider it because it is certainly not a lightweight, nor do I consider it holds out claims 10 and 11, or claim 4. I may be mistaken, of course. The Douglas seems to comply with 1 and 3. I hope this letter will raise an interesting discussion. P. ERFECT.

Delay in Execution of Orders.

[4830.]—I endorse recent letters on the above subject. I ordered a twin machine of well-known make at the Manchester Show, and am assured every fortnight by the makers that the machine is ready for delivery, but the two-speed gear, which is made by a different firm, cannot be obtained. Only the other morning I received another letter. The gear makers cannot give any definite date when the gear can be delivered. Really, I think this is about the limit, as I have twice had to put off a tour, and now it looks as if I shall miss half the summer.

FED UP.

SUMMARY OF CORRESPONDENCE.

A. Turpin (Sydenham) would be glad to hear from the motor cyclist who helped him on Keston Common on the 5th inst., between 5 and 7 p.m.

"E.W.W." (Coventry) would be glad if manufacturers (preferably British) of engines up to 2 h.p. suitable for lightweight motor bicycles, would send him lists.

EXPERIENCES WANTED.

"C.F." (Wellingborough) would be glad of readers' experiences with the Zenith Gradua 3½ h.p. J.A.P., particularly with regard to gear.

"L.L." (Harringay) would be glad of owners' experiences of the 3½ h.p. Lincoln Elk as to reliability of engine, and its suitability for passenger work.

"Nemo" would be glad of readers' experiences of a coupler for a pedal cycle attached to a lightweight motor cycle.

"B.H. 736" would be glad of readers' opinions of the 8 h.p. J.A.P. engine used with a sidecar, particularly regarding petrol consumption and wear on tyres.

Unsatisfactory Belt Rim Brakes.

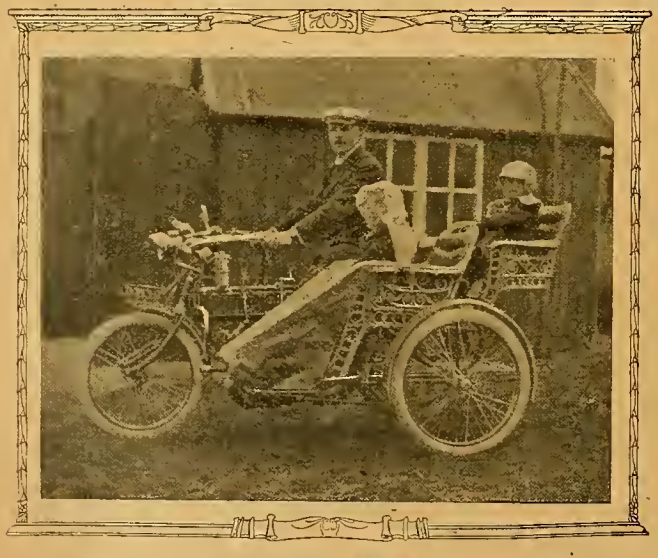
From time to time I hear of certain riders who find the standard belt rim shoe brake inefficient. As this has never been my experience of it I have been puzzled, but of late I have tested two machines implicated, and traced the cause. A common cause with new machines is the painting of the belt rim and the brake pad not fitting the contour of the rim, which destroys the frictional grip. A second cause is insufficient leverage, and this occasionally occurs with machines turned out by inexperienced makers.

A Good Magneto Drive.

I have long advocated the placing of the magneto on a bracket behind the cylinder, but admit the difficulty that it is awkward to set it so high that the contact breaker clears the sag of the belt. Machines have been sold this year with their details so poorly arranged that the belt wears away some projection on the magneto. Hence I was glad to notice in the Isle of Man that the makers of the Moveo machines employed a bevel drive and long shaft for the magneto, enabling it to be carried well out of harm's way, and securing some reduction in weight and increase of fuel capacity as compared with the tank position. This appealed to me as about the best arrangement of the magneto I have seen up to date; though possibly rather heavy for a racing machine it is, if silent, ideal for a tourist mount.

Stub Air Levers.

I notice that several designers, having evolved carburetters which are partially automatic, employ an air lever only an inch or two in length, mounted on the carburetter itself. I submit with all respect that the design is radically wrong. It may work very well in ordinary riding, but its weakness is apparent on all twisty and precipitous hills, not to speak of traffic work. The rider must stoop down, let go one bar, and more or less take his eyes off the road at a moment when such proceedings are difficult or impossible; and several riders tell me they find machines of this type very inconvenient on abnormal hills—the surplus air cannot be shut off smartly enough in rounding a V bend, and the engine does not pick up smartly enough. It is a simple matter to convert such devices to handle-bar control.



"WHEN *IS* MOTHER COMING."

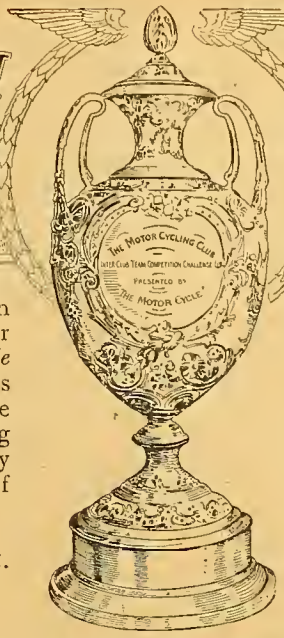
Handle-bar Control of the Oil Pump.

At the close of the T.T. Race I heard one competitor remark that whatever fittings he dispensed with in next year's race he meant somehow or other to rig up handle-bar control of his lubrication! I sympathised with him warmly, for I saw several riders swerve all over the road after removing a hand to make a lightning dab at the pump piston, while those who used thick oil, or had also to operate a tap, were in even worse plight. I doubt if his demand represents a touring need, for in these days of sloped pumps and engines willing to run on thin water-cooled oils, the tourist's lubrication difficulties are limited to efforts of memory or judgment. But for racing we shall certainly have to choose between handle-bar control of the oil (which cannot easily be neat and efficient), or, alternatively, some type of automatic feed, such as figured on several machines in this year's race. The J.A.P. oiler has a long and honourable reputation, and may fill the bill, but I have not heard many riders enthusing about self-acting pumps. Why, I do not know; most cars oil themselves silently and unobtrusively nowadays, and I do not see why a motor cycle should not do ditto. What is wrong, for instance, with an air pump working off the engine and forcing oil under pressure through a needle valve? It absorbs practically no power, cannot foul up, and is far safer than gravity, as it can overcome any probable resistance.

Crank Pins on Racing Machines.

The owner of a T.T. type machine is generally tolerably expert, and I should recommend such to take a look at their crank pins every now and then, especially when a well worked engine is being prepared for a long holiday tour or other important occasion. A species of crystallisation seems to concentrate on the crank pin of these terrifically fast engines, whether their colossal rate of revolution or the knocking and pre-ignition to which the most careful rider must occasionally subject them is responsible I know not. Suddenly without any long warning the engine will commence to knock apart from reasonable provocation, and in a mile or two the crank pin will be found torn in half. At any rate, during the present year the crank pin seems to be the vulnerable point of these racing engines, and when a machine is getting weatherbeaten, trouble may be saved by the examination I recommend.

M.C.C. TEAM TRIAL FOR THE MOTOR CYCLE CHALLENGE CUP



BEAUTIFUL weather favoured the sixth contest organised by the Motor Cycling Club for *The Motor Cycle* Fifty-guinea Challenge Cup. There was again a record number of starters in the competition, proving the ever-increasing interest in this well-conducted trial. It may be of service here to recall the results of previous contests:

1904.—Winners, Coventry M.C.C.
1905.—Competition not held. M.C.C. walked over.
1906.—M.C.C.
1907.—Coventry M.C.
1908.—Coventry M.C. won old trophy outright.
1909.—M.C.C.
1910.—Coventry and Warwickshire M.C.

It will be seen that the M.C.C. and Coventry Club, who have between them won the trophy on every occasion, now hold one share in the new trophy. The team trial is looked upon as the club championship, and it must have been gratifying to the trial hon. secretary, Mr. J. Van Hooydonk, to include the names of eighteen teams on the programme.

The Motor Cycling Club, although not always favoured with fine weather for its competitions, has been singularly fortunate in regard to the Team Competition for *The Motor Cycle* Challenge Cup, as it has not experienced bad weather on any one of its six competitions. Saturday last was a particularly fine day, and the country around Daventry was looking its best. Some of the M.C.C. officials and members of the team representing the organising club arrived in Daventry on Friday evening, as did the Manchester team; part of the Sheffield team stayed at Leicester overnight, while other more hardy members started from Sheffield late on Friday, arriving in Daventry at 11 a.m. on Saturday. The Wheatsheaf Hotel was the headquarters, and there we found most of the officials and competitors at noon, the former busily engaged in serving out numbers and giving final instructions—no light task, as the teams numbered eighteen, and, as each team had six members, the total number of competitors reached 108.

The course was the same as last year, starting from a point one and a half miles from Daventry on the Banbury Road. Two miles from the start the steepest hill on the course is encountered, viz., Badby Hill, which proved too much for several of the riders. Skirting Charwelton, where a right-angled corner was taken, the course was through Preston Capes and Little Preston (where there was another long and gradual rise), Maidford, Brakesley, Greens Norton, a climb out of the village leading to the main London-Holyhead road, which was followed to Daventry and the start. This course measures twenty-five miles, and was covered four times.

At the start, the riders were marshalled in pairs, cards bearing numbers and letters being pegged along the grass to indicate the positions they were to occupy. The competition was advertised to commence at 1 o'clock, and at 1.4 p.m. the first man was timed away, the remainder following at half-minute intervals. The first member of each team from A to T was sent off first, then the second, and so on; in this manner each team was spread all over the course. Rules 6 and 7 governed the competition, and are as follows:

6.—The number of miles, up to 100, accomplished by each rider of each team without stoppage other than stoppages due to the exigencies of traffic, will be added together, and the team scoring the highest mileage will be the winning team except that in the case of a tie the determining factor shall be regularity of running that is to say, the team whose members collectively run for each circuit closest to 1 hour 25 minutes, the intermediate time between the limits of 1 hour 20 minutes (fastest allowed) and 1 hour 30 minutes (slowest allowed), will then be the winning team.

7.—A period of not less than 1 hour 20 minutes, or more than 1 hour 30 minutes, must be occupied over each section of twenty-five miles; transgression of this rule over any section will disqualify the rider from scoring on that particular section.

The Leicestershire team attached large labels to the sides of the tanks bearing the name of their

NOT THE PRIZE DISTRIBUTION!

Scene in the yard of the Wheatsheaf Hotel, Daventry, prior to the start. Mrs. F. J. Jenkins handing a number card to one of the competitors. The chief marshal, F. J. Jenkins, is seated at the table.

M.C.C. Team Trial.—

R. H. Head (left) starting the competitors. F. T. Bidlake (right) timekeeper. The rider is setting the times of his handle-bar watch to coincide with the timekeeper's. The line of competitors extended for nearly a quarter of a mile.

club, the Birmingham men wore sun bonnets, and the Yarmouth contingent carried imitation bloaters as mascots, which also assisted to denote their locality. The Derby and District M.C.C. came to the post with large placards on their backs, which were not approved by the officials and were removed. We are requested to point out that the competition, although a sporting event, should be treated seriously, and placards of the kind referred to will be discouraged in the future.

There were very few restarts required. W. A. Matthews (Oxford) broke a pedal pin. F. Mussell (Herts) dropped the stand, and H. G. Cove (N.W.L.) had not opened the throttle wide enough to start on free engine. These three were allowed to return and start again.

There was little excitement in the first round, although several dropped out or were disqualified for infringement of the regulations. W. Pratt's sidecar tyre punctured, and his passenger adroitly climbed on to the carrier, and the combination was driven two rounds without the passenger seated in the sidecar. Pratt was only allowed to score five marks, as the passenger, contrary to rules, left his seat at the fifth mile. The Yarmouth sidecar was hung up at Badby Hill on the first round, and W. T. Munro (Manchester) burst the back tyre at the twelfth mile. W. Woodward (Islington) stopped at Greens Norton with a choked carburetter, A. Tarr (Sheffield), G. Peppercorn (Essex), and H. Reed (Manchester) punctured; Mrs. Cooke (Herts) had ignition trouble at Weedon. At the end of the second lap —half distance—six clubs, viz., Birmingham, Bristol, Coventry, Motor Cycling Club, Northampton, and Sutton Coldfield, had complete teams still in the running for the cup.

In the third round W. Cooper (N.W.L.) had thoughtfully ordered tea to be provided at Bolt's Farm, where those who wished to avail themselves of his foresight were permitted to snatch a hasty refresher. A good many thought *The Motor Cycle* had repeated its welcome provision in the A.C.U. Quarterly Trials, but this time the credit belongs to Mr. Cooper.

At the completion of the third lap four teams were in the running, viz., Coventry, M.C.C., Northampton, and Sutton Coldfield. Bristol had made a non-stop, but Eli Clark was 40s. too early in the first round, and therefore Bristol's chances were now somewhat remote, and the winner lay among the four above-mentioned teams.

When all the men running had finished the fourth round it was known that E. B. Dickson (M.C.C.) had fallen out for want of petrol at the eighty-eighth mile, and J. St. John (Sutton Coldfield) had stopped two miles from the finish.

W. Pratt (3½ P. and M. and sidecar) suffered a puncture in the sidecar tyre at the fifth mile. His passenger climbed on to the rear carrier, and the combination was driven fifty miles when the officials notified Pratt that he was disqualified, as passengers are not allowed to leave the sidecar seat.

M.C.C. Team Trial.—

This left Coventry and Northampton equal on mileage, and on the results being worked out the Coventry team won by a margin of 7m. 27s. gross errors in punctuality. Below we give the score of each team and their order of merit, also the individual errors in punctuality of the members of the winning team and the runners up.

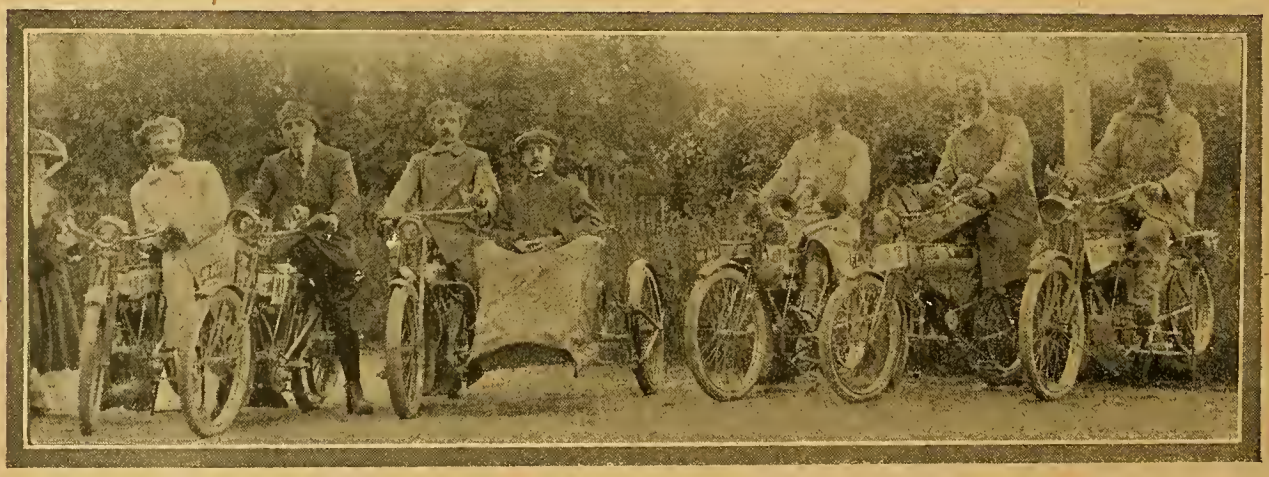
THE NORTHAMPTONSHIRE M.C.C. TEAM, WHO EXPERIENCED HARD LINES IN LOSING ON TIME ONLY

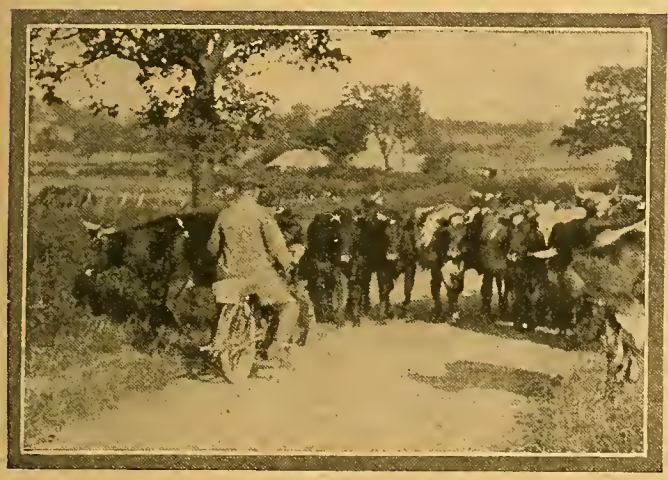


A. Osborne (1908 Triumph). W. Duke (1910 Triumph). W. Barratt (1910 Rex and Sidecar). W. Lees (1910 Triumph). A. Webster (1910 Hobart). A. E. Catt (1910 Triumph).

Team Trial Trifles.

It has been said that the winning of *The Motor Cycle* cup is wholly a matter of luck. Whilst we do not dispute the fact that luck enters largely into the question, systematic preparation is the chief factor of success. The theory of luck is immediately dispelled when we point out that Coventry have lifted the trophy on no less than four occasions, the M.C.C. answering for the other two wins in the six years the trophy has been competed for.

We do not think we shall be disclosing any secret if we mention the methods of the most successful team in preparing for this trial. First of all, the most experienced riders are selected by the committee, the latter eschewing the elimination test favoured by most clubs. Each competitor thoroughly overhauls his machine the week before the start, and cleans and adjusts every vital part with the greatest care, fits *new* tyres and nail catchers. Security bolts are also fitted, so that in case of a puncture the competitor may continue riding on the rim without fear of the cover coming off. It is also a proviso that members of the team fit pedalling gear, so that in case of belt stretch or misfiring assistance can be given on hills. Lastly, chain drive is insisted upon for the passenger machine. Last year, small petrol tins were carried round the riders' necks (no replenishments being allowed during the 100 miles), but this year larger tanks were used in most cases to relieve the riders of anxiety. It may be added that all the Coventry team rode 1910 pattern motor cycles. All this preparation, it may be considered, should not be necessary with latest models, but a team out to win leaves nothing to chance.



There were several droves of cattle on the course, which hampered the competitors. R. M. Brice (3½ Brown) is seen held up near Preston Capes.

The total number of riders to make non-stop runs was 76—a percentage of 70.3 successful competitors.

The Sutton Coldfield A.C. score of 598 was remarkably good, but if they had gained the total marks they would not have won the cup, as their total error was 25m. 26s.

As is usual in this competition, tyre troubles were the chief cause of retirements, nor was this a great surprise, for quite a number of riders started with covers which had already seen many hundred miles of service. On the very first round, we passed six riders repairing air tubes by the roadside.

Everyone will sympathise with the Northamptonshire and Bristol teams. It is no mean accomplishment for every rider to complete the course without a dismount, and the performance is certainly deserving of some reward. The Bristol team lost its chance in this way: On the first round one of the men timed himself by hanging on to another competitor, and somehow or other he entirely misjudged the speed, and finished the first lap forty seconds too early. The Northants team lost because its timing was considerably more inaccurate than the Coventry team.

Never was the interest so great as in this year's event. The whole of the eighteen teams entered duly started, and the hundreds of spectators on the course were rewarded by seeing an interesting contest and a constant string of riders encircling the course.

Reliability is truly on the ascendency. Previous to this year only one team—to wit, the M.C.C.—has completed the course intact. This year three teams repeated the performance, and had it not been for shortage of petrol on the last lap the number would have been augmented by the addition of the Sutton Coldfield A.C. and the M.C.C.

If Dickson had finished between the limits of time his difference could not have exceeded five minutes for the fourth lap, when the M.C.C. score would have been 13m. 24s.—a winning figure. The score of 19s. by S. G. Frost is the closest in the trial.

LEEDS TO LONDON AND BACK.

A dense crowd of people assembled in the Leeds City Square on Saturday evening last to give a send off to the Leeds M.C.C. riders who were riding to London and back. It was a gloriously warm night, and at 9.45 prompt the first two riders threaded their way with difficulty through the crowd, which, however, was handled splendidly by an efficient police force.

T. Bullus (3½ P. and M) and J. R. Kelly 2¾ Moto-Rêve) led off the procession. Mr. Bullus is a Bradford rider, and won the trophy last year. Other competitors followed at intervals of one minute, as follow: 3rd and 4th, Wilkinson and Scott; 5th and 6th, Murphy and Langton; 7th and 8th, Heaton and Brook; 9th and 10th, Cockroft and Speke; 11th and 12th, Ellis and Ramsden; 13th and 14th, Pease and Smith; 15th and 16th, Stevens and Smith; 17th, Graham; 18th, non-starter; 19th and 20th, Wheater and Money; 21st and 22nd, Kitchen and Braithwaite; 23rd and 24th, Burnell and Horner; 25th, Mortimer.

Out of twenty-five entries twenty-four started, the only absentee being F. Greenwood, who has previously won the trophy several times.

The controls were at Grantham, Biggleswade, and Highgate, and at the first two places meals had been arranged for on the outward and return journeys. Secret checks were also instituted throughout the entire run by motor cars kindly supplied by Mr. Rowland Winn (president of the club), who accompanied the competitors with his wife), and also the Bridge Garage, Leeds.

The speed to be maintained was slightly under twenty miles per hour, and the riders had to adhere to schedule time throughout. The run finished the following evening at 8.40, at John-o'-Gaunt's Hotel, four miles from Leeds.

The List of Survivors.

The following completed the run inside schedule time, and qualified for the various awards: Bullus (3½ P. and M.), Kelly (2¾ Moto-Rêve), Wilkinson (3½ Triumph), Scott (Triumph), Murphy (5 Rex and sidecar), Langton (3½ Triumph), Heaton (5 N.S.U.), Brook (3½ S.P.K.), Cockcroft (3½ Triumph and sidecar), Speke (7 S. and R.), Ellis (3½ Calthorpe), Ramsden (7 S. and R.), Money (3½ Triumph), Graham (3½ Triumph and sidecar), Wheater (3½ Humber), Kitchin (3½ Scott), Braithwaite (3½ Triumph), and Burnell (3½ Humber). The actual prize-winners will be known in a few days. Bullus (last year's winner) had hard luck in experiencing two punctures within a few miles of the finishing point, after running very close to schedule right through the run. These two delays put him out of the running for first place. There were twenty-four starters, and of these eighteen finished within the allowed time—a creditable record considering the arduous nature of the contest.

Several Bradford riders took part. Manchester and Keighley also sent a team of riders, and altogether the run was a great success, mainly owing to the efforts of the Brothers Langton, Messrs. F. C. Bagshawe (the trials hon. sec.), and J. R. Kelly.

The Battle of the Cylinders.

Yesterday's T.T. Race at Brooklands promised to be a real battle of the cylinders, the two types being nearly equally represented.

Police Activity.

The police are becoming unusually active in Cromer, and several summonses have recently been issued for driving to the common danger.

Rejoining the Fold.

One of the oldest and most important firms in the cycle and motor industry, which some four or five years ago made an excellent motor cycle, and to the general regret relinquished its manufacture, is, we hear, experimenting with a new model. This machine is fitted with a slide valve engine made under Knight-Daimler patents, and may be exhibited at Olympia this year.

A Real Multi-cylinder Engine.

The latest production from the Gnome factory is a fourteen-cylinder air-cooled rotary engine. It is in reality two of the seven-cylinder engines we recently illustrated and described, built on to one common centre. The simplicity of a motor cycle engine must at once appeal to anyone who takes the trouble to examine the new Gnome production.

SPECIAL FEATURES

M.C.C. TEAM TRIAL.

THE SCOTTISH TRIALS: A RETROSPECT.

TESTS ON ROAD AND TRACK.

A Ride with an Object.

H. Savory (Rugeley) writes: "Some of your readers may like an excuse for a run through the beautiful country round Abbots Bromley, where on July 7th the ancient horn dance will be performed."

Saturday's Open Hill-climb in Yorkshire.

Some prominent motor cyclists have entered for the Bradford M.C.C. open hill-climb at Cockshoot Lane, near Skipton, on Saturday, including a number of Tourist Trophy competitors, and a successful event is assured. It is expected that Jack Scriven will bestride a new 7 h.p. twin-cylinder m.o.i.v. Rex in an endeavour to lift the Eric S. Myers Trophy. The cylinders of this new engine measure 84½ by 89 mm.; the capacity is 993 c.c. In general design, the 7 h.p. engine is a larger replica of the 4 h.p. model.

The Prizes for Amateurs.

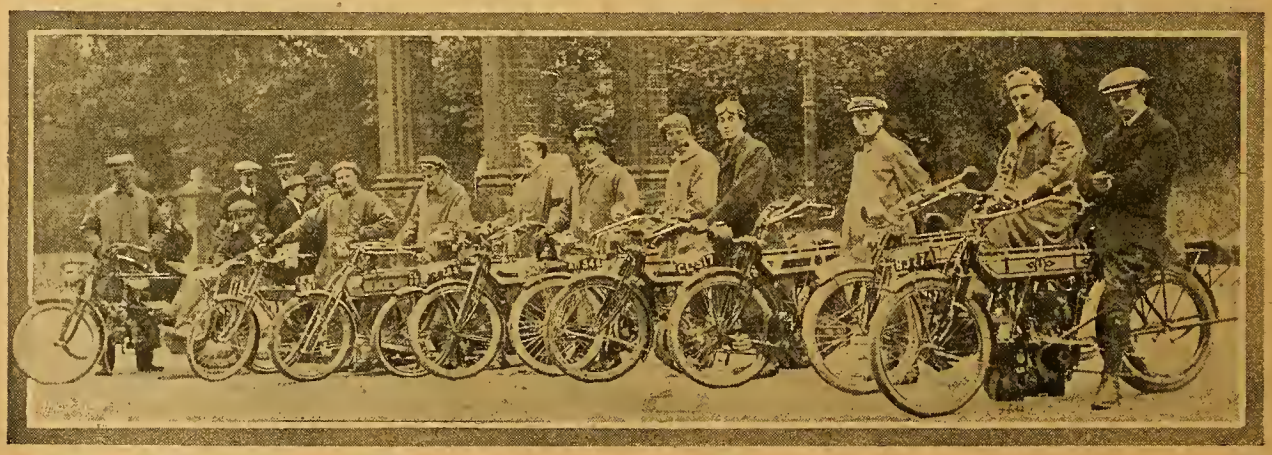
In connection with the above hill-climb, it was stated in the particulars circulated that prizes for amateurs would be announced later. We now hear that the Palmer Tyre, Ltd., have offered a pair of their non-skid tyres as a special amateur prize, and Jos. Lucas, Ltd., a motor cycle lamp. Still more amateur awards are expected.

Long Distance Competitions.

Long distance reliability trials are exceedingly popular with Yorkshire clubs. Last week-end the Bradford M.C.C. held a twenty-four hour run to London and back for the Briggs Trophy, and the Leeds M.C.C. also successfully carried out a reliability run to London and back for a fifty-guinea trophy. In previous years these two competitions have been run jointly, but owing to the Leeds Club having thrown in its lot with the Northern League, the Bradford Club (which remains loyal to the A.C.U.) is debarred from associating with its neighbour in these competitions. It may be mentioned that invitations were issued by the Leeds M.C.C. to the twenty-one clubs comprising the Northern League of Motor Cyclists to send a team of three riders each.

Kenmore Hill-climb Abandoned.

A meeting of the A.C.U. Competitions Sub-committee was held late last week, and it was decided, in view of the reports received from competitors in the Scottish trials and representations made by officials, not to send the competitors in the End-to-end trial up the Kenmore side of Amulree Hill. This decision was arrived at after the article on page 576 of this issue had gone to press, and we commend the Auto Cycle Union on its promptitude in deciding to adopt the course suggested by our representative and others who went through the Scottish trials, and appreciated the severity of a climb, which was even omitted from the Scottish car trials. Perhaps the committee will now adopt our suggestion with regard to Glendoe Hill at Fort Augustus, which would provide a very perfect test for the machines without the personal skill of the rider entering too much into the question. Glendoe Hill is a straight but very steep ascent, and all machines would have to be in good tune to climb it without a falter.



On the warpath of *The Motor Cycle* Cup. Great Yarmouth and District M.C.C. members about to start on their long journey to Daventry to compete in the M.C.C. Team Trials. If ever Coventry or the M.C.C. should make a mistake, surely everyone will wish the Yarmouth riders success for their persistency.

A.C.U. End-to-end Trial.

Entries for the Land's End to John-o'-Groat's reliability trial, which starts on Monday week, have now reached a total of 47. In addition to the names already published, the following have been added to the list: C. J. Fox (7-8 h.p. Bat), Humber, Ltd. (two 3½ h.p. Humbers), S. W. Carty (3½ h.p. N.S.U.), G. Brough (3½ h.p. Brough), Enfield Cycle Co. (2¾ h.p. Enfield), W. F. Newsome (3½ h.p. Triumph), W. Creyton (3½ h.p. Triumph), G. L. Fletcher (2¾ h.p. Douglas), J. Baker (3½ h.p. Triumph), C. Williams (3½ h.p. Triumph), A. Stubbs (3½ h.p. Dot), Rev. Basil Aston (3½ h.p. Triumph), A. J. Stevens (Wolf), J. Stevens (Wolf), W. A. Sale (3½ h.p. Rex), Harold Williamson (5 h.p. Rex), W. A. Jacobs (3½ h.p. Rex), J. P. le Grand (5 Rex), and J. R. Woodward (3½ h.p. No. 2 Speed King Rex. Next week we hope to publish details of the route.

The New End-to-end Sidecar Record.

Some people are always ready to belittle another man's performance. We hear that in a certain quarter in the South-west, Hugh Gibson's sidecar record is doubted. We may state that prior to Mr. Gibson's attempt on record, we arranged with him to send us a series of postcards stating time of arrival and departure at intervals on the route, signed in the presence of witnesses. This collection is in the possession of *The Motor Cycle*, and may be inspected by any interested parties. On the occasion of each of the four End-to-end sidecar records, we arranged beforehand for these postcards to be sent us with the express purpose of allaying any suspicion that might exist. Moreover, we may add that we attached seals to the vital parts of the machine before the start, and on examination after the record ride they were found to be intact.

Worcestershire M.C.C. Speed Judging Contest last Thursday. G. R. A. Deacon (secretary) starting away from headquarters—Hop Market Hotel, Worcester.

FUTURE EVENTS.

June 25—R.A.C. seventh provincial meeting of the Associated Clubs at Chester.
" 25—M.C.C. Members' Petrol Consumption Trial.
25—Bradford M.C.C. Open Hill-climb at Cockshoot Lane, Skipton, 2 p.m.
July 4-9—A.C.U. LAND'S END TO JOHN-O'-GROAT'S RELIABILITY TRIAL.
" 4-20—Bournemouth Centenary Fetes.
" 13—Open Irish End-to-end Reliability Trial, promoted by the Ulster Centre M.C.U.I..
" 13 (Wed.) and 14 (Thurs.)—Brooklands A.R.C. Meeting, 2 p.m.
" 16—Herts County A.C. (motor cycle section) inter-team competition with the Oxford M.C.C.
" 23—A.C.U. Quarterly Trial, Uxbridge to Banbury and Back.
Aug. 1—Brooklands A.R.C. meeting, 2 p.m.
" Coventry and Warwickshire M.C. open hill-climb for motor cycles.

Woodman nearly better again.

We are glad to state that Alan E. Woodman, the T.T. entrant who met with an unfortunate accident in practice, is progressing rapidly. We have had the pleasure of receiving a letter from him this week, in which he states he has been sitting out on the hospital balcony since Thursday, and early next week expects to start walking a little. He anticipates leaving Manxland by the first week in July.

Northern League of Motor Cyclists.

The meeting of the Council of the League did not take place as originally arranged, on the 18th inst., owing to the fact that not sufficient agreements had been received by the secretary, who desires to remind the various hon. secretaries of the fact that it is most important that these agreements should be sent in at once, so that arrangements may be made for the first trials, etc., and the entire summer programme for 1910 submitted. The secretary will also be pleased to send any hon. secretary who has not yet received the rules, etc., of the League a copy on receipt of a postcard bearing his name and address.

A Stipendiary becomes a little excited.

The Liverpool Stipendiary magistrate worked himself up into a state of wrath on hearing the case of S. L. Leftly, a motor cyclist summoned for having ridden his machine at a dangerous speed without sounding an alarm at the junction of St. Oswald Street and Edge Lane Drive. Defendant estimated his speed at six to eight miles an hour, whilst the constable inflated it to eighteen or twenty. Mr. Shepherd Little, the magistrate, is reported to have said: "I take a great interest in these wild animals, and when I see them I am amazed at the speed that they strike me as going at. I think these animals must be kept in check. The defendant will be fined 20s. and costs." If he made use of such expressions he evidently forgot his manners, and we would remind him that a stipendiary's duty is to administer justice, and not to gratuitously abuse a defendant brought before him on such a doubtful charge.

R. G. Geslett (3½ P. and M. two-speed) waiting for the signal to restart half way up Aston hill in the Herts. County A.C. climb. He was third on formula.

RACING AT BROOKLANDS.

THANKS to the extraordinary luck which has favoured Brooklands meetings ever since its inception, Saturday proved to be one of the grandest days we have yet had this summer, and resulted in there being what we judge to be the biggest attendance that the turnstiles at the track have ever registered. This was, no doubt, largely due to the fact that exhibitions of flying were booked to take place after the racing; but, even so, very great interest was taken in the programme, which comprised ten events, of which two were for motor cycles. These were the June Motor Cycle Handicap (1st £5, 2nd £3, 3rd £2), for all classes of machines of an engine capacity between 500 c.c. and 1,000 c.c. Distance, 8½ miles. This race brought forward fifteen entrants, all of whose mounts had twin-cylinder engines.

The scratch men were C. R. Collier and Lee Evans, and the former, on an 85½ mm. × 85 mm. Matchless soon got into winning form and rapidly overhauled the field. Lee Evans, on a big Indian, did not seem to get going as well as usual, and half the race was over before he got into his stride. The order at the Members' Bridge in the first lap was as follows: Le Grand (1m. 27s.), Rex; F. A. Applebee (1m. 27s.), Rex; Geiger (1m. 27s.), V.S.; Partridge (1m.), N.S.U.; Steeves (1m. 27s.), N.S.U.; Dayrell (24s.), Martin-J.A.P.; H. V. Colver (18s.), Matchless—these two were travelling very fast indeed—H. A. Collier (18s.), Matchless; Deacock (1m. 27s.), Wanderer; Benttler (24s.), Bat; D. R. Clarke (18s.), Indian; Lee Evans (scratch), Indian.

After One Lap.

A lap more put Applebee first, with Le Grand close on his heels, but Charlie Collier was riding in splendid style, and was clearly a great many miles an hour faster than the leaders. After him came Colver, Dayrell, and Lee Evans.

The finish of the race was a foregone conclusion, Collier coming in well ahead of Colver and Dayrell, whilst Harry Collier finished a good fourth.

		Start.
1.	C. R. Collier (8 h.p. Matchless, 976 c.c.)...	scr.
2.	H. V. Colver (5 h.p. Matchless, 666 c.c.)...	18s.
3.	F. W. Dayrell (8 h.p. Martin-J.A.P., 964)	24s.

The winner's speed was 72¾ m.p.h.

Applebee stood a good chance of getting a place on his chain-driven Rex had not his pace fallen off somewhat. He did the first lap in good style, but the backmarkers were too strong for him. Dayrell had a plain coil and battery ignition on his Bat, and very well it served him, for he finished only a length or two behind the winner.

Twenty-nine Competitors in the Summer Handicap.

The second motor cycle race was the Summer Motor Cycle Handicap. £10 for first, £5 second, and £3 third. Distance, 5¾ miles. This produced a field of twenty-nine.

Amongst the early starters, Brunton, on a 76 by 76 mm. New Century, soon got going well, and, after overhauling Peach on a similar sized Minerva, kept in front for some time until passed by Oberländer on a twin N.S.U. (52 by 74 mm.), who had started 10s. later, but who was travelling so well that the "bookies" on the hill found it necessary to lower the prices about him. After the above-mentioned riders came Sir R. K. Arbuthnot (1m.), Triumph; Chitty (56s.), Frays; Colrick-Herne (52s.), Triumph; Dewar (52s.), Triumph; H. Hunter (52s.), Triumph; G. F. Hunter (52s.), Triumph; F. W. Applebee (52s.), T.T. Centaur; V. Yates (48s.), Rex; Jacobs (48s.), Rex; Geiger (46s.), V.S.; Le Grand (46s.), Rex; Maitland (46s.), Trump-J.A.P.; Gibson (46s.), Trump-J.A.P.; McNab (46s.), Trump-J.A.P.; Tapley (46s.), Calthorpe; Godfrey (42s.), Rex; Perkins (18s.), N.S.U.; Wilberforce (8s.), Indian; Charlie Collier (scratch), Matchless; Colver (scratch), Matchless; and G. Lee Evans (8s.), Indian.

A novel view of competitors riding out of the paddock at Brooklands to take part in one of the two races held on Saturday.

The second lap was started on with Oberländer a long way in front, followed by Colrick-Herne, Arbuthnot, Maitland, Chitty, and Brunton. The last-named had a funny little machine, with a Longuemare carburetter almost as large as the engine. The oil and petrol tanks were also two tiny torpedo-shaped affairs. The machine was undoubtedly fast, and might have done some good, but during the second lap the belt was slipping badly.

Lining up in the paddock for the start of the Summer Motor Cycle Handicap at Brooklands on Saturday last.

Racing at Brooklands.—

Some of the back-markers put up a fine show on the big banking by the Members' Bridge. Charlie Collier, right up the banking, passed Colver, who was keeping lower down, but who in turn overhauled Peach and Wilberforce.

The race finished with Oberländer an easy winner:

	Start.—m. s.
A. Oberländer (two-cylinder N.S.U., 314 c.c.)	1 30
E. D. Colrick-Herne (3½ Triumph, 499 c.c.) ...	52
H. V. Colver (5 Matchless, 666 c.c..)	scr.

Winner's speed 54 m.p.h.

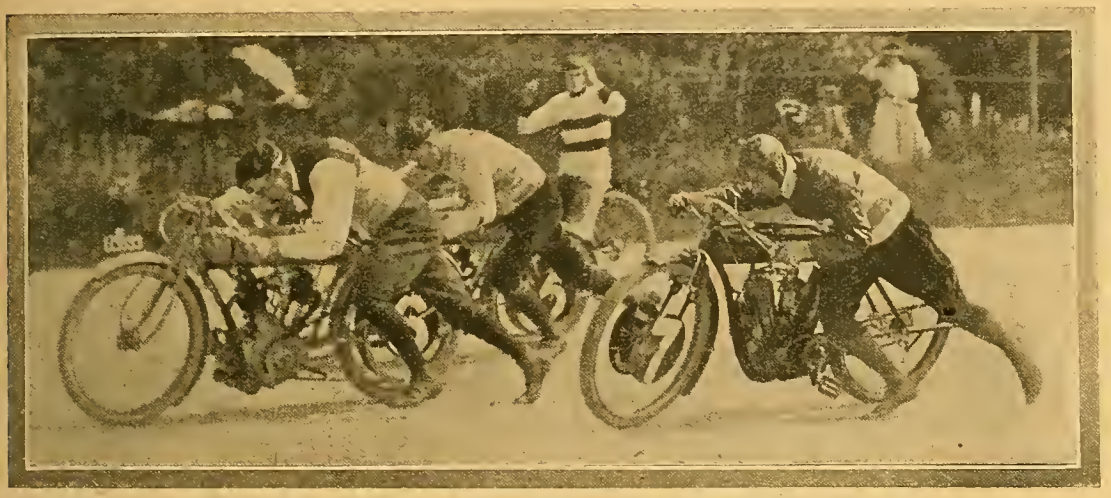
Colrick-Herne was second, and Colver a good third. The latter was travelling magnificently, and had the race been half a mile longer he would have won. Next came Charlie Collier, with Maitland hard on his heels.

Chitty's machine had a J.A.P. engine, but instead of a single exhaust pipe it had two, both branching from the valve chest, and thus sticking out on either side of the cylinder. It also had auxiliary exhaust release.

Brunton's New Century had a Givandan engine, and also had a somewhat strange auxiliary exhaust, consisting of four radial tubes drilled and plugged.

The 3½ h.p. Calthorpe, which made its first appearance on the track, is a nice looking machine on standard lines, and has a vertical engine with chain-driven magneto in front. The tank slopes away at the back *à la* Rex.

A very noticeable feature of the racing was the fact that most of the men rode in their shirt-sleeves. The weather was much too hot for jerseys.



H. A. Collier and H. V. Colver (Matchless J. A. P.'s), and D. R. Clarke (Indian), starting in the June Handicap at Brooklands. Colver and Collier finished second and fourth respectively in this event.

IRISH END-TO-END RELIABILITY TRIAL.

The above important event, under the auspices of the Ulster Centre of the Motor Cycle Union of Ireland, has been fixed for the 13th July next, and is already attracting considerable attention. The competition was inaugurated in 1909, when over twenty riders took part and proved so successful that the number of starters will probably be doubled this year. The contest consists purely of reliability, and is judged by the ability to run to schedule [illegible] stations being arranged when the time of each co[illegible] taken. The rules and regulations are now re[illegible] intending to take part in the trial shoul[illegible] the secretary, E. B. Waring, 19, H[illegible] whom all information co[illegible] prizes will be gi[illegible] awarded to [illegible]

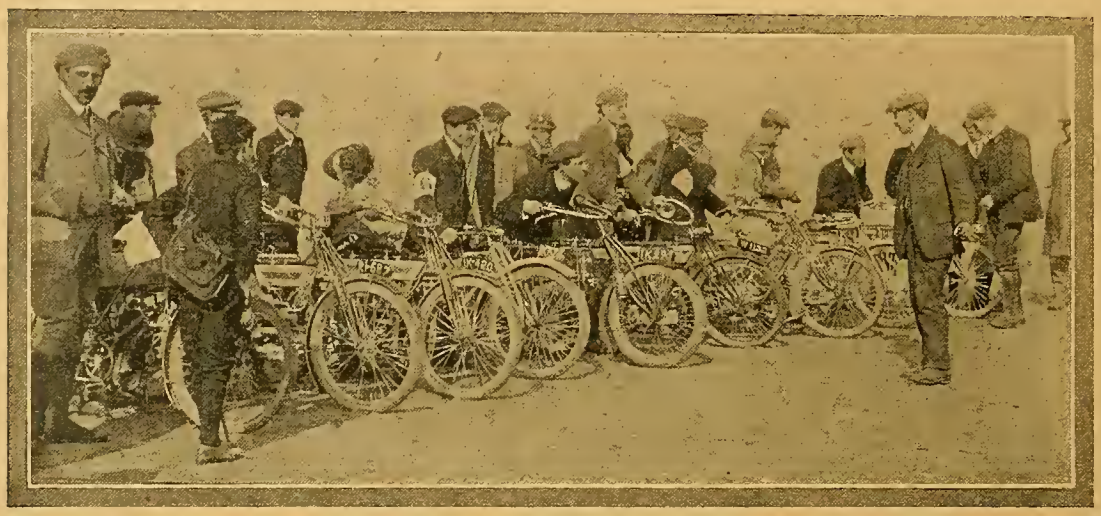
SPEED TRIALS AT PORTMARNOCK.

DESPITE the advantages that the Velvet Strand at Portmarnock offers to Dublin motor cyclists for the purpose of holding speed tests, that venue does not retain the popularity it acquired when first "discovered." A few years ago race meetings at Portmarnock were of almost weekly occurrence, but this year only three are announced—two under the auspices of the Dublin and District Motor Cycle Club and one by the Motor Cycle Union of Ireland. The first of these was held on Saturday last, when the Dublin and District Club ran off three events. The evening was very favourable, and some keen racing was witnessed in the various races. Franklin was the virtual scratch man in the open events, and ran third in each. In the twenty miles he did a good performance by covering the distance in 25m. 55s., breaking his own record for the [illegible] won the twenty miles, and was second to [illegible] novices' race was secured by

One Mile Handicap.—J. Healy (3½ h.p. Rex), 25s. start, 1; R. Walsh (3½ h.p. Triumph), 15s., 2; C. B. Franklin (5 h.p. Indian), 3s., 3. Also ran: Carlville (2¾ h.p. Douglas), 40s. start; Green (3½ h.p. Peugeot), 25s.; McQuirke (4½ h.p. Minerva), 20s.; Jameson (3½ h.p. Triumph), 20s.; Tyson (3½ h.p. Triumph), 15s.

Twenty Miles (out and home over mile course).—R. Walsh (3½ h.p. Triumph), 5m. start, 1; J. Tyson (3½ h.p. Triumph), 5m., 2; C. B. Franklin (5 h.p. Indian), scratch, 3. Also ran: Carville (2¾ h.p. Douglas), 12m. start; Chambers (2¾ h.p. F.N.), 12m.; Healy and Green (3½ h.p. Peugeots), 7m.; McQuirke (4½ h.p. Minerva), 7m.; Woods (3½ h.p. Bradbury), 4m. Walsh won easily by over two miles, Franklin being a poor third. Nett times: Walsh, 28m. 5s.; Tyson, 30m. 20s.; Franklin, 25m. 55s.

Two Miles (Novices') Handicap.—Green (3½ h.p. Peugeot), 25s. start, 1; McQuirke (4½ h.p. Minerva), 15s., 2. Time (nett), 3m. 22⅕s.



Racing at Portmarnock Beach on Saturday last. Start of the Novices' Race, won by H. Green (3½ Peugeot).

SMARTENING UP A TRICAR.

By F. H. WHITE.

THOSE who are not fortunate enough to be able to indulge in a new mount every year will be pleased to know how to make their old love look smarter.

The first thing that faces one in this respect, usually, is the necessity for re-enamelling, as the plating is often in very good condition long after the enamel is scratched and looking the worse for wear, and there is no reason why a tricar should not be smartened in this way at a cost of a few shillings.

Re-enamelling and Lining.

Prompted by a desire to improve the appearance of my three-year-old tricar, I recently decided to try my hand at re-enamelling and lining.

The colour decided upon was dark blue, with white lines, and if I may say so without being considered egotistical, the machine presented when finished quite a smart appearance, and only a very close inspection would have revealed the fact that the lining had been done by an amateur.

The first thing to decide was what enamel to use. There are, I believe, several very good enamels for the purpose on the market, but whether it was the sight of the prize-winning samples of tubes at Gamage's recent competition, or the amount of advertising it has received, I know not. Anyway, I plumped for Robbialac, and have certainly not regretted my choice. I purchased two tins at 1s. 6d. each, and used very little of the second tin, despite the fact that my machine is a coach-built one. There is no doubt, therefore, that one tin would be ample for a motor bicycle.

Now, as to the mode of procedure. I may say at once that, not being of a very patient turn of mind, I did no more stripping than was absolutely necessary, the only parts removed being the front seat complete with springs, driver's bucket seat, all footboards, and toolboxes. I also left sandpapering to look after itself, though, of course, if time and patience allow this is to be highly recommended.

Applying the Enamel.

After thoroughly cleaning all framework and coach-work, I proceeded to apply a thin even layer of the enamel with a good quality, medium hard, flat enamelling brush, which cost 1s., and I may here say that one of my doubts was at once allayed, and that was with regard to the covering property of the enamel. The machine was originally dark green, but one coat, although not at all thick in itself, was quite sufficient to entirely obliterate any sign of green, and produced a beautifully smooth and shiny hard surface when dry.

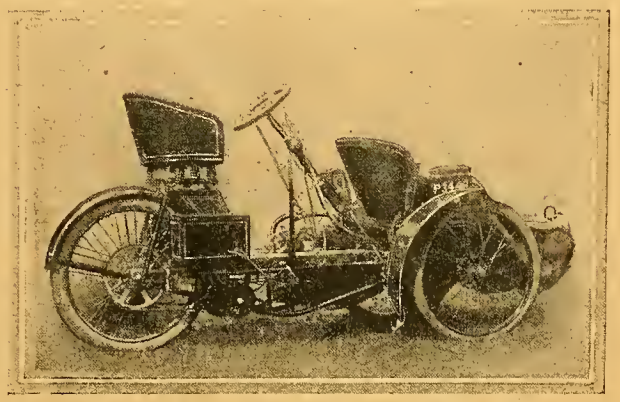
And now we come to the lining, which was another cause of grave doubt to me before tackling it, and often I think debars one from attempting the re-enamelling altogether, as paintwork certainly does look very "amateurish" if not lined.

There are two ways of accomplishing the lining. The first is to have it done for one, and the other is to do it one's self. In the former case, if one has done all the enamelling and preparing, the charge of an expert for lining a tricar or motor bicycle should be very moderate, especially if there is not too much of the air of a wealthy motorist displayed!

In the country most good wheelwrights employ man capable of this work.

Lining for Amateurs.

However, I decided to line the machine myself. therefore procured a small sample tin of white enamel, keeping it fairly thin all the time it was in use by adding a little turpentine, though with enough body to produce a quite white line, and with the point of a camel-hair brush traced over the old white lines which just faintly showed through the blue enamel, using any convenient edge or surface as a guide for the hand. As a matter of fact, a special brush is made for the purpose of lining, having hairs 1½in. to 2in. long, and known as a lining tool, which is much better than



The tricar described in the accompanying article after being re-enamelled dark blue and lined white by an amateur.

the one I used, as they hold more paint and can be laid well on the line and drawn along a good distance without renewed dipping in the paint, thus ensuring a straight line being made, and with a little practice considerable proficiency can be attained.

Where the lines did not show through, or where none previously existed, I marked points at intervals, equal distances from the edges, and made a pencil or light chalk line over which I followed with the brush.

While the machine was dismantled I fitted a new lid to one of the tool boxes to replace a cracked one, and a new front lamp bracket adapted for a separate generator gas lamp. This was much more easily accomplished with the front seat removed. Among other minor alterations, I also fitted a new apron. This was made of best quality American cloth lined with a cheap woollen material.

In the first place, I cut brown paper patterns the shape of the top and side pieces of the apron to fit the portion of the front seat occupied by the passenger's legs. The American cloth and wool lining were then cut to these with allowance for turnings at seams, and the whole well sewn together, with strong braid at all seams and edges, and brass rings attached by leather tabs where required. The sewing I had done at a local bootmaker's, and the total cost of the material and labour was about seven shillings.

The treatment described not only improves a machine's appearance for one's own pleasure, but considerably enhances its selling value.

CLUB NEWS

Shropshire M.C.C.

At a committee meeting held on the 16th inst. at headquarters, it was decided that the competition for the A.C.U. Cup should take the form of a hill-climb at Wenlock Edge on Thursday, July 21st. There will be a first and second prize. The following runs were arranged:

June 26th.—Vyrnwy, 35 miles; start 10 a.m., return 6 p.m. prompt.

July 3rd.—Llanidloes, 50 miles; start 10 a.m., return 6 p.m. prompt.

July 10th.—Lichfield, 41 miles; start 10 a.m., return 6 p m. prompt.

July 17th.—Bettws-y-coed, 60 miles. A non-stop run will be held to Bettws and back on this date. Competitors will be started from Shrewsbury at 10 o'clock prompt, and must arrive at Bettws not later than 1 o'clock and not before 12.30. They will be sent on the return journey at 6 o'clock, and must arrive in Shrewsbury by 9 o'clock and not before 8.30. Club certificates will be given to all making a non-stop run.

North-west London M.C.C.

The results of the hill-climb at Lippetts Hill, near Potters Bar, on A.C.U. formula, as passed by the committee. are as follow:

Lightweight Class.—W. Doe (Douglas), figure of merit 74.4 (fastest time); Miss Berend (Moto-Rêve), 163.4; A. Loughlin (2½ h.p. Max), 176.2.

Single-cylinder Class.—W. Cooper (3½ h.p. Bradbury), figure of merit 48 (fastest time); E. Colliver (3½ h.p. Triumph), 58; L. Joiner (3½ h.p. Brown), 79.5; H. Pooley (3½ h.p Premier), 81.6; E. Westacott (3½ h.p. Triumph), 83.3; H. Hollis (3½ h.p. Triumph), 98.2; H. Frankel (3½ h.p. Triumph), 132.8.

Twin-cylinder Class.—H. G. Cove (6 h.p. Matchless), figure of merit 104.2 (fastest time); J Liscombe (6 h.p. Laurin and Klement), 140.8.

Passenger Class.—F. Thomas (7 h.p. G.O.K.), figure of merit 80.4 (fastest time); G. Rowden (8 h.p. Bat), 103; H. Berlandina (7 h.p. V.S.), 135.6.

The gymkhana will be held on July 2nd. A splendid programme has been arranged.

M.C.U.I. (Ulster Centre).

A hill-climbing competition in connection with this centre was held at Ballybannon, near Castlewellan, on the 18th inst., for prizes presented by Mr. C. E. Murphy, of Cootehill. It is three years since a contest took place on this hill, and Saturday's event was looked forward to with considerable interest. The surface was scarcely in as good order as usual, but, notwithstanding this, some very fast climbs were made. An entry of seventeen had been received, but a few of the riders did not reach the starting point. The fastest time was recorded by J. E. Coulter on a 3½ h.p. Triumph, and this rider tied for first place with T. Mallon (3½ h.p. Premier), but at the second trial Coulter won rather easily. The electrical timing apparatus was used, and worked most satisfactorily:

	Gross time.	Handi-cap.	Nett time.
*J. E. Coulter (3½ Triumph) ...	32⅕s. ...	1⅖s. ...	30⅘s.
*T. Mallon (3½ Premier)	34⅖s. ...	3⅗s. ...	30⅗s.
J. Stewart (3½ Triumph) ...	32⅘s. ...	scr. ...	32⅘s.
J. D. Coates (3½ Triumph) ...	41s. ...	6s. ...	35s.
J. Lavery (3½ Triumph) ...	43⅗s. ...	5⅖s. ...	38⅕s.
D. H. O'Flaherty (3½ Triumph)	42⅖s. ...	4s. ...	38⅖s.
B. J. McManus (3½ Premier) ...	39⅖s. ...	scr. ...	39⅖s.
S. S. Porritt (3½ Triumph) ...	43s. ...	3⅕s. ...	39⅘s.
J. "Gordon" (3½ Triumph) ...	46⅕s. ...	2s. ...	44⅕s.
D. H. O'Flaherty (3½ Triumph)	49s. ...	3s. ...	46s.
Hugh Denby (3½ Rex)	63s. ...	7s. ...	56s.

*Dead heat. On re-riding for first place, Coulter won by over 7s., beating his previous time by 1⅖s.

Officials: Starter, M. J. Lindsay; judges, T. H. Dunlop, R. G. Lindsay, and J. S. Garrett; timekeepers, H. E. Lyners and E. B. Waring.

Streatham and District M.C.C.

The committee have accepted with regret the resignation of the captain, Mr. W. V. Sherwell, who was one of the founders of the club.

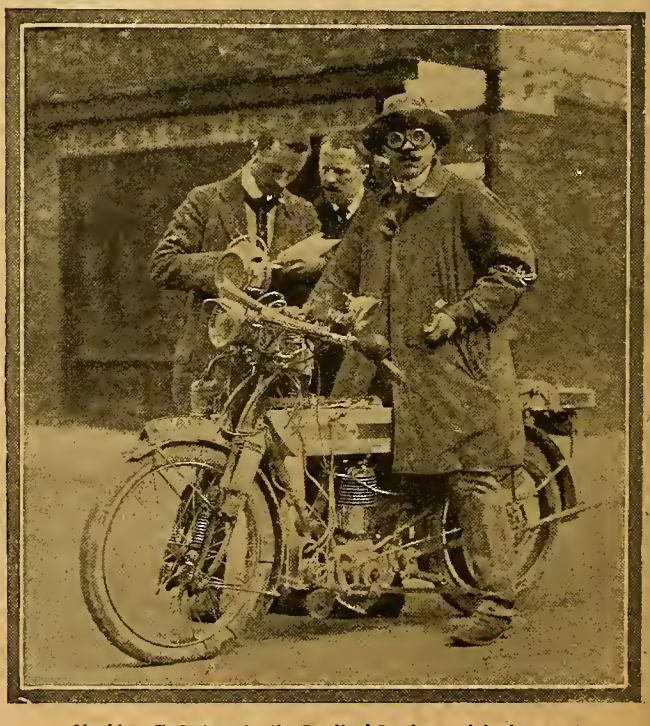
The committee are pleased to announce that they are fortunate in finding Mr. Hunter, who will undertake the onerous duties of captain.

An impromptu hill-climb is being held on Wednesday, 29th inst. Members will meet at the Clayton Arms, Godstone, at 4 o'clock sharp, when the venue of the hill will be announced.

A special meeting of members and their friends will be held on July 3rd, at the Clayton Arms, Godstone.

North-Eastern Automobile Association.

The reliability trial, open to members of the N.E.A.A., which took place on June 11th over a 120 miles course from Sunderland to Brough (Westmoreland) and back, has resulted as follows: H. M. Wood, Newcastle (3½ h.p. Triumph), 1; H. Mason, Newcastle (5 h.p. Bercley), 2; H. F. Inkson, Newcastle (3½ h.p. Excelsior), 3; E. J. Tiffin, Sunderland (7-8 h.p. Minerva); T. T. Jack, Sunderland (3½ h.p. Triumph); I. Baty, Newcastle (3½ h.p. Dean); F. Rowntree, Newcastle (4½ h.p. Minerva); L. Forster, Sunderland (3½ h.p. Triumph); G. W. Rayner, Newcastle (6 h.p. N.S.U.); W. M. Duguid, Newcastle (3½ h.p. Triumph); F. Turvey, jun., Sunderland (3½ h.p. Humber); J. P. Robson, Newcastle (3½ h.p. Excelsior); J. Adams, Newcastle (3½ h.p. Excelsior); and T. Holzappel, Newcastle (5 h.p. Rex), the order in which the names are given indicating precedence in order of merit. J. Clark, Newcastle; T. Wood, Darlington; and H. N. Hall, Bishop Auckland, did not finish. Messrs. Wood and Mason, who are placed first and second respectively, tied, having only lost two marks throughout the journey, and the result was arrived at by taking into consideration the times at the secret checks, which only differed 8 secs.



Checking F. Scriven in the Bradford-London and back run at Beaumond Cross, Newark-on-Trent.

Club News.—

Coventry and Warwickshire M.C.

It has again been decided to hold an open hill-climb for motor cycles, and the date will be announced later. Classes embracing nearly all types of motor bicycles will be included in the programme, as well as a class for passenger machines.

Redditch and District M.C.C.

There will be a club run to Warwick and Leamington on Saturday. Further runs arranged are: July 9th, Pershore and back to tea and smoking concert at the Unicorn. July 23rd, Evesham and boating picnic on the River Avon.

Proposed Club for Lancaster and Morecambe.

Readers in the neighbourhood of Lancaster and Morecambe desiring to help in the formation of a motor cycle club should communicate with Mr. C. H. Hitchen, Euston Road, Morecambe. Mr. Hitchen is prepared to offer a prize for a reliability trial or hill-climb.

Bishop Auckland, Darlington, and District M.C.

A successful team trial was held recently, in which six teams took part, each composed of four competitors. The route was over a course of forty miles, which had to be completed at a speed of 18 m.p.h. Riders were penalised one mark for each half-minute ahead or behind schedule time. The winning team finished 10s. only behind time, and was composed as follows: J. Adamson (3½ h.p. Rex), R. S. Cowper (3½ h.p. Triumph), A. R. Poole (3½ h.p. Triumph), and R. Rowntree (3½ h.p. Bradbury).

The flexibility and speed-judging competitions will be held on the 29th inst.

Newcastle and District M.C.C.

The annual two-days reliability trial for motor cycles promoted by the Newcastle and District M.C. for the N.S.U. and A.C.U. cups, will be held on July 31st, and August 1st. This is one of, if not the, principal reliability trial in the North, and is always well supported, the turnout last year numbering thirty-five riders.

This year's route will be from Newcastle to Stranraer, *viâ* Morpeth, Wooler, Kelso, Selkirk, St. Mary's Loch, Moffat, Douglas Mill, Muirhead, Ayr, and down the west coast of Scotland, and back from Stranraer *viâ* Newton Stewart, Castle Douglas, Dumfries, Annan, Conobie, Langholm, Hawick, Jedburgh, and Otterburn to Newcastle.

The winner of the two-days trial will receive the N.S.U. cup and a gold medal presented by the president, Mr. Robert Crosier, and the A.C.U. cup and medal will go to the second man. A silver medal, presented by Mr. L. Rosenvinge, will be awarded to the novice making the best performance, gold medals will be awarded to those who do not lose more than thirty marks, and bronze medals to those losing not more than a hundred marks.

Stroud and District M.C.C.

The opening run of the above newly-formed club was to Painswick, Birdlip, Cirencester, Northleach, Cheltenham, and Stroud. Eleven members took part and spent a most enjoyable time. Mr. G. H. Pavey Smith was the captain.

Birmingham M.C.C.

Club fixtures for the week-end are: Saturday, June 25th, Cleeve Prior. Meet King's Heath Tram Terminus, 2.45 p.m., *viâ* Alcester and Bidford. Distance, thirty miles. Sunday, June 26th, Stourport (afternoon run). Meet Fountain, Hagley Road, 3 p.m. Distance, twenty-three miles.

Reading and District M.C.C.

On the 25th inst. the run is to Eversley, starting at 3 p.m. from Whitley. Next day, members will ride to Burnham Beeches, leaving The Park, London Road, at 2.30.

A general meeting is to be held on Friday, June 24th, at headquarters, 9 o'clock.

Western District M.C.

The reliability trial to Daventry and back for the Triumph Cup was well supported, there being thirteen starters out of fourteen entrants. The following are the results:

1. E. Caudwell (3½ h.p. Triumph) ... Non-stop.
2. W. F. Ritchie (5 h.p. V.S.) ... ... Non-stop.
3. F. W. Ritchie (5 h.p. Indian) ... Non-stop.

Non-stops were also recorded by B. E. Platt (3½ h.p. T.T. Triumph) and B. Martin (3½ h.p. Triumph).

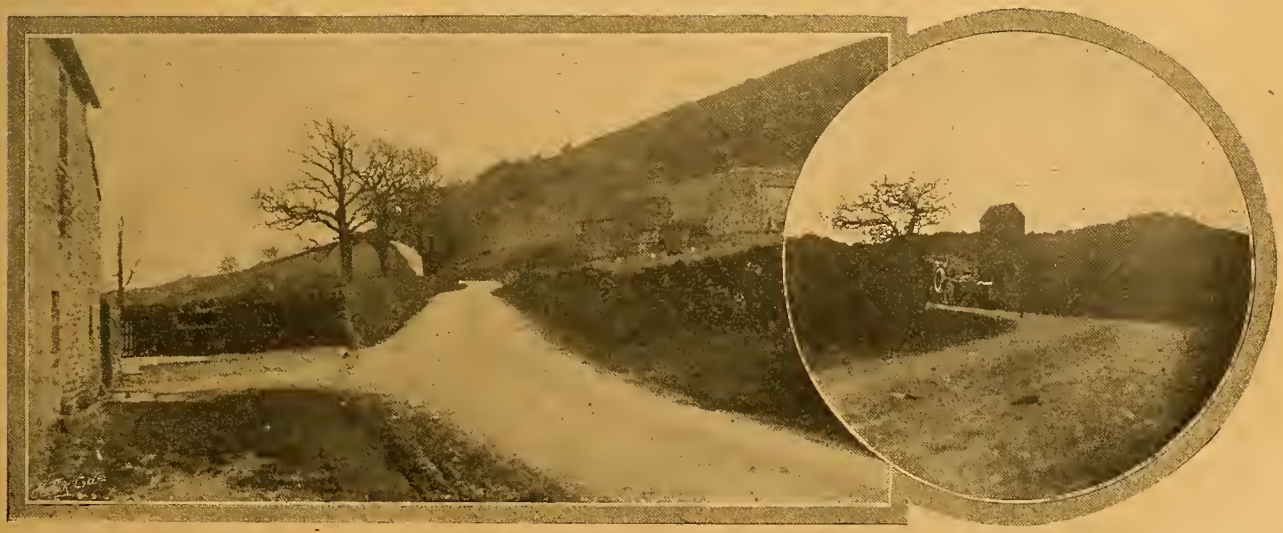
Leicester and District M.C.C.

A hundred miles reliability trial has been arranged for June 30th, and a course, approximately twenty-five miles, will be selected near Leicester.

A run on the 12th inst. was held jointly with the Northampton M.C.C. A splendid attendance was made, and the trip was of historic interest, covering as it did Naseby Battlefield and Rothwell Church, etc. The return journey was through Daventry, where the Leicester men bade good-bye to their Northampton friends.

Middlesex County A.C.

The annual hill-climb of the Middlesex County A.C., the first since the club's reconstitution as the County Club, took place on the 11th inst. on Handpost Hill, on the road between Northaw and Newgate Street. The hill has a rise of 1 in 7 over a great part of its length. Mr. A. G. Reynolds, who shared the work of timekeeping with Mr. J. H. Burley, handicapped and judged the motor cycles. The results were: 1, W. H. Wells (5 h.p. Indian), fastest time—winner of Earl Ronaldshay Cup and gold medal; 2, H. Grose (8 h.p. Chater-Lea with sidecar); 3, H. Gibbs (3½ h.p. Triumph); 4, W. Bruce (8 h.p. Chater-Lea and sidecar); 5, C. T. Cutler (3½ h.p. P. and M. and sidecar); 6, L. Marcus (3½ h.p. Triumph).



COCKSHOOT LANE, NEAR SKIPTON, THE SCENE OF THE BRADFORD M.C.C. OPEN HILL-CLIMB ON SATURDAY NEXT.

(1) Starting point showing the first severe rise between the trees. (2) A bend in the hill about half way up.

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

Controlling a Twin at Slow Speeds.

? At present I have a Brown and Barlow on my twin Vindec Special. The machine is a lot too fast for town work. Can you tell me a way to make the engine more controllable at slow speed?—B.J.

Your machine could be made to run slower by fitting a smaller jet and reducing the diameter of the air cone round the jet by means of the special ferrules supplied by Brown and Barlow, Ltd. If your machine still runs too fast, you might try slightly weaker inlet springs. Do not alter your present ones, but fit weaker springs if you can get them. If you still experience trouble in throttling down sufficiently, try a lower gear ratio.

Continental Touring.

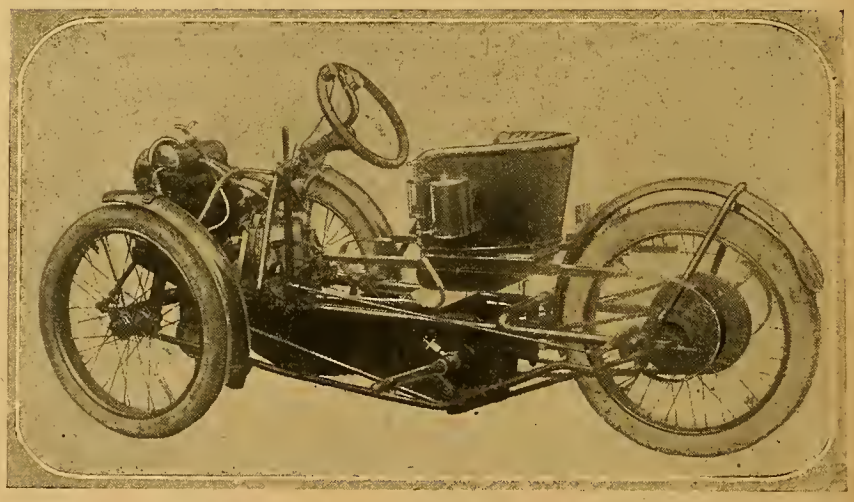
? (1.) Is there by law any necessity for a person taking a motor bicycle into France to have fresh number-plates or take out a driver's licence, and if so how much does the licence cost? (2.) Are there any octroi duties into Paris, and if so, what are they? (3.) Can you also tell me which is the best road from Paris to Orleans? I am not very particular about taking a circuitous route, so long as I have a road with a good surface. I understand that people do go to France and do not take out a licence or have fresh number-plates, but that this is against the strict law of the country. I am a member of the Touring Club de France, and understand that I can take my machine into the country if I have a Plaque de Control on payment of sixty centimes.—M.

(1.) The very latest information with regard to taking machines into foreign countries was published in *The Motor Cycle* of May 5th under the heading of "International Motor Licences," see page 396. (2.) There are octroi duties when entering Paris on the petrol in the tank. It is therefore advisable to reach the octroi gates with as small a quantity of petrol as possible, either way, and if you are staying inside the Paris gates and it is your intention to return the same day, you should endeavour to return with the same amount of petrol as there was in the tank when you left. Petrol is cheaper outside the gates than inside. (3.) The main road from Paris to Orleans is a particularly good one, and leaves Paris by Versailles, passing through Limours and Dourdan. The total distance is 128 kilometres. If you are a member of the Touring Club de France you will have no difficulty in taking your machine into the country unless the new regulations referred to above affect the Touring Club de France regulations.

Magneto Switches.

? (1.) I am in a state of indecision as to whether to fit a switch to my 1909 Triumph or not. I have been strongly advised both ways by more experienced riders than myself. I shall be greatly obliged if you will kindly inform me as to what, in your opinion, can be learned from the T.T. Race as regards the desirability or otherwise of switches. Were the majority of the machines fitted with switches? I notice you refer to "switching off" in your excellent report of the race. (2.) When my machine is running perfectly on the level or easy grade using the utmost air it will take and I come to a decided rise, or want to accelerate, should I leave the throttle alone and reduce the air, or leave the air alone and increase the throttle? Either has the same effect, and I should like to know whether it is better for the engine to do the majority of the manipulation of the mixture with the throttle or with the air lever? Which gives the best carburation for the work to be done?—NOVICE.

(1.) There is no reason whatever why you should not fit a switch to your machine if you would like one. It is quite easily done, and has the advantage of enabling one to stop the machine if by any chance the exhaust valve lifter wire should break, or the throttle is not a gas-tight fit. On the other hand, there is no real need for one. As to how many machines competing in the Tourist Trophy Race were fitted with switches, we are afraid we cannot recollect, but we should estimate that not more than 25 per cent. of them had switches. Please bear in mind that the term "switching off" is used rather loosely here, and is about synonymous with the raising of the exhaust valve lifter. (2.) In the cases mentioned you had better open the throttle slightly to accelerate speed, adjusting the air to suit as occasion should require. Drive on the throttle as far as possible, and use as perfect a mixture as you can to enable the engine to keep cool.



A smart 6 h.p. Twin-cylinder Eagle Runabout owned by a member of the Leeds Motor Cycle Club. Special attention is directed to the springing of the driver's seat.

Equipping a Lightweight.

(1.) I am buying a new light F.N., 2¼ h.p., 1910, and wish very particularly to avoid punctures. Would the fitting of (i.) Palmer Cords or (ii.) heavy Kempshalls materially lessen this risk? Would it be both possible and desirable to get 2¼in. tyres instead of 2in.? (2.) Would the addition of (i.) (handle-bar) magneto control or (ii.) a switch (I shall ride in traffic) be worth the (small) extra expense? (3.) Would the fitting of a larger or other silencer considerably lessen the noise?—R.F.J.

(1.) If you wish to lessen the risk of punctures it would be advisable to fit heavier tyres of any well-known make. The two brands named are first-class and equal in merit. If there is sufficient clearance, 2¼in. tyres would increase the comfort and render tyre troubles less likely. (2.) We should advise the addition of handle-bar control to the magneto. It would be well worth the extra expense. (3.) The larger silencer, if it is efficient, should reduce the noise. Consult the makers on this point.

Various Queries.

Kindly help me by answering the following: (1.) What other disadvantages (if any) has wipe contact and trembler coil besides big current consumption? Is it an advantage in wipe contact that it has no platinum points to look after? (2.) What shape of handle-bar is best for good steering on a machine which has XL'All spring forks? I find my machine with footboards and 28in. wheels feels insecure on wet roads and tramlines, although the saddle position is quite low. (3.) With an a.o.v. machine what should be the effect of having exhaust and inlet valve springs too strong, especially the inlet valve? Would the machine refuse to start? (4.) What is really the best way to store accumulators when not in use? I have seen two opposite methods suggested in the press lately, and am perplexed to know what is best. (5.) Can you suggest why, after removing and cleaning the contact breaker (make and break) on a trembler coil machine, we now get the spark at the trembler all the time when the switch is on? I have proved that the wiring does not short to the frame, and so far have been unable to solve the difficulty. (6) Should a 20 ampère four-volt accumulator always give a reading of 4.2 directly after being charged?—L.C.

(1.) There is a variation in the degree of lag in a trembler coil, viz., the appreciable time occupied before the current starts the trembler vibrating, which is not existent with a plain coil. Yes, it is a slight advantage in the case of a wipe contact that there are no platinum points, but in the case of a good plain coil with well-proportioned condenser the platinum points require very little attention, certainly no more than the two points of a trembler coil. (2.) What shape handle-bars you have is simply a matter of your own personal taste. If they are too long and whippy, this would account for the insecure feeling. A low frame is absolutely essential for safe riding on grease. (3.) Of course there is a limit. Too strong springs will in time break the valves and prevent the inlet valve from opening quickly enough, causing difficult starting and impossibility to run slowly. (4.) With regard to storing accumulators, you had better take the advice given in letter 4760, page 420 of *The Motor Cycle* of May 12th. This is the best advice that can be given. (5.) Possibly the insulation of the platinum screw has broken down; this would account for the trouble. (6.) The accumulator should show 4.2 after being charged; some four-volt accumulators show as much as 4.5 when first removed from the charging wires.

Knocking on Hills.

I have a 3¾ h.p. 82 × 86 mm. single-cylinder motor bicycle with two-speed gear, weight 234 lbs. in touring trim, high gear 5 to 1. My trouble is knocking on hills. If I start cold it will take a reasonable hill, but on a journey after a good run it gets hot and knocks. I read your paper eagerly (I wish it were twice as big). So far as I know from eight years' riding experience, the machine is in good order so far as compression, etc., is concerned. My idea is the carburetter is at fault. I have experimented with it, closing or opening jet; if closed, find it fails through insufficient gas; if slightly enlarged, takes all extra air, also about $\frac{3}{16}$ hole in inlet pipe (not affected by throttle). I can open another hole in pipe and so make mixture too weak. Perhaps I have got to limit of machine's capabilities—it has never knocked on low gear. Perhaps you could help me by answering the following questions: (1.) Should it take twelve stones up (solo) Harrow Hill (London to Hastings road; last hill into Hastings) after a sharp run for ten miles previously? (2.) Should I be likely to improve it by lowering the compression by inserting a plate; if so, what thickness would you advise? (3.) Could you advise on better carburetter adjustment? I use a sidecar occasionally, and so want to get the utmost out of the machine.—D.S.C.

F. H. Mullett, the writer of the article, "Checking in Reliability Trials" Mr. Mullet has been very successful in competitions with his 1909 Triumph, his most recent successes being two firsts at the M.C.C. Brooklands Gymkhana.

(1.) Yes, we should say it ought to do it with a gear of 5 to 1, but weight of machine is rather against it. (2.) Possibly, but too thick a plate would mean a great reduction in engine power. Try one-sixteenth of an inch between cylinder and crankcase, and do not forget to lengthen tappets. (3.) You should obtain the back number of *The Motor Cycle* for January 10th containing an article on "Testing and Adjusting Carburetters." Perhaps you do not close the air sufficiently when climbing hills. At any sign of knocking the air lever should be gradually closed.

Sidecar Combinations.

I intend buying a 3½ h.p. two-speed Humber motor cycle for sidecar work. (*a*) Is this machine good enough as regards power, the gear, and lasting qualities of the moving parts? I intend using it in and around London. (*b*) What are the advantages of a flexible over a rigid sidecar or *vice versa*, and which do you advise me to get? (*c*) Is there a sidecar that can be packed quickly into a small space?—P.J.W.

(*a*) The machine is quite powerful enough for average weights if not used in too hilly a district. We do not doubt that it will wear well. (*b*) The advantage of a flexible sidecar is that the combination can be steered more or less like a bicycle, and it perhaps requires less power to propel it. The great feature of the rigid sidecar, however, is its stability on greasy surfaces. The rigid pattern is the one most generally in use. (*c*) The sidecar made by Messrs. Bramson and Company, 6, Farleigh Road, Stoke Newington, N., will fold up into a small space

READER'S REPLY.

A Beginner's Mount.

I notice someone has written in *The Motor Cycle* regarding a beginner's mount, and says that he cannot afford more than £7 or £8. A year ago I was in a similar position, and bought an old pattern Humber 3 h.p. I have had very satisfactory running with this mount, and during the winter had the frame lowered, so that now I can reach the ground with both feet. There are plenty of these machines to be picked up at from £5 to £8. If your correspondent would purchase one of these machines, there are several firms who would cut it down, and he would find that he had a reliable if not up-to-date machine for under £10. It may interest you to hear that after twelve months' riding I have suffered no ill effects as regards the rupture about which I wrote you, and which, through the valuable assistance of your paper, I was enabled to get some practicable advice upon. Perhaps a paragraph in your paper regarding the latter item may encourage some reader who fears taking up the pastime owing to the same infirmity.—YORKIST.

A Motor Cyclist's Garage.

S. E. Pemberton, a pioneer motor cyclist, has lately taken over Bond's Garage, Maidenhead Bridge. Mr. Pemberton will specially cater for motor cyclists.

An Accessory List.

A very complete catalogue of motor cycle accessories reaches us from H. Taylor and Co., 21a, Store Street, W.C. It contains illustrations and particulars of practically all up-to-date motor cycle accessories, and will be sent post free on application to the above address.

Competition Riding.

A lightweight rider accustomed to tune up and ride motor cycles in competitions is open for a re-engagement. His mechanical and riding skill was repeatedly demonstrated three or four years ago, and we have no hesitation in putting any firm interested in touch with "Lightweight, c/o The Editor."

Successful in Competitions.

We understand that a 3½ h.p. Premier, ridden by Mr. S. Hudson, in the Newcastle and District M.C. Edinburgh and back trial, on the 4th and 5th inst., ran through without a single adjustment being necessary, and secured a gold medal. In the Burnley Victoria Cycle and Motor Club's hill-climb on Sawley Brow, Mr. H. Walton, also on a Premier, made fastest time.

Exchanges.

Mr. R. G. Nye, 69, Leather Lane, E.C., makes a point of dealing in second-hand machines of all makes, and is prepared to take second-hand machines in part payment for new ones. Mr. Nye has had considerable experience in this branch of the business, and makes a point of treating his customers fairly and with consideration.

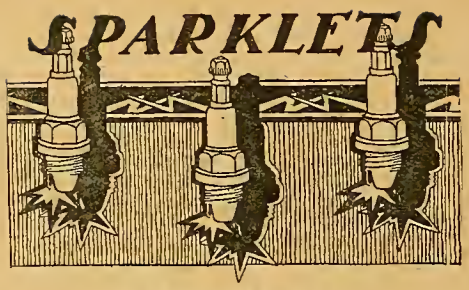
A Reliable Belt.

We are advised by Lycett's Rawido Belt Co., Ltd., Bromley Street, Birmingham, that twenty-five of their belts were used in the T.T. Race. Thirteen of the machines that finished were fitted with them, and not one of the twenty-five caused the riders any trouble. Lyso belts are now made of 30° section, which is said to prevent wedging.

British Motor Cycles in Holland.

Despite a 5 per cent. import duty, we hear that motor cycles of English manufacture are mostly in favour in Holland. The country is particularly flat, nevertheless two-speed gears are in demand, and the Roc motor cycle with two-speed gear has a ready sale, doubtless partly due to the fact that, combined with the two-speed gear and clutch, starting is rendered far easier. Messrs. Croes and Co., Bossum, who are the agents for the Roc machines in Holland, will be glad to supply information to English motor cyclists visiting Holland with their machines.

The correct postal address of A. W. Wall. Ltd., is Roc Motor Works, Hay Mills, near Birmingham, not Tysley, as stated on the 9th inst.



A Topical Showcard.

The manufacturers of Pratt's motor spirit, the Anglo American Oil Co., Ltd., 22, Billiter Street, E.C., are now distributing among dealers throughout the country a new showcard of a topical character. The illustration depicts an aeroplanist descending a ladder from his flying machine and handing a two gallon tin of Pratt's spirit to a motorist who is stranded by the roadside for want of petrol.

The Crowsley Spring Wheel Sidecar.

Some time ago we gave a report of the excellent behaviour of the Crowsley spring wheel sidecar, invented by Mr. E. A. Crowsley, 167, Victoria Street, S.W. The annexed illustration clearly depicts the working of the device, the spring arm of which now works on a large ball bearing. The parts for the spring wheel attachment are manufactured by Messrs. Chater-Lea, Ltd., 116, Golden Lane, E.C., and local cycle agents can now make use of these fittings. A spring wheel on a sidecar is an undoubted advantage. It saves not only the rider, but the whole of the machine, from road shocks. The spring wheel may be fitted to an ordinary sidecar, provided a lug is brazed on to the frame to take the suspension springs.

Arrangement of springing in the Crowsley Spring Wheel Sidecar.

The "Spirit" of Speed.

At the Motor Cycling Club gymkhana and race meeting at Brooklands on the 4th, riders using Shell spirit captured six first, six second, and seven third prizes.

A New Magneto.

The latest motor cycle magneto introduced into this country is the Mea, for which the United Motor Industries, Ltd., 45-46, Poland Street, W., have been appointed sole agents in the United Kingdom and the colonies.

Saddles and Speed.

Of the first fifteen riders who finished in the Tourist Trophy Race thirteen were equipped with Brooks saddles. These saddles are fitted with the well-known system of compound springing, which prevents bouncing and absorbs vibration. The makers, J. B. Brooks and Co., Great Charles Street, Birmingham, will be pleased to furnish further particulars on application.

Supply of Spares on Tour.

Motor cyclists should note that for their convenience the Dunlop Pneumatic Tyre Co., Ltd., have arranged to keep the following depots open till five o'clock on Saturday evenings: London—14, Regent Street. Birmingham—Aston Cross. Manchester—190, Deansgate. Dublin—Oriel House, Westland Row. Newcastle-on-Tyne—11, Bigg Market. Glasgow—61, Bath Street.

An Unbreakable Goggle.

Brown Bros., Ltd., Newman Street, Oxford Street, W., have just introduced a useful goggle with mica instead of glass windows. Another small accessory which motor cyclists may find useful for lighting acetylene gas lamps is the "Hardre" gas lighter. This is an instrument for producing a spark by means of a spring controlled flint and steel. Naturally, it will light a lamp in the highest wind when matches would be easily extinguished. Riders possessing damaged lamps will be interested to know that the above firm have a well equipped repairs department competent to undertake repairs to all kinds of battered and damaged lamps and horns.

Aeroplanes and Flying.

Many motor cyclists are interested in flying, and those who wish to gain more knowledge of the subject should procure a little book called "Flying: The Why and Wherefore," by "Aero-Amateur." A little acquaintance with flying generally breeds a desire to make a model of some kind fly, and the cheapest way of doing so is admirably set forth in "Model Flying Machines," by W. G. Aston. Both books are obtainable from Iliffe and Sons Limited. 20, Tudor Street, E.C., price 1s. 2d. post free.

Those who wish to keep up to date on the subject should also order *The Aero* (a 1d. weekly illustrated journal devoted to flying machines), for it deals very fully with flying all over the world, in a manner which acquits it of any suspicion of being too technical for the ordinary reader.

WHITTLE'S (Patent Link Grip) BELT

was used by Mr. Holroyd on his Motosacoche

IN THE SCOTTISH TRIALS,

who finished without losing a mark, and was awarded one of the only 4 Gold Medals gained. The course was an exceptionally severe one of 897 miles, the gradients in some cases being as much as 1 in 4.

Proving beyond all doubt the

RELIABILITY, FLEXIBILITY, & DURABILITY

of the Whittle belt under the severest conditions possible.

Send for new Booklet with full directions and copies of recent testimonials.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns — 1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

New Motor Cycles of all leading makes supplied for Cash or Exchange. All requiring early deliveries should take advantage of our large contracts with the leading cycle manufacturers.

WAUCHOPE'S,

9, Shoe Lane, Fleet Street, LONDON, E.C.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry", or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20 Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days, and if no sale is effected, each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

1909 Triumph, Palmer cords, first-class condition; £35.—Corre, Lowther St., Carlisle.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

THE MOTOR CYCLE SHOW AT OLYMPIA.

AN INTERVIEW WITH THE SECRETARY, MR. ALFRED BEDNELL.

THE first International Cycle, Motor Cycle, and Accessories Exhibition will be held by the Cycle and Motor Cycle Manufacturers' and Traders' Union, Ltd., on Monday, November 21st, to Saturday, November 26th, both days inclusive.

Having heard that numerous motor cycle firms have booked space for this exhibition, we took an early opportunity last week of interviewing the secretary, Mr. A. Bednell.

"We hear you have been very successful, Mr. Bednell, in regard to the applications for space at Olympia?"

"Yes, practically every important firm in the trade will exhibit, and every inch of space has been applied for. For weeks past I have been engaged in the organisation of details. Here is a list of exhibitors. Thirty-eight firms will show motor cycles only, thirteen will show both motor cycles and pedal cycles, and twenty-two firms bicycles only."

"What about accessories?"

"The whole of the accessory firms will be situated in the gallery with the exception of the tyre companies, who will occupy, in conjunction with the press, two lines of stands, one on each side of the hall. Only firms engaged in the motor cycle and cycle trade will be allowed to exhibit, as it is the committee's desire to raise the tone of the exhibition and make it one which will impress visitors the moment they enter as a collection of exhibits by those engaged in an important industry. Side shows on the part of those not engaged in the trade will be rigidly excluded."

"You have perhaps read, Mr. Bednell, that *The Motor Cycle* has urged the importance of classifying the exhibits as much as possible, and has particularly pointed out from time to time that it is desirable that the motor cycle exhibits should form a separate section of the Show?"

"Yes, I have, and it is one of the items I have brought before my committee, and if it is possible to do so it is our intention to arrange the stands in such a way that there will be two lines of stands of complete motor cycles and three lines of stands of pedal bicycles arranged alternately. In this way a visitor who is only interested in the motor cycle exhibits will be able to inspect both sides of rows two and four without bothering about the other stands."

"Will exhibitors at the Olympia Show be allowed to exhibit elsewhere?"

"No, certainly not. One of the conditions in regard to the allotment of space is that no exhibitor must exhibit or sanction the exhibition of his goods at any other cycle show in London or within a radius of twenty miles thereof during 1910."

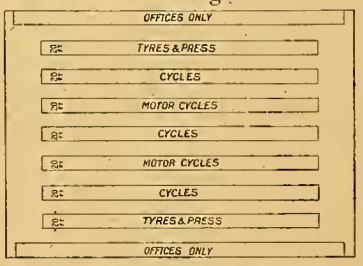
"Will any arrangements be made for trial runs?"

"Anything that can be done to further the business side of the exhibition will receive the serious attention of the committee, and I see no objection to firms who are exhibiting motor cycles having machines outside the building if they wish to give trial runs to prospective purchasers. Proper arrangements can, of course, be made for passing visitors in and out of the exhibition when they desire to make a trial of any particular model on view, and the machines can be parked in the open spaces near the Hammersmith Road entrance, where the trial cars are always lined up at the Olympia car show."

The Olympia Show.—

"Is there any other information which you think would be of interest to our readers?"

"Yes, I think so. Posters advertising the exhibition will be exhibited at every railway station in Great Britain and Ireland, and these posters will make it clear that motor cycles form a very large and important section of the Show. By this means we hope to draw riders of motor cycles from all parts of the kingdom to Olympia in November next."



Rough plan of The Cycle and Motor Cycle Show at Olympia, showing proposed arrangement of stands. Each stand is 20 feet wide, and no offices will be permitted to be erected except at the sides of the building.

"We presume that motor cycle manufacturers are represented on your show management committee?"

"Certainly. Mr. W. Williamson (Rex Motor Mfg. Co.), Mr. W. H. Wells (Hendee Motor Mfg Co.), and Mr. W. Pratt (Phelon and Moore, Ltd.) are members of the executive, and represent the purely motor cycle makers as distinguished from those who represent manufacturers of pedal bicycles as well as motor cycles."

Following is a list of firms making motor cycles who have actually booked space, and above is a rough plan of the exhibition which will give our readers an idea of how the Olympia Cycle and Motor Cycle Exhibition will probably be arranged:

Manufacturers of complete motor cycles who have booked space at Olympia:

Alldays and Onions.
Arno Motor Co.
Auto-Carriers, Ltd.
Bat Motor Mfg. Co.
Bayliss, Thomas and Co.
Bradbury and Co., Ltd.
Centaur Cycle Co., Ltd.
Collier and Sons.
Components, Ltd. (Ariel Dept.)
Douglas Bros.
Enfield Cycle Co., Ltd.
Grandex Motor Co.
Green's Patent Motor Syndicate.
Hendee Mfg. Co.
Hobart Bird and Co.
Humber, Ltd.
Lloyd Motor Co.
Moto-Rêve Co.
Motosacoche, Ltd.
Norton Mfg. Co.
N.S.U. Motors, Ltd.
Nye and Co.
Phelon and Moore, Ltd.
Premier Motor Co., Ltd.
Premier Cycle Co., Ltd.
Rex Motor Mfg. Co., Ltd.
Scott Engineering Co., Ltd.
Service Co., Ltd.
Singer and Co., Ltd.
Triumph Cycle Co., Ltd.
V.S. Motor Co.
Wall, A. W., Ltd.
Wilkinson Sword Co.
Wolf Engineering Co.
Zenith Motors, Ltd.

The Stanley Show.

In response to an enquiry addressed to Mr. E. A. Lamb, the secretary of the Stanley Show, the following letter has been received: "In reply to the letter, at present I am unable to send you the names of the firms exhibiting in the forthcoming Stanley Show, or any special information, beyond this, that we have a fair number of exhibitors, and, as far as I can see, we shall have a fairly good exhibition. Thanking you for your interest in the matter."

SURVIVORS IN THE LEEDS M.C.C. RUN TO LONDON AND BACK. SEE PAGE 585 OF OUR LAST ISSUE.

The first two arrivals at the finish, John-o'-Gaunt's. (N.S.U. and Peugeot machines.)

Five competitors who qualified for gold medals

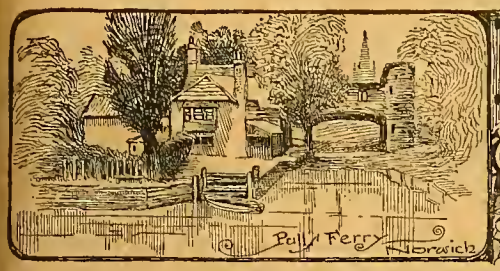
A successful competitor driving a 3½ h.p. Triumph and sidecar.

A RESILIENT STUD TYRE.

A REPRESENTATIVE of Messrs. Brettel, Wanklin, and Co., Regent Works, Walsall, recently submitted a motor bicycle to us for a short trial run fitted with the Cairns stud tyre. This tyre is built up with a number of hollow rubber studs secured to a steel band, which encircles the rim and can be removed bodily with the studs in position by undoing eight bolts. Each hollow stud has flat sides and a rounded grooved tread, the base being formed with a lip which passes through holes in the band. After the studs have been placed in position they are locked by a cap, which holds the stud in position, and also acts as an air retainer when the weight of the machine and rider is taken by that particular stud.

Having tried so many different substitutes for pneumatic tyres on pedal bicycles in the past, we were somewhat sceptical with regard to this stud tyre when we saw it, but a short trial convinced us that it was quite comfortable. On a fairly good road and at moderate speeds we could not detect any very great difference between it and a hard pumped pneumatic tyre, the only exception being when a pothole or rough surface was struck the jerk was slightly more noticeable and in a way sharper than with a pneumatic tyre.

Of course, the great claims on behalf of the Cairns tyre are freedom from tyre troubles in the form of punctures or bursts. A badly cut or worn stud can also be replaced with facility.



Occasional Comments.

By Ixion.

Touring Weights.

A number of talkers and writers, from whom I cannot except myself, have got entrapped into a habit of referring to 3½ h.p. tourist machines as "one hundred and fifty pounders," with the accompanying implication that the average high-powered twin scales about 170 lbs. all on. As a matter of fact, these weights are sadly below the mark. Scales were not employed at the T.T. Race this year, and for the actual weights of modern speed machines, stripped for racing, we must wait until some hill-climb officials publish official statistics. But I have just received the actual weights of a set of touring machines, *complete with a full kit of clothing and spares for a reliability trial*, and they should be sufficient to quash the notion that a roadster 3½ h.p. machine with normal equipment scales no more than 150 lbs. Here they are:

(*a*) 3½ h.p., single geared, free engine, 229 lbs.
(*b*) Two 3½ h.p. machines of another make, with free engine and variable pulley, 212 lbs. and 226 lbs. respectively.
(*c*) Three twin-cylinder lightweights with two-speed gears, 155, 158, and 163 lbs. respectively.
(*d*) A high-powered twin-cylinder machine with side-car, 367 lbs.
(*e*) Three variably-geared machines of different makes, all of 3½ h.p., 226, 228, and 252 lbs. respectively.
(*f*) Two single-geared 3½ h.p. machines of less well-known makes, 201 and 248 lbs.

We must evidently realise that lightweights weigh more than their list claims when in full touring kit, and that a standard roadster ready for touring scales much nearer 2 cwt. than 150 lbs.

A New Hill.

I have been studying our report of the Scottish Trials ascent of Glencroe in conjunction with a contour book, and it has impressed me with the need of some reform in the hill tests embodied in the A.C.U. Six Days' Trial. I pay little attention to the failure of the Scottish trial riders on many other hills. On such ascents as Cockbridge or Amulree, corner work is an important factor, and a skilled rider on a good machine may fail utterly because he lacks the experience or the nerve to take a hairpin bend at a fast speed. But the Pass of Glencroe, terminating in a wicked bend at the very summit, is an excellent test.

The climb is six miles in length, there are no awkward bends below the summit, and there is no really stiff gradient, a short patch of 1 in 9 being the maximum, which occurs on a perfectly straight stretch about half a mile from the top. Here is a hill which we should expect any tourist to climb, with the proviso that he might fail at the stiff corner which concludes the climb. But as a matter of fact only three riders in a presumably expert entry made clean ascents.

The two-speeders are as helpless as the single-geared machines. The *length* of the ascent, the prolonged distance to be covered on a generous throttle opening, proves too much for the majority of the aspirants, and stops one or two machines which, in the hands of practised exponents, have never before failed on a straight ascent with no trick corner work in it. The moral is obvious. Each A.C.U. trial ought to include a hill test of this kind.

Such hills are not easily unearthed in Great Britain, but a Northern rider has kindly provided me with a description of a climb which appears highly suitable. It appears in the Northern volume of the Contour Book, route No. 42, comprising the ascent of Killhope on the Durham to Alston road. The total climb includes nearly twenty miles of tolerably easy collar work, terminating in a really formidable pitch up to the summit of Killhope. This is an intrinsically fair climb, devoid of freak corners up a single-figure gradient, and this hill, or a similar ascent, ought to be included in the Six Days' Trial of 1911.

A considerable market for motor bicycles lies among the well-to-do artisans of the Northern Counties, and we hope that next year the A.C.U. will give the North of England its turn in their route, and select several of its famous climbs as testing grounds. The Alston side of Killhope would also provide a fine test of climbing abilities, and this particular route deserves to be taken in both directions.

Gold medal winners in the Bradford M.C.C. London and Back Twenty-four Hours' Run.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Riding Round Corners.

[4831.]—I see that the method of taking corners in the T.T. has caused a good deal of comment, so perhaps my way may be of interest to some of your readers. I found that on a push-cycle the best way to take a corner fast was to stand on the left pedal and hook my right knee over the top bar, and then swing round, keeping the bicycle nearly vertical. When I came to try this on a Motosacoche I found it worked admirably. This is for taking corners left-handed.

Wishing your excellent paper every success,

FREDK. H. PEPPE.

A Successful Tricar Conversion.

[4832.]—With reference to letter 4818, I should be obliged if your correspondent "CP 125" would inform me how he was able to decrease the weight of his tricar by over 100 lbs., as the alterations which he has carried out appear to me to increase rather than reduce the weight, as he has added a differential and a two-seated body with wind screen, while the weight of framework removed cannot surely be more than 30 lbs. As I possess a tricar of a similar type I should be pleased to receive any particulars.

J. L. BAIRD.

Spring Fork Patents.

[4833.]—I am glad to see that you still advocate further improvements in springing motor cycles, but I notice that the most prominent feature in this direction is never mentioned. I refer to the type of spring fork that is driving all others off the market, such as the Druid, Matchless, Brown, Kerry Abingdon, etc. No one appears to be able to claim to be the original inventor of this type of spring fork. It may be interesting to some if I point out that the first illustration of a spring fork on these lines appeared in *The Motor Cycle*, June 27th, 1904.

I claim to be the original inventor of the principle to which this type of spring fork owes its success. I patented it in 1901. The patent lapsed, but it is my intention to revive it again, and I think anyone who feels inclined to doubt my claims to be the original inventor will have some difficulty in finding any spring fork embodying the principle I mention, previous to 1901.

WM. GODDEN.

A District to be Avoided.

[4834.]—Will you kindly insert the following letter warning motorists in general to avoid the Lindsey division of Lincolnshire, more particularly Skegness and Spilsby?

The undersigned defended summonses at Skegness on June 14th for an alleged offence of driving to the public danger on May 17th with motor cycles and sidecars.

Despite the fact that in our opinion we proved the police evidence to be unreliable, we were fined £2 and 8s. costs each. The Chairman of the bench stated during the proceedings that one mile an hour might be dangerous. Further, that motorists had the last right—and that only because of Act of Parliament—of anyone to be on the roads.

Under such circumstances we think you will agree that no motorist has the remotest chance of receiving justice at the hands of these two benches, and we strongly advise them all to leave this district severely alone until such time as the constitution of the benches is changed.

It is further interesting to state that the Chairman at the end of the proceedings remarked that the penalty was not to be considered as a punishment, but as a warning. This we heartily endorse, as the whole affair certainly is a warning to avoid the district.

FRANK H. THOMPSON.
J. NORMAN LONGFIELD.

Wear of Rubber and Canvas Belts.

[4835.]—Having read the correspondence *re* wear of rubber belts, I think the two following cases may be of interest to your readers. I myself am using at present a 1in. Continental (not grooved), which has up to date run just over 5,000 miles, and still looks perfectly good. The machine is a 7 h.p. two-speed V.S. A friend of mine has a similar belt in use, which has run 4,280 miles, partly on a 5 h.p. two-speed Vindec and partly on a 7 h.p. V.S. These distances are not guesswork, but have been carefully recorded in each case.

V. F. M. OLIVER.

The Glasgow Clarion Sports.

[4836.]—In reply to Mr. James S. Grant's letter in your issue of Jnne 16th, may I, as one of the judges, state that Grant was reported for riding wide at the bends; his protest was not accepted becanse he had finished first in the heat, and heat winners only qualified for the final. Baxter protested against Grant, whose wide riding was palpable to everyone who followed the race, and Baxter's protest was held to be fully justified. There was no reason for Grant's astonishment on taking his place in the final, as his disqualification was posted on the board.

HENRY S. BILBE.

Belt Fastener Screws.

[4837.] — I was pleased to read the letter signed "D 3985" and J. B. Dall in your issnes of 26th ult. and 2nd inst. with reference to the above. Abont six months ago I wrote to the makers of a well-known belt fastener, and asked them why they could not make the screws with square heads. They replied saying that owing to the low charge made for their fasteners they could not see their way clear to adopt my suggestion, as screws made with square heads would cost more.

Now, how many users would object to paying a few pence more for a satisfactory article? It is not a matter of shillings but pence—threepence the most. It would save time and temper, especially in the winter, when the threads are rusted in, and also save one from getting a cut in the top of the thumb from the screwdriver slipping, as I have experienced more than once when shortening belts by the roadside. Wishing your excellent paper every success.

HENRY BUCKELL.

Road Dangers.

[4838.]—The letter of "J.M.E." in the issue of June 16th has caused considerable comment amongst local motorists who constantly traverse the Douglas Moor, N.B.

"J.M.E." warns motor cyclists from travelling over this stretch. In the name of the local motorists I would like to recommend all coming North to utilise this route, as there is not a better surface in all the road from Glasgow to Carlisle. He talks about the road being sprinkled here and there with sharp stones like a razor. I defy anyone to find a single stone anything like the sharpness of the back of a knife in any patch, and, what is more, the road-menders on this moor road always leave a track on the right or left clear for cyclists, as all are cyclists themselves, and I have never yet heard of a cyclist having a puncture on this road since I started cycling or motor cycling. "J.M.E." must have started with a tyre that should never have been on. If he had made diligent enquiries in Glasgow for a cover 24 × 2½ he could have had as fine a collection to choose from as there is to be had in any big city in Britain.

C.D.C.

An Experience with a Tyre-filling Compound.

[4839.]—Early in May this year I was troubled with a porous inner tube on my front wheel tyre which defied all efforts to locate the defective spot. Before starting upon the London-Edinburgh run I decided to replace it on the first provocation with a new butted inner tube, which I carried for the purpose during the aforesaid run.

This tube needed to be pumped up once or twice each day, it being quite old, and had nine patches, but all of which seemed to be sound, and yet I would find the tyre flat each morning.

It seemed a shame to scrap this tube with the price of rubber on the ascendency, and in looking through your columns for a remedy I came across the advertisement of Firmax. On May 23rd I filled the front inner tube and pumped up to 60 lbs. per square inch, and since then I have not been troubled, although the tyre has been through wet and mud as well as perfect weather for 1,029 miles.

Since the first of this month the rear tyre has been 887 miles (including a business trip to London), and although I pulled out a ⅜in. nail while in London, and a hobnail while in Birmingham, this latter causing the air to hiss out quite fiercely, but after turning the wheel round and tapping a bit, I pumped up, and rode to Manchester, and only pumped it up once a little harder as a precaution during the trip, and it still holds up hard.

I may add that I have absolutely no interest in this material other than a satisfied user, and I hope that the competitors in the A.C.U. End-to-end Trials will record their experiences with this or other most welcome tyre fillers. H. W. TURNER.

A Pressure-fed Four-cylinder F.N.

[4840.]—Thinking it may interest some of your readers, I send you a photograph of my four-cylinder F.N. motor bicycle.

As you will see, the saddle is at its lowest possible point, only just clearing the rear wheel. This is attained by placing the petrol tank under the engine, pressure being obtained by a small air pump driven from the half-time shaft. By this pressure feed I find I can get more power up hill, the supply being constant. The small pressure pump (the piston being only ⅜in. diam.) is just above the footboard in base of engine.

J. WILSON.

The Future of the T.T. Race.

[4841.]—The fact seems to be generally recognised that the limit of speed in the Tourist Trophy Race has now been reached, and that any further rules must tend to decrease the average pace. It has been suggested that this should be done by reducing the size of the engines. I think that the majority of motor cyclists will agree with me when I say that this would be a great pity. The original object of the race was to perfect the design of the touring motor bicycle. If the only machines allowed to compete are ultra-efficient midgets, which in touring condition would not give more than about 3 h.p. (much too low for the average tourist), the whole aim of the race is entirely lost sight of. Would it not be far more rational to keep the same capacity of engine, and to insist that every machine entered must be a genuine touring machine, and not a Brooklands racer fitted with a silencer and a pair of flimsy mudguards for the occasion? It was bad enough to have all our hill-climbs won by trade riders on special machines, but when the same state of things applies to the only road race that ever takes place in the British Isles, it is surely time that something was done.

I would suggest that the same plan should be adopted as was suggested with regard to the hill-climbs years ago, namely, that each firm should send word to the officials as to the number of machines they wished to enter, and that the officials should send two committeemen to the factory to choose out this number of bicycles from stock, and carefully seal them, so that they should not be tampered with until they were safely in the Isle of Man. Every private owner would, of course, have to have his machine examined carefully to see that it was genuinely standard. I do not think the trade would raise any great objections to this plan, as it would obviously be a far better advertisement for the winning machines than is the case at present, when special engines, special frames, special saddles, and special silencers are the vogue, and when pulleys, magneto brackets, belt rims, and frames are drilled to the very limit of safety, and in some cases beyond it.

If we have separate races for singles and twins next year, I suppose the size of the twin engines will be increased so as to include the standard 5 and 6 h.p. machines.

E. K. WYATT.

Motor Cycle Insurance.

[4842.]—Referring to letter "L.D. 1889" in regard to motor cycle insurance, I should like to put your correspondent right in regard to the facts. As regards the people responsible for the prospectuses, I think I may claim to know something about motor cycles, being on A.C.U. committees and a founder of the Essex Motor Club. For years I have been fighting the case of the motor cyclist for reasonable rates for insurance, and have succeeded in arranging vastly different terms from those in practice three years ago.

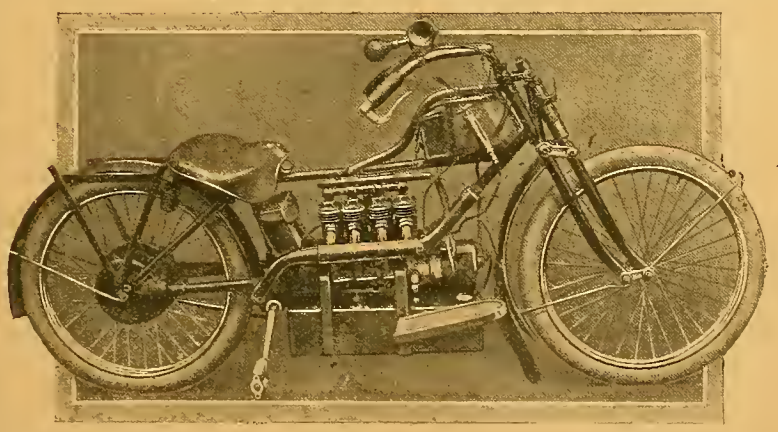
Taking your correspondent's figures, 50 per cent. is not charged on the whole of the risk for converting to a three-wheeler, the increase does not apply either to burglary or to fire, but 20 per cent. only is added on third party risk rates; the former rates are according to value of combined vehicle.

Taking personal accidents, the rate to cover £250 at death with other benefits is not £1 10s. per annum but 15s. I should like to know the company the correspondent is insured with for any accidents for 18s. 9d. per annum.

ERNEST J. BASS.

Increase of Speed on Partially Raising Exhaust Valve.

[4843.]—We have read the articles which have appeared from time to time in your columns relative to the above, and with your permission would like to give our opinion regarding same, which we think is about the only solution of the "phenomenon," as some of your readers call it.



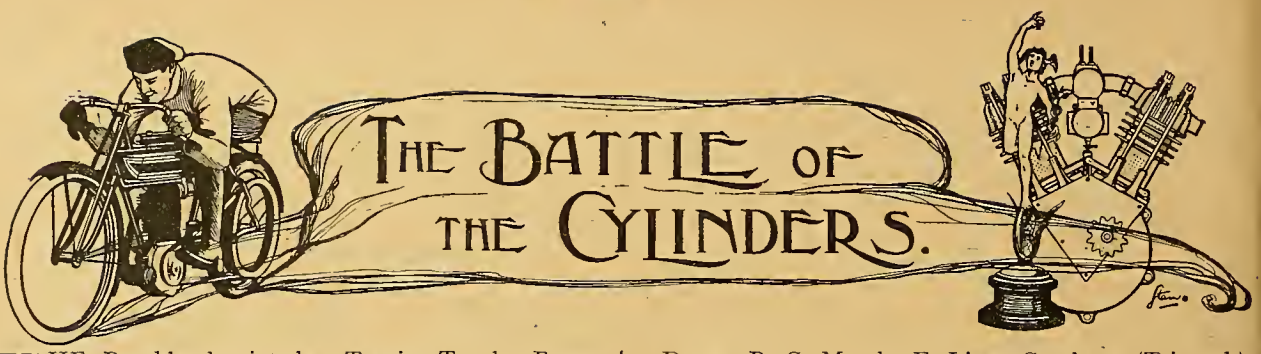
A four-cylinder F.N. altered to give a very low riding position. The petrol tank, it will be observed, is underneath the engine. (See letter No. 4840.)

We would first of all point out that the exhaust valve has to open against a pressure varying from 60 to 120 lbs., according to the size of the valve, and it certainly must be an advantage if the valve can be opened against a less pressure. It therefore must be due to the lead that is given to the exhaust by lifting it that causes the increase of power. It was the outcome of experiments which were carried out by the patentee of our Concentric Pilot valve some fourteen months ago that gave him the idea of lifting a smaller or pilot valve first and then the main valve, and it is upon this basis that our patent rests.

We have proved conclusively that this increase of power or speed on partial lifting of the exhaust valve is due to the surge of exhaust gases against the head of the valve being partially relieved, thereby giving a freer path for the exhaust gases to escape. J. C. LYELL AND CO., LTD.

EXPERIENCES WANTED.

"A 5036" would be glad of private owners' experiences of the F.N. 2¼ h.p. shaft-driven lightweight, particularly with regard to hill-climbing, comfort, and reliability.



The Battle of the Cylinders.

THE Brooklands sixty-lap Tourist Trophy Race held on Wednesday last week proved, thanks to the track's usual slice of luck in the matter of weather a great success and a most interesting event. The morning was spoilt by a heavy thunderstorm, but afterwards the weather improved considerably, so that at 4 p.m., the time the race was booked to start, there was one of the biggest attendances of spectators the B.M.C.R.C. has yet had.

The conditions of the race were similar to those governing the road event in the Isle of Man, except singles and twins were not competing for the same prizes; in fact, it might be said that there were two entirely separate and distinct races run off concurrently. It was notwithstanding a battle of the cylinders, as at one time it looked as though the honour of making fastest time might have belonged to a rider of a single-cylinder machine.

The List of Entrants.

SINGLE CYLINDERS.—W. E. Cook, N. E. Parker (N.L.G.); S. Wright, B. Yates (Humber); Lieut. Spencer Grey, R.N., A. R. Abbott (Rex); H. Lister Cooper, J. H. Watson, E. D. Colrick-Herne, J. Marshall, W. F. Newsome, W. Creyton, E. Gwynne, W. Dewar, R. G. Mundy, F. Lister Goodacre (Triumph); F. McNab, J. Gibson, A. C. Maitland (Trump-J,A.P.); G. E. Stanley (Premier); and J. H. Slaughter (Ariel).

MULTI-CYLINDERS.—G. Lee-Evans, D. R. Clarke, A. Moorhouse, C. B. Franklin, A. G. Fenn (Indian); W. H. and J. T. Bashall, S. A. M. Witham, H. H. Bowen (Bat); M. Geiger, F. H. Arnott (V.S.); B. V. Jones, F. Savory (Premier); E. C. Fitzherbert, R. O. Clark (F.N., four-cylinder); N. E. Drury (Chater-Lea-J.A.P.); Deacock (Wanderer); and H. Reed (Dot).

All the above faced the starter with the exception of the two V.S. riders and Colrick-Herne. The latter had had a nasty spill in practice owing to his front wheel having buckled when riding at full speed, with the result that his hands and arms had suffered.

The riders were started from the fork shortly after 4 o'clock by Mr. Ebblewhite, and within a quarter of a mile the "tailing-out" process had begun. Witham immediately took the lead in dashing style, but did not get much in front of Bowen, the order for the first lap being as follows: Witham, Bowen, J. T. Bashall, Read, Abbott, Marshall, and Moorhouse. In the next lap W. H. Bashall got well up in front, and for a lap

A Tourist Trophy Reunion. Crowded scene at the fork before the start of the Sixty Lap T.T. race.

INDIANS IN COMPETITION. 1910.

Jan. 29th.—FIRST 1910 A.C.U. QUARTERLY TRIALS. 3 INDIANS make non-stop runs.

S & H.

The Time for the Tour

is now—and that Time, and especially that devoted to your preparation, reveals many needs- needs that the Tour will emphasise as no other experience can.

Now on such occasion the Spare Belt and Tube are absolute essentials, and equally essential for their conveyance is the

BROOKS Spare Belt and Tube Case.

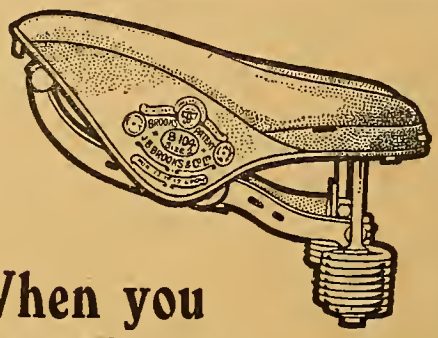
This is made either in best quality leather or the finest stout waterproof canvas on special fibre board. Belts are carried in the outer compartment, the central division being designed for the reception of spare tubes, and both belts and tubes are held in position by a stout strap, as illustrated. The lid is closed with strap and buckle and the case can either be carried on the top of the Carrier or attached to the side of same and the downstays of the machine by means of detachable and adjustable Clips.

Its size is 9½in. diameter by 3½in. deep, and its price in canvas 9/- and in leather 10/6.

This fills one need, but you have many others in the matter of luggage-carrying equipment, all of which are provided for in the range of Touring and Tool Bags illustrated and described in the BROOKS BOOK.

Let us send you copy.

J. B. BROOKS & CO., LTD.,
49, Criterion Works, Birmingham



When you specify the Saddle

say BROOKS and, by so doing, vanquish that vibration which *at least* will bring discomfort and fatigue and *may* have still more serious consequences.

The exclusive feature of this Saddle is the BROOKS PATENT COMPOUND SPRINGS which are designed in such manner as to absorb all vibration within themselves and, at the same time, eradicate that common fault—a tendency to bounce.

Remember, these *are* an exclusive feature, and the advantages accruing from their unique construction are only obtainable in the various models of the

BROOKS Anti-Vibratory Motor Cycle Saddles & Seats

Of these we illustrate B104 P, which is specially constructed to give a low-riding position—perfectly shaped—and made of the finest quality superfine leather with padded top.

Its price is 29/-, and it is fully described, with others of the range, in the BROOKS BOOK, which we will send you free upon request.

J. B. BROOKS & Co., Ltd.,
49, Criterion Works, Birmingham.

In answering this advertisement it is desirable to mention "The Motor Cycle."

The Battle of the Cylinders.—

or two the field was led by the four Bat riders, all travelling at a tremendous speed and hard on each other's heels. Reed and Jones were also travelling very fast, and amongst the singles Parker looked to be as speedy as any; the F.N.'s had not got thoroughly into their stride, whilst Lee-Evans was travelling by no means up to his usual pace.

Moorhouse and Marshall having once got together seemed loth to part company, and lap after lap were reeled off within a few feet of one another. One round Marshall would be, apparently, jamming his front wheel into Moorhouse; the next the positions would be reversed, and then for a circuit or two they would whizz along side by side.

of his belt, which was slipping badly, whilst Dewar found the belt he had started with unsatisfactory, and changed it for a new one.

Following the example of Marshall and Moorhouse, the two four-cylinder F.N.'s, which went round with a very pleasing hum, and the brothers Bashall kept close together, but there was in other cases a good deal of rather reckless riding. Some of the competitors seemed to strain every nerve to get behind someone and use him as a wind shield for a few moments, with the result that there was a lot of dangerous dodging.

Four or five laps of the pace that the Bats were setting very soon weeded out the field, and a good many riders disappeared into the oblivion of the far side of the track. One of the first to retire was

Lined up for the start. There were 21 single-cylinder machines and 17 multi-cylinders in the race.

Owing to the large number of riders and the considerable divergence of the speed of the twins and singles, it was impossible to count the laps of the various machines. The following account consists of notes taken on the spot and in their chronological sequence as far as possible.

Bowen's Stop to Change a Plug.

A replenishment and repair depot, where each rider might avail himself of the services of one helper, had been established at the fork, and Bowen was the first to patronise it to change a plug which had blown itself completely out of commission. The sparking point end of the internal rod dropped into the cylinder and remained there until the end of the race, when Bowen exhibited a small piece of metal about the size of a pea, which he had just extracted from his engine.

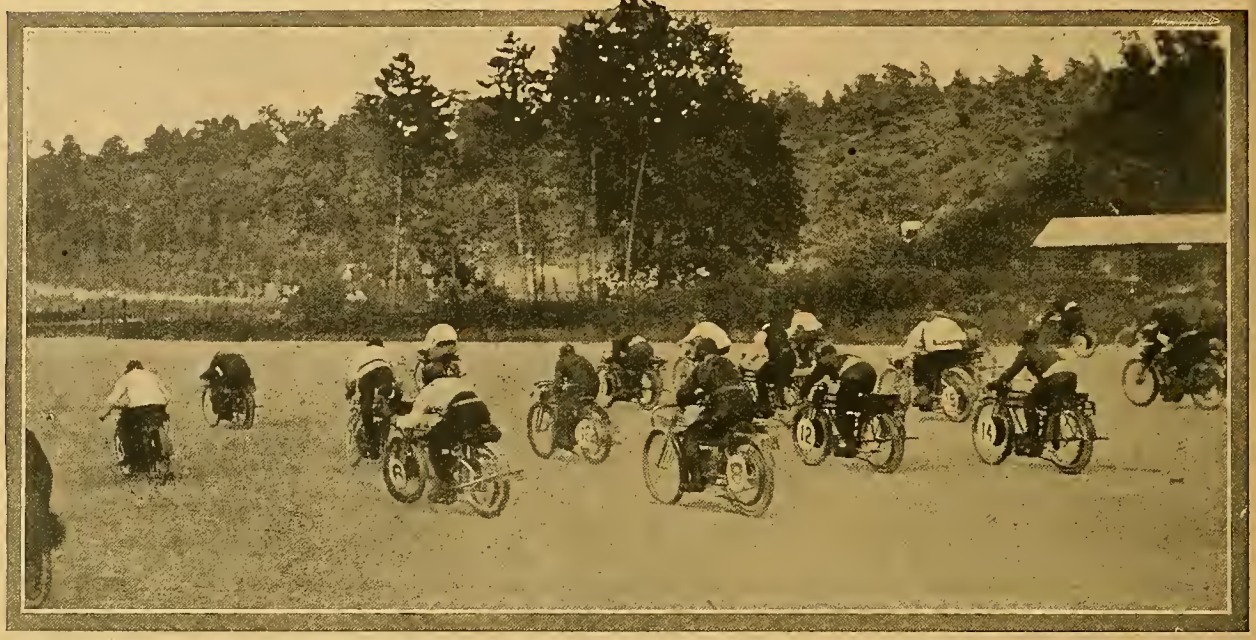
Shortly after Deacock stopped to take a piece out

Stanley. The tank on his machine was fitted with a very large and heavy filling cap, which came loose owing to vibration and was lost on the track. Stanley came in soaked with petrol and gave up, as at the rate the petrol was splashing out, his tank—at any speed—would barely have lasted him a couple of laps, and there was, of course, considerable risk of fire.

That Witham was setting a somewhat hot pace may be appreciated when it is said that he knocked almost three minutes off the existing fifty miles record, made by Colver in October of last year, Witham's time for the distance being 45m. 45⅘s. against Colver's 48m. 25s.

Scarcely had this dashing rider set up this new record when he met with an accident which put him completely out of the race. Whilst on the Byfleet banking, and going "all out," his front mudguard

The Battle of the Cylinders.—



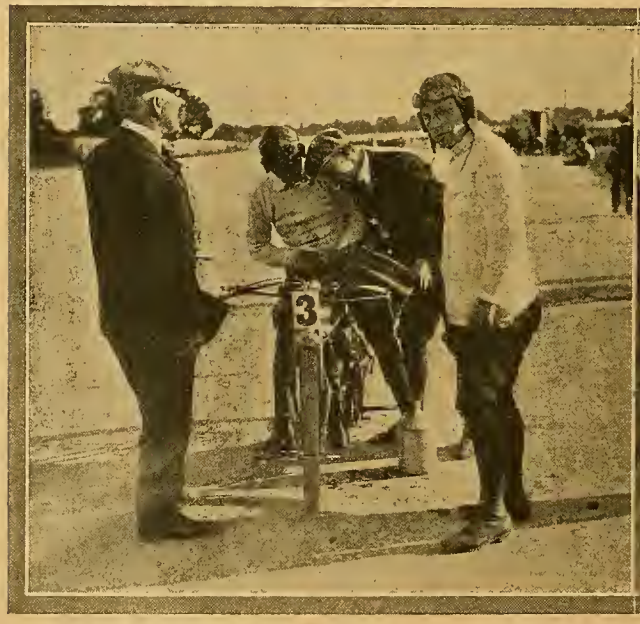
Off! A splendid photograph of the start showing that every competitor got away well.

came adrift, locked the wheel suddenly, and brought him off. Witham estimated the number of somersaults he had done as twelve, but, whether or no, he had a marvellous escape, for he escaped without a single scratch—and this after coming off at nearly seventy miles an hour!

This unfortunate mishap did not change the "make" of the leading machine, as J. T. Bashall now dropped into first place, with his brother and Bowen close behind him.

Lee Evans was early in trouble; his engine was not running at its best, and he was lubricating it so generously that a stop for replenishment after eight or nine laps became necessary. After completing another lap he tried the effect of a change of plugs, but it was clear by the behaviour of the engine that several causes were contributing to its troublesomeness. The other Indians were, however, going well, especially Franklin and Fenn, the latter riding with his right leg resting on the back step.

Sam Wright, who was anticipating some valve trouble, was going extremely steadily and well,



S. Wright (chain-driven Humber) stops for petrol. The special overhead valve engine used on this machine was described in *The Motor Cycle*, June 9th.

The single-cylinder class winner, F. A. McNab (3½ h.p. Trump-J.A.P.), finds time to drink a cup of tea.

The Battle of the Cylinders.—

although he was obviously keeping a good deal in hand. The other "aeroplane" Humber rider did not appear after the first lap or two, but the precise trouble which had put him out of the race was not known.

Amongst the Trump-J.A.P.'s, Maitland's machine was very noticeable. Geared 4 to 1, it was amongst the fastest of the singles, from which it is evident that the engine must have been doing something pretty high in r.p.m. As a result, his valves began to give

A competitor stops for replenishments.

trouble through lengthening. A few minutes in the depot with a file, however, effected a quick repair, and he was soon off again.

Although the programme stated as clearly as English could that only *one* helper would be allowed for each machine, most of those who came in for some cause or other were soon surrounded by a crowd of willing assistants, but thanks to the efforts of one or two of the marshals this state of affairs was quickly ameliorated.

Harrison Watson, who rode very pluckily indeed, early had a taste of the trouble which continually kept him busy at the repair depot. Do what he could his valves would lengthen, in spite of the fact that they were of a special design expressly made by the Triumph Co. for racing purposes. Watson's spring fork appeared to be much too flexible for the speed and the roughness of the track, with the result that at times he was obliged to drop down into a lower speed for safety's sake.

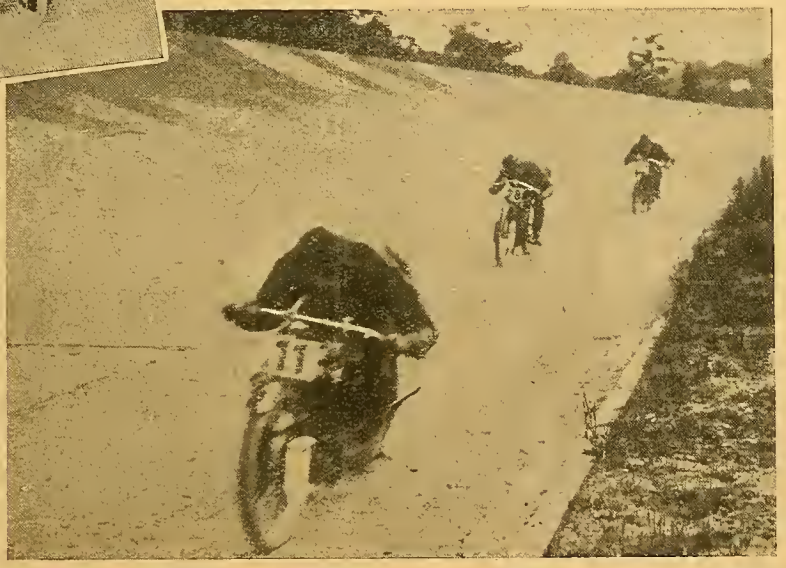
The Triumphs, as a team, had been going very fast and consistently, but unfortunately two of their best riders were thrown out of the race quite early. Creyton, who had been making a very hot pace, came badly to grief just beyond the members' bridge, owing to his front wheel failing in much the same way as Colrick-Herne's. A few laps later Newsome had the misfortune to run over the filler which Stanley's Premier had lost, and so badly was his back wheel buckled in consequence that he was obliged to retire.

A Rapid Replacement. A Dissolved Partnership.

Fenn executed a remarkably quick repair to his Indian, as he changed the chain wheel on the engine-shaft for a new one in a mere matter of seconds. After going along together for fifteen laps or so, Marshall and Moorhouse both stopped for tank replenishment, and after this point the partnership seemed to be for some reason dissolved, as Moorhouse rapidly got going much faster than he had been hitherto.

The "bookies" had made Bowen favourite at the start, but it looked as though they would have been wiser to "bar" all the Bat riders. Witham still maintained the position he assumed during the first lap, and the only machines that seemed capable of keeping in touch with him were his own stable companions.

Harry Reed, whose Dot had been going extremely



J. Marshall (3½ h.p. Triumph), A. J. Moorhouse (5 h.p. Indian), and B. V. Jones (5 h.p. Premier) at speed. This trio kept together for several laps.

well, and whose lap times were amongst the best recorded, had the misfortune to lose the pin out of his tappet rocker, and he therefore gave up. Half an hour or more after this, however, Charlie Collier fixed him up with a new pin, and he started off again, but with the loss of so much time as to ruin his chance.

Amongst the Indians, Moorhouse now seemed to be easily the fastest, but his sporting match with Marshall had evidently done no good to his eyes, which troubled him considerably. Moorhouse adopts a peculiar attitude on his machine, which is quite individual and makes him easily distinguishable at a distance. It was a pity that more of the riders did not do the same. The machines carried metal number discs on which were posted paper numbers. Wind, oil, and a hot sun,

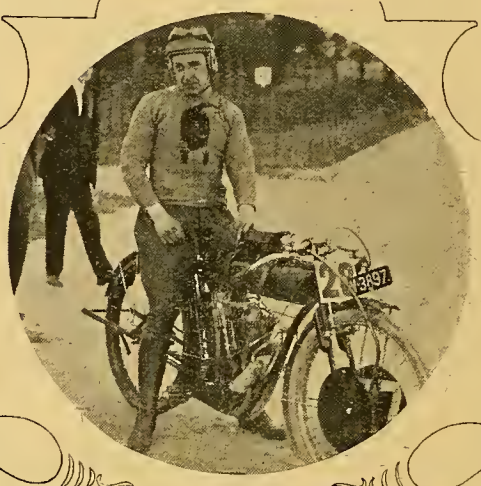
The Battle of the Cylinders.—

however, soon peeled them off, and for the greater part of the race most of the machines could only be identified by the small card number plate.

Opposite the fork an arrangement for lap scoring had been erected, but, unfortunately, there were not enough numbers available.

Vickers Jones's Premier was not only speedy, but extremely consistent, and for lap after lap he did wonderfully good times. His silencer, however, caused him some little delay. Meanwhile McNab was going in quite his best style, and appeared to be the fastest single left in the race. His machine was a brand new one. Parker's N.L.G., which had started off so well, had plug trouble, and this was followed by some internal derangement of a more serious kind, and he was therefore forced to retire after twenty-two laps.

At 6.10 the following riders were left on the track, all the others having retired. Many of the latter were on the further portion of the track, and it was therefore impossible to ascertain what trouble it was that had proved too much for them: Moorhouse, Drury, Grey, Jones, Wright, NcNab, Goodacre, Marshall, Gwynne, J. T. Bashall, Fitzherbert, Franklin, Bowen, Bashall, Watson, Reed, Abbott, and Clarke. Of these, J. T. Bashall had done forty laps and was lying first to Moorhouse's second place with thirty-seven laps, whilst Marshall was leader of the singles.



The winner, A. J. Moorhouse (5 h.p. Indian), the popular hon. sec. of the Manchester Motor Club.

F. A. McNab (3½ h.p. Trump-J.A.P.), first of the single-cylinders. A remarkable performance considering his bulk.

Retirement of the Leaders.

Casualties now seemed to increase in number, valve troubles being the principal cause of the riders seeking the repair depot. Watson seemed especially unhappy in this respect, and Marshall also had trouble with his valves lengthening. W. H. Bashall, who was well up amongst the leaders, had to stop to clean his belt, as the oil with which it was smothered caused it to slip badly. Jones and Drury also had belt troubles, the latter's pulling clean in two.

The F.N. ridden by Clarke now stopped owing to lubrication difficulties, but Fitzherbert on the other four-cylinder continued to ride in great style, although he found it necessary to keep his thumb permanently on the float needle.

At 6.40 J. T. Bashall was leading with fifty-two laps to his credit, whilst Moorhouse was second with forty-eight. The former with only eight laps to go looked an easy winner, but in spite of his great pace misfortune caught him up. On the Byfleet banking a valve broke and dropped into the cylinder, the head of which was blown off, and Bashall was therefore put completely out of the race. This mishap put the Indians into first and second places, Moorhouse being first with forty-nine laps and Franklin second with forty-six. At this point Gwynne's front tyre burst and almost caused a catastrophe, but the rider with great cleverness and pluck managed to save himself amid the cheers of the spectators. Just previous to this he had had an upset and lost a good deal of skin off his face.

Jones, who had put up a capital fight, was now put out of the running by a broken valve. In trying to get it out he broke the valve cap. Marshall and McNab continued to travel exceedingly well, as also did W. H. Bashall.

At 7.5 the positions were as follows: Twins, Moorhouse and Franklin. Singles, McNab leading, followed by Marshall. A few minutes later Moorhouse rode in an easy winner as well as a highly popular one.

Franklin stopped with only a couple of laps to go, owing to some misunderstanding, and in doing so lost his second place to Bowen.

The result of the race was declared as follows:

TWIN-CYLINDER MACHINES.

1.	A. J. Moorhouse (Indian)... ...	2h. 52m. 30s.
2.	H. H. Bowen (Bat-J.A.P.) ...	3h. 17m. 24s.
3.	C. B. Franklin (Indian)	3h. 19m. 36s.

The Battle of the Cylinders.—

SINGLE-CYLINDER MACHINES.

1. F. McNab (Trump-J.A.P.) ... 3h. 2m. 10⅕s.
2. J. Marshall (Triumph) ... ... 3h. 5m. 46⅗s.
3. A. R. Abbott (Rex) ... ... 54 laps
4. F. L. Goodacre (Triumph) ... 52 laps

During the progress of the race several motor cycle records were broken. A list of these is printed in the next column.

TWIN-CYLINDER MACHINES.

150 miles, F. A. McNab, 2h. 51m. 17⅗s.
3 hours, F. A. McNab, 158 miles 548 yards.

BRADFORD-EDINBURGH AND BACK OPEN TRIAL.

An innovation in the way of competitions is to be introduced by the Bradford Motor Cycle Club in connection with its twenty-four hours run to Edinburgh and back on July 16th and 17th. The scheme was laid before the club committee on Tuesday evening by Mr. S. Johnson, an energetic official of the club, and briefly it is as follows: Mr. Johnson considers that long distance reliability trials are too monotonous and will die a natural death on account of the unfailing reliability of present day machines, instancing the fact that only eleven entries were received from a membership of 120 for the recent Bradford to London and back twenty-four hours' run. By inviting entries of teams of three riders, novices and others who do not care for solitary twenty-four hour jaunts will be encouraged to enter because a team may be formed of a party of three friends, and all will be allowed to ride together and help each other, and it is to their advantage to do so, as the team scoring the highest number of marks will win the trophy. A team at checks and the finish are timed in accordance with the last man's schedule, so that on the last man practically depends the success of his team. In addition to the trophy a gold medal will be presented to each member of the winning team (should a team and not an individual rider be successful), and clubs may nominate teams or individual teams may enter as desired, the event being open, and under A.C.U. rules. Another new departure is in connection with the passenger class. To encourage further entries, it has been decided to present gold medals to the passenger as well as the driver of successful passenger combinations, and further a change of drivers will be permitted.

*Denote private owners.

The following competitors' machines are fitted with change-speed gears: Nos. 8, 11, 12, 17, 18, 20, 26, 29, 30, 31, 32, 46, 48, 70, 71, 77, 80, 81, 82, and 83.

Couples competing for the Team prize are: 1 and 2, 7 and 8, 11 and 12, 29 and 30, 33 and 34, 41 and 42, 44 and 45, 48 and 49, 53 and 58, 60 and 61, 64 and 65, 66 and 67, 72 and 73, 74 and 75, 78 and 79.

A map of the route, with distances and a list of stopping places, will be found on the centre pages.

Open Hill-climb in Yorkshire.

A SPLENDID entry was received for the Bradford Motor Cycle Club's second annual open hill-climb at Cockshoot Lane, about three miles from Skipton, last Saturday, and an interesting competition, so far as hill-climbs go, was the result. The weather conditions in the morning could hardly have been more depressing, local thunderstorms were prevalent, and heavy rain clouds hovering about threatened to discharge a heavy load. This was not enough to stop motor cyclists and others interested from attending the event, and the conditions improving about midday, it is probable that over a thousand people witnessed the climbing. With reference to the venue of the climb, although we have great respect for the Bradford officials' care and forethought in formulating competition regulations fair to everyone, we cannot congratulate them upon the selection of Cockshoot Lane for a hill-climbing contest. In other words, it is by no means an ideal hill. Its severity is undoubted, but it is of too tortuous a nature, and, moreover, too narrow to encourage riders of fast motor cycles to climb it at speed, and no one was surprised that several suffered bad spills. The surface was good, and, fortunately, unaffected by the downpours. The measured distance of the climb would be about five-eighths of a mile. The chief award in the competition was a handsome silver challenge cup for fastest time, presented by Eric S. Myers, a popular member of the club. The practising was marred by an unfortunate accident, which might have proved much more serious than it did. Mr. Myers, excellent sportsman that he is, had spent some time tuning up one of his motor bicycles with the idea of lifting his own trophy, and incidentally settling a few good-natured differences with one or two of his trade rivals. But he was doomed to disappointment, for on his very first flight up the hill (everyone who saw him said he was "really flying") the rear tyre burst, pitching Mr. Myers over the handle-bars, and he was lucky to get off with a few bruises and a bad shaking.

A competitor at the last bend, where several riders came to grief. Competitors call this "bad selection of the hill"; officials call it "bad judgment in taking the corner."

Examination of the Competing Machines.

The Bradford club, it may be recalled, was the first organisation to seriously take up the question of standard machines in competition. A committee of scrutineers examined each machine at the weighing scales to ascertain whether it conformed to the regulations.

It was impossible for one person to observe the whole length of the hill, but below are a few notes we made at the steep stretch, halfway up the hill.

CLASS 1.—LIGHTWEIGHTS.

The lightweight machines were geared very low, yet found the 1 in 7 gradient a little too stiff. Hall (N.S.U.) appeared to travel fastest (he was afterwards disqualified), Clark (Douglas) was slow but sure, and Davey (Moto-Rêve) pedalled—a contravention of the rules—but he was nevertheless declared the winner.

CLASS 2.—STANDARD SINGLES.

Marshall (Triumph) was first up, and he created quite a stir, for hitherto the spectators—who, by the way, had persisted in meandering aimlessly about the road—had only seen low-powered machines. P. E. Tolfree (Matchless), hon. sec. of the Edinburgh M.C.C., followed, but both were allowed another attempt, as the telephone at the hill top had been placed some distance from the finish, and the competitors mistook the finishing point until the matter was rectified. Platt (Bradbury) travelled at a rare bat, the other performances being quite ordinary.

Open Hill-climb in Yorkshire.—

CLASS 3.—STANDARD TOURING TWINS.

Smith (Clyno) failed at the first attempt owing to his carburetter valve sticking. He (as well as other competitors who experienced a stop on the hill later in the afternoon) was generously allowed another try, but was by no means a flier. The energetic trials hon. sec., Felix Scriven (Rex), did much better. A couple of two-stroke Scotts in this event ascended the hill without apparent effort in their usual silky manner, a brand new standard 4 h.p. model ridden by T. Hargreaves beating F. Philipp's 5 h.p. machine.

CLASS 4.—STANDARD TWO-SPEED SINGLE-CYLINDERS.

In this and No. 5 event, competitors had to stop and restart on the gradient on being warned by an official with a red flag. W. Milnes (P. and M.) was first up, and he stopped and restarted very neatly. The other three competitors could not have read the rules carefully, for they fumbled in the restarting test and lost valuable seconds.

CLASS 5.—STANDARD TWO-SPEED TWINS.

Lord (Rex) caused alarm, but later considerable amusement at the stopping and starting test. He came up to the flag well, judged the stop to a nicety, and, on receiving the word to start, stamped on the low gear pedal, which caused the front of his machine to rear straight up for all the world like a bucking broncho. Lord exhibited no fears whatever, he coolly kept his place in the saddle, and got away in splendid style. The odd second Lord lost by in the placing was easily wasted in this little episode.

CLASS 6.—SINGLE-CYLINDER RACERS.

Marshall again led the vanguard, and his T.T. Triumph though geared 3¾ to 1, showed no perceptible slacking of pace except when the rider was obliged to switch off for the corners. Silencers were optional on racing machines, and Cockcroft, dispensing with his, created a rare din. Hugh Gibson, on his End-to-end sidecar record machine, stripped of all superfluous parts, did well. Bottoms came a cropper at the finish through looking round, but did nothing more than buckle his back wheel. Pitney (Rex) stopped once, but was among the fastest on his second trial.

CLASS 7.—TWIN RACING MACHINES.

Moorhouse (Indian) was agreed to be fastest on the steepest stretch, so that his time is unaccountable. Mackay (Rex) tore up the hill, wobbled dangerously at the top corner, recovered, and finished in fine style. Four well-known Bat riders had entered for this event —Bowen, the brothers Bashall, and Fenn—but all were absentees.

CLASS 8.—OPEN.

Some powerful monsters competed in the open class, and the spectators wisely allowed extra space at the corners. Moorhouse, the first rider up, again judged the corners nicely, and a moment or two later, another Indian rider, H. D. Shaw, drove the spectators' hearts into their mouths. He was admittedly miles the fastest of the bunch, and though he switched off and jammed on his brake some yards before the top bend, he could not clear the ditch, and rider and machine parted company, the former rolling over and over, but, to the astonishment of the onlookers, he immediately sprang up and walked to his machine which reposed in the ditch. J. Scriven, who was trying for the first time the paces of the new 7 h.p. twin Rex, took no undue risks, but was travelling at a great pace. Next Marshall came over through running on to sodden grass bordering the ditch. He made a gallant effort to right his machine after it commenced wobbling, but it finally shot from under him. Pluckily remounting, he made another ascent, but had obviously lost the nerve he displayed in former sprints. It was whispered that Marshall, anxious to regain some of his laurels, was "all out" for Mr. Myers's trophy, so his success was warmly received. Mackenzie-Cott had fitted new pistons and cut down the stroke of his 8 h.p. J.A.P. the day before the climb to bring it within the limit, so no surprise will be expressed when we say that his

T. Hargreaves (4 h.p. Scott) restarting in the Variable Gear Class. The gradient at this point is about 1 in 12.

Open Hil-cllimb in Yorkshire.—

Group of competitors outside the Devonshire Hotel, Skipton, where the results were announced.

performance was not so good as he and his machine are capable of. He was also quite naturally shy of the stone walls bordering the roadside.

The Complete Results.

The actual times and the positions of the competitors in order of merit are as under:

CLASS 1.—Lightweight motor cycles not exceeding 120 lbs. (standard).

G. E. Davey (2¼ Moto-Rêve)	1m. 14s.
Eli Clark (2¾ Douglas)	1m. 15⅘s.

W. E. Hall (2½ N.S.U.) made fastest time (1m. 9s.), but was disqualified, as his machine did not conform to the rules.

CLASS 2.—For standard pattern single-cylinder machines.

J. Marshall (3½ Triumph)	0m. 43⅗s.
P. Platt (3½ Bradbury)	0m. 49s.
P. E. Tolfree (3½ Matchless-J.A.P.) ...	0m. 53⅗s.
Geo. Wray (3½ Bradbury)	0m. 55⅕s.
J. Windle (3½ Triumph)	0m. 55⅗s.
W. Houghton (3½ Bradbury)	1m. 11⅖s.

CLASS 3.—Standard touring twins.

T. Hargreaves (4 Scott)	0m. 48⅘s.
F. Philipp (5 Scott)	0m. 58s.
F. Scriven (5 Rex)	0m. 58⅗s.
F. Smith (5 Clyno)	1m. 3⅕s.

CLASS 4.—Standard single-cylinder two-speeders.

P. Weatherilt (3½ Zenith-Gradua) ..	1m. 10⅘s.
H. Hands (3½ Rex)	1m. 23⅗s.
W. Milnes (3½ P. and M.)	1m. 31⅗s.
T. G. Bullus (3½ P. and M.)	1m. 50⅘s.

CLASS 5.—Standard twin-cylinder two-speeders.

F. Philipp (5 Scott)	1m. 13⅗s.
R. Lord (5 Rex)	1m. 14⅗s.
T. Hargreaves (4 Scott)	1m. 25⅖s.

CLASS 6.—Single-cylinder racing machines not exceeding 500 c.c.

J. Marshall (3½ Triumph)	0m. 38⅖s.
P. Cockcroft (3½ Triumph)	0m. 47⅕s.
F. E. Pitney (3½ Rex)	0m. 47⅗s.
Hugh Gibson (3½ Triumph)	0m. 48⅖s.
S. Grange 3½ Triumph)	0m. 50⅕s.
J. Bottoms (3½ Triumph)	1m. 8⅘s.
R. Ogle (3½ Triumph)	1m. 10⅗s.

CLASS 7.—Twin racing machines not exceeding 670 c.c.

F. Mackay (4 Rex)	0m. 46⅖s.
P. Butler (5 Dot-J.A.P.)	0m. 47s.
T. Hargreaves (5 Scott)	0m. 51s.
A. J. Moorhouse (5 Indian)	1m. 1⅘s.

CLASS 8.—Open to any motor bicycle with engine not exceeding 1,000 c.c.

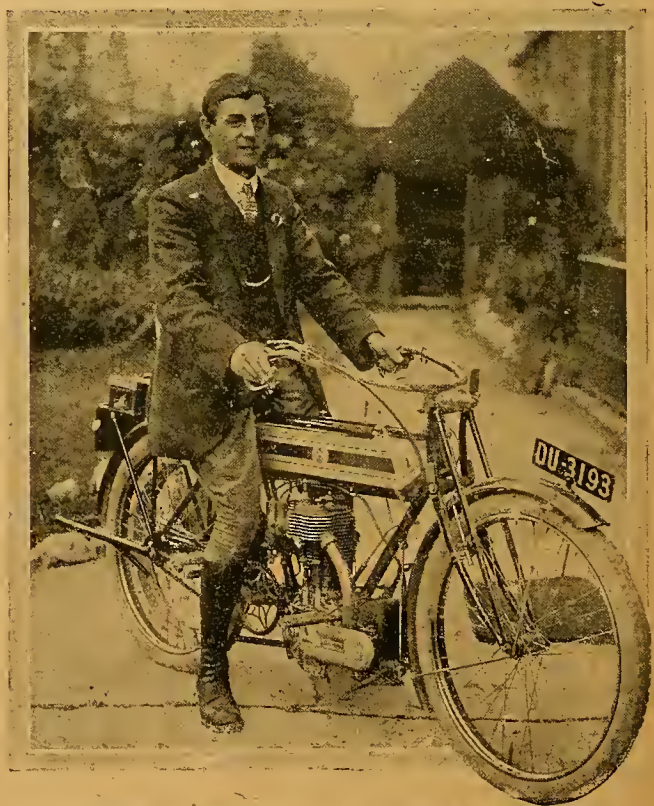
J. Scriven (7 Rex)	0m. 42s.
A. J. Moorhouse (5 Indian)	0m. 44s.
J. Marshall (3½ Triumph)	0m. 44⅘s.
S. Grange (3½ Triumph)	0m. 45⅕s.
P. Butler (5 Dot-J.A.P.)	0m. 47⅖s.
A. Mackenzie-Cott (8 King-J.A.P.) ...	0m. 47⅘s.
P. Cockcroft (3½ Triumph)	0m. 49⅕s.
T. Hargreaves (5 Scott)	0m. 51s.
G. Wray (3½ Bradbury)	0m. 56⅕s.

The foregoing results were announced at the Devonshire Hotel, Skipton, on Saturday evening.

Special amateur awards were as under: A pair of Michelin Trident tyres for fastest twin-cylinder machine outside Myers's trophy winner, won by J. Scriven (7 h.p. Rex); a pair of Palmer rubber-studded tyres and tubes for fastest single-cylinder outside trophy winner, S. Grange (3½ h.p. T.T. Triumph); a Lucas acetylene lamp for fastest touring machine not exceeding 750 c.c., P. E. Tolfree (3½ h.p. Matchless).

IMPORTANT STOP PRESS NOTICE.

On going to press, we are advised by telephone by the hon. sec. of the Bradford M.C.C. that the timekeepers have made an extraordinary muddle in the hill-climb times announced Saturday evening, and published on this page, and practically all are incorrect. Their excuse is that they hurried unduly to oblige the competitors, and, moreover, they were not used to working together. J. Scriven (7 h.p. Rex) wins the Eric S. Myers Trophy for fastest time. The revised and checked results give the following class winners: Class 1, Eli Clark; Class 2, J. Marshall; Class 3, Felix Scriven; Class 4, P. Weatherilt; Class 5, F. Philipp; Class 6, J. Marshall; Class 7, A. J. Moorhouse; Class 8, Jack Scriven.



J. Marshall (3½ h.p. Triumph), winner of the two single-cylinder classes.

Inter-'Varsity Racing at Brooklands.

NOW that Brooklands is getting so busy, fine weather cannot always be expected for every kind of meeting that is held there, but 'ements might well have been a little better disp last Saturday, when teams representing the Universities of Oxford and Cambridge came down to contest car and motor cycle events. The drenching downpour, which lasted from the beginning of the meeting until the end, and was continuous except for very, very brief intervals, accounted not only for a very sparse attendance of spectators, but also no doubt for the fact that a rather large proportion of the competitors failed to put in an appearance. Apart from the unpleasantness of the weather, which was really as bad as it well could be, the racing was never very exhilarating, so that the meeting can hardly be written down an unqualified success.

The Selection Trial.

The first event was the Oxford Cycle Eliminating Race over a distance of five and threequarter miles, and the first six riders past the post were to be eligible to compete against the Cambridge team in the Inter-'Varsity Race. The handicaps were based on the cubic capacity of the engines, twin-cylinder motors being calculated at two-thirds of their actual capacity. The scratch machines were two V.S. which were to have figured in the Cambridge Eliminating Race, but of which the owners did not turn up. Out of eleven entrants, only six put in an appearance and faced the starter. These were:

G. P. L. Henderson (two-cylinder Matchless)	0m. 6s.
E. D. Tate (Triumph)	0m. 48s.
A. F. M. Stevenson (two-cylinder Clyno) ...	0m. 51s.
D. B. Rea (Moveo)	0m. 54s.
M. K. Mackenzie (Triumph)	1m. 0s.
W. J. Frings (two-cylinder N.S.U.) ...	2m. 20s.

Tate, whose Triumph was a very racy-looking machine with a specially small torpedo tank and minus guards, soon overhauled the rest of the field and won by a mile and a half. Frings, whose 3½ h.p. twin N.S.U. was stripped to the last ounce, stood a good chance of winning this event, but failed to start until the race was practically over. Tate's speed of 49½ m.p.h. was by no means bad considering that the track was practically under water. Henderson was second, Rea third, and Mackenzie fourth. Stevenson came in very late, and Frings finished just before the next race started.

The Cambridge Cycle Eliminating Race brought out a couple of Indians which put up a good fight. Out of fifteen entrants five riders only put in an appearance, so that as far as the eliminating part of the race went this event, like the previous one, performed a work of supererogation. The starters were:

C. K. Wigram (two-cylinder Bat)	0m. 24s.
N. Gray (Triumph)	0m. 48s.
E. D. Dickson (two-cylinder Indian) ...	0m. 54s.
C. Perrens (two-cylinder Indian) ...	0m. 54s.
J. Ashworth (Minerva)	1m. 40s.

The two Indian machines got away in good style, and leaving the field splashing through the wet behind them made a close finish, Dickson winning by twenty yards. Gray was threequarters of a mile behind, and Ashworth half a mile behind him. Speed, 58 m.p.h.

The result of the contest was an easy win for Dickson (Cambridge), with Tate (Oxford) second, but over a mile behind. Perrens would have been a close second but his magneto was literally drowned, and within a quarter of a mile from the finish he was obliged to dismount and walk home. Gray (Cambridge) was third, Ashworth (Cambridge) fourth, Mackenzie (Oxford) fifth, and Henderson (Oxford) sixth. As the first cycle past the post scored eleven points for its University, the second ten, and so on, Cambridge won this contest easily by 28 points against 23.

The Cambridge team, winners of the Inter-'Varsity contest at Brooklands. This usually interesting event was spoiled by continuous rain.

A.C.U. INTER-CLUB CHAMPIONSHIP ELIMINATING TRIAL (Metropolitan Centre.)

The results of the above trial were to have been decided on Saturday last from Beaconsfield, but rain, poor support, and an insufficient number of officials caused a fiasco. Only three teams competed, and of these the Herts County A.C. (motor cycle section) was the only one to send a complete team. The North-west London M.C.C. sent five competitors, and the Essex Motor Club only four. The A.C.U. was represented by Messrs F. Straight, H. P. Beasley, and H. B. Renner. The route was typed on foolscap paper, which was almost immediately reduced to pulp by the rain. After much discussion, it was decided to start the trial, but as the route had not been previously marked Beasley left to put up some arrows.

A late start was made, and the first competitor, C. C. Cooke, of the Herts team, about twenty miles from the start was hopelessly lost in a wilderness of lanes which were little better than sheep tracks strewn with stones and sand. Other competitors then came up, and a halt was called for a consultation. It must be remembered that the rain was all the time coming down in torrents, so the plight of the competitors can be imagined.

On enquiry of the local people, it was found that some of the places mentioned on the route sheet were not known. It was ultimately decided to proceed to Missenden and Chesham, and then return to Beaconsfield, where the trial was abandoned.

AUTO CYCLE UNION

LAND'S END TO JOHN-O'-GROAT'S TRIAL.

JULY 4th to 9th.

THE route and details in connection with next week's annual six days' reliability trial of motor cycles are clear from the accompanying map and details. Readers residing in the locality of the End-to-end route may select a point from which to see the competitors pass by, following one or other of the dotted lines close to the route. The route line is numbered, the figures representing the day on which the particular stretch marked will be traversed. A complete list of the entries will be found on page 607.

Below we give the daily programme:

MONDAY.
Leave Penzance (Union Hotel) ... 6.30 a.m.
Leave Land's End ... ... 8 a.m.
Arrive Launceston (lunch White Hart Hotel)
Distance, 85½ miles.
Leave Launceston
Arrive Taunton (London Hotel)
Total distance for day, 159 miles.

TUESDAY.
Leave Taunton ... ... 8 a.m.
Arrive Worcester (lunch Star Hotel)
Distance, 107 miles.
Leave Worcester
Arrive Warrington (Patten Arms)
Total distance for day, 202½ miles.

WEDNESDAY.
Leave Warrington ... ... 8 a.m.
Arrive Kendal (Railway Hotel)
Distance, 72¼ miles.
Leave Kendal
Arrive Moffat (Buccleuch Arms)
Total distance for day, 158¾ miles.

THURSDAY.
Leave Moffat ... ... 8 a.m.
Arrive Stirling (Station Hotel)
Distance, 75½ miles.
Leave Stirling
Arrive Pitlochry (Scotland Hotel)
Total distance for day, 183 miles.

FRIDAY.
Leave Pitlochry ... ... 8 a.m.
Arrive Speans Bridge (Speans Hotel)
Leave Speans Bridge
Distance, 78½ miles.
Arrive Inverness (Station Hotel)
Total distance for day, 160½ miles.

SATURDAY.
Leave Inverness ... ... 8 a.m.
Arrive Golspie (Lovatt Arms)
Distance, 85½ miles.
Leave Golspie
Arrive John-o'-Groat's
Total distance for day, 157¾ miles.
Return to Wick (Meredith's Hotel)
Total distance, 1,021½ miles.

The time schedule is worked out on a basis of minimum speed of eighteen miles per hour, and maximum speed twenty miles per hour. Certificates and gold and silver medals will be awarded to the entrants of machines which may show sufficient merit in the opinion of the judges.

for the best performance by a private owner in the bicycle and passenger classes.

Specially prepared by THE MOTOR CYCLE

"THE BATTLE OF THE CYLINDERS." THE ATTACK ON "FATHER TIME" BY THE MOTOR CYCLE ARMY. (SEE PAGES 602-607.)

Lighting-up Times.

The times to light lamps for this week are as under:

June 30th	... ...	9.18 p.m.
July 2nd	... ...	9.18 p.m.
,, 4th	... ...	9.17 p.m.
,, 6th	... ...	9.16 p.m.

Police Traps.

On the London to Chatham Road, just beyond Welling. Strict legal limit should be observed from Shooter's Hill to Bexley.

The Team Prize in the Six Days' Trials.

In connection with the End-to-end reliability trial, a special prize will be awarded for the best performance of a team of two machines entered or nominated by a trade representative. Hitherto, teams of three have competed for the team prize.

The A.C.U. Six Days' Trials.

From the double-page map in the centre of this issue readers residing in the locality of the End-to-end route will be able to see at a glance the nearest and best point at which the competitors in the End-to-end run may be seen. This year's total distance is 1,021½ miles—the longest officially observed open reliability trial to date.

Good and Bad Roads.

The dust on the roads from Leeds to Doncaster is simply appalling, as competitors in the Leeds-London-back run found to their cost. As a contrast the roads from Doncaster to Retford are a great improvement in this respect, and the dust causes very little inconvenience. It would appear that those responsible for the condition of the roads south of Doncaster could supply some useful information to the road authorities in some portions of the North. A similar state of affairs exists in many parts of the country. One can travel fast over a stretch of road without creating any dust, and suddenly run on to a stretch of road which causes the dust to be scattered in all directions. Again, after continued rain, some roads are dangerously greasy, while others remain comparatively dry. Do not these conditions prove the need for a central authority to carry out experiments and govern the upkeep of the roads?

Inter-club Meet in the South.

"R.S.H.'s" suggestion in *The Motor Cycle* of June 9th for a general meeting of clubs and motor cyclists south of the Thames has drawn forth a further reply from R. Port, assistant hon. sec. of the Winchester and District M.C.C., which club will be pleased to help forward the suggestion. The Surrey M.C.C. has already promised its support, and it is also understood that the Western District M.C. (London) is favourable to the proposal. We should recommend the secretaries of clubs named to get into communication with one another and fix upon a suitable date for the meeting.

Two Motor Cycles Stolen.

Motor cycle thefts are increasing. Two machines were stolen from Cox's Motor Garage St. Andrew's Hill, Cambridge, on the 24th. One is a 1909 Triumph with brass acetylene gas lamp and generator; the other is a new free engine Excelsior with Lucas plated lamp and generator, and Lucas horn. The thieves left the garage about 5 a.m. on the 24th, and took care to equip themselves with two new air tubes, two new belts, and a spare cover, besides a number of tools.

The Road Board.

In connection with the newly-appointed Road Board, we are glad to state that Mr. W. Rees Jeffreys (late secretary of the Motor Union) was offered and has accepted the post of permanent secretary. Col. R. E. B. Crompton, C.B., is the engineer.

A Warning.

Mr. William Corcutt, London Road, Doncaster, writes to warn speed men of all kinds that it will be wise for them in future to ride considerately through Doncaster, and thus help all concerned to keep this town a "clean" place on the Great North Road, as it has always been hitherto.

Brooklands July Meeting.

The B.A.R.C. has decided to cancel the meeting which was to have been held on the 13th and 14th of July. This decision has been arrived at owing to the Bournemouth Fetes, as the B.A.R.C. does not wish to attract aviators to Brooklands on these dates.

The M.C.C. Team Competition.

Mr. J. Van Hooydonk, hon. secretary for the M.C.C. team trials for *The Motor Cycle* Cup, wishes to thank, on behalf of the club, the many willing helpers who gave their assistance on June 18th. The Motor Cycling Club also wishes to express its hearty appreciation of the way in which it was assisted by the Daventry police, who did everything they possibly could to make the event a success.

Two members of the Oxford M.C.C. team changed numbers after the programmes were issued, viz., J. Aldworth (3½ h.p. Kerry Abingdon) and J. F. Salter (3½ h.p. Triumph). The latter scored 90 and the former 100 marks.

M.C.C. Petrol Consumption Trial.

THE M.C.C. seems particularly unfortunate in regard to weather when it holds a petrol consumption trial. Last year's event was marred by atrocious weather, and this year's event, held on Saturday last, was run under even worse conditions; at least, the weather for two or three hours previous to the appointed time for starting was bad, which doubtless stopped many of the entrants

H. Karslake (two-speed Dreadnought) victor in Class 1. of the M C.C. petrol consumption test.

from turning up. As it was, the journey out to Northwood —the scene of the start—was made in stages owing to the rainstorms, with the result that many competitors arrived late. However, the organisation of the event was so perfect in other respects that once the men were gathered together it was an easy matter to despatch them. This year a new course was selected, starting from Northwood, near Pinner, Middlesex. The new circular course was an ideal one, taking in Rickmansworth Hill (competitors rode down this hill and up a long gradient the other side), the distance per circuit being four miles. The event was divided into three classes—(1) for single-cylinder motor bicycles, (2) for multi-cylinder motor bicycles, and (3) for passenger machines and cars—but of the thirteen entered in Class 1 only six faced the starter (Mr. R. H. Head). Four started in Class 2, and five in Class 3, two of which were sidecar combinations.

The Petrol Allowance.

Regarding allowances of petrol, this was arranged on the previous year's table, viz., at the rate of one pint for 300 lbs. total weight, increasing to one and a half pints for 600 lbs., and two and a quarter pints for 1,200 lbs., due allowance being made for intermediate weights. Multi-cylinder machines in Class 2 over 150 lbs. in weight were allowed thirty per cent. extra spirit. As it happened, all four of the machines in Class 2, including two Douglas machines (which were apparently weighted up), weighed well over 150 lbs., and the extra allowance was not given, which accounts for the poor performances of multi-cylinder machines compared with some of the singles.

The actual start was made from the True Lovers' Knot Hotel, Northwood, approximately one mile from the actual start of the circuit, so that five miles were covered in the first round.

The first to fall out was A. Mabon (3 h.p. Mabon and sidecar), who, we observed, had his machine fitted with his new and ingenious infinitely variable gear. He suffered from an air lock, and never got properly started. Noel Hans Hamilton was the next to stop, with slipping clutch, when only half-way round the first circuit. Godsal (6·7 h.p. Bat) was the third to drop out after covering one complete circuit and 1¼ miles of the second, making the total distance covered 6¼ miles. Bell, who had entered in Class 1, turned up on his four-cylinder F.N., and was allowed to start in Class 2. He ran on three cylinders only the whole way, a refractory plug refusing to spark. His machine, however, was accommodating, since it stopped at the finish of the second circuit after having covered nine miles exactly. Fletcher, on a two-speed Douglas, managed to squeeze in eleven miles, and Robinson, on the other Douglas, 13½; meanwhile, Holroyd (Motosacoche) had finished at 10¼ miles, the only one so far in Class 1 to fall out.

A Sidecar Wins Class 3.

Colyer (3½ h.p. Humber and sidecar), with two cars and Mabon out, was left winner of his class, and he eventually covered 14½ miles.

With Classes 2 and 3 finished, interest was centred on the single-cylinder machines. De Lissa (Motosacoche), Pratt (lightweight Phelon and Moore), B. Marians (Phelon and Moore), Karslake (Dreadnought), and Hill (Kerry) all safely completed four circuits, and disappeared from view; but the fifth lap was to be the decider. Marians and Hill both ran out of the precious sprint at the top of Rickmansworth Hill, and Marians was able, by taking greater risks down the hill, to coast further than Hill, so just beating him. Marians covered 18¼ miles. De Lissa managed to crowd in 21 miles, finishing within a stone's throw of the end of the fifth circuit. Pratt improved on this distance by one and a half miles; but Karslake, on his ancient war horse Dreadnought, was still going strong, and eventually came to rest at 24½ miles. He rode with an abnormally high gear, with a low gear for emergencies, and his engine has an auxiliary exhaust port at the bottom of the stroke. Results:

Class 1. Rider and machine.	Petrol allowance. ozs.	drms.
1 (Gold medal). H. Karslake (4 Dreadnought)	23	4½
2 (Silver). W. Pratt (2½ P. and M.)	19	5
3 (Bronze). O. L. De Lissa (1½ Motosacoche)...	19½	0

W. Pratt (lightweight P. and M.) travelled 22½ miles on an allowance of 19 ozs. 5 drms. of petrol, gaining the second award.

M.C.C. Petrol Consumption Trial.—

CLASS 2.

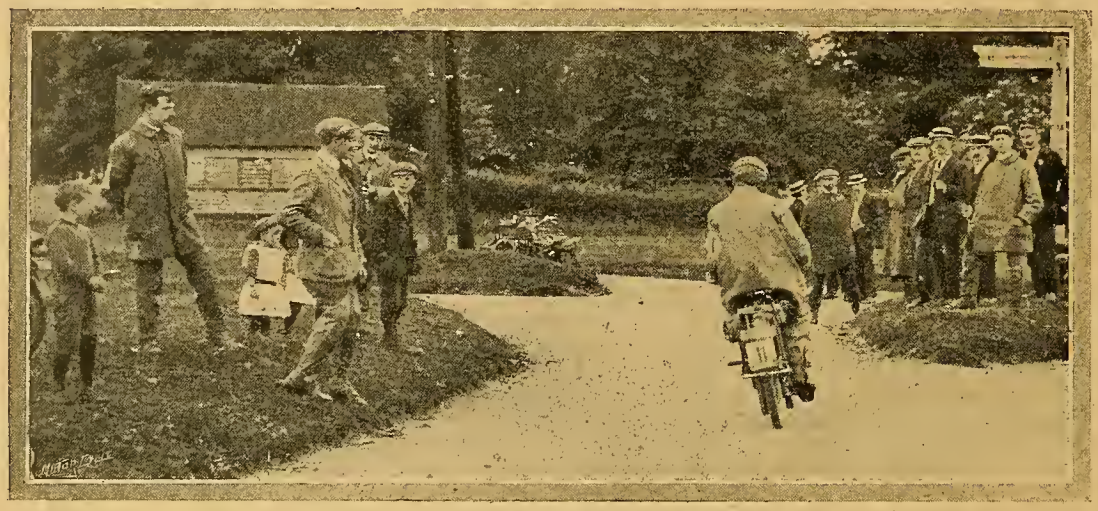
1.	J. V. Robinson (2¾ Douglas)...	21	1
2.	G. L. Fletcher (2¾ Douglas)	21	3
3.	H G. Bell (5-6 four-cylinder F.N.)... ...	22	7

CLASS 3.

1.	A. L. Colyer (3½ Humber and sidecar) ...	32	3
2.	T. Pears (15 Rover car)	32	5
3	A. Meschini (20 Rover car)	32	5

Petrol consumption trials, although very interesting as a proof of the great distances that can be covered on a motor cycle with a very small quantity of petrol, do not attract the members of the M.C.C. like some of their other competitions. The event, however, was well arranged and organised.

Mr. Jenkins was responsible for the organisation and clerical work in connection with this event, and was ably assisted by Mr. F. T. Bidlake (timekeeper), Mr. Head, Dr. Clifford Gibbons, and Captain Dickson, whose garage was placed at the club's disposal for weighing, etc.



B. Alan Hill (Kerry-Abingdon) competing in the M.C.C. Petrol Consumption Trial. Many competitors and others from the abandoned A.C.U. "Club Championship" witnessed the M.C.C. Trial.

CLUB NEWS.

Western District M.C. (London).

In the hill-climbing competition on Dashwood Hill on the 18th inst. F. H. Mullett (1910 Touring Triumph) was first in the single-cylinder class and second in the racing class. The first competitor in the racing class was F. W. Ritchie (5 h.p. Indian).

North-west London M.C.C.

Owing to a desire expressed by the general body of members, the committee has decided to hold a speed-judging competition on July 2nd, in place of a gymkhana, as arranged. The start will be from the Duke of York Hotel, just beyond Barnet, on the Hatfield Road.

Nottingham and District M.C.C.

The speed trials which were down for July 2nd are postponed, and in place thereof the committee have been allowed the privilege of the use of the Hardwick Hall Drive for a hill-climb on Saturday next, for the Percy Johnson Cup. The entrance fee for the hill-climb is 2s. 6d., pre-paid before Friday next.

Leicester and District M.C.C.

The route chosen for to-day's reliability trials is Newtown Linford, past Grueby Pool, through Grueby, Markfield, past Ulverscroft Grange, and back to Newtown. Competitors must assemble at 2.30 p.m., to start at 3 p.m. promptly. There will be prizes for the three best performances. The course will be negotiated six times. Chief marshal, Dr. C. B. Moss Blundell (captain); competition secretary, W. Carrington.

Bolton and District M.C.C.

The following are the results of the two days' reliability run to Grasmere: J. Fishwick (3½ h.p. Triumph), 93 points; J. H. Green (3½ h.p. Runwell), 87; Norman Haddock (3½ h.p. P. and M.), 82; L. R. Hardman (3½ h.p. T.T. Triumph), 82; F. Lucas (3½ h.p. Triumph), 75. P. J. Foster (3½ h.p. P. and M. and sidecar) lost all points through punctures and retired.

Prizes were given to the first four competitors. Each rider started with 100 points, five were deducted for each stop, one for each minute late or early at controls, and there were three secret checks.

Birmingham M.C.C.

A week-end run is arranged for July 16th and 17th, as the last run proved so successful. Builth is to be the venue this time, whilst on July 30th a four days' tour is arranged with Bournemouth as the goal. On July 9th a novel hill-climb is to take place, each competitor to ride the same machine, and a speed-judging contest is to be held on July 23rd on somewhat novel lines.

Westmoreland M.C.C.

The above club held a non-stop run on Thursday last of about eighty miles for Triumph medals. The course included some bad and steep by-roads. Sixteen competitors started, and on completion it was found that three had gained full marks, viz., two Triumphs and one Bradbury. These three were sent round the full course a second time, but all three managed to gain full marks again, which made it necessary to re-run it on Saturday last, speedometers and watches being barred. Final: A. M. Somavell and W. Westwood (Triumphs) tie; 3, H. Harrison (Bradbury).

Newcastle M.C.

A reliability run for motor cars and motor cycles from Newcastle-on-Tyne to Edinburgh and back on the coast route, a distance of 222 miles, was held by the Newcastle Motor Club on Thursday last, this being the fourth annual reliability trial for the Lucas Challenge Bowl. Two cars and twelve cycles were entered for the competition, and one competitor dropped out of each class. The competitors were judged on their previously declared time, which varied at the option of the rider from eighteen to twenty miles per hour, and medals were given for points as well as for those finishing within schedule time. The latter numbered nine and were as follows: H. Mason (4½ h.p. Bercley), J. R. Robson (3½ h.p. Excelsior), D. U. Wright (3½ h.p. Dene), A. Clark (3½ h.p. Dene), J. Adams (3½ h.p. Excelsior), D. Daglish (4 h.p. Antoine), R. Rowntree (3½ h.p. Bradbury), and W. H. Peel (4½ h.p. J.A.P.) The awards for the challenge bowl and the special prizes will be made after the time sheets from the various controls have been gone through. Messrs. Arthur J. Lucas and A. Parkin were the judges, and the timing was carried out by Mr. William Dunn, secretary to the club. The event was carried out in the best of weather, and proved very successful and enjoyable.

Club News.—

Ayr and District M.C.

On the evening of the 22nd the third hill-climb of the season took place at Benguhat, a mining village sixteen miles from Ayr. Fifteen members were present, and got caught in a thunderstorm which broke over the district just as the competition commenced. The results were based on the formula $\frac{W}{T \times D^2 N \times \sqrt{S}}$, and are as follow:

		Time in seconds.	Figure of merit.
1.	J. Johnston (3½ h.p. Triumph) ...	70 ...	12836
2.	T. L. Rankine (3½ h.p. Bradbury)	64 ...	13693
3.	J. Robertson (3½ h.p. Triumph)...	74 ...	13901

Special prize for fastest time was won by T. L. Rankine.

South Devon M.C.C.

The above club held its first hill-climb on the 18th inst., on Moorshop Hill, near Princetown, Dartmoor, the average gradient being 1 in 5½. The competitors were started off by Captain W. J. Gordon, whose enthusiasm and courtesy greatly contributed to the success of the competition. The fastest time of the day was made by T. Trinaman on a 7 h.p. V.S., time 1 min. 25 secs. The results on formula were as follows:

Single-cylinder Class.—1, H. King (3½ h.p. Triumph); 2, H. W. Oliver (3½ h.p. Triumph); 3, P. O. Penrose (3½ h.p. Triumph); 4, R. Birkett (3½ h.p. Triumph); 5, S. King (3½ h.p. Triumph); 6, W. J. S. Bament (3½ h.p. Triumph); 7, R. H. Smith (3½ h.p. Triumph); 8, W. H. Tidbould (3½ h.p. Quadrant); 9, F. Arnfield (3½ h.p. Rex); 10, H. Terry (4 h.p. Roc).

Twin-cylinder Class.—1, H. Shires (6-7 h.p. Bat); 2, V. B. Hilton (8 h.p. Bat); 3, T. Trinaman (7 h.p. V.S.); 4, C. R. Roberts (5 h.p. Vindec); 5, V. O. Ratcliffe (9 h.p. Bat); 6, C. Dearden (5 h.p. Indian).

Leeds M.C.C.

The complete result of the Leeds to London and back reliability trial has now been announced, as follows:

1 (trophy and gold medal)—Wilkinson and Scott (both on 3½ h.p. Triumphs) tie; they will each hold the trophy for six months, and will each receive a gold medal.

3 (gold medal)—F. K. Langton (3½ h.p. Triumph).

4, 5, and 6 (silver medals)—Wheater (3½ h.p. Humber), Ellis (3½ h.p. Calthorpe), and Kitchin (Scott).

Bronze medals—Braithwaite (3½ h.p. Triumph), Ramsden (7 h.p. S. and R.), Heaton N.S.U.), Noney (3½ h.p. Triumph), Speke (7 h.p. S. and R.), Kelly (2¾ h.p. Moto-Rêve), Cockcroft (3½ h.p. Triumph and sidecar), Burnell (3½ h.p. Humber), Murphy (5 h.p. Rex and sidecar), and Brook (3½ h.p. S.P.K.)

The special gold medal for the sidecar class was won by S. Graham (3½ h.p. Triumph and sidecar).

The Leeds to Edinburgh and back reliability ride is to take place on Saturday and Sunday, July 23rd and 24th.

Scarborough and District M.C.

The second monthly hill-climb was carried out successfully on Wednesday, the 15th inst. The electrical timing apparatus, provided and worked by Mr. J. W. F. Tranmer, proved a great boon, the telephonic communication being decidedly useful. There were twelve competitors, and they were judged on the A.C.U. formula. Each man was allowed two attempts, his better time being taken. The times were recorded by Mr. Topham. The hearty thanks of the club are due to all those who so kindly assisted in making the climb a success. Results:

Class 1.—Lightweights.

		Time.	Fig. of merit.
1.	E. Castlehouse (2 N.S.U.) ...	65s. ...	66
2.	F. H. Mason (2 Moto-Rêve) ...	86⅘s. ...	100

Class 2.—Singles.

1.	S. H. Clay (3½ Triumph) ...	58⅖s ...	81
2.	W. Woodall (3½ Triumph) ...	64⅕s. ...	90.41
3.	G. E. Wilkinson (3½ Triumph) ...	57⅗s. ...	90.48

Class 3.—Twins.

1.	J. Hornby (3¾ Premier)	47s. ...	72
*2.	J. Wilks (3¾ Premier)	45⅗s ...	74
3.	Dr. Forman (6 N.S.U.)	50⅖s. ...	106

Class 4.—Heavyweights.

1.	N.E. Railway char-à-banc	4m. 37⅗s.

*Fastest time.

Bradford M.C.C.

Felix Scriven (3½ h.p. Rex) has been declared winner of the Wm. Briggs Trophy offered in the Bradford-London-Bradford twenty-four hours trial referred to in our last issue.

Glasgow M.C.C.

The above club will hold a twelve hours reliability trial on Saturday next. The course will be as follows: Start at Cannisburn Toll (near Bearsden) and proceed by Duntocher, Alexandria, Ardlui, Crianlarich, Killin, Kenmore, Aberfeldy to Pitlochry, then return to Aberfeldy, Amulree, Crieff, Yetts-o'-Muckhart, Stirling, Kippen, and Drymen to Bearsden. Approximate total distance 204 miles. The start will be at 8 a.m. Competitors will be despatched in couples. The trial will be conducted on a twenty miles per hour basis. Lunch will be at Pitlochry, during which time the machines will be in charge of officials, and no repairs whatever will be allowed. Entries close to-day (Thursday), and should be sent to Mr. A. Gordon Bostock, Students' Union, University, Glasgow.

Middlesbrough and District M.C.C.

The fourth annual competition for the Gjers Cup was run off in a most satisfactory manner on Wednesday, June 22nd. The competitors (eighteen in all) started from Marton Bungalow about 8 a.m. in brilliantly fine weather, and proceeded round the course of 205½ miles, viz., Guisborough, Whitby, Scarborough, Malton, and York. At the latter place the competitors had one and a half hours interval, in which time lunch was partaken; they then proceeded to Tadcaster, Pateley Bridge, Harrogate, Ripon, Leyburn, Northallerton, returning *via* Clack Lane Ends, Tontine, and Leven Bridge. The results are:

1.	Evan Rees (3½ h.p. Triumph)	85 marks.
2.	H. Fairgrieve (3½ h.p. Triumph) ...	83 ,,
3.	J. G. Fairgrieve (3½ h.p. Triumph) ...	79 ,,
4.	E. Young (3½ h.p. Bradbury) ...	71 ,,
5.	J. Telford (3½ h.p. Triumph)	69 ,,
6.	J. Gilchrist (3½ h.p. Zenith Gradua)...	65 ,,
7.	F. C. Jones (3½ h.p. Quadrant) ...	61 ,,
8.	W. A. George (3½ h.p. Rex)	59 ,,
9.	W. B. Cobb (2½ h.p. Enfield)	44 ,,
10.	R. Hewitt (2½ h.p. Enfield)	27 ,,
11.	G. Bellerby (5½ h.p. Viadec)	22 ,,

The prizes are: Winner to hold Gjers Cup for a year and receive club gold medal; 2nd, Armstrong prize value £1 1s.; 3rd, club silver medal; 4th, motor cycle horn presented by Messrs. Oliffe and Co. Seven other riders who finished within schedule time will receive club bronze medals.

Surrey M.C.C.

A petrol consumption competition was held on the 22nd inst. over a circular course of thirty-six miles. The route was from Guildford to Surbiton, by way of Ripley, thence through Hook to Leatherhead, and home by Horsley and Clandon. There were twelve starters out of sixteen entrants. The figure of merit was determined by the formula $\frac{\text{Weight of rider and machine}}{\text{Consumption of petrol (ozs.)}}$ with an addition of 20 per cent. for multi-cylinder machines. The result was as follows:

		Miles per gal.	Fig. of merit.
1.	Frank Smith (6 J.A.P.)	118 ...	1.097
2.	H. R. Owtram (3½ Triumph) ...	145 ...	979
3.	J. A. Manners-Smith (3½ Triumph)	137 ...	857
4.	R. Ranger (2⅜ Douglas)	145 ...	838
5.	Rev. R. Measures (3½ Triumph)...	144 ...	795
6.	H. Mitchell (3½ Triumph)	124 ...	788
7.	E. Cox (3½ Zenith-Gradua) ...	115 ...	780
8.	C. J. Feeny (3½ Triumph) ...	113 ...	725
9.	J. H. Sparks (3½ Triumph) ...	116 ...	718
10.	G. S. Williams (3½ Arno)	107 ...	703
11.	L. Kennard (1¼ Motosacoche) ...	144 ...	650

Mr. P. Mitchell (2¼ F.N.) was easily first on formula, his consumption being at the rate of 202 miles per gallon, but for some reason he went the reverse way round the course and was thereby disqualified.

In the twelve hours reliability trial, held on the 1st inst., two competitors tied for first place. It has now been decided to award a gold medal to each, while the McNab Cup is to be offered as a prize in another reliability trial to be held in August.

Club News.—

Newport (Mon.) and District M.C.C.

The following runs have been arranged: Thursday, June 30th, to Hereford; Saturday, July 2nd, to Hereford, leaving headquarters at 2.30; Sunday, July 3rd, Worcester, leaving headquarters at 10 a.m.

Inter-club Hill Climb.

Next Saturday, the annual motor cycle inter-club hill-climb of the Derbyshire and North Staffs. and Mid-Staffs. Automobile Clubs and the University of Birmingham Motor Club is to be held near Oakamoor for a silver challenge cup presented by Mr. Francis A. Bolton, J.P. The competition commences at one o'clock.

Middlesbrough and District M.C.C. 200 Miles Reliability Trial. Competitors nearing the top of Ormesby Bank, a very long and gradual ascent, four miles from Middlesbrough, often used for hill-climbing trials.

Bath Cycling Club (Motor Section.)

The first competition took the form of a speed-judging contest. Competitors had to ride over a half-mile course at two speeds, twenty and thirty miles an hour, the winner being the one whose aggregate time was most nearly correct. Twenty-one competed, and the event was most interesting. The winners of the three prizes offered were as follow:

1. C. Wilson (3½ h.p Humber) ... ... 4s. out
2. T. C. Leaman (3½ h.p. Triumph) ... 4⅕s. out
3. Eli Clark (2¾ h.p. Douglas) ... ... 5⅖s. out

One competitor actually rode "on time" over the thirty mile an hour section. The section boasts of over forty members, the club runs are well attended, and the hill-climb arranged for July 9th and future competitions are being eagerly looked forward to.

Durham Motor Cyclists Congregating.

A motor cycle club has been formed in Durham and district; the proposed subscription is 4s., which will include affiliation to the A.C.U. The secretary *pro tem.* will be pleased to receive communications from motor cyclists in the district, when a general meeting will be held to elect officers and committee. The secretary *pro tem.* is R. W. Holmes, Dunster House, Durham.

Walthamstow M.C.

The above club held its third annual competition for the dinner cup last week over a course of ninety-two and a half miles on the London-Newmarket road and back to Thornwood, near Epping. Out of a total of fourteen competitors, twelve succeeded in making non-stop runs, and qualified for the gold centre silver medal. The winner of the cup was decided by secret timing at a milestone on the route. J. Henbrey, on a 7-9 V.S. sidecar, succeeded in winning, being only 9⅖ seconds out. He has been declared winner of the gold medal and holder of the silver dinner cup. The following qualified for medals: G. West (5 Rex and sidecar), F. A. Applebee (5 Rex and sidecar), D. Fairhead (5 Peugeot and sidecar), J. W. Percival (6-7 Fafnir Royal tricar), R. J. Lisles (5½ Humber tricar), W. S. Low (3½ Rex), H. J. Beal (3½ Rex), A. A. Blanks (3½ Rex), W. Cooper (3½ Bradbury), A. T. Stanton (3½ h.p. Bradbury), A. G. Peppercorn (3½ Triumph). S. McMinn (6-7 Phänomen and sidecar) and J. H. Kerr (5 Rex and sidecar) punctured.

Pontefract M.C.

The hill-climb for the Robson Trophy was held at Minsthorpe Hill, Moorthorpe. Messrs. J. R. Kelly, Langton, and "Harry fra' Leeds" (of the Leeds M.C.C.) kindly acted as handicappers and judges. At the close of the contest the competitors and their friends were entertained to tea by the president of the club, Colonel J. R. Shaw, at his residence, Elmsall Lodge, when Mr. Kelly declared the official times (gross) as follows:

Class A.—Lightweights.

R. F. Turner (1½ Motosacoche, 1910) ... ... 67⅖s.
C. P. Finn (2¼ Royal Enfield, 1910) ... ... 54s.

Class B.—1909 and 1910 Single-cylinders.

Will Bentley (3½ Triumph, 1909) ... ... 48s.
E. Lee (3½ Triumph, 1909) ... ... 48⅘s.
C. C. Moxon (3½ Phelon and Moore, 1909) ... 71⅗s.
W. C. Smith (3½ Phelon and Moore, 1909) ... 61⅒s.

Class C.—1908 and Previous Models, Single-cylinders.

E. M. Dolan (3½ Triumph, 1908) ... ... 56⅖s.
Horace Bentley (3½ Triumph, 1908) ... ... 50⅕s.
E. Vaux (3½ Triumph, 1908) ... ... 51⅗s.
H. Holmes (3½ Triumph, 1908) ... ... 56s.

Class D.—1909 and 1910 Twins and Two-strokes.

T. G. Mackenzie (5 F.N., four-cylinder, 1909) 76⅗s.
C. P. Finn (2¼ Royal Enfield, 1910) ... ... 55s.
E. Lee (3½ Scott two-stroke, 1909) ... ... 45⅖s.

In the final, H. Bentley-made even time (50⅕s.), whereas the other finalists (Turner and Lee) lost slightly on their previous time. Bentley therefore became the first winner of the Robson Trophy. E. Lee made the fastest time of the day on his Scott.

The newly-formed motor section of the Bath Cycling Club, assembled outside the Blathwayt Arms, on the Lansdown heights.

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

Fitting a Free Engine Clutch.

Please say—(1.) Would the fitting of a Mabon clutch to my Triumph injure the engine in any way? (2.) Is the Mabon clutch entirely satisfactory? (3.) Would the machine run freer or quicker down a hill in free engine position than at present with exhaust lifter raised?—G.J.I.

(1.) No, the fitting of the clutch would not injure the engine in any way. (2.) The clutch is satisfactory. (3.) Naturally the machine would run more easily with the clutch out than with the exhaust lifter raised, as there would be no friction in the engine to overcome with the clutch disengaged.

Damage to a Gate.

In going on bueiness to our local workhouse the other day on my Rexette I had the misfortune to get upset through the projection in the centre of the gateway which holds the gates together when closed, catching in one of the front wheels of my machine and wrenching the steering wheel out of my hands. The result was that the machine charged the gate and damaged it. Can the guardians make me pay for the damage?—UNFORTUNATE.

Our legal adviser's reply with regard to your query is as follows: "This query cannot be definitely answered on the facts given in the letter. May I presume that it is customary for the roadway from the main road to the workhouse to be used by horses and carts and vehicles generally? Has 'Unfortunate' been in the habit of using this road with his Rexette? At what rate was he travelling? Ought he not with reasonable care to have been able to avoid the projection? Did he previously know that the projection was there? Do I understand that the projection was just the same as usual, or when the gates were opened ought it to have been put down in some way to allow carriages to go through? If the latter was the case, and 'Unfortunate' was riding with reasonable care, and had a right to use the road, it would be difficult for the authorities to recover damages. It would certainly be best for 'Unfortunate' to explain the full facts to a local solicitor before agreeing to pay any damage."

Dirty Engines and Over-lubrication.

My machine, a 3½ h.p. 1909 Triumph, covers the chain wheel and crank case with oil which escapes *vid* tappet holes, etc. There is apparently no valve in the crank case release. Now in previous machines I have always had a ball valve, which I take it produced a slight vacuum in the crank case, and so prevented oil escaping. Would such a valve fitted to my machine be harmful? That is to say, would the vacuum remove the oil from the guides and crankshaft too effectively so as to under-luhricate them? I should esteem it a favour if you will help me in this, as, of course, an oily crank case does not look nice. —C.V.

Your machine has a hollow crankshaft, which has the same effect as a ball release valve, so there would be little improvement effected by fitting a ball valve. Although identical engines vary considerably in cleanliness, we are inclined to think that, provided the cylinder joint is perfect and the cylinder is tightly bolted down, you are using lubricating oil which is of too thin consistency, and it seems clear that you are injecting far too much oil into the crank case. Try thicker oil and cut down the quantity, and observe the result.

Repair of a Punctured Float.

Recently I had a case of carburetter float leakage, which revealed itself by excessive flooding. Fortunately this occurred at home, and was quickly remedied by putting in a spare float; but, supposing this mishap had taken place on the road remote from a repair shop or station, what could be done in order to get home? I never had a leaky float before, and naturally it suggested the thought what would effect a temporary repair or substitution if far distant from one's ordinary resources? If float chamber was firmly packed with a sponge or cotton wool, converting carburetter into a surface pattern, would such arrangement work? I have heard of a cork float being used, but think adjustment of same might be difficult.—R.G.L.

Curiously enough, we experienced the same trouble not long since. Thanks to the help of a local blacksmith, we were able to repair the float by soldering up the leakage. This is rather an interesting repair. To get the petrol out of the float, the float was immersed in boiling water, with the result that the petrol vaporised and the vapour issued through the leakage and through a small hole made in the top with a needle. The leak and the needle hole were then soldered up by lightly touching the places with a soldering iron. Of course, it is quite possible nowadays to carry a small soldering outfit quite up to this sort of work on a motor bicycle. In the event of no repair place being at hand, the machine can be coaxed along by careful manipulation of the petrol tap, preventing the float chamber from overflowing. Filling the float chamber with sponge or wool will not convert the carburetter into a surface pattern.

Cost of Running Lightweights and Heavyweights.

I am thinking of taking up motor cycling, but before buying a machine I should like to know the approximate upkeep per annum. What would be the cost of running (1) a Triumph, (2) a Motosacoche or lightweight F.N.? I should need to do about 8,000 miles per annum. (3.) What is the mileage per gallon of petrol for each of the above machines? (4.) What is a reasonable mileage to expect from the front and back tyres respectively. (5.) Given a reasonable amount of care for how long should one of the above machines remain serviceable? I should require the machine mainly for going to and from business and for week-end trips.—R.L.

(1 and 2.) The difference in cost of running would be mostly in connection with petrol and tyres. The tyres fitted to the Motosacoche and the lightweight F.N. are of smaller size than the tyres on a 3½ h.p. Triumph, and consequently renewals cost less. (3.) The mileage per gallon for a 3½ h.p. single-cylinder machine averages about eighty or ninety miles, on a 1¾ h.p. about 120 miles, and on the 2¼ h.p. lightweight about 110 miles. (4.) An extra strong front tyre of suitable size with care should last 10,000 miles and a back tyre from 3,000 to 4,000 according to circumstances. (5.) With renewals there is no reason why any of the machines you mention

should not be serviceable for a practically indefinite period, but after a few years machines are usually disposed of through becoming obsolete in pattern, not so much because they are actually worn out or unserviceable.

Increasing Engine Speed.

My engine is a 2¾ h.p. De Dion, just rebored, etc., and practically as new. I have altered carburetter several times (larger and smaller jets), taking care to employ a fairly strong inlet spring, but fail to get the power or speed I should expect. Thinking of increasing power, I added ⅛in. on the exhaust cam, making lift of valve fully ¼in., and timed same to open (rapidly) when piston is within ⅝in. from bottom of firing stroke, and close (rapidly) at dead top of stroke. (Stroke of engine approximately 3in.) What I should like to know is: (1.) What engine speed, normally, should I expect? (2.) Am I right by having ¼in. lift to exhaust valve or is same too much? (3.) Does valve open too early in my case; if so, when should it open? (4.) Which gives the most power — rapid opening and closing, easy opening and closing, or easy opening (at the correct time, of course), and rapid closing? (5.) Would you advise me to increase the compression ratio a little?—G.W.

(1.) Engine speed depends upon the gear and other factors, but when not worked too hard or driving too heavy a load 2,000 r.p.m. should be easily attained. (2.) The usual amount of lift is between $\frac{3}{16}$in. and ¼in. (3.) The valve should commence to open when piston is within one-seventh of the end of the working stroke. The stroke is 76 mm., so that the valve should commence to rise when piston is within 11 mm. of the bottom of the firing stroke. 11 mm. is approximately $\frac{7}{16}$in., so apparently the valve opens too early. (4.) There seems to be no hard and fast rule on the subject, but for power consideration only the valve should open and close quickly. (5.) No, it will only cause the engine to overheat, and the flywheels being made to suit the compression raising the latter would necessitate heavier wheels for smooth running.

Fitting a Magneto Switch.

Please tell me how to connect a switch to the magneto of my machine. Is any special wiring needed? In running down a long hill with the magneto cut out, would the magneto be likely to heat up or receive damage to its armature or internal parts?—H.H.P.

Over the contact-breaker of your magneto you will find a steel screw. Connect a wire to this and the other end to the handle-bar switch, and as soon as you earth the current through the switch the magneto will be put out of action. The magneto will receive no damage if a switch is fitted as we have suggested.

Wear of Bearings. Overhead and Pocket Valves.

The big-ends of my 7-8 h.p. twin have worn so much in about 1,500 miles that I have had to have them rebushed: I have always given plenty of oil—in fact, over-lubricated. (1.) Could the wear be caused by an excessive use of the magneto switch, as I am continually using it, especially in traffic? There is always a considerable kick every time I switch off and on. (2.) What are the advantages and disadvantages of overhead valves; and why are they fitted to racing machines and not to touring ones?—F.C.M.

(1.) It is quite possible that excessive use of the switch may have accentuated the trouble. It is far better to slow down with the aid of the exhaust valve lifter, as the power is too suddenly applied with a switch, unless the spark lever be retarded and the throttle almost closed. (2.) The advantages of overhead valves are that there is an absence of pockets, and, in consequence, increased efficiency. The disadvantage is that there is a possibility of the valve head falling into the cylinder and being jammed through the piston in case of breakage.

Route. Carriage Tax.

(1.) What is the best route from Holyhead to Southampton? (2.) Are there many police traps on this route? (3.) Will it be necessary for me to take out the 15s. carriage tax for my motor bicycle which is registered in Ireland, my driving licence also having been taken out in Ireland?—W.E.H.

(1.) Your best route would be as follows: Holyhead, whence the road is marked by the R.A.C. straight away to Shrewsbury, and is, in consequence, easily found, then through Ironbridge, Bridgnorth, Kidderminster, Worcester, Evesham, Moreton-in-the-Marsh, Chipping Norton, Woodstock, Oxford, Abingdon, East Ilsley, Newbury, Whitchurch, Winchester, to Southampton. (2.) We do not know definitely of any police traps on this route. (3.) Yes, it will be necessary for you to take out a local taxation licence, and the law states that it must be taken out "within twenty-one days of becoming liable."

READER'S REPLY.

A Double Purpose Accumulator.

Seeing "C.G.'s" query of June 16th for using an accumulator for a double purpose, I should like to give my reply. If the cell is a 12, or more, ampère-hour one he could use it for both purposes, provided the coil he uses takes a small current, say ¾ ampère, and also the lamp about the same. Personally I can recommend a 3 or 4 c.p. Osram bulb, as this gives an excellent light, and takes very little current. Using both together will not cause misfiring or intermittent lighting, provided he connects up properly—in parallel, and not in series. I beg to remain one who has "DONE IT."

The team of Tourist Trophy Triumph riders who created a record in the Isle of Man by finishing complete. Left to right: H. Lister Cooper, W. F. Newsome, W. G. McMinnies, J. W. Adamson, Howard Smith, W. Creyton. J. Marshall, and C. E. Murphy.

THE RUDGE-WHITWORTH MOTOR BICYCLE.

IN a recent issue we published a brief announcement regarding the motor bicycle which Rudge-Whitworth, Ltd., is preparing for 1911. Apparently there is no intention of producing anything in the nature of a radical departure from standard practice, but the company has already made one or two innovations which are the results of experience gained by a long motor cycling career on the part of members of the staff. Readers may, therefore, expect a thoroughly practical machine, free from fads, yet embodying good engineering practice.

At present it has been decided to make a single-cylinder engine with dimensions 85 × 88 mm. bore and stroke, with internal flywheels, detachable combustion head, and mechanically operated inlet valve operated by an overhead tappet and rocking lever. The detachable head is secured to the cylinder by four long bolts, let into the crank case in a similar manner to the old De Dion and M.C.C. tricycle engine. The inlet valve seating is held down to the combustion head by a dome provided with a bayonet joint. To remove the valve and inlet pipe it is only necessary to unscrew the set pin through which the inlet valve tappet works, and the valve seating with the valve complete may be taken out bodily. One pair of timing wheels only are used, the cams for the exhaust and inlet valves being on one spindle. The magneto machine is fitted in front of the crank case and driven by chain, but is not too high up to prevent effective cooling of the lower portion of the cylinder.

The carburetter, a B. and B. spray of the usual handle-bar controlled type, is situated behind the cylinder. To provide a very low seat the top tube runs parallel for two-thirds of its length, and is then curved down towards the back stays and seat tube lug. The tank, of course, is shaped to fit the space. The distance from the ground to the top of saddle is only 30¾in. The free engine clutch is on the engine-shaft, and the machine is so designed that either belt or chain drive can be finally adopted. The pedalling chain for starting, instead of being connected to a ratchet clutch on rear hub on the right-hand side, is directly coupled to the engine-shaft. The clutch only comes into operation when required, and is not continually over-running when the pedals and cranks are stationary. Large diameter tubes are used throughout the frame, and the petrol and lubricating oil tanks have large filler caps, the lubricating oil tank being a separate reservoir with hand controlled spring plunger pump.

The first of the Rudge-Whitworth motor bicycles is expected to be on the road within the next few weeks, when we hope to have an opportunity of trying it and giving our readers an opinion with regard to its capabilities on the road. Judging by the careful way in which the design is being elaborated, we fully believe that the firm will have an excellent model, and one which it will repay our readers to examine closely.

RIDING HINTS.

I HAVE heard a good many complaints recently from motor cyclists that, after injecting petrol or paraffin into the cylinder, they have great difficulty in starting up, either by means of the handle on the back wheel axle or by the pedals, owing to stiffness of the engine when cold. They probably find that even a large amount of the solvent does not free the piston sufficiently.

The simplest and most effective method is to inject a small quantity of paraffin into the cylinder at least half an hour before starting up. The engine will be found to be quite free if this be done. The explanation is obviously that the piston and piston rings are a very close fit, and as a result the solvent is not able to dissolve the congealed oil immediately, but gradually makes its way past the top ring, and finally reaches the bottom ring.

Riders should ascertain whether the engine is quite free when hot. If it is, there is nothing wrong, and the above method of starting will overcome the difficulty.

Many 1909 and earlier models have no petrol injecting pipe. This is easily remedied by fitting a pipe and universally-jointed union in place of the tank drain tap.

I note that "Ixion" recommended recently that magneto cut-outs should always be fitted. Surely he must know that opening the extra air valve wide cuts out the engine and uses only a small quantity of fuel, the mixture being very weak and composed largely of air. And even if we assume that for some reason this method of cutting-out the engine should fail, one can always in emergency shut the throttle. So that the exhaust valve lifter, extra air valve, and throttle must all three fail before a magneto cut-out would be required. But if a few ultra-cautious riders do require a magneto cut-out, they can so fit one that the operation of fully retarding the contact breaker brings the insulated terminal connected to the bell-crank into metallic contact with an earthed portion of the magneto. I have effected this by means of a small piece of brass attached to the insulated terminal connected to the bell-crank. When the lever is fully retarded, this piece of brass makes contact with the brass oil-cup cover, and short-circuits or earths the current and prevents the occurrence of the spark at the plug. No extra knobs or wires are required, and nothing could be simpler.

Owners of Humbers and other two-speeded models fitted with the Roc type of clutch and gear may be glad to hear of the following tip: In order to push off on the low gear, fit a piece of spring steel to the inside of the left footboard in such a manner that the back end is attached rigidly and the front end is free to move in a lateral direction, and capable of being brought behind the pin projecting from the small lever which actuates the low gear clutch rod. To use this device, press low gear pedal home, and push spring behind projecting pin; now release low gear clutch pedal, and the result is low gear is held in engagement. Push off, step on at a low speed, press low gear clutch pedal when seated, and spring catch flies out of action. Releasing low gear clutch pedal gives free engine. This is often a convenient way of starting when one does not desire to push off with high gear in or to get out the starting handle. C.W.

AN EXPERIENCE OF THE COWEY SPEEDOMETER.

THE Cowey speedometer has attained a well-deserved amount of popularity amongst motor cyclists owing to the absolute steadiness of the indicating hand and also owing to its accuracy. In its working it differs considerably from other speedometers. Referring to fig. 1, the balance wheel A is driven by means of a propelling arm B mounted on the eccentric E, which is rotated direct by the flexible shaft. The spring C has a small chain D attached to it, one end of which is fastened to the spindle upon which the balance wheel is mounted. The propelling device, the face of which is provided with a number of teeth, which mesh with the teeth cut on the edge of the balance wheel, gives a series of intermittent impulses to the wheel, which tend to draw it continuously against the direction in which the spring is pulling, namely, the direction of zero on the dial. The faster the machine travels the more numerous will be the impulses given to the balance wheel by the propelling arm, so that the spring, having more work to do in overcoming the effect of these impulses, will be deflected and allow the balance wheel to have more or less movement. The balance wheel actuates the indicating hand and moves it into a position which shows the speed at which the machine is travelling. In actual practice the hand moves up slowly, and when it has reached the speed at which the machine is travelling it remains absolutely steady at that point. On the speed being reduced the handle drops back slowly until it indicates the speed to which the machine has been slowed down. The stud F on the eccentric E serves to actuate the odometer, which is situated at the side of the casing.

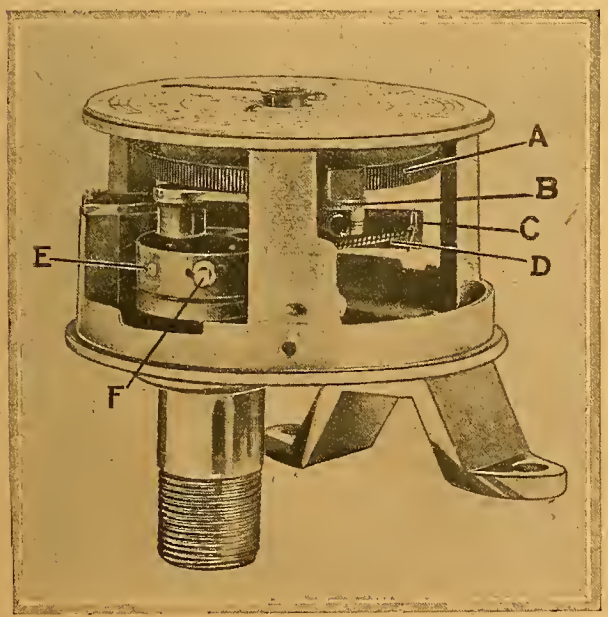

FIG. 1.—A. Balance wheel. B. Propelling arm. C. Spring. D. Chain. E. Eccentric. F. Stud.

Fig. 2 shows the driving mechanism and flexible chain E. This chain runs in the flexible shaft C. The method of attaching the driving wheel to the spokes is ingenious. It is backed by a split ring, and is clamped on by screws and nuts, the latter being specially shaped.

We have had one of these indicators in use nearly all this season, and have not had a moment's trouble with it. It indicates speed quite accurately as far as we have been able to ascertain by rough timing between milestones and the distances recorded on the odometer check, with the mile posts and other means of reckoning distance travelled. We can recommend the use of the Cowey speedometer to any reader who contemplates fitting one of these devices. The makers are Cowey Eng. Co., 1, Albermarle St., W.

The Battle of the Cylinders.

In the 60 Lap Race at Brooklands on the 22nd S. A. M. Witham used Wakefield motor oil, "Castrol" brand, when he broke the fifty miles record.

Catering for Motor Cyclists.

Messrs. John Piggott, Ltd., Cheapside, E.C., one of the oldest firms of outfitters in the City, are now devoting themselves seriously to catering for the requirements of motor cyclists. An excellent suit which should appeal to our readers at this time of the year, specially designed to protect the rider from dust, consists of a double-breasted jacket and seatless gaiter trousers. The same firm have also an excellent accessory department, in which all the best-known tools, accessories, and tyres are stocked. Motor cyclists who are also campers will be interested in the J.P. sleeping tent, made from swallow-wing yacht canvas with ground sheet sewn in. It packs into an American cloth case provided with a strap.

SPARKLETS

The End-to-end Six Days' Trials.

Competitors in the A.C.U. End-to-end Trial will be interested to know that spare Continental tyres may be obtained at the following towns *en route*: Penzance, N. Holman and Son; Taunton, the Taunton Motor Co.; Warrington, J. Skelton, 55, Sankey Street; Moffat, the Sportsman's Emporium (A. D. McDonald); Pitlochry, J. Kennedy; Inverness, Macrae and Dick; Wick, A. Robertson and Son.

Mr. Alec S. Ross, of Bowden Wire, Ltd., will be at the Union Hotel, Penzance, on July 2nd and 3rd, when any assistance he can give competitors will be at their disposal.

A Telescopic Soldering Iron

A handy telescopic soldering iron has been brought out by the proprietors of the "Tinol" solder, Neville Williams and Co., 88, Southwark Street, S.E. This small tool is made to take into three parts—the iron, the handle, and an intermediate tube which permits the tool when extended to be nearly 12in. long. Closed it measures 5in. by 2in. over all, and will therefore easily go in the toolbag.

The Scottish Six Days' Trials.

In the recent Scottish Trials, which are certainly the most severe test that has ever been held for touring motor cycles, all the competitors but two employed Vacuum Mobiloil, and expressed their entire satisfaction with the lubrication of their engines.

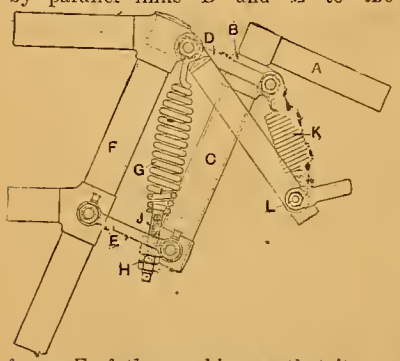
Mr. J. Talfourd Wood, who was a competitor in the Scottish Six Days' Trials, has written to the Kempshall Tyre Co., Ltd., to inform them that all his tyre troubles were due to burst air tubes which were not Kempshalls.

RECENT PATENTS.

By ERIC W. WALFORD F.C.I.P.A.

A Spring Seat-pillar.

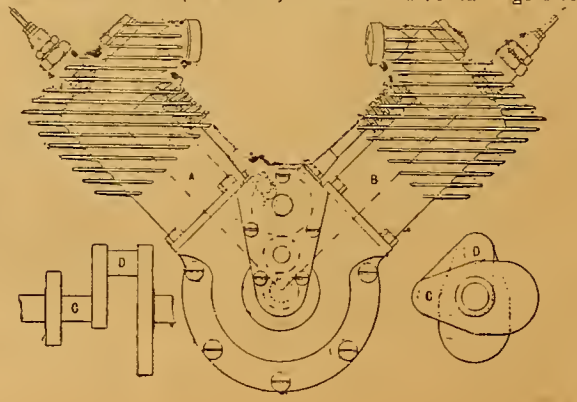
The ordinary seat-pillar A is held in a clamp B, which permits of adjustment in the tube C. This is connected by parallel links D and E to the



frame F of the machine so that it can rise and fall, the seat-pillar A always remaining at the same angle. Diagonally is arranged one or more tension springs G, which carry the weight, and are adjustable by adjusting the nuts H on the screwed stem J. A recoil spring K is attached to the clamp A, and to the machine frame at L.—C. T. B. Sangster, No. 16,386, 1909.

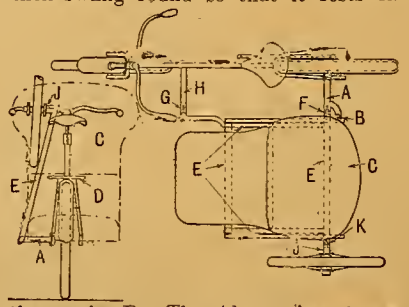
A Balanced Twin.

The cylinders A B are set at an angle of 90° to each other, as also are the crank pins C D. By this arrangement a more even turning moment is attained than when both piston rods are connected to the same crank pin.—G. H. Rotherham, No. 10,407, 1909.



A Collapsable Sidecar.

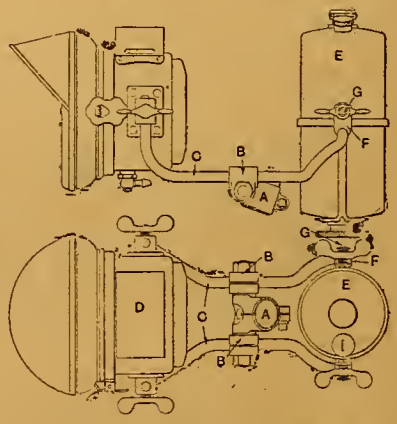
This sidecar is made collapsable in an ingenious manner, so that the whole machine can be passed through a narrow doorway. Projecting from the machine is a fixed arm A with an upstanding pillar B, to which is pivoted the seat C. To collapse the machine the seat is slipped up the pillar C, and then swung round so that it rests on



the carrier D. The side carriage frame E, which is of rectangular shape, is pivoted at F to the arm A, and at G to the arm H. The wheel axle J is pivoted at K to the frame. When the seat is swung out of the way as described, the whole side carriage frame can be turned about its pivots so that it is swung up into the position illustrated.—A. E. Abrahamson, No. 22,170, 1909.

A Lamp and Generator Bracket.

This bracket is attached to the steering head or elsewhere by a clip A, to which is pivotally attached a clamp B securing two rods C. These rods are formed to carry at the front end the head lamp D, and at the rear the generator E. The rods terminate at the rear in flattened portions F, which



are slotted to receive trunnions G formed on the side of the generator. It will be noticed that the rods C are adjustable through the clamp B, and that the whole bracket can be set at an angle.—H. Lucas and W. H. Edwards, No. 16,633, 1909.

1910 Motor Cycles on the Road.

Two Clyde motor cycles in the Leicester M.C.C. team competing for *The Motor Cycle* Cup made non-stop runs and gained 100 marks each. They were ridden by T. Needham and A. R. Barker.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

WAUCHOPE'S,

9, SHOE LANE,

Fleet Street, LONDON, E.C.

(JUST OFF LUDGATE CIRCUS).

'Phone: 5777 Holborn. Telegrams: "Opificer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20 Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days, and if no sale is effected, each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

1910 Triumphs ready for delivery; £48 18s., or with P. and M. two-speed £56.—Walker's.

DOUGLAS, Model B., new October, many extras, good order, perfect running; £27.—Jackson, 8, Cable Rd., Hoylake.

"CORONET" SUCCESS

Mr. Youngman secured first prize with a Twin Rex and "CORONET" SIDECAR in the Halifax Reliability Trial Run, on June 12th, to Morecambe and back, a distant of 130 miles over some of the roughest roads imaginable. This Sidecar he has driven some thousands of miles without trouble.

£4 17s. 6d.

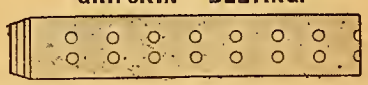
We maintain the "Coronet" is the BEST DESIGNED SIDECAR on the Market.

Free from Side-slip.—The "Coronet" Sidecar is attached in three places, the front down tube, bottom stay, and saddle bolt, and can be detached in three minutes. Every tube of attachment is telescopical and adjustable to suit any length wheelbase, any height or width. When attached the combination is as firm and rigid as a Tricar, and entirely free from side-slip, and can be driven safely without passenger if desired.

Springing.—In the majority of sidecars the front portion of chair is laid on tubes forming part of the framework. Consequently all road shocks are transmitted along these tubes to the feet of the passenger; not so with the "Coronet." The chair is luxuriously sprung clear of the frame, on double C springs, and riders declare this sidecar to be equal in comfort to an expensive motor car. This is one of the most important features of the "Coronet." Discount to the trade.

Delivery from stock to suit TRIUMPHS, REXES, P. & M.'s, N.S.U.'s.
Price £4 17s. 6d. Discount to trade.

"GRIPSKIN" BELTING.



Made from selected parts of hides, correct angle, perfect drive; the best leather belt on the market. Longer life than rubber.

⅜in., 10d.; ½in., 11d.; ⅞in., 1/1; 1in., 1/2.
Special terms to the trade.

RUST on a Motor Cycle

is a prolific source of mischief and trouble.

A speck of it in the right — or wrong — place means vexations, misfiring, or perhaps no spark at all.

3in One

prevents rust,

and it is not merely a rust preventive, but a lubricant for all bearings; it never dries out or gums.

3-IN-ONE OIL COMPANY,

Dept. O, 124, HOLBORN, LONDON, W.C.

Say "Yes."

When you soliloquise in your heart of hearts are you not wholly sick of belt troubles?

SAY "YES."

You would really prefer a transmission which under all circumstances, and in any hands, is absolutely weather proof and non-slipping, wouldn't you? Be candid—

SAY "YES."

And are there not many fine exhilarating days on which you would snatch a run but for the muddy roads and that belt of yours?

SAY "YES."

Then you are the man who ought to have a

2¼ h.p. F.N. Shaftdriven Lightweight

Wet weather, damp weather, muddy weather, they're all the same to the cardan transmission of the 2¼ F.N. Lightweight, which takes no heed of climatic conditions.

Make a New Year's resolution to-day; decide to have a 2¼ F.N. Lightweight, and the next time you're asked if you've finished with belt troubles

SAY "YES."

£40.
